STATUS, DISTRIBUTION AND HABITAT. Resident and breeds in Sind (West Pakistan); not uncommon but extremely local. Seasonal movements, if any, not recorded. There is only a single unexplained occurrence reported outside Sind (January 1872 — Brooks), near Etawah in Uttar Pradesh, c. 1100 km east of its nearest known habitat. Affects damp cultivation in canal-irrigated desert colonization areas, and tamarisk jungle in the Indus riverain.

GENERAL HABITS, FOOD, VOICE AND CALLS. Keeps in small parties of half a dozen birds or so; apparently never large flocks like the wintering migrant starlings; otherwise like 1001 and other races.

BREEDING. Season, March to May. Nest, a pad of grass and feathers in a hole in a tamarisk or *Prosopis* tree growing along a canal bank or in the middle of a dhand (jheel). Eggs, 5 or 6 (?), pale skim-milk blue as in 1001. Average size of 12 eggs 26.1 × 19.6 mm (Baker). Breeding biology unrecorded.

MUSEUM DIAGNOSIS. Most distinct of all Asiatic races of *S. vulgaris*, with the glossy reflections characteristic and constant. Not only smaller-looking than the other Starlings, but acquires the yellow bill of the breeding season long before the winter-visiting birds do. Entire head, throat and ear-coverts green; upperparts including wing-coverts red-purple; no distinct pectoral band as in *pollaratskyi* (997), the green of the throat joining the purple breast which shades off to green on belly and flanks; under tail-coverts purple.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus
♂♀	110-120	26-27	28-30 mm
			(CBT)

COLOURS OF BARE PARTS. As in 1001. 'Iris in ♂ brown, in ♀ bright gold' (Ticehurst).

1001. **Kashmir Starling.** *Sturnus vulgaris indicus* Blyth

Sturnus indicus Blyth, 1844, Ann. Mag. Nat. Hist. 12: 97 ex Hodgson in Gray, 1843, Zool. Misc.: 84 nom. nud. (Nepal, restricted by Ripley, 1961; based on only specimens available to Blyth in 1843)

Sturnus humii Brooks, 1876, Ibis: 500, new name for *Sturnus nitens* Hume, 1873 (Cashmere)

Baker, FBI No. 973, Vol. 3: 31

LOCAL NAMES. *Tilgiri*, *Tsinhangoor* (Kashmir).

SIZE. Myna —; length c. 19 cm (7½ in.).

172

STURNIDAE

MUSEUM DIAGNOSIS. 'Head deep purple-blue, redder purple on chin, throat and hindneck; ear-coverts deep metallic green; mantle coppery red to bronze; scapulars deep green; rump and upper tail-coverts, belly and flanks bronze-green to bluish green; pectoral band of copper-red continuous with throat and passing to the green underparts. Under wing-coverts blackish brown with narrow whitish edges. Wing shorter than in the other races except *minor* [1000]' — Ticehurst.

In first-winter plumage whitish spots on abdomen so large that abdomen appears almost white.

Juvenile. Pale brown, the feathers of the underparts streaked with darker brown; throat and chin very pale.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	116-121	29-32	30-32	56-59 mm
♀♀	113-119	28-30	29-31	54-58 mm
				(HW)

Wing ♂♀ 119-125 mm (CBT)

Weight 15 ♂♀ 55-72 (av. 62.1) g — SA.

COLOURS OF BARE PARTS. Adult. ♂ Iris dark brown. Bill bright yellow, horny steel colour about nostrils and on base of lower mandible. Legs and feet salmon-brown, darker on tarsus; claws dusky horny, darker towards tips. ♀ Iris: outer ring pale yellow, inner dark brown. Bill horny yellow. Legs and feet as in ♂. Immature. ♂ roughly as in adult. ♀ Bill horny, mottled with brown and yellow; or bright yellow, horny at base of lower mandible.

SIZE. Myna ±; length c. 23 cm (9 in.).

FIELD CHARACTERS. A trim black and white myna with conspicuous deep orange-red orbital skin and bright orange-and-yellow bill. Sexes alike. Young much paler and browner, the breast streaked or smeared with vinaceous brown. For details see Museum Diagnosis.

STARLINGS, MYNAS

173

x c. 1

STATUS, DISTRIBUTION and HABITAT. Resident, evidently with some seasonal (?) local movements, as yet little investigated. Local and patchy in some parts. Northern and eastern continental India east of a line from c. 76°E. (Ludhiana and Hisar in Punjab) south through eastern Rajasthan roughly to Hoshangabad (Madhya Pradesh), Hyderabad (Andhra) and the Krishna river delta (c. 16°N. lat.)¹. In the north along the U.P. and Nepal

Sturnus contra

Distributional ranges

▨ *contra* (1002).

▨ *sordidus* (1003).

▨ *superciliosus* (1004).

terai, duars, foothills and through the Gangetic Plain to Lakhimpur and N. Cachar districts, Assam [where some intergrading with *sordidus* (1003) occurs]; also East Pakistan. Plains and foothills up to c. 700 m. Affects open cultivated well-watered country in the vicinity of human habitations—damp grazing grounds, margins of tanks, sewage farms, municipal refuse dumps, etc.

¹ An odd pair or two (presumably escapes) observed in Greater Bombay in 1939, and as breeding more or less regularly since; but the species has failed to colonize in strength; the largest number seen in March 1963 five birds (HA & SA, JBNHS 51: 736).

1003. Eastern Pied Myna. *Sturnus contra sordidus* Ripley

Sturnus contra sordidus Ripley, 1950, *Postilla*, Yale Peabody Mus., No. 1: 3 (Sadiya, Northeastern Assam [= Lohit division, NEFA])
Not in Baker

LOCAL NAME. *Kān kurikā* (Assam).

SIZE. Myna ±; length c. 23 cm (9 in.).

FIELD CHARACTERS. As of 1002, q.v. See Key to the Subspecies and Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Northeastern Assam from Dibrugarh and Margherita (95–96°E.) north to the Brahmaputra gorges and Mishmi foothills, east through the Lohit Valley (very common and abundant in the neighbourhood of Sadiya). Presumably extends south to the Patkai and Naga hills (?), but exact limits undetermined.

GENERAL HABITS, FOOD, VOICE and CALLS. As in the Indian form (1002). BREEDING. Not specifically recorded; doubtless as in 1002.

MUSEUM DIAGNOSIS. Differs from nominate *contra* (1002) in having the streaklets much reduced on the shoulders, and absent on the nape; the streaklets sepia rather than vinaceous or drab. Underparts darker.

MEASUREMENTS. 2 ♂♂ Wing 118, 124; bill (from skull) 33, 35 mm (SDR).

COLOURS OF BARE PARTS. As in 1002.

1004. Burmese Pied Myna. *Sturnus contra superciliosus* (Blyth)

Sturnopaster superciliosus Blyth, 1863, *Jour. Asiat. Soc. Bengal* 32: 77 (Burma)

Baker, FBI No. 1006, Vol. 3: 64

LOCAL NAMES. *Kān kurikā* (Assam); *Chong nga* (mynas generally — Manipur); *Zeyet* (Burma).

SIZE. Myna ±; length c. 23 cm (9 in.).

FIELD CHARACTERS. As of 1002, q.v. See Key to the Subspecies and Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Resident. Manipur Valley up to c. 800 m. Inhabits open well-watered country and cultivation near habitations; abundant about Logtak Lake.

Extralimital. Plains of Burma, south to Tenasserim.

GENERAL HABITS, FOOD, VOICE and CALLS. As in the Indian form (1002). BREEDING. As in 1002. Average size of 40 Burmese eggs 26.8 × 19.8 mm (Baker).

MUSEUM DIAGNOSIS. Differs from nominate *contra* (1002) in having the forehead and anterior crown streaked with white, and a broad white supercilium to ear-coverts. Streaks on neck and shoulders absent or obsolete.

MEASUREMENTS

11 ♂♀	114–118	32–35	62–70 mm (CBT)

COLOURS OF BARE PARTS. As in 1002.

174

STURNIDAE

Extralimital. Other races extend the species to Thailand, N. Laos, and to Sumatra and Java.

GENERAL HABITS. Sociable, predominantly insectivorous and ground-feeding. Keeps in small parties and noisy squabbling flocks of up to 30 or more birds when not paired off for breeding, commonly in association with other mynas. Rarely met away from villages and human habitations though never actually entering or utilizing houses like Indian Myna. Refuse dumps, cattle pens and marshy grazing land are some of its favourite feeding-grounds.

FOOD. Insects, fruit and cereal grain; apparently less fond of flower-nectar than many other mynas. Among stomach contents in an intensively cultivated area in Bihar, have been identified grasshoppers (*Chrotogmus* sp.) and crickets, beetles (of the families Tenebrionidae, Melolonthidae, Copridae and Carabidae), ants (*Camponotus compressus*), cutworms, caterpillars and grubs (Mason & Lefroy, 1912).

VOICE and CALLS. An assortment of high-pitched but pleasant musical liquid notes, some reminiscent of snatches of the flight-song of the finchlike *Ammodramus* and *Eremopterix*. Is a good mimic and if taken young will learn to imitate whistled tunes and song of Shama and other birds to perfection.

BREEDING. Season, March to September; often two successive broods. Nest, a massive dome affair, roughly globular but often merely a shapeless mass of straw, roots and rags on a foundation of twigs, with wispy 'beards' of straw and rubbish dangling untidily below. Placed among the outer branches of trees like shesham, babool, mango or peepul growing near a village, 5 to 10 metres from the ground; occasionally up in the head of a *Borassus* palm. Nests tend to be loosely colonial, sometimes maybe a dozen or more built in the same tree. Eggs, 4–6, most commonly 5, glossy unmarked blue. Average size of 100 eggs 27.6 × 20.2 mm (Baker). Both sexes share all the domestic chores. Period of incubation undetermined.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Young (immature). Loes and feathers to base of bill rusty white, ear-coverts whitish suffused with brown; underparts buffish white with a few brown smudges; white edges of scapulars less defined and less pure. Rest of plumage as adult, but black replaced by brown; brown of throat with pale tips and bases and a few brownish tips to lesser coverts. Tail feathers narrower. Postjuvinal moult complete (Tieckumt).

Birds from the western parts of the range (Punjab, Gwalior) have a tendency to be browner above whiter below; those from the eastern (duars, Bengal, Assam) are black above pearly grey below. But there is a continuous colour cline, and some examples are indistinguishable.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	116–126	30–35	32–35	63–75 mm
♀♀	114–120	31–33	32–34	64–72 mm

(SA, HW, Maricou)

Weight 7 ♂♀ 72–82 g (SA).

COLOURS OF BARE PARTS. Iris brownish orange or orange-buff; orbital skin deep orange. Bill, basal portion orange-red, terminal pale yellow or flesh colour; mouth leaden-black. Legs and feet yellowish brown.

176

Pastor turdiformis Wagler, 1827, *Syst. Av. Pastor* sp. 15, new name for *O. sinensis* Gmelin

Baker, FBI No. 991, Vol. 3: 37

Plate 68, fig. 13

LOCAL NAMES. None recorded.

SIZE. Greyheaded Myna (987); length c. 20 cm (8 in.).

FIELD CHARACTERS. A small greyish and black myna with a large and prominent white shoulder-patch (scapulars and upper wing-coverts), smaller and greyish buff in female. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Apparently an irregular vagrant as in Burma, Thailand and Malaya, or overlooked as a winter visitor. Only a single authentic sight record within our limits in Manipur, 30 April (Hume, 1888, SF 11: 267).

Extralimital. China (SE. Yunnan, Foochow, Kwangtung) and the Indo-chinese countries (La Touche).

GENERAL HABITS, etc. Described as gregarious, cheerful and noisy, feeding in trees as well as on ground, nesting in holes of roofs and houses, 'making free with verandahs and quite domesticated during the breeding season' (La Touche).

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. Adult. Above, whole head and rump pale rosy ferruginous; nape and back deep grey. Wings black; scapulars and upper wing-coverts white, washed with rosy ferruginous. Tail black, slightly graduated, broadly tipped with white. Below, throat, sides of neck and breast pale grey; centre of abdomen white; flanks, thighs and under tail-coverts rosy ferruginous.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	103–108	18–21	24–26	57–62 mm
♀♀	99–104			53–58 mm

(La Touche)

COLOURS OF BARE PARTS. Iris white to bluish white. Bill slaty grey or pale bluish plumbeous; mouth and base rich slaty blue. Legs and feet slaty blue to plumbeous grey (Baker).

Genus *ACRIDOTHERES* Vieillot

Acridotheres Vieillot, 1816, *Anal. nouv. Orn.*: 42.

Type, by subsequent designation, *Perdix tritris* Linnaeus

Arthropus Sharpe, 1889, in Oates, *Fauna Brit. Ind.*, Bds. 1: 518, 533.

Type, by original designation, *Pastor fuscus* Wagler

Nasal and frontal plumes lengthened and erect or slightly curving backwards. Feathers of crown elongated and pointed. Sides of head well feathered or with a patch of naked skin below and behind eye. Bill shorter than head with the culmen curved. Wing blunt; tail rounded. Sexes alike.

SIZE. Dove —; length c. 23 cm (9 in.).

FIELD CHARACTERS. A familiar, perky, well-groomed dark brown bird with glossy black head, and bright yellow legs, bill and a naked patch below and behind eye. A large white patch on the wing conspicuous in flight. Sexes alike.

Young (immature). A pale edition of adult: duller, less dark brown, with the head ashy brown rather than black.

STATUS, DISTRIBUTION AND HABITAT. Resident; ubiquitous. One of the commonest and most familiar birds in the entire subcontinent including both Pakistan, Nepal, Sikkim and Bhutan; also Ceylon [another subspecies (1007)]. Plains and hills. Breeds up to c. 3000 m in the Himalayas, descending lower from the highest altitudes in winter. Very abundant all-year resident in Kashmir Valley, quite at home in Srinagar even in snow. Introduced in the Andaman islands (c. 1867) as probably also in the Nicobars, Laccadives and Maldives where now well established and common. Addicted to the neighbourhood of human habitations and cultivation — villages, towns and cities as well as outlying homesteads in desert or forest.

EXTRALIMITAL. Russian Turkestan, Afghanistan, SE. Persian Baluchistan, Burma, peninsular Thailand and the Indochinese countries. Introduced

STARLINGS, MYNAS

179

also provide popular roosts. Usually there is considerable competition for nesting sites, and during the breeding season violent battles ensue between prospecting pairs or to oust occupants of coveted holes. Each partner grapples with his opposite number in a vicious rough-and-tumble, the adversaries dropping to the ground locked in each other's claws, rolling over and over and jabbing mercilessly with their bills to the accompaniment of loud screaming complaints. Partisans of either side, drawn to the scene by the outcry, join in the mêlée which continues as a noisy free-for-all until one of the combatant pairs withdraws.

FOOD. Chiefly fruit, grain, insects and grubs but also everything else that can be eaten: kitchen scraps, titbits from refuse dumps, small animals such as baby mice, frogs, lizards and crabs, and flower-nectar. It is an important agent in the cross-pollination of flowers such as *Salma* and *Erythrina*, and in the dispersal of seeds of many plant species, some of great economic significance: *Ficus*, *Zizyphus*, *lantana*, mulberry (*Morus*), *Salvadora*, sandal (*Santalum*) and others. Often causes damage to orchard fruit and standing cereal crops, but on the other hand is highly beneficial as a destroyer of serious agricultural pests. In an intensively cultivated area in Bihar the following insects have been identified among stomach contents of specimens: grasshoppers (Acrididae: *Chrotogonus*, *Tryxalis*, *Oxya* sp.), crickets (Gryllidae: *Liogryllus bimaculatus*), beetles (Scarabaeidae: *Anomala varians*, *Trox indicus*, *Gymnopleurus miliaris*, *Tenebrionidae*: *Opatrum depressum*), weevils (Curculionidae: *Astycus lateralis*, *Mylocerus discolor*), bugs (Pentatomidae: *Bagrada picta*), wasps (Scoliidae: *Scolia quadri-pustulata*), flies (Bibionidae: *Bibio* sp.), ants (Formicidae: *Oecophylla smaragdina*, *Camponotus compressus*, *Phidole malini*, *Dorylus* sp.) (Mason & Lefroy, 1912); in addition termites, spiders, geometrid larvae and butterflies also recorded.

VOICE AND CALLS. A varied assortment of high-pitched falsetto notes and chatter, some eloquently expressive of passing moods and emotions such as pleasure, contentment, alarm, anger and agitation. The harsh angry swearing cries *chake, chake*, etc. uttered with partially drooped shivering wings on sighting a cat or snake are readily understood even by birds other than its own species who soon gather on the spot to chivvy the unwelcome presence. One of the more familiar calls is a loud, scolding *rādio, rādio, rādio*. While a pair is resting in a shady spot during the midday heat, the male (not only in breeding season) will frequently go through an amazing gamut of *kek-kek-kek, kok-kok-kok, churr-churr*, etc. with plumage frowled and a ludicrous bowing and bobbing of the head before his mate. A *sotto voce* solo (subsong) is sometimes given while resting on a shady branch during daytime, interlarded with mimicry of other birds' calls (Neelakantan, JBNS 52: 619). In captivity will learn to repeat a few words of human speech, but is far inferior to the Hill Myna as a talker.

BREEDING. Season, overall March to September; principally April to July, but peak periods varying locally. In Kerala chiefly March–April, commencing as early as mid January. Two successive broods commonly raised; sometimes three. Nest, an untidy collection of twigs, roots, tow and rubbish (often including bits of tissue paper, tin foil and snake sloughs) stuffed in holes in trees, rock scarps, vertical earth banks, walls of houses or between the ceiling and roof, even in the midst of noisy bazaars.

178

STURNIDAE

and well established in many countries, to pest proportions in some, e.g. Australia, New Zealand, Hawaii, South Africa, and islands in the Indian Ocean (Seychelles, Mauritius); also in the Atlantic and Pacific.

GENERAL HABITS. Along with the crow and sparrow a confirmed commensal of man, quick to colonize virgin areas in his wake, even far out in the desert. Sociable disposition, aggressive and self-possessed demeanour and omnivorous habits combine to make the Myna the highly successful colonist it is. Except in the breeding season keeps in family parties, usually of 5 or 6 birds, which join up into flocks sometimes of many hundred strong. Feeds on trees as well as on ground sauntering along or hopping jauntily sideways to dig for grubs and worms on inundated lawns and maidans. Grazing cattle and fired grass fields or scrub jungle likewise afford it attractive feeding opportunities. Flocks follow the plough for the insects and grubs turned up with the soil, the birds leap-frogging or flying ahead in their eagerness to keep up with the advancing bullocks. Usually tame and confiding, fearlessly entering kitchens and verandas of inhabited houses to pick up crumbs from within hand reach of the inmates. Roosts communally; in large leafy trees, coconut groves, reed-beds and sugarcane fields in company with other mynas, Rosy Pastors, parakeets, crows and sparrows, flock after flock converging on the site from considerable distances in all directions at sunset. Deafening clamour and pandemonium prevails before the vast congregation settles down to sleep, and even during night the silence is frequently broken by minor outbreaks of noisy chattering choruses from different sections of the roost. Railway stations and warehouse sheds

STURNIDAE

180

Occasionally builds a cup-shaped or domed nest in a tree like Pied Myna's, or appropriates an old crow's nest. Same site often used year after year. Eggs, 4 or 5 (rarely 6), uniform turquoise blue. Average size of 100 eggs 30.8 × 21.9 mm (Baker). Both parents share all the domestic chores. Incubation period 17 to 18 days (Lamba); 13–14 days! (Bengal, Sen Gupta); fledging period 22–24 days.

MUSEUM DIAGNOSIS. Head, neck and upper breast glossy black; rest rich vinous-brown, paler and albescent on abdomen. A large white patch at base of dark brown primaries. Tail brownish black with broad white tips to the rectrices.

Birds from NW. India tend to paleness, from S. India to darkness. Kerala population shows intergrading with *melanosternus* of Ceylon.

MEASUREMENTS	Wing	Bill (from skull)	Tarsus	Tail
♂♂	138–153	25–30	34–42	81–95 mm
♀♀	138–147	25–28	35–41	79–86 mm
				(SA, HW)

Weight 17 ♂ ♀ 82–130 (av. 109.8) g — SA. 3 ♂♂ 120–138 g — BB.

COLOURS OF BARE PARTS. Iris brown or reddish brown mottled with white; orbital skin bright yellow. Bill yellowish, base of lower mandible brownish green; mouth dark slate. Legs, feet and claws yellow like bill, paler than orbital skin.

1007. Ceylon Myna. *Acridotheres tristis melanosternus* Legge

Acridotheres melanosternus Legge, 1879, Ann. Mag. Nat. Hist. 3: 168
 (Pasaden Korale, Ceylon)
 Baker, FBI No. 997, Vol. 3: 55

LOCAL NAMES. *Myna, Gon karadiyā* (Sinhala); *Nākanam petchi* (Tamil).

SIZE. Dove —; length c. 23 cm (9 in.).

FIELD CHARACTERS. As of 1006, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Subspecies endemic in Ceylon. Subject to slight local movements; abundant throughout the lowlands and lower hills to c. 1300 m, less commonly to c. 1600 m; occasionally higher. 'Is gradually increasing its range upwards' (Phillips).

GENERAL HABITS, FOOD, VOICE AND CALLS. As in 1006.

BREEDING. Season, February to December, but chiefly during April and again during August' (Phillips). Nest, eggs and breeding biology as in the Indian Myna.

MUSEUM DIAGNOSIS. Differs from nominate *tristis* as follows: White primary-coverts variegated irregularly with black; black of the chin, throat and breast very much darker in tint and produced down the centre of the abdomen till it meets the central white patch; vinous-brown of flanks and thighs very considerably darker.

Young (immature). Easily separable from juvenile of peninsular birds as follows: Rufous-brown on hindneck, mantle and rump much duller and darker, making the contrast between these parts and black head less pronounced; vinous-brown of underparts much darker, merging imperceptibly into the blackish chin, throat and upper breast; white patch on central abdomen virtually absent or small and sullied with vinous-brown; primary-coverts variegated with black.

1008. **Bank Myna.** *Acridotheres ginginianus* (Latham)
Turdus ginginianus Latham, 1790, Index Orn. 1: 362 (Gingee)
Baker, FBI No. 998, Vol. 3: 55

Plate 68, fig. 14

LOCAL NAMES. *Gāngā mynā* (Hindi); *Gāng sālīk* (Bengali); *Bārdā myna* (Bihar mirshikars); *Bārdī myna* (Nepal); *Lāli* (Sind); *Daryta myna* (Uttar Pradesh).

SIZE. Myna —; length c. 21 cm (8½ in.).

FIELD CHARACTERS. Like Indian Myna but slightly smaller and pale bluish grey overall instead of vinous-brown, also with black head. Naked skin below and behind eye brick-red instead of yellow. Wing-patch and tips of tail-feathers pinkish buff instead of white. A distinct tuft of feathers at forehead, as in Jungle Myna (1009) but smaller, sometimes very erect. Sexes alike.

Young (immature). Above, head and neck brown; rest of upperparts more brown-tinged than in adult; wings unglossed brown. Below, grey flank and breast-feathers edged with buff. Iris bluish grey. For details see Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident; patchy, and subject to regular seasonal local as well as nomadic movements in some areas. Plains of northern and central India from the Himalayan foothills, terai and duars southward roughly to a line from Bombay (c. 19°N.) to Balasore in N. Orissa (c. 21°N.); from NW. frontier districts and Indus Valley in Sind (W. Pakistan) eastward to W. Bengal and East Pakistan. A single example taken near Madras from amongst common mynas (Sundara Raj, JBNHS 23: 155) — probably an escaped cage bird. Locally up to c. 800 m altitude. Affects the neighbourhood of human habitations. The species does not occur extraliminally; a straggler once taken at Kandahar, Afghanistan (HW, JBNHS 45: 112).

GENERAL HABITS. Gregarious; more or less like Indian Myna. Keeps in flocks even during breeding season. Usually very tame and confiding. Commonly haunts railway stations, sauntering about jauntily on the platforms picking up titbits from in among the hurrying feet of the passengers and piles of baggage, almost drowning the hubbub by its own incessant screeching and chatter. Surreptitiously hops on to the vendors' handcarts to filch eatables, dodging clear of the owner's angry protestations. Is also quite at home in noisy and congested city bazaars (e.g. Old Delhi), cheekily bouncing into the foodstalls and helping itself to whatever scraps it can find. In the open countryside keeps to irrigated fields, sewage farms, and grazing grounds usually in attendance on cattle, or to cattle pens on the outskirts

STARLINGS, MYNAS

183

shafts of brick-lined wells often shared out with House Sparrows and pigeons. The wells sometimes so deep and narrow as to necessitate almost vertical rise to the top, a seemingly hazardous feat for an inexperienced fledgling on its initial flight. Eggs, 3-5, glossy pale blue, unmarked. Average size of 60 eggs 27.5 × 20.3 mm (Baker). Breeding biology as in *tristis* (1006), but incubation and fledging periods undetermined.

MUSEUM DIAGNOSIS. See Key to the Species and Museum Diagnosis.

Young (immature). Above, whole head and ear-coverts dark brown, glossless and unbacked; rest of upperparts brown. Tail dark brown, the pinkish buff tips replaced by dirty buffish white; tail-feathers narrower. Below, dirty pale buff, suffused with grey on breast and sides of body; wings and coverts dark brown with some rusty margins to most of the feathers and a slight gloss; primary-coverts and patch on wing buffish white. Postjuvinal moult complete. In fresh plumage upperparts dark slaty brown which later fades to paler brown. Bare parts as adult (Tiechurst).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	118-129	24-25	36-38	65-74 mm
♀♀	114-123			60-71 mm (SA, Marien)

Weight 6 ♂♂ 64-76 (av. 72) g — SA.

COLOURS OF BARE PARTS. Iris orange-red. Bill orange-yellow; naked orbital patch reddish orange. Legs, feet and claws yellow.

Pastor fuscus Wagler, 1827, Syst. Av. Pastor sp. 6

[India = East Bengal, Baker, 1921 = Sikkim (Whistler, 1933, JBNHS 36: 590)]
Baker, FBI No. 999 (part), Vol. 3: 57

Plate 68, fig. 15

LOCAL NAMES. *Pāhārī mynā*, *Jungli mynā* (Hindi); *Jhont sālīk*, *Jungli sālīk* (Bengali); *Vānā kābār* (Gujarati).

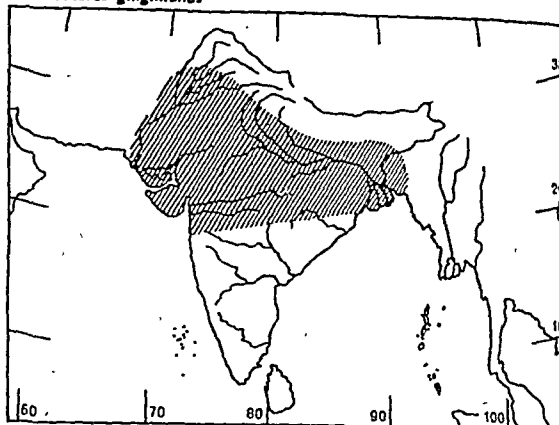

SIZE. Common Myna; length c. 23 cm (9 in.).

FIELD CHARACTERS. Very similar to Indian Myna (1006), also with the large white wing-patch but distinctly greyer brown overall. A prominent tuft of erect black feathers at base of bill on forehead, absence of bare

182

STURNIDAE

Acridotheres ginginianus

Distributional range

of villages and outlying herdsmen's settlements. Hunts insects disturbed by the grazing animals' feet; sometimes rides on their backs or clings to the ear of buffalo to pick out ticks, comically steadying itself in the precarious position by a vigorous flapping of wings each time the animal tries to shake it off. Likewise, municipal refuse dumps, and the neighbourhood of rivers, canals and jheels are amongst its favourite resorts. Flocks follow the plough for the insects and grubs turned up with the soil. Roosts in vast congregations in company with Indian Mynas and other birds in groves of large trees or reed-beds; frequently also among the trusses of corrugated iron roofs of railway stations and goods sheds, regardless of trains thundering past or shrieking locomotives.

FOOD. As in Indian Myna: fruit, grain and insects. Very destructive locally to ripening crops of jowar (*Sorghum*). An important additional insect pest, recorded among stomach contents in Bihar, is larvae of the moth *Ophiusa melicerte* (Noctuidae), highly injurious to castor (*Ricinus*) (Mason & Lefroy, 1912).

VOICE AND CALLS. Similar to Indian Myna's (1006) but somewhat softer.

BREEDING. Season, overall March to August, principally April to June. Nesting colonial, often several score pairs together. Nest, a loose pad of straw, feathers and miscellaneous rubbish, commonly including bits of snake slough, placed in the widened chamber at the end of a horizontal earth tunnel. The tunnels c. 7 cm in diameter, from c. half to one metre deep, slightly upward-sloping, drilled honeycomb fashion in steep earth banks of rivers, sides of disused brick kilns, *kutcha* wells and the like. Commonly also stuffed within weep-holes in revetment of masonry bridges, and down

184

STURNIDAE

× c. 1

yellow skin round eyes, broadly white-tipped tail and yellow iris are diagnostic clues. Sexes alike. See Key to the Subspecies and Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident; patchily distributed and subject to seasonal local movements. Throughout the lower Himalayas (breeding from the foothills to c. 2100 m) from about Murree in W. Pakistan eastward through Jammu, Himachal Pradesh, Nepal, Sikkim, Bhutan, and

Acridotheres fuscus

Distributional ranges

fuscus (1009). *maharattensis* (1010). *fumidus* (1011).

Assam Valley; southward roughly to a diagonal line from Mount Abu in Rajasthan to the mouth of Mahanadi river in Orissa (c. 20°20'N.), including Uttar Pradesh, northern Madhya Pradesh, northern Orissa, Bihar, West Bengal, western Assam and East Pakistan. In many of these areas very local, or perhaps only a seasonal visitor. Affects well-wooded country in the neighbourhood of cultivation, forest villages, and tea gardens, etc. chiefly in the foothills.

GENERAL HABITS. Not markedly different from Indian Myna but is less commensal with man. Often found in association with it and with other mynas. Keeps in family parties and flocks of 10 to 30 or so, commonly in

STARLINGS, MYNAS

185

attendance on grazing cattle. Also has large communal roosts in sugarcane fields, reed-beds and the like, shared with noisy congregations of common mynas and other birds. Is very partial to flower-nectar and an important cross-pollinator for many species, the feather-tuft on the forehead functioning as an efficient pollen brush.

FOOD. Fruits and berries, grain, flower-nectar, and insects.

VOICE and CALLS. Not appreciably different from Indian Myna including the courtship 'song' with its accompaniment of comical bowing and bobbing of the head.

BREEDING. Season, principally April to June or July; often two successive broods raised. Nest, a collection of twigs, roots, feathers, tin foil, paper and miscellaneous rubbish, often including bits of snake slough, stuffed in a tree-hollow or disused or usurped woodpecker boring, usually at moderate heights, c. 2-6 metres. Large colonies occupy weep-holes in buttressing walls along hill roads and in masonry revetments of bridges; less commonly under roofing of houses. Often the same sites are occupied year after year. Eggs, 4 to 6 — sometimes only 3 — like Indian Myna's, unmarked turquoise blue, smooth and with a slight gloss. Average size of 100 eggs 28.9 × 20.9 mm (Baker). Both sexes take part in building the nest, incubation and feeding the young. Incubation period undetermined.

MUSEUM DIAGNOSIS. Adult. Whole head, lores and ear-coverts black, the feathers of the head hackled. Rest of upperparts cinereous brown becoming greyer with wear. Below, chin, throat and breast dark ashy grey; belly and under tail-coverts buffish white.

Young (immature). Upperparts brown to grey-brown, darkest on head which is not hackled; ear-coverts with pale shafts. Underparts brown with pale mottling on throat; belly and under tail-coverts buffish white. Tail-feathers narrower, dark brown with white tips as in adult. Postjuvénal moult complete.

MEASUREMENTS

Baker, FBI No. 999 (part), Vol. 3: 57

LOCAL NAMES. *Kāṭhā nāhanarāi* (Tamil); *Kinnari mynā* (Malayalam); *Jungli mynā* (Hindi); *Vānā kābār* (Gujarati).

SIZE. Myna; length c. 23 cm (9 in.).

FIELD CHARACTERS. As of 1009, q.v. See Key to the Subspecies and Museum Diagnosis.

STARLINGS, MYNAS

187

from plains level to c. 650 m. Affects the neighbourhood of cultivation and outlying habitations in semi-evergreen biotope.

Extralimital. Undetermined.

GENERAL HABITS, FOOD, VOICE and CALLS. As in 1009 and 1010.

BREEDING. Not specifically recorded; doubtless as in adjoining 1009.

MUSEUM DIAGNOSIS. Differs from nominate *fuscus* (1009) in being darker, more sooty on the upperparts particularly on the rump; darker, more smoky on the abdomen and belly.

MEASUREMENTS. Wing 4 ♂♂ 120-128 mm (SDR).

COLOURS OF BARE PARTS. Iris yellow; rest likewise as in 1009.

1012. Orangebilled Jungle Myna. *Acridotheres javanicus infuscatus* (Baker)

Aethiops fuscus infuscatus Baker, 1918, Bull. Brit. Orn. Cl. 38: 70

(Lower Chindwin, Burma)

Baker, FBI No. 1002, Vol. 3: 59

Plate 68, fig. 18

LOCAL NAME. *Hagrani dzo myna* (Cachari).

SIZE. Myna; length c. 23 cm (9 in.).

FIELD CHARACTERS. Very like Northern Jungle Myna (1009), also with a prominent white wing-patch, but much blacker, with wholly yellow bill and reddish to orange-brown irides. Sexes alike. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Resident (?). Nagaland, Manipur, Tripura (?), Mizo Hills district, and East Pakistan in the Chittagong Hill Tracts; from the foothills up to c. 1300 m. Affects fairly open country with elephant-grass, semi-cultivation, and village environs.

Extralimital. Burma.

Some intergradation may occur in eastern Assam and northern Burma at low elevations between this form and the species *fuscus*, and perhaps, further east with *cristatellus*.

GENERAL HABITS, FOOD, VOICE and CALLS. Similar to *A. f. fuscus* (1009). Commonly associates with Collared Myna (1013) insect-hunting on wet meadows among grazing cattle, or feeding from Silk Cotton (*Salmalia*) and other flowers. Likewise, roosts in vast mixed congregations with the above in sugarcane fields and elephant-grass.

BREEDING. Season, April-May. Nest, as in 1009, a collection of straw, feathers and rubbish almost invariably intermixed with bits of snake slough, placed in holes in trees or in earth banks of rivers. Frequently nests in association with Collared Myna but in segregated colonies. Eggs, 4 or 5, uniform blue, typical of the mynas. Average size of 30 eggs 29.2 × 20.7 mm (Baker). Breeding biology not specifically recorded.

MUSEUM DIAGNOSIS. Adult. Resembles *A. f. fuscus* (1009) but hackled feathers of head longer, and rest of upperparts near black; bronze on wings much darker. Underparts ashy black, ashy at vent; under tail-coverts with black bases. Bill wholly yellow with no blackish at base.

Young (immature). Like *A. f. fuscus* but darker above; entire underparts dark brown, with some pale margins only on belly; under tail-coverts dark brown with broad white tips. Moult as in *fuscus*, q.v.

186

STURNIDAE

STATUS, DISTRIBUTION and HABITAT. Resident; patchily distributed and subject to seasonal local movements. West and south of the range of 1009, viz. of a diagonal line roughly from Mount Abu in Rajasthan to the mouth of Mahanadi R. in Orissa. Chiefly on the western side of the Peninsula from Saurashtra (Gir) and northern Gujarat (Ahmedabad) southward along the coastal and Sahyadri tract to Kerala, including Goa (?), W. Mysore (Coorg), W. Tamil Nadu (Nilgiri and Palni hills); from sea level to c. 2400 m. Also found in M.P., southern Orissa and Shevaroy and Chitteri hills, but poorly recorded elsewhere in SE. India. Affects well-wooded deciduous country in the neighbourhood of cultivation, coastal and forest villages, tea and coffee plantations and hillmen's settlements; occasionally urban compounds. Avoids evergreen forest.

GENERAL HABITS, VOICE and CALLS. As in the northern subspecies (1009).

FOOD. As in 1009. Also scraps scavenged at municipal refuse dumps and on village outskirts. Figs of the various *Fici* and *Lantana* berries are among the major food items. Does considerable local damage to orchard fruit in the south Indian hills. Also feeds regularly on nectar of *Salmalia malabarica*, *Erythrina indica* and *E. suberosa*, *Bombax insignis*, *Butea monosperma* and *Careya arborea* as well as of the introduced Tulip Tree (*Spathodea campanulata*).

BREEDING. Season, chiefly February to May. Nest, eggs (c/3 or 4) and breeding biology as in 1009.

MUSEUM DIAGNOSIS. Differs from the northern (nominate) subspecies in being more brown, less slaty grey on the upperparts, and in the colour of the iris: grey or bluish white c. lemon-yellow.

Young (immature). Like *fuscus* (1009) but browner above and below.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	126-134	26-28	c. 36	73-79 mm
♀♀	121-131	25-27	c. 36	70-78 mm

(HW, Marien)

Weight 15 ♂♂ 72-98 (av. 82.8) g - SA.

COLOURS OF BARE PARTS. Iris bluish white or grey. Bill orange-yellow, dark brown at nostrils, gape and base of lower mandible; mouth dark slate. Legs and feet yellow; claws brown.

1011. Eastern Jungle Myna. *Acridotheres fuscus fumidus* Ripley

Acridotheres cristatellus fumidus Ripley, 1950, Postilla, Yale Peabody Mus., No. 1: 4

(Sadiya, northeastern Assam)

Not in Baker, FBI

LOCAL NAMES. None recorded.

SIZE. Myna; length c. 23 cm (9 in.).

FIELD CHARACTERS. As of 1009, q.v. See Key to the Species and Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Presumably resident, with local movements as in the other forms. Nagaland, eastern Assam in the North Cachar and Lakhimpur dists., and the Sadiya-Mishmi tract of NEFA;

1013. Collared Myna. *Acridotheres albocinctus* Godwin-Austen & Walden

Acridotheres albocinctus Godwin-Austen & Walden, 1875, Ibis: 251

(Manipur Valley)

Baker, FBI No. 1003, Vol. 3: 60

Plate 68, fig. 17

LOCAL NAMES. None recorded.

SIZE. Myna; length c. 23 cm (9 in.).

FIELD CHARACTERS. An unmistakable myna with slightly tufted forehead: glossy slate-black above, greyish black below, with a prominent buffy white collar from side to side of neck (rather indistinct on hindneck). In flight a conspicuous white wing-patch and broadly white-tipped tail are additional pointers. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Said to be locally migratory, at least in part. Manipur Valley between c. 800 and 1200 m elevation. Stuart

Baker obtained a single specimen, apparently a straggler, in N. Cachar. May straggles to adjoining Nagaland or Mizo. Frequents damp localities and open elephant-grass country, and the vicinity of cultivation and villages.

Extralimital. N. Burma and NW. Yunnan.

GENERAL HABITS. Very similar to Indian and Jungle mynas, qq.v. Keeps in pairs, family parties or flocks of up to 30 to 50 birds attending grazing cattle on marshland. Among stomach contents have been recorded tiny frogs and lizards in addition to the usual grasshoppers and other insects, fruit (largely *Ficus* spp.), flower-nectar and cereal grains — thus equally omnivorous with its relations and congeners.

BREEDING. In general similar to *A. f. fuscus* (1009), but unrecorded within our limits.

MUSEUM DIAGNOSIS. With wear the upperparts become browner, and the half collar becomes white.

Young (immature). Whole plumage dark brown, paler brown on throat and belly; under tail-coverts tipped whitish; white patch on primaries smaller, and that on primary-coverts tipped with black. Tail-feathers narrower and with narrower white tips. Postjuvénal moult complete (Tiechurst).

STURNIDAE

Kumaon (Almora, c. 80°E.) eastward through Nepal, Sikkim, Bhutan and NEFA — terai, bhabar, duar and foothills, locally up to c. 2000 m. Also Manipur, Nagaland and the hills and hill tracts of Assam and East Pakistan; in tropical moist-deciduous and semi-evergreen forest.

Extralimital. Burma south to Tenasserim, Thailand and the Indochinese countries.

GENERAL HABITS. Sociable and noisy. In non-breeding season keeps in parties of 5 or 6 birds to tree-tops on the edge of closed forest or in cultivation clearings with a sparse sprinkling of standing trees. Almost entirely arboreal; will occasionally descend to feed in berry-laden bushes, but hardly ever to the ground. Moves about on boughs etc. by hopping sideways, unlike most other mynas which have a characteristic jaunty walk. Large congregations of up to a hundred birds or more will sometimes collect to feed in a grove of fruiting *Ficus* trees in company with hornbills, barbets, green pigeons and other frugivorous birds, flying from one branch or tree to another with a noisy whirring of wings as in green pigeons. While feeding or resting during the day the birds constantly call and answer one another in low conversational croaks. Very lively and noisy towards sunset, settling individually on bare tree-tops and calling and answering in loud creaky whistles for long periods before flying to roost. Roosts individually, or in pairs or family parties, on leafy branches or in tree-holes, not in large mixed communities like Indian and many other mynas.

FOOD. Mainly fruits and berries, predominantly the various wild figs (*Ficus*); also flower buds, nectar, and insects. Flowers of Silk Cotton tree (*Salmalia malabarica* and *Bombax insignis*) provide a large part of the nectar diet everywhere, and from the coating of pollen always adhering to forehead and chin feathers the birds evidently play an important role in cross-pollination. Insect food mostly procured in trees, but winged termites often hawked in the air by awkward flycatcher-like sallies. Lizards and other small animals frequently taken.

VOICE AND CALLS. Both sexes make an extraordinarily wide range of loud calls, these being often whistles, wails, screeches and gurgles, sometimes melodious and often very human-like in quality. Each bird has a repertoire of between 3 and 13 such call-types. No bird shares any of these call-types with its mate, but it shares most of them with a few near neighbours of the same sex, having learnt them when young by selective imitation of neighbouring Hill Mynas. There is a very rapid rate of change of dialect with distance, such that birds living more than about 15 km apart have no call-types in common with one another (Brian Bertram, *in epist.*). In captivity this bird is renowned as a first-rate mimic, learning to reproduce many everyday sounds and particularly the human voice, even whistled tunes.

STARLINGS, MYNAS

193

with astonishing accuracy and clarity. In the wild state, however, Hill Mynas do not normally imitate other species, unlike Racket-tailed Drongos and contrary to popular belief, although some of their very varied notes may to the casual listener bear a resemblance to other species' calls. *Intermedia* also make a number of soft grunts and whispering sounds, audible only at close range, and a very loud piercing chip alarm squeak.

BREEDING. *Season*, principally April to July. *Nest*, a loose collection of fine twigs, grass, feathers and rubbish in a hole in a tall tree-trunk 10 to 15 metres from the ground, standing at the edge of forest or a tea garden, or isolated in the middle of a cultivation clearing. Holes usually appropriated by woodpeckers etc. Sometimes several nests one below the other in the straight bole of a lofty *Salmaal malabarica*, *Tetrameles nudiflora* or such-like tree, occupied apartment-house fashion by different pairs. *Eggs*, 2 or 3, bright blue, scantily speckled or blotched with reddish brown to deep chocolate. Average size of 30 eggs 36.2 × 25.6 mm (Baker). The birds pair for life and both sexes take part in all the domestic chores. Incubation period undetermined.

MUSEUM DIAGNOSIS. See keys to Species and Subspecies. Adult. Whole plumage black; central crown, hindneck, mantle and breast glossed with purple; lateral crown velvety black. Rest of plumage glossed with greenish. An irregular-shaped patch of feathers from posterior rim of eye just fails to divide the bare patch below eye from that over the ear-coverts; the latter patch joins the occipital wattle.

Young (immature). Upperparts, wings and tail like adult, but the black dull and with little gloss. Underparts unglossed brownish black. Bare patches on head like adult, but no occipital wattles. Tail-feathers narrower. Postjuvenile moult complete (Ticehurst).

MEASUREMENTS	Wing	Bill (from skull)	Tarsus	Tail
♂♂	166-176	31-32	c. 35	75-85 mm
♀♀	163-169	31-33	—	80-84 mm
			(HW, BB, Marien)	

Weight 2 ♂♂ 209, 211; 3 ♀♀ 178-229 g (BB).

COLOURS OF BARE PARTS. Adult. Iris dark brown. Bill orange or reddish orange, yellow at tip; bare skin on head and wattles bright yellow. Legs and feet yellow; claws dark horny; pads pale yellow. Young (immature). Iris grey-brown. Bill yellowish orange, dusky on culmen and anterior half of upper, and yellow on tip of lower mandible; bare skin on head lemon-yellow. Legs and feet as in adult (Biswas).

MISCELLANEOUS. This subspecies, and *peninsularis* of Orissa and northern Andhra, are popularly credited with being much superior to south Indian birds (*indica*) in learning ability and as talking birds; they are in greater demand by fanciers and command much higher prices. But this is partly a fallacy (see under *indica*). Enormous numbers of fledglings are taken from nests by local tribes and forest contractors for supplying bird markets in the cities and export to western countries where there is a growing demand. Good talking birds fetch high prices, in consequence of which over-exploitation threatens a serious depletion in Hill Myna populations in some areas. (See Brian Bertram, 1969, *Avicultural Magazine* 75: 253-5.) In the Garo

STARLINGS, MYNAS

195

liting squeak (in contrast to the sharp *um* grunt of *intermedia*). They do not imitate other species in the wild state (Brian Bertram, *in epist.*). Some of its wheezy whistling notes are casually confusable with the Black Bulbul's (*Hyphantornis m. ganessa*), though possessing a distinct myna quality.

BREEDING. *Season*, principally February to May in S. India; March to August (chiefly April and May) in Ceylon. *Nest*, site, *eggs* (c/2 or 3) and breeding biology as in 1015. Average size of 40 eggs 31.6 × 23 mm (Baker).

MUSEUM DIAGNOSIS. Smaller than *intermedia* (1015) with a weaker bill; white wing-patch rather less extensive; bare patch below eye separated by feathers from auricular patch. Side wattles extend up back of nape to crown in the shape of narrow tongues. These narrow tongues are appreciably diminished in birds from the northernmost part of the range (North Kanara) and are entirely absent in *intermedia* and *peninsularis*. That part of the wattle situated above the ear-coverts is also variable according to locality. In *indica* the band connecting the base of the two lobes is so narrow that it barely shows save as a parting of the feathers; in *intermedia* and *peninsularis* this band is broad and conspicuous.¹ There are further differences of the pattern in the nominate (extralimital) subspecies.

MEASUREMENTS	Wing	Bill (from skull)	Tarsus	Tail
♂♂	139-155	29-32	29-33	55-72 mm
♀♀	140-149	28-31	31-33	60-70 mm
			(SA, HW)	

Weight 1 ♂ 126 g (SDR).

COLOURS OF BARE PARTS. Iris brown. Bill orange with yellow tip; palate yellow, gullet pink. Wattles and infra-orbital patch bright yellow. Legs and feet orange-yellow; claws blackish brown.

MISCELLANEOUS. It is an entrenched popular belief that south Indian birds are much inferior to northern in their ability to learn to talk in captivity. Thus they are in lesser demand as pets and fetch considerably lower prices. The main cause of this, apparently, is the fact that northern birds are usually taken from the nest before fledging and then hand-reared, whereas southern birds are mostly trapped as adults, which rarely become really tame and which have already acquired their natural vocabulary. The few *indica* taken from the nest when young do become quite proficient talkers, although apparently less able than *intermedia* to reproduce deeper richer sounds with great accuracy. (See Sâlim Ali, 1963, JBNHS 60: 455-6.)

1017. Eastern Hill Myna. *Gracula religiosa peninsularis*

Whistler & Kinnear

Gracula religiosa peninsularis Whistler & Kinnear, 1933, Jour. Bombay nat. Hist. Soc. 36: 586 (Sambalpur) [Orissa, 21°28'N., 84°04'E.]

Baker, FBI No. 964 (part), Vol. 3: 19

LOCAL NAMES. As in 1015.

SIZE. Same as 1015: length c. 29 cm (11½ in.).

¹ *indica* differs from *intermedia* also in its alarm and social calls. 'If kept together the two races do not call to one another as they do to members of the same race, nor do they preen or pair with one another. The two races largely keep apart and ignore birds of the other

194

STURNIDAE

Hills district of Assam, the locals induce the birds to breed in artificial nests made of a split-bamboo framework covered with grass and put up in accessible positions in tall trees in a forest clearing or at the edge of a small village. The villagers are thus enabled to extract the young at the proper time for easy hand-rearing, making 'Hill Myna farming' a profitable minor cottage industry at present. (For details see Brian Bertram, 1967, JBNHS 64: 369.)

1016. Southern Hill Myna. *Gracula religiosa indica* (Cuvier)

Eulabes indicus Cuvier, 1829, Règne Anim., ed. 2, 1: 377

(India = South India vide Whistler & Kinnear, 1933, JBNHS 36: 585)

Baker, FBI No. 962, Vol. 3: 17

LOCAL NAMES. *Kēnkni mynā* (Hindi); *Kōndā gorinkā* (Telugu); *Kāttu mynā* (Malayalam); *Sela līhīniyā* (Sinhala); *Melāi nākanam pāthi* (Tamil, Ceylon).

SIZE. Myna +; length c. 25 cm (10 in.).

FIELD CHARACTERS. As of 1015, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident, with slight seasonal local movements. Southwestern peninsular India in the Western Ghats (Sahyadri) complex from c. 17°N. southward through W. Mysore (including Coorg, Nilgiri and Palni hills) and Kerala. Stragglers — solos and pairs (once a party of five) observed in different years in wooded country in Greater Bombay. In evergreen forest biotope, from plains level up to c. 1700 m; commonest in the foothills and between c. 300 and 1300 m. Partial to edges of coffee plantations and to lofty natural shade-trees in cardamom sholas. Also Ceylon — locally distributed in the Wet zone and in the southern and eastern forest tracts of the Dry zone, up to c. 1100 m.

GENERAL HABITS AND FOOD. As in Northern Hill Myna (1015). Besides *Salmaal* and *Bombax* it is habitually in attendance for the nectar on flowers of *Erythrina suberosa* and *Grevillea robusta*, two important shade-trees grown in south Indian tea and coffee plantations. Large numbers descend to feed on nectar of the freely flowering forest shrub *Helicteres isora*, where most of the capturing is done with bird lime.

VOICE AND CALLS. The calls of this form are higher pitched and considerably less varied than those of *intermedia*, consisting of less mellow wheezes, screeches and chuckles. The alarm-call is a loud squeaky wheeze (unlike the sharp chip of *intermedia*), while the close-range contact sound is a soft

196

STURNIDAE

FIELD CHARACTERS. As of 1015, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident, with slight seasonal local movements. Orissa, eastern Madhya Pradesh and northern Andhra; from plains level to c. 800 m in tropical semi-evergreen forest, especially foothills.

GENERAL HABITS, FOOD, VOICE AND CALLS. As in 1015 and 1016, qq.v.

BREEDING. *Season, nest, eggs* and breeding biology as in the sub-Himalayan population (1015).

MUSEUM DIAGNOSIS. Head wattles as in *intermedia* (1015); differs from it by somewhat smaller size and finer and shorter bill.

MEASUREMENTS	Wing	Bill (from skull)	Tarsus	Tail
♂♀	158-165	29-31	c. 35	72-74 mm
				(HW, SA)

COLOURS OF BARE PARTS. As in 1015 and 1016.

1018. Andaman Hill Myna. *Gracula religiosa andamanensis*

(Beavan)

Eulabes andamanensis 'Tyder' = Beavan, 1867, Ibis: 331 (Andamans)

Gracula jacensis halibrecta Oberholser, 1926, Jour. Washington Acad. Sci. 16: 516 (Little Nicobar Island)

Baker, FBI No. 965, Vol. 3: 20

LOCAL NAMES. None recorded.

SIZE. Same as 1015: length c. 29 cm (11½ in.).

FIELD CHARACTERS. As of 1015, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident. Andaman and Nicobar islands. Common in Middle and South Andamans, and Central, Little and Great Nicobars. Not yet reported from the intervening Little Andaman or Car Nicobar. Affects high forest.

GENERAL HABITS, FOOD, VOICE AND CALLS. As in 1015 and other races.

BREEDING. Not recorded; presumably as in 1015.

MUSEUM DIAGNOSIS. Like sub-Himalayan *intermedia* (1015) but bill longer; the 'peninsula' of feathers projecting into the bare patch on side of head rather differently shaped. There is an increase in size from north to south, birds from the Nicobars being appreciably larger than from the Andamans. But the increase represents a continuous cline, and recognition of the Nicobar race *halibrecta* on this single character (as was originally done) seems unwarranted.¹

¹ race. Thus they would almost certainly not interbreed, and they should perhaps best be regarded as separate species. *Peninsularis* is very much closer to *intermedia* (Brian Bertram *in epist.*).

² However, Abdulali has recently pointed out (1967, JBNHS 64: 180-1) that birds from Little and Great Nicobar possess 'two large naked lappets joined at the back of the neck at the top end, leaving no feathered portion in between' which apparently distinguishes them from all others in the Andamans and the rest of the Nicobars. If this character can be established on more material, it may be used as an additional diagnosis for the recognition of *halibrecta*.

(Ceylon)

Baker, FBI No. 966, Vol. 3: 21

Plate 68, fig. 20

LOCAL NAMES. *Sela līhinyā*, *Mal kawadiyā*, *Kampatiyā* (Sinhala); *Malāi nākanam pāchi* (Tamil, Ceylon).

SIZE. Myna +; length c. 25 cm (10 in.).

FIELD CHARACTERS. Like Southern Hill Myna (1016) but more glossy and with no bare patch on side of head. Two well-separated occipital wattles

x c. 1

which are half as broad as long. White wing-patch smaller than in northern birds. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Endemic to Ceylon. Resident in the Hill zone and low-country Wet zone. Moderately plentiful, but local, in forests and well-wooded areas in the hills to over 2100 m. In some localities found together with Southern Hill Myna (1016) but there is no interbreeding with it. Frequents high trees in tall forest, as well as on estates and village gardens in their neighbourhood.

GENERAL HABITS. Similar to 1016, but less gregarious, usually living in pairs in scattered colonies.

FOOD. Chiefly *Ficus* figs and other jungle fruit.VOICE AND CALLS. Various piercing whistles [distinctly louder and deeper than *indica* (SDR)] one of which sounds like a whistled *h'you*; sundry croaking and guttural conversational notes (Henry). Is an accomplished mimic like Southern Hill Myna, and also a popular cage bird.

Tail not tipped with white.....	<i>G. glandarius</i> 199

200

CORVIDAE

occurs. From c. 1500 to 2500 m; occasionally down to c. 1000 m in winter. Affects wet temperate mixed forest of pine, oak, chestnut, rhododendron, etc.

GENERAL HABITS. Generally less common than *lanceolatus* (1022). In many respects unmistakably crow-like. Is inquisitive and clannish, and can be both bold and exceedingly wary as occasion dictates. Keeps in noisy pairs or parties of 4 or 5, joining up into larger flocks of 20 or more in autumn and winter. Associates with Blackthroated Jays, Himalayan Tree Pies, Blue Magpies and laughing thrushes in the itinerant hunting parties in forest. Flight seemingly laboured, with much flapping of wings. Has the characteristic crows' habit of rallying together and raising a loud hue and cry when one member of the party has come to grief. Feeds on the ground as well as in trees.

FOOD. Fruits and nuts, insects, lizards, small mammals, eggs and chicks of small birds, kitchen scraps around hill-station bungalows; almost anything that can be procured. Is destructive to fruit in hill orchards. Acorns plucked off oak trees or picked up off the ground; either carried to a branch or dealt with on the spot; held underfoot, the kernel hacked out by repeated hammer-blows of the short stout bill.

VOICE AND CALLS. Indistinguishable from *lanceolatus* (1022); most commonly a characteristic harsh, monosyllabic, and penetrating *shak*. Some very similar to the raucous croaks and chuckles of Himalayan Tree Pie, whistling squeals of Blue Magpie, and the rather similar cry of hawk-eagle (*Spizaetus*); others almost identical with the screeching and swearing 'Snake alert' of Indian Myna. Yet another call described as of three syllables *ko-kaw-lee* (Fleming). Rarely also a rather low, varied and almost pleasant 'song' uttered in the nature of a soliloquy, with good mimicry of other bird calls interlarded.

BREEDING. Season, March to June, chiefly April and May. Nest, a largish cup of twigs mixed with green moss, usually more compact than of 1022, but similarly lined with fibres and fine roots. Built up to c. 8 metres from the ground in a sapling or thick shrub, often standing on the edge of a steep declivity, and with little effort at concealment. Eggs, 3 to 5, olive-brown or olive-green, freckled and blotched with brown, more densely and forming a cap at the broad end. Average size of 80 eggs 28.4 x 22.1 mm (Baker). Both sexes take part in building the nest, incubation and tending the young. Incubation period undetermined.

MUSEUM DIAGNOSIS. See keys to the Species and Subspecies; for details of plumage Baker, loc. cit.

Garrulus bispecularis interstinctus Hartert, 1918, Novit. Zool. 25: 430 (Darjeeling)

Garrulus bispecularis persaturatus Hartert, 1918, Novit. Zool. 25: 430 (Khasia Hills)

Garrulus bispecularis azureitinctus Koelz, 1951, Jour. Zool. Soc. India 3: 30

[Karong (Sungun), Manipur]

Baker, FBI No. 43, 44, Vol. 1: 64, 65

LOCAL NAMES. *Lho khario pho* (Lepcha); *Dao flampu* (Cachari).

SIZE. Dove; length c. 33 cm (13 in.).

FIELD CHARACTERS. As of 1020, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Resident, rather local and with slight winter-summer altitudinal movements: Eastern Nepal, Darjeeling dist. (W. Bengal), Sikkim, Bhutan, NEFA, Assam hills south of Brahmaputra R., Nagaland, Manipur, Mizo (?), East Pakistan (Chittagong Hill Tracts?). Between c. 2000 and 3000 m altitude (recorded up to c. 3600 m) descending to at least 1500 m in winter. Affects wet temperate oak, rhododendron and conifer forest in summer, extending into the lower semi-tropical zone in winter.

EXTRALIMITAL. Neighbouring parts of SE. Tibet and SW. Sikkim. Other races in Burma. The species extends from Europe across Asia to E. Siberia and Japan.

GENERAL HABITS, FOOD, VOICE and CALLS. As in 1020.

BREEDING. Season, presumably as in 1020, but not definitely recorded; chiefly during May and June in the Khasi Hills *vide* Baker. Nest and eggs (c/3 or 4) indistinguishable from 1020. Average size of 12 eggs (Khasi Hills) 29.6 × 22.2 mm (Baker). Breeding biology presumably as in the West Himalayan form.

MUSEUM DIAGNOSIS. Differs from *G. g. bispecularis* (1020) only in having both upper and lower parts more rufous in tint.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♀	160-170	29-32	38-43	142-156 mm (SA)

Weight 7 ♂ ♀ 102-125 g (SA); 3 ♂ ♂ 129-136; 3 ♀ ♀ 109-128 g (Paynter, BB).

COLOURS OF BARE PARTS. As in 1020. Also recorded as: Iris hazel brown; fine beaded ring round eye magenta. Bill horny brown. Legs and feet pale brownish flesh-colour; claws horny brown (SA).

CROWS, MAGPIES, JAYS

203

crest and flicking wings and tail while swearing angrily at the unwelcome presence as if to underline its disapproval.

FOOD, VOICE and CALLS. As in Redcrowned Jay (1020).

BREEDING. Season, April to June, chiefly May. Nest, a deep untidy cup of twigs lined with roots, fibres and grass stems — similar to 1020 but usually more loosely built. Placed in the top of an oak or suchlike sapling 5 or 6 metres up, in open forest on a hillside. Eggs, 3-5, brown stone colour or pale greenish white, minutely and variably freckled and mottled all over with pale sepia brown, sometimes forming a cap at the broad end. Average size of 89 eggs 28.8 × 22 mm (Baker). Both sexes take part in all the domestic chores. Incubation period undetermined.

MUSEUM DIAGNOSIS. See Key to the Species.

Young (immature). Like adult but crown duller black and crest shorter; upper- and underparts with more brownish less vinous cast; white lanceolation on chin and throat less defined, the streaks smaller; white tips to secondaries absent, and instead a subterminal white patch on outer web; white tips to tertiaries absent or a mere white mottling, and black subterminal band less defined.

MEASUREMENTS

	Wing	Bill (from skull)	Tail
♂ ♀	144-158	c. 28	141-169 mm (Paludan, BB)

(China, corrected to southern Thailand by Robinson & Kloss, 1923 = *Mergui rida*

Stresemann, 1952, Ibis 94: 516)

Baker, FBI No. 24, Vol. 1: 45

Plate 69, fig. 4

LOCAL NAMES. *Sirgoom* or *Sirgang* (Bengal); *Dhori kaili* (Paharia in Sikkim); *Chap ling pho* (Lepcha); *Rab ling chapa* (Bhutaneese); *Telpili* (Dafila); *Lil sordi* (Assamese), *Dao gatang lili* (Cachari).

SIZE. Myna ± with a long tail; overall length c. 38 cm (15 in.).

FIELD CHARACTERS. A bright leaf-green long-tailed bird with arresting cinnamon-red wings and a broad black band running backward through eyes to meet on nape. Sexes alike.

Black-and-white-tipped graduated tail especially conspicuous in the treepie-like flight, and bright coral-red bill and legs, are further diagnostic clues.

STATUS, DISTRIBUTION and HABITAT. Resident. The lower Himalayas from c. 78°E. in Garhwal eastward through Kumaon, Nepal, Sikkim, N. Bengal (Darjeeling dist.), Bhutan and NEFA. Assam hills south of Brahmaputra R., Nagaland, Manipur, Mizo, Tripura (?) and East Pakistan (Chittagong

Cissa chinensis

Distributional range

C. c. chinensis (1023).

Hill Tracts). Terai, bhabar, duars and foothills, occasionally wandering into the adjoining plains. Normally up to c. 1200 m, rarely and locally to c. 1600 m. Affects tropical and subtropical wet evergreen secondary jungle in nullahs with dense tangles of vines etc.; also mixed moist-deciduous bamboo forest.

CROWS, MAGPIES, JAYS

205

Extralimital. Burma, Thailand, N. Vietnam. The species extends to Cambodia, Malay Peninsula, Borneo, Sumatra, Java.

GENERAL HABITS. Keeps singly or in pairs, sometimes in small noisy parties, and almost unfailingly in association with hunting flocks of laughing thrushes and racket-tailed and other drongos up in shrubs as well as on ground — occasionally in tall trees. Many of its habits closely resemble those of laughing thrushes. Usually shy and wary and, aided by concealing coloration, is oftener heard than seen — this chiefly when flying from one covert to another.

FOOD. Mainly animal; large insects (grasshoppers, beetles, mantises, etc.), frogs, lizards, snakes, and small birds; even carrion recorded.

VOICE AND CALLS. A loud discordant quick-repeated *peep-peep* or *kik-wee*. Also a raucous mewling note, and some rich melodious squealing whistles. Mimics other birds' calls convincingly — e.g. hawk-eagle (*Spizaetus*).

BREEDING. Season, April/May to July. *Nest*, a well-made broad massive but rather shallow cup of twigs, tendrils and bamboo and other leaves often intermixed with moss, lined with finer roots; placed up in a small tree in dense jungle, occasionally in a bamboo clump. *Eggs*, 4 to 6, variable, greyish or pale greenish in ground colour blotched and freckled all over with reddish brown, more densely and forming a cap at the broad end — closely resembling those of laughing thrushes (*Garrulax*). Average size of 200 eggs 30.2 × 22.9 mm (Baker). Breeding biology and incubation period unrecorded.

MUSEUM DIAGNOSIS. Apart from bright green colour and shorter, stiffer tail, differs from the Blue Magpie in having a bright red ring of wattled skin encircling eyes — prominent in life.

Museum skins fade rapidly if exposed to light; the green turns to pale blue and the cinnamon wings to yellowish olive. This is usually the case also with birds in captivity; a tendency towards it is likewise noticeable in wild birds inhabiting comparatively dry areas.

Young (immature) like adult but crest shorter, underparts paler and under tail-coverts white. Rectrices more pointed.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	137-157	37-42	46-47	193-210 mm

Baker, FBI No. 23, Vol. 1: 44

LOCAL NAMES. Chainchal (Kangra); Lot rūzā, Literāz (Kashmir).

SIZE. Pigeon ±, with tail c. 39-43 cm (15-17 in.) long. Overall length c. 66 cm (26 in.).

FIELD CHARACTERS. As of nominate *flavirostris* (1026), q.v. See Key to the Subspecies and Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident; with some winter-summer altitudinal movements. Range almost identical with that of *Garrulus g. bispecularis* (1020): the outer Himalayas from Hazara dist. (c. 73°E.) in West Pakistan eastward through Kashmir, Himachal Pradesh, Punjab,

Cissa flavirostris

Distributional ranges

■ *cucullata* (1025).

■ *flavirostris* (1026).

Garhwal and Kumaon to central Nepal where intergradation with *flavirostris* occurs. From c. 3300 m in summer (breeding chiefly between 1600 and 2700 m), occasionally down to c. 800 m (Dehra Dun) in winter. Affects wet temperate mixed forest of pine, oak, chestnut, rhododendron, etc.

GENERAL HABITS, FOOD, VOICE AND CALLS. As in the eastern form *flavirostris*. Associates locally with Redbilled Blue Magpie (1027) though normally occupying a higher altitudinal zone. Is unusual below c. 1600 m whereas 1027 is unusual above this elevation. Whether the breeding ranges of the two actually overlap at any point needs determining.

BREEDING. Season, principally May and June. *Nest*, eggs (c/3-6), site and breeding biology as in 1026.

206

CORVIDAE

SIZE. Myna +, with a long graduated tail. Overall length c. 47 cm (17 in.).

FIELD CHARACTERS. A showy bright blue magpie with whole head, nape, upper back and breast rich chestnut. Long graduated tail blue, tipped with white and sub-tipped with black — this pattern prominent in flight. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Endemic to Ceylon. Resident. South-western aspects of the Hill zone up to c. 2100 m and adjacent forests of the Wet zone down to c. 150 m. Confined to dense evergreen forest; occasionally entering tea gardens.

GENERAL HABITS. By and large as of Green Magpie (1023), q.v. Keeps in parties of up to 6 or 7 — sometimes pairs or solos — usually associated with mixed flocks of other birds, hunting energetically for food on the ground or in trees and bushes, sometimes clinging upside down to pry into crevices of bark or sprigs of leaves.

FOOD. Mainly animal: items specifically recorded are hairy caterpillars (rubbed against mossy branches to remove the stinging hairs), beetles, tree frogs; also fruit (Henry). 'Very' partial to large Sphinx moth caterpillars which infest cinchona trees' (A. L. Butler).

VOICE AND CALLS. Squeaks and chirps when feeding; a variety of loud raucous or rasping notes; a loud jingling call uttered with beak wide open and audible at a considerable distance described as 'chink chink, or cheek cheek' — in various repetitions and variations. Other notes are: a very rasping crrak-crrak; a plain, loud whee whee, sometimes rendered as twee-twee. Solitary birds indulge in a quaint sub-song of squeaks, chatterings and sucking noises, interspersed with imitations of the notes of other birds' (Henry).

BREEDING. Season, mid January to end March. *Nest*, has rarely been found. One described as resembling a crow's nest but smaller, lined with 'beard' lichen; well concealed in the top of a small jungle tree. *Eggs*, 3-5, said to be indistinguishable from those of Green Magpie (1023): greyish, or greenish white, profusely spotted and speckled with various shades of brown. Average size of 24 eggs 30.5 × 22.1 mm (Baker). Breeding biology and incubation period unrecorded.

MUSEUM DIAGNOSIS. See Key to the Species and Field Characters.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail

(Darjeeling)

Baker, FBI No. 22, Vol. 1: 43

Plate 69, fig. 6

LOCAL NAMES. Lām pūchhāri (Paharia in Sikkim); Tying jongring (Lepcha); Pīangring jabring, Tūu (Bhutane).

SIZE. Pigeon ±, with tail c. 39-43 cm (15-17 in.) long. Overall length c. 66 cm (26 in.).

FIELD CHARACTERS. A spectacular purplish blue bird with black head, neck and breast, whitish underparts and long graduated black-and-white-tipped tail ending in pliant arching streamers. A small white patch on nape. Bill yellow, legs bright orange. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Resident; with some winter-summer seasonal altitudinal movements. The eastern Himalayas from about central Nepal (where intergradation with *cucullata* occurs) eastwards through Sikkim, N. Bengal (Darjeeling dist.), Bhutan and NEFA, between c. 2000 and 3300 m; in winter down to c. 1000 m.¹ Affects wet temperate mixed forest of pine, oak, chestnut, rhododendron, etc.

Extralimital. SE. Tibet, Burma, NW. Yunnan west to Mekong Valley.

GENERAL HABITS. Sociable, inquisitive and rather parochial. Keeps in noisy parties and flocks of 4 to 10 individuals in non-breeding season, commonly in association with jays and laughing thrushes, on forest-clad hillsides often wandering out to feed in the open glades, or terraced cultivation, tea gardens, etc. adjoining forest. Usually frequents the same patch of forest or wooded ravine day after day. Mainly arboreal, procuring its food in low bushes, but will descend to the ground to feed on insects and windfallen fruit or to glean grain in harvested fields. Hops comically on the ground with the long pliant tail partially cocked like a robin's. The parties fly from tree to tree or across a glade in follow-my-leader style, the

¹ *Cissa flavirostris shufeldti* Sick, 1939, Orn. Monath. 47: 78 (Mount Victoria) of the Chin Hills, Burma, is quite likely to occur in SE. Manipur, Mizo (Lushai) hills and Chittagong Hill Tracts of E. Pakistan. It differs from the nominate form in having shorter wings and tail (Wing 5 ♂♂ 166-177, 9 ♀♀ 162-174 mm).

long graduated tail spread out and the streamers trailing behind. Flight typical of the pies — a few rapid wing-flaps followed by a glide, sometimes with a curious butterfly-like 'delayed action' of the wings which almost clap over the back.

FOOD. Varied and all-embracing, mainly animal: insects (grubs, beetles, white ants, etc.), tree frogs, lizards, small snakes, eggs and nestling birds, small mammals, carrion. Land leeches recorded. Also fruits and berries (sometimes becomes a nuisance in hill orchards) and kitchen scraps around camps and hill-station bungalows.

VOICE and CALLS. Has a remarkable and often intriguing vocabulary of loud, harsh and creaking calls and sharp squealing whistles interlarded with faithful imitations of other birds' calls and improvisations. Some mimicked species recorded are Giant Squirrel (*Ratufa*), the jays (*Garrulus*), Pied Crested Cuckoo (*Clamator*), Hawk-Eagle (*Spizaetus*) and Serpent Eagle (*Spilornis*).

BREEDING. Season, chiefly May-June. Nest, a rather shallow cup of twigs like a small crow's nest, lined with rootlets etc., 5 or 6 metres up in the top of a small leafy oak, rhododendron or suchlike tree standing away from the edge of open forest. Eggs, 3 or 4 (5 ?) pale cream coloured, blotched with bright reddish brown, with sparse secondary blotches of neutral tint. Average size of 9 eggs 34.8 x 23.4 mm (Baker). Both sexes build the nest, incubate, and tend the young. Incubation period unrecorded.

MUSEUM DIAGNOSIS. Less bright blue, more ashy above than west Himalayan birds. In live or freshly killed specimens the underparts, tips of all rectrices excepting central pair, wing margins, under wing-coverts and lower back are strongly suffused with primrose yellow. This fades to pale lilac in museum skins.

Young (immature). Like adult but the black parts browner; upperparts and all wing-coverts tinged with slate-brown; feathers of nuchal patch slightly fringed with black. First-year birds recognized by the browner primary-coverts (CBT, HW).

MEASUREMENTS	Wing	Bill (from skull)	Tarsus	Tail
♂ ♀	175-195	37-42	48-51 (SA, Stresemann, BB)	345-423 mm

Weight 5 ♂♂ 168-180; 3 ♀♀ 132-143 g (SA, BB, Paynter).

COLOURS OF BARE PARTS. Iris dark brown. Bill orange-yellow. Legs and feet yellowish orange; claws horny brown with a yellowish tinge.

Ps. (Ilorhinus) occipitalis Blyth, 1846, Jour. Asiat. Soc. Bengal 15: 27
(Nepal and to the N.W., as at Mussooree)

Baker, FBI No. 20, Vol. 1: 41

Plate 69, fig. 7

LOCAL NAMES. *Nilkānth* (Mussooree, U.P.); *Digdal* (Simla).

STATUS, DISTRIBUTION and HABITAT. Resident, with some summer-winter altitudinal movements: the Himalayas from c. 77°E. in Himachal Pradesh (Kangra dist.) eastward through Garhwal and Kumaon to c. 87°E. in eastern Nepal (Okhaldhunga dist.); between c. 1000 and 2100 m. Reported occurrence in western Sikkim needs verification. Ecology and habitat as

Cissa erythrorhyncha

Distributional ranges

□ *occipitalis* (1027). ▨ *magnirostris* (1028).

in Yellowbilled (1025) and both sometimes found together, especially in winter, but it normally occupies a lower altitudinal zone, being unusual above c. 1600 m whereas 1025 is unusual below this elevation. Whether the breeding ranges of the two actually overlap at any point needs determining.

GENERAL HABITS, FOOD, VOICE and CALLS. Not noticeably different from 1025, q.v. Is much less shy than Yellowbilled and oftener met with at Himalayan hill-stations. One call is rendered as 'a piercing quier-pig-pig' (Fleming).

BREEDING. Season, between April and June chiefly during May. Nest, a rough and flimsy smallish cup of twigs, coarse roots and leaves; normally c. 6 to 8 metres up — sometimes higher — in trees on wooded slopes or growing at the edge of hill cultivation. Eggs, 5-6, clay- or stone-coloured, boldly blotched with dark brown or reddish brown, often densely to form a ring or cap at the broad end. Average size of 60 eggs 33.9 x 23.9 mm (Baker). Both sexes take part in building the nest, incubation and feeding the young. Incubation period undetermined.

MUSEUM DIAGNOSIS. White nuchal patch larger, more vertical, covering almost entire nape and continuing on to upper back v. smaller, more transverse and restricted in Yellowbilled (1025).

SIZE. Pigeon ±, with a tail c. 39-43 cm (15-17 in.) long. Overall length c. 70 cm (27 in.).

FIELD CHARACTERS. A showy purplish blue magpie with long graduated tail, the central feathers elongated into gracefully arching streamers. Head, neck and breast velvety black, with a large white patch on nape. Underparts below breast greyish white. Sexes alike.

x c. 1

Very similar to and confusable with 1025, but larger nuchal patch and bright red bill and legs (v. yellow) diagnostic.

Young (immature). Pattern much as in adult. Black of head replaced by dark brown; most of the crown white. Upperparts, lesser, median and greater coverts dark ashy grey-brown tinged bluish; upper tail-coverts with no black tips or grey band. Underparts whiter than in adult. First-year birds distinguished by browner primaries and primary-coverts (HW, CBT).

MEASUREMENTS	Wing	Bill (from skull)	Tarsus	Tail
♂♂	199-207	39-43	c. 45	390-469 mm
♀♀	187-199			

(HW, BB, Fleming)

Weight 5 ♂♂ 205-232; 3 ♀♀ 196-230 g (GD, Paynter).

COLOURS OF BARE PARTS. Iris brown or red-brown. Bill, legs and feet coral red; claws yellowish.

1028. Burmese Redbilled Blue Magpie.

Cissa erythrorhyncha magnirostris (Blyth)

Ps. (Ilorhinus) magnirostris Blyth, 1846, Jour. Asiat. Soc. Bengal 15: 27, 28
(Ya-ma-dong Mountains, separating Arracan from Pegu)

Baker, FBI No. 21, Vol. 1: 42

LOCAL NAMES. Not recorded.

SIZE. Pigeon ±. Overall length c. 70 cm (27 in.) including long tail (c. 40 cm).

FIELD CHARACTERS. As of 1027, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Rather equivocal. Hills of N. Cachar dist. (Assam), Nagaland, Manipur, Mizo (?), and probably East Pakistan in the Chittagong Hill Tracts: from the edge of the plains up to c. 1600 m, in tropical and subtropical dry- and moist-deciduous forest.

EXTRALIMITAL. All Burma south to northern Tenasserim. Other races extend the species to the Indochinese countries and SW. China.

GENERAL HABITS, FOOD, VOICE and CALLS. As in 1027 and 1025, qq.v.

BREEDING. Not recorded within our limits. Season in Burma, March-April. Nest, eggs (c/3-6), and breeding biology as in the Himalayan form (1027).

MUSEUM DIAGNOSIS. Differs from the Himalayan population in being darker and more suffused with purple-blue on upperparts; bill 4-5 mm longer.

MEASUREMENTS (excepting bill), and COLOURS OF BARE PARTS as in 1027.

Genus PICA Brisson

Pica Brisson, 1760, Orn. 1: 30, 2: 35.

Type, by tautonymy, *Cerrus pica* Linnaeus

Like *Corvus*, q.v., but tail very long and graduated; first primary (aa.) peculiarly shaped: attenuated and falcate. Plumage strongly contrasting black and white.

Baker, FBI No. 16, Vol. 1: 38
Plate 69, fig. 3

LOCAL NAMES. *Dūd* (= thief), *Shākūk* (Brahui); *Khashim brah* (Kashmir, Suru).
SIZE. Myna ±, with a tail c. 30 cm (12 in.) long. Overall length c. 52 cm (21 in.).

FIELD CHARACTERS. Strongly contrasting black and white plumage and long graduated black tail adequately diagnostic.

× c. 1

Adult. Above, head (all round) and back black; scapulars and a broad band across rump white; wings and tail black, the former brilliantly glossed with bluish green, the latter with bronze-green and purple. Below, breast, thighs, vent and under tail-coverts black; rest of underparts white. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Resident, subject to winter-summer altitudinal movements. The mountainous northwestern regions of W. Pakistan and India: N. Baluchistan, NW. Frontier districts, Chitral, Gilgit, Baltistan, Ladakh and Himachal Pradesh (Chamba); between c. 1500 and 4500 m. Chiefly trans-Himalayan: common and familiar about villages in the upper Indus Valley and side valleys; only a rare vagrant in Kashmir proper south and west of the Zoji La pass. In Baluchistan its distribution coincides more or less with juniper forest, between c. 2000 and 2500 m. Affects cultivated upland valleys among the barren windswept hills (as in Ladakh), and the vicinity of villages with orchards and planted poplar and willow groves.

Extralimital. E. Russia and the Urals, south through the Aral-Caspian region to Iran, S. Iraq, Afghanistan and Russian Turkestan to Lake Balkhash. (For details see Vaurie, 1959, 2: 150-1.) The species in numerous races is widely distributed across Europe and Asia.

GENERAL HABITS. Omnivorous. Keeps in the vicinity of upland village cultivation and orchards mostly in pairs, sometimes in loose parties of 8 to 12 and even up to 30 birds or so. Stalks about on the ground in search of food with a rather upright carriage and strutting gait, tail held low, jerked and flicked at all angles to the body on every little excitement or

Baker, FBI No. 18, Vol. 1: 39

LOCAL NAMES. None recorded.

SIZE. Myna ±, with a tail c. 30 cm (12 in.) long. Overall length c. 52 cm (21 in.).

FIELD CHARACTERS. As in 1029, q.v. See Key to the Subspecies and Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident? Bhutan, evidently only in Bumthang dist. (c. 27°30'N., 91°E.), from c. 3400 to 4600 m in Tibetan Plateau country; perhaps also NEFA in similar facies. Frequents buildings, cliffs, cultivated fields, and clumps of trees around upland villages. Occurs chiefly north of the main Himalayan range, apparently not south of the Tang La pass into Sikkim.

Extralimital. 'Northern Tsinghai south to central Sikang (Batang), then west through southwestern Sikang . . . to southeastern Tibet' (Vaurie).

GENERAL HABITS, FOOD, VOICE AND CALLS. As in 1029. In addition to the usual harsh corvine calls of the family has a note deceptively similar to the *scape* or *pench* of a rising snipe (Ludlow).

BREEDING. Not recorded within our limits. *Season* in neighbouring SE. Tibet, April to June. *Nest* and *eggs* (c/4 or 5, sometimes 6) as in 1029, the latter likewise greatly variable in size; average of 22 eggs 38 × 26 mm (Ludlow).

MUSEUM DIAGNOSIS. Rump black. The largest subspecies of *P. pica* with the biggest bill and proportionately the shortest tail. Tail length only 101 per cent of wing v. 115-130 per cent in other races (Vaurie).

MEASUREMENTS

Wing 35 ♂ 224-268 mm (Vaurie, Kinnear)
1 o? Wing 234, Bill (from skull) 43, Tarsus 57, Tail 240 mm (SA).

b	Nape blackish.....	<i>D. bayleyi</i>	228
2	Central rectrices partly ashy		
c	Belly ochraceous.....	<i>D. vagabunda</i>	216
d	Belly ashy.....	<i>D. fermeuse</i>	223

214

CORVIDAE

change of emotion. Sometimes progresses in long hops. When not feeding sits about in trees, on roof-tops, rocks or the piled stone, boundary walls of cultivation patches. Characteristically of the crow family, is highly inquisitive; wary, suspicious and cunning where persecuted, but otherwise tame and fearless around the village houses. Flies at sunset in straggling flocks to roost communally in favourite trees. Flight rather laboured, flapping and undulating — the wing action, together with the long tail trailing behind, reminiscent of a Pheasant-tailed Jaçana.

FOOD. All-embracing: insects, lizards, small mammals (mice, voles, etc.), young birds and eggs (including those of domestic poultry), and carrion; cereal grains, fruits and berries (often destructive to ripening cherries etc.); kitchen scraps, and almost everything else that can be procured.

VOICE AND CALLS. Normally a subdued rasping *querk* or *kick*. 'Sometimes a curious call in flight sounding like *ker-plonk*' (Trott). Alarm: a loud harsh *kekky kekky kekky* run together as a rattling note; this uttered with bill wide open, head and neck a little outstretched, and with an occasional expressive flick of the wings and upward jerk of the tail.

BREEDING. *Season*, in Ladakh March to May. *Nest*, a conspicuous, massive domed structure of sticks and thorny twigs reinforced within with a thick layer of mud and lined with fine roots etc., with a lateral entrance-hole. Occasionally nest undomed and crow-like. Frequently same nest repaired or built upon in successive years (once 'not less than five one on top of the other making a pyramid many feet high' — Wathen, JBNHS 29: 697). Built in willow, poplar or ilex trees in the vicinity of villages, 2 or 3 metres up. In treeless country thorn thickets flanking streams, e.g. *Hippophae rhamnoides* are used. Nests often serve as roosting shelters during winter. *Eggs*, 3 to 7, rarely 8 (mostly 5 or 6) pale blue-green profusely blotched, freckled and spotted with dull reddish brown, more densely at the broad end, showing considerable variation in size. Average size of 112 Ladakh eggs 36.5 × 24.9 mm (BBO). Breeding biology not specifically recorded; presumably as in the nominate form, namely, incubation by female alone; period 17-18 days; young fed by both parents (Witherby).

MUSEUM DIAGNOSIS. See Key to the Subspecies. First primary (as) falcate; black on outer web, white on inner.

In first-year birds first primary not falcate and tip of its inner web black.

from Hazara district (West Pakistan) southeast to the vicinity of Dehra Dun (India); from plains level to c. 2100 m. Intergrades into *pallida* in Baluchistan and Sind and into nominate *vagabunda* in eastern Kumaon and extreme western Nepal. Affects forest plantations, secondary jungle, cultivation and habitations, gardens, etc., in dry- and moist-temperate biotope.

GENERAL HABITS, FOOD, VOICE AND CALLS. As in 1032.

BREEDING. Season, April to June. Nest, eggs (c/4 or 5), and breeding biology, as in 1032 and other races.

MUSEUM DIAGNOSIS. The largest of the races of *D. vagabunda*, with a considerably longer tail than *pallida* and a somewhat longer wing; as richly coloured as the nominate form (1032). These characters are most pronounced at the northwestern-most limit of its range, which probably is also the limit of the distribution of the species *D. vagabunda*. To the east, south, and southeast there are marked clines toward the contiguous races *pallida* and *vagabunda* (Paynter).

MEASUREMENTS

	Wing	Tail

LOCAL NAMES. *Māhālāt*, *Mootri* (Hindi); *Tākhāchār* (Marathi); *Khākhedo* (Gujarati); *Chhotā māhūkā* (Saugor, M.P.).

SIZE. Myna +, with tail c. 30 cm (12 in.) long. Overall length c. 50 cm (20 in.).

FIELD CHARACTERS. As of 1032, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident. Rajasthan southward through Gujarat, Saurashtra (apparently absent in Kutch), western Madhya Pradesh and Maharashtra. Locally abundant in the plains and hills up to c. 1700 m. Affects well-wooded country about villages and cultivation, mango topes, open deciduous forest and scrub jungle. Intergrades into *bristoli* in the north and west (Sind, Baluchistan), into *vagabunda* on the east, and into *parvula* in the south. The populations are contiguous and their differences entirely clinal, therefore no more than an approximation of their ranges is possible or warranted.

GENERAL HABITS, FOOD, VOICE AND CALLS. As in the nominate race 1032, q.v.

BREEDING. Season, overall March to July, the peak periods varying according to locality, but mostly between April and June. Nest, eggs, and breeding biology as in 1032.

CROWS, MAGPIES, JAYS

219

GENERAL HABITS. Social, arboreal and omnivorous. Keeps in noisy pairs or family parties of 4 or 5 — sometimes larger temporary gatherings of up to 20 or so, e.g. at a heavy swarming of winged termites. Is a regular member of the itinerant commensal parties of assorted insectivorous birds, its very regular and close association with racket-tailed drongos and woodpeckers, in particular, often commented on by observers. Seizes moths and other large insects flushed by its associates from tree-trunks or amongst litter of fallen leaves; also attends grass and forest fires to feast on the fleeing refugees. Joins the company of barbets, green pigeons and other frugivorous birds to feed on fruit-laden banyan and peepul trees, sometimes descending to the ground and hopping about with tail partly cocked to pick up food. Characteristically of the crow family is highly inquisitive at all times, and can likewise be excessively cunning and wary when occasion dictates. Where unmolested will boldly enter verandas of bungalows to hunt wasps and geckos, and small bats roosting in crannies of the ceiling. Is usually the first to discover kills of the larger cats in forest, from which it greedily tears out and devours titbits of flesh. Flight noisy and dipping — a few rapid wing-flaps alternated with sailing on stiffly outspread wings and partially expanded tail.

Extralimital. The species in other races extends through Burma and Thailand to the Indochinese countries.

FOOD. Practically all-embracing. A large variety of fruits including neem (*Melia*) and even the poisonous *Trichosanthes palmata*, but preponderantly wild figs (*Ficus* spp.) — banyan, peepul, *guler* and others. Highly destructive to orchard fruit, e.g. cultivated figs, mulberries, papaya, etc. Cereal crops; and flower-nectar (*Salmaia*, *Erythrina*, etc.). Frogs, lizards (*Hemidactylus* and *Calotes*), small snakes, small bats, young rodents; eggs, nestlings and young or sickly birds (sunbird, tailor bird, white-eye and Indian Robin recorded). Has been observed systematically tearing holes in weaver birds' nests above the egg-chamber and extracting and devouring the eggs and young; carrion from fresh tiger kills or newly shot game animals; a wide assortment of insects including crickets, grasshoppers, beetles, wasps, moths, ants and termites, caterpillars and grubs. Also spiders, centipedes, snails, and almost any other small animal. In an intensively cultivated area in Bihar the following insects specifically identified among stomach contents of specimens and by direct field observation: weevils *Myloecerus discolor* and *M. maculor*, ants *Crematogaster subnuda*, *Camponotus* sp., *Myrmecocystus* sp., wasps *Sphex lobatus*, *Pelictes hebraeus*, *Vespa orientalis*, *Rhynchium* sp. in addition to Noctuid and Geometrid moths and smooth-bodied caterpillars (Mason & Lefroy, 1912).

VOICE AND CALLS. Has a large repertoire of harsh and raucous as well as musical melodious calls. A loud harsh *kitter kitter kitter* or *ke* (or *ka*)-*ke-ke-ke* strung out as a rattling call (*kā-kā-kā-kā-kā*) and reminiscent of a Magpie; this often interspersed with a metallic flute-like *ko-ki-la* or *ku-lo-lee* (or *to-o-lit*) recalling Blackheaded Oriole, uttered with back arched and tail depressed and turned in under the perch. A very metallic *te-chuck* *chuck* *chuck*; a long-drawn *mee-aw* in breeding season. Particularly noisy in courtship. The pair will sit side by side a few centimetres apart, half turning and bobbing ludicrously at each other like mechanical toys, craning

218

CORVIDAE

MUSEUM DIAGNOSIS. Slightly smaller and paler than *bristoli*, with a markedly shorter tail. Back and scapulars isabelline with a tinge of dusky but no rufous; rump paler. Belly and under tail-coverts pure isabelline or buff cream colour.

MEASUREMENTS

	Wing	Tail
38 ♂♂	149-173	218-297 mm (36 msd.)
28 ♀♀	144-165	219-279 mm (27 msd.) (RAP)
	Bill (from skull)	Tarsus
♂♂	32-37	33-37 mm
♀♀	30-35	32-37 mm (SA, HW)

Weight 13 ♂♂ 90-118 (av. 100) g — SA. 1 ♂ 130 g (BB).

COLOURS OF BARE PARTS. As in 1032.

1032. Northeastern Tree Pie. *Dendrocitta vagabunda vagabunda* (Latham)

Coracias vagabunda Latham, 1790, Index Orn. 1: 171

(India, restricted to Calcutta by Ticehurst, 1922, Ibis: 537)

Baker, FBI No. 26, Vol. 1: 48

Plate 69, fig. 10

LOCAL NAMES. *Māhālāt* (Hindi); *Kotri*, *Tākā chōr* [= stealer of rupee coins], *Handi chāchā* (Bengali); *Kola Mea* (= plantain-eater. Dibrugarh, Assam); *Cekuragi*, *Kōndā kati gāda* (Telugu); *Vāl kākai* (Tamil, Madurai dist.).

SIZE. Myna +, with tail c. 30 cm (12 in.) long. Overall length c. 50 cm (20 in.).

FIELD CHARACTERS. A long-tailed bright rufous arboreal bird with dark sooty grey head, neck and breast. Broad black tips to graduated greyish tail, and greyish, white and black pattern on wings conspicuous and diagnostic, particularly in flight. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Resident. The Himalayan submontane tract (terai, bhabar, duars, etc.) from extreme western Nepal eastward to NEFA, southward through Assam, Manipur, East Pakistan, West Bengal, Bihar, Uttar Pradesh, Madhya Pradesh, eastern Maharashtra, Orissa and northern Andhra; south to c. 17-18°N. and west to c. 78th meridian; plains and hills up to c. 2000 m. Affects lightly wooded country in dry- and moist-deciduous biotope. Forest plantations, thin tree- and scrub jungle, mango topes, village groves, sprawling jungly gardens and compounds in urban areas, and roadside avenues of ancient banyan and suchlike trees are amongst its favourite haunts.

220

CORVIDAE

their necks till the bills almost touch and uttering strange musical croaks and chuckles.

BREEDING. Season, overall March to July, varying locally; chiefly May and June. Nest, crow-like: a scanty and flimsy deepish cup of thin, often thorny twigs lined with finer twigs, rootlets, etc. — rather small for the size of the bird. Placed c. 6 to 8 metres up in trees such as sheesham (*Dalbergia*), mango, salai (*Boswellia*) or *Acacia* standing alone at edge of cultivation or in open deciduous forest, or in a village grove or roadside avenue. Though often built in a leafless tree, nest not unduly conspicuous thanks to its small size. Eggs, 4 or 5, rather variable in shape, size and colour. Commonest type pale reddish- or salmon-white, boldly splashed and streaked with bright reddish brown and inky grey, more densely at the broad end. Average size of 100 eggs 29 × 21.5 mm (Baker). Both sexes take part in building the nest, incubation and feeding the young. Incubation period undetermined.

MUSEUM DIAGNOSIS. A richly coloured form: back and scapulars dark brownish rufous; rump, belly and under tail-coverts fulvous buff.

Young (immature). Head, neck, throat and mantle concolorous brown; rump, upper tail-coverts and entire underparts buffy cream; the white wing-coverts tinged rusty cream towards tips, the smallest lesser coverts at edge of wing greyish brown. Rest of wings and tail as in adult but browner instead of black, and tips of all rectrices pale rufous, least marked on the centrals.

First-year birds recognized by pale tips to the rectrices and browner remiges, these feathers not being covered by the postjuvinal moult (Whistler).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	146-168	30-35	31-35	204-263 mm
♀♀	136-161	30-33	31-34	198-240 mm (SA, HW, RAP)

Weight 3 ♂♂ 112-128; 3 ♀♀ 98-118 g (RAP).

COLOURS OF BARE PARTS. Iris orange-brown to brownish red. Bill dusky plumbeous, paler towards base of lower mandible; mouth slaty (in juvenile flesh-coloured till after postjuvinal moult). Legs and feet dusky plumbeous.

1033. Kerala Tree Pie. *Dendrocitta vagabunda parvula* Whistler & Kinnear

Cercus rufus Latham, 1790, Index Orn. 1: 161, based on 'La Pie rousse de la Chine' ex Sonnerat. (Malabar, fixed by Baker, preoccupied)

Dendrocitta vagabunda parvula Whistler & Kinnear, 1932, Jour. Bombay nat. Hist. Soc. 35: 515, new name for *Cercus rufus* Latham (Malabar)

Baker, FBI No. 26 (part), Vol. 1: 48

LOCAL NAMES. *Vāl kākai* (Tamil, Madurai dist.); *Olē nāli*, *Kānākkān* (Malayalam).

SIZE. Myna +, with tail c. 25 cm (10 in.) long. Overall length c. 46 cm (18 in.).

FIELD CHARACTERS. As of the nominate race 1032, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident. The SW. coastal and Sahyadri strip (from c. 13°-14°N.) in Mysore southward through Kerala

to Kanyakumari (Cape Comorin), east to c. the 77th or 78th meridian. Affects moist-deciduous and semi-evergreen biotope, from sea level to c. 1600 m, especially favoured haunts being the kampongs or gardens of coconut, mango, jack-fruit, cashew, plantains and pepper surrounding the homesteads by the backwaters, and light open forest. Replaced in moister evergreen by Whitebellied Tree Pie (1036).

Curiously enough this widespread Indian species (*D. vagabunda*) does not extend to Ceylon.

GENERAL HABITS, FOOD, VOICE and CALLS. As in 1032.

BREEDING. Season, principally March–April. Nest and eggs (c/4 or 5) and breeding biology as in the nominate subspecies. Bhendi (*Thespesia populnea*) in coastal areas, and neem (*Melia azadirachta*) are popular with the birds as nest trees. Eggs somewhat smaller, measuring about 27 × 21 mm.

MUSEUM DIAGNOSIS. The smallest race of *D. vagabunda*; as richly coloured as the nominate form: back and scapulars dark brownish rufous; rump, belly and under tail-coverts fulvous buff; chin, throat and breast blackish.

MEASUREMENTS

	Wing	Bill (from skull)	Tail
♂♂	133–152	31–35	189–239 mm
♀♀	131–144	29–32	196–204 mm (HW, SA)

COLOURS OF BARE PARTS. As in 1032.

1034. Southeastern Tree Pie. *Dendrocitta vagabunda vernayi* Whistler & Kinnear

Dendrocitta rufa vernayi Whistler & Kinnear, 1930, Bull. Brit. Orn. Cl. 51: 17 (Nallamalai Range, 2000 ft, S. Kurnool)
Baker, FBI No. 26 (part), Vol. 1: 48

LOCAL NAMES. *Vāl kākāi* (Tamil, Madurai dist.); *Gokurayi*, *Kūdā kāti gādu* (Telugu); *Olī nāli* (Malayalam).

SIZE. Myna +, with tail c. 30 cm (12 in.) long. Overall length c. 50 cm (20 in.).

FIELD CHARACTERS. As in 1032, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Resident. Andhra Pradesh south of Godavari R., Tamil Nadu (including the Nilgiris and associated hills) and southeastern Mysore; plains level and up to c. 2000 m. Affects dry- and moist-deciduous wooded country — open forest and the neighbourhood of cultivation and habitations; also urban gardens and compounds.

GENERAL HABITS, FOOD, VOICE and CALLS. As in 1032.

BREEDING. Season, principally March to May. Nest and eggs (c/4 or 5), and breeding biology, as in nominate *vagabunda* and other races.

MUSEUM DIAGNOSIS. Smaller and even paler than *pallida* (1031): about same size as *vagabunda*. Chin, throat and breast sooty grey; belly and under tail-coverts pale creamy fulvous. Intergrades into *vagabunda* at the Godavari Delta and into *pallida* and *parula* along its western boundary.

Dendrocitta frontalis and *D. leucogastra*

Distributional ranges

■ *D. f. frontalis* (1035). ■ *D. leucogastra* (1036).

BREEDING. Season, April to July. Nest, like that of Himalayan Tree Pie (1038), somewhat more compact: of twigs etc. lined with fern roots and softer material. Built up in bamboo clumps or tall thorny bushes near the edge of forest. Eggs, 3 or 4, like those of 1038, rather more profusely marked. Average size of 100 eggs 27 × 19.9 mm (Baker). Breeding biology presumably as in 1038.

MUSEUM DIAGNOSIS. See Key to the Species and Field Characters.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♀	120–126	c. 25	c. 30	245–255 mm (Baker)

COLOURS OF BARE PARTS. Iris reddish brown. Bill, legs, feet and claws black.

1036. Whitebellied Tree Pie. *Dendrocitta leucogastra* Gould

Dendrocitta leucogastra Gould, 1833, Proc. Zool. Soc. London: 57 (Eastern Asia = Malabar Coast)
Baker, FBI No. 31, Vol. 1: 51
Plate 69, fig. 9

LOCAL NAMES. *Neela rāl kākāi* (Telugu); *Kātu nāli* (Malayalam).

SIZE. Myna +, with tail c. 30 cm (12 in.) long. Overall length c. 50 cm (20 in.).

FIELD CHARACTERS. An unmistakable tree pie, distinguished from the Indian (1032) by chestnut-bay back and pure white rump and underparts.

Juveniles of the races indistinguishable, all having pale creamy fulvous underparts, a character which normally persists in adult *vernayi* and distinguishes it.

First-year bird, as in other races, distinguished from adult by the pale tips to the unmoulted rectrices of the juvenal plumage.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	145–158	29–35	31–34	197–236 mm
♀♀	137–152	29–33	31–33	188–225 mm (HW)

Weight 3 oo? 90–95 g (SA).

COLOURS OF BARE PARTS. As in 1032 and other races.

1035. Blackbrowed Tree Pie. *Dendrocitta frontalis frontalis* Horsfield

Dendrocitta frontalis Horsfield, 1840, Proc. Zool. Soc. London: 163 (Assam)
Baker, FBI No. 34, Vol. 1: 54
Plate 69, fig. 11

LOCAL NAMES. *Hamshi bon* (Lepcha); *Kolio ko* (Bhutane); *Dao ka link gashim* (Cachari).

SIZE. Myna ±, with a tail up to c. 25 cm (10 in.) long. Overall length c. 38 cm (15 in.).

FIELD CHARACTERS. A pale grey and chestnut tree pie with very white nape, black face, throat and foreneck, and heavy bowed black bill. Readily distinguished from the rather similar Himalayan Tree Pie (1038) by entirely black tail (v. ashy and black), and absence of the large white wing-patch. Sexes alike.

STATUS, DISTRIBUTION and HABITAT.

Resident. Sikkim (apparently very rare and local), Bhutan (?), NEFA (Dafia, Abor and Mishmi hills) and round the head of the Brahmaputra Valley (in the Luhit and Tirap

frontier divisions and Dibrugarh, N. Cachar and Khasi Hills districts). Also Nagaland, Manipur, and possibly East Pakistan (hill tracts); foothills and up to c. 2100 m altitude. Affects dense mixed evergreen forest and bamboo jungle.

Extralimital. Adjoining northern Burma (fairly common). Another race in N. Vietnam.

GENERAL HABITS. Similar to those of Himalayan Tree Pie (1038), q.v. Keeps in small parties; said to be less noisy and less shy.

FOOD. Fruits, seeds, insects, lizards, eggs and nestlings of birds, etc. Has been observed hawking winged termites from tops of bamboos in the manner of drongos — springing vertically a few metres up in the air and diving back to the perch after each capture.

VOICE and CALLS. The characteristic tree pie range of discordant as well as musical metallic notes, but claimed to be clearly distinguishable from those of its congeners.

Forecrown, face, throat and breast black; hindcrown and hindneck white. A large white patch on the black wings, and the long grey-and-black graduated tail conspicuous in flight. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Resident. The Sahyadri or Western Ghats complex from c. 16°N. (Goa, Belgaum), southward through western Mysore (Malnaad), Nilgiri Hills (W. Tamil Nadu) and Kerala; from c. 60 to 1500 m, in wet evergreen biotope: dense forest, cardamom sholas and ravines, secondary jungle, abandoned and neglected overgrown rubber plantations, etc. Has been recorded from Bangalore and east to Palmaner (c. 13°15'N., 78°45'E.) in southern Andhra Pradesh.

McMaster (*Jour. Asiat. Soc. Bengal*, 1871, pt. 2: 214) claims to have procured a specimen in May in the Gawilgarh Hills at Chikalda (c. 21°30'N., 71°20'E.) far beyond the known range of the species. Lack of confirmation since that time, and total absence of compatible habitat in that area renders the record open to suspicion.

GENERAL HABITS. Similar to the more widely distributed *vagabunda* species (see under 1032). Chiefly arboreal, but will sometimes descend to feed in low bushes or to the ground. Keeps in pairs or noisy parties of 3 to 5 often in company with the roving hunting parties of flycatchers, tits, nuthatches and other insectivorous forest birds, but is seen almost unfailingly in association with racket-tailed drongos in particular. Flight, as typical of the tree pies, noisy and dipping — a few rapid wing-flaps followed by a short glide on stiffly outstretched wings and expanded tail, rocketing down at a steep angle with wings closed for alighting in a tree. As a rule keeps segregated from *vagabunda*, completely replacing it in moist-evergreen biotope. But the two species may occur side by side locally in the intermediate zone with a mingling of the deciduous and evergreen forest types.

FOOD. Fruits, seeds, flower-nectar, insects and small animals: lizards, young rodents, etc.; also eggs and nestlings of small birds. Very fond of the seeds of *Sterculia villosa* Roxb., which are avidly plucked from the ripe orange-scarlet pods on the tree.

VOICE and CALLS. Similar to Indian Tree Pie's but louder, harsher and more metallic, some notes closely resembling those of its constant associate the racket-tailed drongo. When hunting among the foliage, a subdued quick-repeated castanet-like rattle *kt-kt-kt-kt-kt* etc. ending in a short frog-like croak. A throaty *chuff-chuff* frequently given with tail cocked and body horizontal, accompanied by a ludicrous mechanical jumping or bobbing up and down on the perch like some cheap clockwork toy! 'Two birds on the ground faced each other and emitted grotesque rhythmical creaking as of a heavily laden bullock cart with ungreased wheels and wooden brakes applied, coming along the road. Courtship?' (Alice M. Barnes). During breeding season 'one call curiously like that of a duck' (J. Stewart). The significance of the various vocalizations and behaviour needs study.

BREEDING. Season, February to April, and reportedly again in August. Nest crow-like, a deepish cup of thorny twigs lined with finer twigs and rootlets. Placed in tall shrubs or moderate-sized saplings in heavy rain-forest, away from human habitations. Often built in the same or a nearby tree in successive years. Eggs, 3 or 4, variable in colour: creamy white, pale stone, reddish white or pale greenish white, blotched and streaked

CROWS, MAGPIES, JAYS

225

(more richly than in 1032) with various shades of brown, from greyish brown to reddish- or dark brown with underlying markings of lilac, these often confined to the broad end as a ring or cap. The eggs resemble those of Himalayan Tree Pie (*D. formosae*) more closely than of the *vagabunda* group (cf. also Museum Diagnosis). Average size of 50 eggs 28.3 × 20.5 mm (Baker). Breeding biology not recorded; presumably as in Indian Tree Pie (1032).

MUSEUM DIAGNOSIS. Colour pattern of wings and tail, and also of body plumage, very similar to Himalayan Tree Pie (1038) suggesting close relationship between the two.

Juvenal plumage almost exactly like adult save for narrower, less spatulate tail-feathers and a slight brown fringing to tips of lesser wing-coverts and rump.

First-winter birds distinguished from adults by shape of the rectrices retained from juvenal plumage (as is characteristic of the moult in the family Corvidae). As in *formosae* these feathers lack the pale rufous tips of *vagabunda*, emphasizing closer affinity with the former group.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♀	141-157	34-38	32-34	278-324 mm (SA)

Weight 1 ad. ♀ 3.5 oz. (99.25 g) — Davison.

COLOURS OF BARE PARTS. Iris dark crimson. Bill horny black; mouth dark slate. Legs, feet and claws blackish brown.

DENDROCITTA FORMOSAE Swinhoe

Key to the Subspecies

Larger; tail over 240 mm.....	<i>D. f. occidentalis</i>
Smaller; tail under 240 mm.....	<i>D. f. himalayensis</i>

1037. West Himalayan Tree Pie. *Dendrocitta formosae occidentalis* Ticehurst

Dendrocitta formosae occidentalis Ticehurst, 1925, Bull. Brit. Orn. Cl. 46: 22

(Simla)

Baker, FBI No. 32 (part), Vol. 1: 52

LOCAL NAME. Kokiā kāk (U.P., Mussooree).

SIZE. Myna ±, with tail up to c. 25 cm (10 in.) long. Overall length c. 43 cm (17 in.).

FIELD CHARACTERS. As of 1038, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Resident, with marked summer-winter altitudinal movements. Foothills and outer ranges of the western Himalayas from about Murree (c. 73°E.) and the Jhelum Valley eastward through Jammu, Himachal Pradesh, Punjab and Garhwal to about Almora and W. Nepal (c. 81°E.); from c. 600 to 1500 m, occasionally to 2100 m; patchily distributed and less common in the western part than between Mussooree and Almora. Affects well-wooded country and edges of terraced cultivation on forested hillsides.

GENERAL HABITS, FOOD, VOICE and CALLS. As in 1038.

BREEDING. Season, April to July, chiefly May and June; between c. 700 and 1600 m altitude, sometimes up to 2000 m. Nest, eggs (c/3 or 4) and breeding biology as in 1038.

CROWS, MAGPIES, JAYS

227

SIZE. Myna ±, with tail up to c. 23 cm (9 in.) long. Overall length c. 41 cm (16 in.).

FIELD CHARACTERS. A typical, long-tailed, slender, grey and sooty brown tree pie with the elongated central rectrices (blunt and rather spatulate) ashy grey and broadly black-tipped.

Above, forehead black; sides of head sooty brown; crown, nape, and upper mantle ashy grey; lower mantle and scapulars buffy brown; rump and upper tail-coverts paler. Wings black with a pure white patch. *Below*, chin and throat dark sooty brown; rest chiefly rusty brown and whitish; under tail-coverts chestnut. Sexes alike.

White wing-patch and chestnut under tail-coverts particularly conspicuous in flight.

STATUS, DISTRIBUTION and HABITAT. Resident, with marked summer-winter altitudinal movements. The Himalayas from western Nepal eastward through Sikkim, W. Bengal (Darjeeling and Jalpaiguri districts), Bhutan and NEFA (including Dafia, Abor; Miri and Mishmi hills, and Luhit and Tirap frontier divisions); Assam ranges south of Brahmaputra R., Nagaland, Manipur, Mizo and East Pakistan (hill tracts). Duns, duars, foothills and outer ranges between c. 600 and 1500 m, occasionally up to 2300 m; in broad-leaved forest (oak, rhododendron, etc.) at the higher elevations, tropical evergreen in the duars. The Eastern Ghats complex in Orissa and northern Andhra, between c. 18° and 20°N; up to c. 1000 m, in tropical semi-evergreen. *Extralimital*. Northern Burma, Yunnan, Vietnam, N. Laos. The species extends to S. China, Hainan and Taiwan.

GENERAL HABITS. Keeps in small parties of 4 or 5 birds or loose flocks of up to 20 or so in tall forest and around abandoned cultivation and tea gardens, etc., often in commensal association with various laughing thrushes (*Garrulus* spp.). Chiefly arboreal, but will occasionally descend to feed in low bushes or to the ground, e.g. in harvested terraced fields, several birds together hopping about to pick up scattered grain with tails comically cocked. Feeding parties in fruit-laden trees flutter restlessly among the canopy foliage, now flying off from the tree now back again, with a noisy whirring of wings. Flight undulating, typical of the pies — a few rapid wing-flaps followed by a short glide. When flitting from one tree-top to its neighbour, the actions curiously jerky, with deep 'saw-edge' undulations and closed-wing nose dives.

FOOD. Fruits, seeds, flower-nectar (*Salmalia*, *Erythrina*, *Rhododendron*, etc.), insects (beetles, moths, larvae; destructive to semi-wild 'mooga' silkworms in Assam), centipedes, lizards, eggs and young of small birds, and doubtless other small animals.

VOICE and CALLS. Very varied: harsh and raucous as well as fluty and musical: of same general pattern as *D. vagabunda*'s but distinctive and unmistakable. One common call rendered as a rather nasal *koki-ko-ko-ko*; another frequently heard as 'wot-wot-ek-ek' with strong emphasis on the penultimate note (Lister). 'Song' common in pre-nuptial season, a mixture of harsh and musical *tū-tū-tū-kākā* (or *-kākā-kākā*). A peculiar, rather comical, creaky long-drawn *kree-ee-chok* uttered two or three times in succession at c. 5 second intervals by itself and not as part of the *tū-tū-tū-kākā-kākā* song. Significance of this obscure.

226

CORVIDAE

Dendrocitta formosae

Distributional ranges

occidentalis (1037).

himalayensis (1038).

MUSEUM DIAGNOSIS. Differs from *D. f. himalayensis* (1038) only in being larger. Young (immature) as in 1038.

MEASUREMENTS

	Wing	Bill (from skull)	Tail
♂ ♂	145-160	35-40	243-260 mm
♀ ♀	149-157	35-40	241-261 mm (BB, CBT)

Weight 1 ♀ 104.5 g (Paynter).

COLOURS OF BARE PARTS. As in 1038.

1038, 1039. East Himalayan Tree Pie. *Dendrocitta formosae himalayensis* Blyth

Dendrocitta himalayensis Blyth, 1865, Ibis: 45

(Sikkim, restricted by Ticehurst, 1925, Bull. Brit. Orn. Cl. 46: 22)

Dendrocitta formosae sarkari Kinnear & Whistler, 1930, Bull. Brit. Orn.

Cl. 51: 17 (Anantgiri, Vizagapatam)

Baker, FBI No. 32, Vol. 1: 52

Plate 69, fig. 8

LOCAL NAMES. Kokila (Paharia); Kario pho (Lepcha); Karioah ban (Bhutanes); Kok long ah (Assamese, Dibrugarh); Dao ka link (Cachari); Inru ko kink (Naga).

¹No. 1039 of *Synopsis*. Examination of more material shows that the measurements (including 'smaller' bill on which character *sarkari* was described) fall well within the range of those of *himalayensis*. The subspecies is thus considered untenable (Biswas, B., 1964, JBNS 60: 650-1).

CORVIDAE

228

BREEDING. Season, April to July, chiefly May and June. Nest, of the crow type: a rather flimsy shallow platform of twigs, tendrils, coarse roots and leaves with the central depression lined with finer material. Placed 3 to 7 metres up in a bush or sapling on the edge or in the neighbourhood of a scrub-covered ravine, in oak and similar forest, with little effort at concealment. Eggs, 3 or 4, rarely 5, pale bluish or yellowish stone colour, boldly blotched with dark brown or reddish brown with some inky secondary markings. Average size of 200 eggs 28.8 × 20.1 mm (Baker). Both sexes take part in building, incubation and feeding the young, and are very quiet and secretive in their comings and goings throughout the nesting. Incubation period undetermined.

MUSEUM DIAGNOSIS. Differs from the West Himalayan population only in being smaller, with a shorter tail.

Juvenile. Upperparts like adult, but black forehead not so broad, and grey of hindneck less clear; faint rufous tips to all the feathers including inner tertials, lesser and median coverts; chin blackish; throat dusky, hardly different from rest of underparts; belly whitish; under tail-coverts paler chestnut; outer rectrices narrower. Postjuvenal moult of body, lesser and median coverts.

First-year birds recognized by the rather duller primary-coverts and unmoulted wings and tail of juvenal plumage.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♂	135-151	32-40	28-35	191-236 mm

Weight 16 ♂♂ 90-112; 9 ♀♀ 93-115 g (SDR, GD, SA, BB). 22 ♂♂ 90-121; 12 ♀♀ 89-106 g (Paynter).

COLOURS OF BARE PARTS. Iris brownish crimson. Bill horny black. Legs, feet and claws blackish brown.

1040. Andaman Tree Pie. *Dendrocitta bayleyi* Tytler

Dendrocitta bayleyi Tytler, 1863, Jour. Asiat. Soc. Bengal 32: 88

(Andamans)

Baker, FBI No. 35, Vol. 1: 55

Plate 69, fig. 12

LOCAL NAMES. None recorded.

SIZE. Myna ±, with tail c. 22 cm (8½ in.) long. Overall length c. 36 cm (14 in.).

FIELD CHARACTERS. A smallish slender-bodied tree pie with the typical long graduated tail and elongated central rectrices.

Above, feathers round base of bill black; head, neck, and mantle dark bluish ashy; lower back and rump pale rufous-olive; upper tail-coverts bluish ashy. *Below*, upper breast dark bluish ashy, diffusing to rufescent ashy on lower breast; rest of underparts chestnut. Tail and wings black, the latter with a large white patch on primaries and secondaries, very conspicuous in flight. Sexes alike.

CROWS, MAGPIES, JAYS

229

STATUS, DISTRIBUTION AND HABITAT. Endemic to Andaman Islands. Not uncommon in South and Middle Andamans. Evidently absent in the Great and Little Cocos and the Nicobars. Affects tall trees in dense evergreen forest.

GENERAL HABITS, FOOD, VOICE AND CALLS. Typical of tree pies cf. 1032. Keeps in pairs or family parties; sometimes loose flocks of a dozen to twenty or so. Has 'a sharp metallic note something like that produced by drawing a coarse file across the teeth of a saw' (Davison).

BREEDING. Poorly known. Apparently the only authentic records are a nest with c/3 taken by B. B. Osmaston on 27 May (1907) and another by Wickham, in the same month, 3 years later. *Nest*, described by Osmaston as 'a flimsy cup-shaped structure of bents and fine sticks, lined with rootlets, 15 ft from the ground in a small thickly foliated sapling growing in forest'. *Eggs*, pale creamy yellow with numerous small blotches of light brown and inky grey, rather denser at the broad end. Size c. 25 x 20 mm.

MUSEUM DIAGNOSIS. See Key to the Species and Field Characters.

MEASUREMENTS		Wing	Bill (from skull)	Tarsus	Tail
3	♂♂	119-124	26-28	27-28	193-206 mm
4	♀♀	117-123 (3 msd.)	26-28	27-28	180-183 mm (3 msd.) (HA)

Weight ♂ ♀ 3.25-4 oz. (c. 92-113 g) — Hume.
COLOURS OF BARE PARTS. *Iris* variable: olive-green, bright yellow, or rich golden yellow. 'Bill, legs, feet and claws black; soles plumbeous grey' (Hume).

Genus *PODOCES* Fischer

Podoces Fischer, 1821, *Lettre adressée* . . . Pander: 6.

Type, by monotypy, *Podoces panderi* Fischer

Pseudopodoces Zarudny & Loudon, 1902, *Orn. Monatsb.*

10: 185. Type, by original designation and monotypy, *P. humilis* Hume

Bill slender and very long; nostrils completely concealed by stiff plumes. Wings short and rounded; tarsi long and strong. Only a single species within our limits.

1041. **Hume's Ground Chough.** *Podoces humilis* Hume¹

Podoces humilis Hume, 1871, *Ibis*: 408 (Kitchik-Yilak = Sanju Pass, Hill Yarkand)

LOCAL NAME. *Day-day* (Tibetan).

SIZE. Myna —; length c. 20 cm (8 in.).

¹ *Podoces pleikei* Zarudny, 1896 (Alkor, Eastern Persia) probably enters West Pakistan near the Iran-Baluchistan boundary at Nokkundi (Ludlow, 1945, *JBNHS* 45: 233). It is a cinnamon-coloured bird, about hoopoe size, with black throat and tail and black-and-white wings. Largely terrestrial and fast-running.

CROWS, MAGPIES, JAYS

231

Weight 4 ♂♂ 1.5-1.65 oz. (= c. 42.5-48.5 g) — Scully.
COLOURS OF BARE PARTS. *Iris* brown. Bill, legs, feet and claws brownish black.

Genus *NUCIFRAGA* Brisson

Nucifraga Brisson, 1760, *Orn.* 1: 30, 2: 59.

Type, by tautonymy, *Corvus caryocatactes* Linnaeus

Plumage soft and full, blackish brown, more or less spotted with white. Bill about as long as head, somewhat rounded laterally, straight and pointed. Nostrils circular, entirely concealed by bristles. 4th to 6th primaries (as.) almost equal and longest, 3rd very little shorter, 1st not much more than half 2nd. Tail about three-quarters length of wing, slightly rounded at end, almost square. Only one species within our limits.

LOCAL NAMES. *Khākārra* (Pushtu); *Linnpia* (Lahuli); *Tong she sha ga* (Tibetan).

SIZE. Pigeon ±; length c. 32 cm (12½ in.).

FIELD CHARACTERS. A chocolate and umber-brown crow, streaked and spotted with white all over. Bill black, stout, wedge-shaped and pointed.

x c. 1

230

CORVIDAE

FIELD CHARACTERS. A greyish sandy brown bird with darker brown wings, a whitish collar round neck (broad and conspicuous on nape), a dark streak through eyes, and long, slender, blackish curved bill. Tail square-ended, largely sandy white, with the central rectrices brown. Sexes alike.

General effect of a chat or wheatear; colour pattern at rest and in flight reminiscent of Large Grey Babbler (1258).

STATUS, DISTRIBUTION AND HABITAT. Resident? Extreme northern Sikkim (Gyagong, Thangu) c. 4200 to 5200 m; in semi-arid Tibetan steppe facies above tree-line, with scattered dwarf rhododendron and furze (*Caragana*) bushes. Affects sandy stone-littered hillsides and hummocky country cut up by dry watercourses etc.

Extralimital. Southern Kansu, NW. Szechuan westward through Tsinghai and Sikang to Tibet and southern Sinkiang (Vaurie).

GENERAL HABITS. Mainly terrestrial; very active and sprightly; usually tame and fearless. Keeps singly, or in pairs or loose parties of 6 to 8. Rum-mages amongst the shingle for food, 'pick-axing' the soil energetically with its bill like a Jungle Babbler, peering under stones and probing into crevices of boulders etc. Very obliteratingly coloured in its native environment, its presence often detected only by the momentary flicker of the whitish tail-feathers even at close range. Progresses on the ground in a stiffly erect posture by long bouncing hops like a rubber ball. Mounts a stone every now and again to bob or curtsy violently a couple of times like a chat, flicking open the tail and wings while so doing. Flight weak and laboured, reminiscent of a shrike, and seldom sustained for over fifty or a hundred metres. When approaching nest-hole, which often entered directly from the air, wing action rapid and vibratory. In Tibet often found in proximity of habitations, entering villages freely, perching on piled stone boundary walls and roof-tops of the houses.

FOOD. Ground beetles and other insects.

VOICE AND CALLS. A feeble/cheep like a munia's but more prolonged. A plaintive whistling chip (slight pause) . . . cheep-cheep-cheep-cheep (quick repeated) reminiscent of Yelloweyed Babbler (*Chrysomma sinense*, 1231); also of Chestnutbellied Nuthatch (*Sitta castanea*, 1830).

BREEDING. Not recorded within our limits. *Season* in adjacent Tibet May to July. *Nest*, a large untidy pad of sheep's wool, yak hair, etc. (in one case weighing over 700 g), sometimes on a foundation of moss, grass and fibres, stuffed in the widened chamber at the end of a horizontal tunnel, some 75 mm in diameter and 1½ to 2 metres long, excavated by the birds in the side of a steep earth bank. *Eggs*, 4 to 6, white, unmarked, with a pinkish translucence when fresh. Average size of 6 Tibet eggs 23.6 x 16.75 mm (SA). Both sexes feed the young and attend to nest sanitation. Share in building nest and incubation, and incubation period, undetermined.

MUSEUM DIAGNOSIS. See Key to the Species and Field Characters.

MEASUREMENTS		Wing	Bill (from skull)	Tarsus	Tail
♂ ♀		85-94	22-24	26-34	52-64 mm (SA)

232

CORVIDAE

Central rectrices black, faintly tipped with white; rest of tail largely, under tail-coverts wholly, white. Sexes alike.

In flight partly spread white tail and white under tail-coverts contrasting strongly with dark body, diagnostic. White-spotted rump and upper tail-coverts distinguish it from Himalayan Nutcracker (1043) which has these parts immaculate chocolate-brown.

STATUS, DISTRIBUTION AND HABITAT. Resident; rather patchily distributed. West Pakistan and NW. India from Fort Sandeman (c. 31°21'N., 69°31'E.) in N. Baluchistan northward along the Suliman Range; Chitral, Gilgit, Baltistan (north of Pir Panjal Range), Kashmir (Sind Valley, Kishtwar,

Nucifraga caryocatactes

■ *multipunctata* (1042). ■ *hemispila* (1043)
▨ *macella* (1044).

Badrawar, etc.), Himachal Pradesh (Chandra-Bhaga Valley, Lahul). Stragglers recorded from Peshawar, Bilaspur, and Sulej Valley. From c. 2000 to 3000 m, wandering as low as 1000 m and occasionally up to 4000 m. In moist- and dry-temperate oak and conifer forest, especially Blue Pine (*Pinus excelsa*) and spruce (*Picea morinda*).

Intergrades with *hemispila* (1043) in Kangra between c. 77° and 79°E. **Extralimital.** Eastern Afghanistan (Safed Koh and southern side of the Hindu Kush mountains).

GENERAL HABITS, FOOD, VOICE AND CALLS. As in 1043.

BREEDING. No authentic record; presumably as in 1043, but season earlier. Young hardly able to fly have been recorded in Astor, Kashmir (c. 35°20'N., 74°50'E.) at end April (Buchanan), and evidence of gonads and moult indicates that breeding is normally finished by May.

CROWS, MAGPIES, JAYS

233

MUSEUM DIAGNOSIS. Differs from *hemispila* (1043) in having the white spots much larger especially below, making the underparts look very whitish. See also Key to the Subspecies.

Juvenile. Like adult but upperparts and ear-coverts pale sandy grey-brown, the white centres not much more than shaft lines except on mantle and scapulars where they are as large as in adult. Upper tail-coverts darker brown. Remiges browner (v. glossy black in adult) and with the coverts less glossy, all the white markings not so pure or so sharply defined. Outer rectrices more pointed. *Below*, chin and throat dull white; vent and under tail-coverts white; rest of underparts with dull white centres and sandy brown fringes. Postjuvenile moult of body and lesser and median wing-coverts.

First-year bird distinguished by browner remiges and by less glossy primary- and greater-coverts, the latter with white tips. If not worn, the more pointed outer rectrices are distinctive.

Nucifraga hemispila Vigors, 1831, Proc. Zool. Soc. London: 8

(Himalayan mountains, restricted to Simla-Almora dist. by Ticehurst & Whistler, 1924, *tom. cit.*)

Baker, FBI No. 46 (part), Vol. 1: 66

Plate 69, fig. 14

LOCAL NAME. *Lho kariyo pho* (Lepcha).

SIZE. Pigeon ±; length c. 32 cm (12½ in.).

FIELD CHARACTERS. As of 1042, q.v., but white spots smaller generally and entirely lacking on rump and upper tail-coverts which are immaculate chocolate-brown. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Resident; rather patchily distributed. The Himalayas from about Kangra dist. in Himachal Pradesh (c. 77-79°E.) eastward, apparently intergrading into the Yunnan subspecies *macella* (1044) from about east-central Nepal; from c. 2000 to 3300 m, occasionally straggling lower or higher. Affects tall rhododendron, fir, spruce and deodar forest where interspersed with open glades and alpine meadows.

GENERAL HABITS. Keeps to the tops of tall conifers on hillsides in widely separated pairs or family parties of 4 or 5 birds, these sometimes uniting in small flocks of 10 to 15 or so. Attracts notice from afar by its characteristic loud, grating and far-carrying calls. Usually shy, curious and inquisitive. Sometimes descends to the ground in a forest glade moving about in long hops to pick up nuts and other titbits, or to hack out seeds from fallen pine cones by vigorous hammer blows of the bill. Seldom undertakes long flights except to cross a valley; then flies straight and direct with deliberate wing-flaps like a crow but with a curious 'delayed action' effect between the

234

CORVIDAE

flaps. More commonly seen flapping lazily from one pine-top to another in a manner recalling the jays (*Garrulus*) and Blue Magpies (*Cissa*), with the same jerky hesitant wing-beats. In flight tail partially spread, the central rectrices showing as a dark wedge contrasting strongly with the rest. When alighting on a branch, and from time to time while perched, flicks tail open and shut flashing the white tail-feathers, producing a curious effect while the bird itself remains camouflaged amongst the dark pine foliage. On alarm or suspicion, as when its nest is being handled, becomes very noisy and demonstrative, flying around fussily from tree to tree peering down at the intruder with harsh swearing cries, which soon attract other nutcrackers in the vicinity to join in the outcry.

FOOD. Largely pine and spruce seeds, especially those of Blue Pine (*Pinus excelsa*) and *Picea morinda*. The seeds are often extracted, before the mature cones open naturally, by prising apart the 'scales' with the tips of the mandibles from below, or while swinging from a twig upside down, causing the seed to fall into the open gullet (Osmaston). Also wild walnuts and hazelnuts and others; grubs and beetles (*Caccobius himalayanus* and dung beetles like *Onthophagus* identified), and allegedly eggs and young of other birds.

VOICE AND CALLS. Harsh, grating, far-carrying and distinctly corvine. A single *gurrrr* or *kurrrr* or *kraak*, or sometimes several run rapidly together as a discordant rattling note. Flying young following parents utter a nasal bleat as of a goat kid, sometimes ending in a guttural *kraak*.

BREEDING. An early nester. Many young already on the wing by end March when parts of the habitat still under snow. *Season*, March to May/June. *Nest*, a platform of twigs, rather like a crow's but more neatly and compactly built, sometimes with a little lichen intermixed on the outside; lined with grass and pine needles. Placed 6 to 18 m up in a lateral branch near the trunk of a large deodar or suchlike tree preferably in mixed forest on a steep hillside. *Eggs*, 3 or 4, pale bluish white with a few blotches and numerous specks of dull brown and inky brown scattered all over the surface, rather more densely at the broad end; size c. 35 × 26 mm. Both sexes take part in building the nest (?), incubation and tending the young. Incubation period undetermined.

MUSEUM DIAGNOSIS. Differs from *multipunctata* (1042) in the white spots being generally smaller giving the impression of a much darker bird. Rump and upper tail-coverts without any white markings.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♀	208-227	45-52	41-43	137-147 mm (Stresemann, SA).

Weight 1 ♂ (Nepal) 212 g (GD); 2 ♂♂ (Darjeeling dist.) 206, 214; 2 ♀♀ 183, 184 g (Paynter).

COLOURS OF BARE PARTS. Iris rich brown. Bill (and mouth), legs, feet and claws black.

Baker, FBI No. 46 (part), Vol. 1: 66

LOCAL NAMES. *Lek bhali* (Paharia); *Lho kariyo pho* (Lepcha).

SIZE. Pigeon ±; length c. 32 cm (12½ in.).

FIELD CHARACTERS. As of 1043, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident; rather patchily distributed. The eastern Himalayas from about east-central Nepal (where the zone of intergradation with *hemispila* apparently begins) through Sikkim, Bhutan and NEFA (including Dafia, Abor and Mishmi hills); from c. 2000 to 3600 m, in moist-temperate and alpine conifer forest.

Extralimital. Western Hupeh, Shensi (Tsinling Range), northern and western Szechuan, eastern, southern and southeastern Sikang to northern Yunnan, SE. Tibet and northern Burma (Vaurie).

GENERAL HABITS, FOOD, VOICE AND CALLS. As in 1043.

BREEDING. Not authentically known within Indian limits. Doubtless as in 1043.

MUSEUM DIAGNOSIS. Like *hemispila* (1043), also with unspotted rump but slightly darker, with the spots on breast and back averaging smaller, and less numerous. However, coloration and spotting very variable, and subject moreover to pronounced seasonal changes in the living bird and to foxing in museum skins: on the whole a relatively weak and equivocal race.

MEASUREMENTS AND COLOURS OF BARE PARTS as in the Himalayan form (1043). Weight (Bhutan birds) 6 ♂♂ 200-235 (av. 217.3); 5 ♀♀ 189-200 (av. 194) g —BB, SA.

LOCAL NAMES. None recorded.

SIZE. House Crow —; length c. 38 cm (15 in.). Slightly smaller than Redbilled Chough.

FIELD CHARACTERS. A glossy jet black crow with yellow bill and bright red legs. Sexes alike.

× c. 1

STATUS, DISTRIBUTION and HABITAT. Resident at high altitudes, largely in the main Himalayan range in West Pakistan and India, normally between 2700 and 5000 m, descending in winter to c. 2400 and even 1800 m. Northern Baluchistan (only in the higher hills above c. 3300 m), and from Safed Koh

Pyrrhocorax graculus

1 *graculus* (RE).
2 *digitatus* (1045).

through Chitral, Gilgit, Baltistan, Astor, Ladakh, Kashmir, Himachal Pradesh (Lahul, Spiti), Garhwal, Kumaon, Nepal, Sikkim, Bhutan and NEFA. Affects moist- and dry-temperate high mountain biotope with cliffs, alpine meadows and pastures, and upland cultivation.

Extralimital. Lebanon, Iran, Transcaspia, Afghanistan, Russian Turkestan, SE. Tibet, Sikang to Kangting (for details see Vaurie, 1959, 2: 163).

GENERAL HABITS. Very gregarious and sociable keeping in family parties and flocks, sometimes quite large, throughout the year. Occupies a higher altitudinal zone than Redbilled Chough, but where both occur together the flocks intermingle freely. Is apparently more tolerant of cold than Redbilled, keeping to higher elevations even in severe winters. Frequents the neighbourhood of upland villages and cultivation, and alpine meadows and pastures, sauntering about like a starling digging vigorously in the soil for grubs and insects. Everest climbers have reported Alpine Choughs scavenging regularly for kitchen scraps etc. round their camps up to 8000 metres, and it has been observed flying even at c. 8600 m (Charles Evans, *pers. comm.*). Usually tamer and more confiding than Redbilled, entering villages and traders' and herdsmen's bivouacs and encampments to pick up food among and around the houses and animal pens. Nevertheless not known to roost or nest in buildings or monasteries as the shyer Redbilled commonly does. Flight and general behaviour characteristically crow-like.

1046. West Himalayan Redbilled Chough. *Pyrrhocorax pyrrhocorax centralis* Stresemann

Pyrrhocorax pyrrhocorax centralis Stresemann, 1928, Jour. f. Orn. 76: 344 (Semirjetchensk. Gebirge bei Dscharkent [Tschischkan])

Plate 70, fig. 4

LOCAL NAMES. *Zāgh* (Persian Baluchistan); *Wān kāvīn*, *Wozij tēnti kāvīn* (Kashmir); *Kāngni* (Garhwal).

SIZE. House Crow ±; length c. 45 cm (17½ in.).

FIELD CHARACTERS. A glossy jet-black crow with bright red legs, and slender slightly curved red bill. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Resident at high altitudes, with appreciable winter-summer altitudinal movements. West Pakistan and India, in N. Baluchistan (Nushki, Quetta, Ziarat, Kach — breeding in the highest hills), Chitral, Gilgit, Ladakh, Baltistan, Kashmir, Himachal Pradesh (Lahul, Spiti); eastern limits not yet determined. Between c. 2400 and 3500 m in summer, down to c. 1800 in winter; largely coincident with Alpine

Pyrrhocorax pyrrhocorax

1 *centralis* (1046).
2 *himalayensis* (1047).
3-7 extralimital races (see Vaurie, 1959, 2: 160-2).

Chough (1045) except at altitudes above c. 3500 m. Affects moist- and dry-temperate high mountain biotope with precipitous cliffs, alpine meadows, steep pastures, and upland cultivation; also barren mountains beyond penetration of monsoon.

Flocks love to disport themselves, especially during the middle of the day, quite obviously just for fun. The birds mill around in a rabble up in the sky sometimes at immense heights, making full use of every wind-current and eddy, sailing buoyantly round contours and precipices on motionless wings, tail fully spread and canted from side to side to act as rudder. Now and again the circling flock is lifted almost vertically upward on a thermal and the birds engage in fantastic aerobatics with lightning twists and turns and sidesteps, and swishing nose-dives with wings pulled in, of maybe several hundred metres down into the valleys, ending in an effortless upward zoom to alight gracefully on a high cliff or resume the extravagant evolutions.

FOOD. Beetles and grubs, crickets, larvae of (noctuid) moths, carrion from pack animal carcasses, kitchen scraps, etc. Other recorded items: berries (*Hippophae rhamnoides*, *Berberis lycium*, *Juniperus*), mulberries, red hips of wild rose (*Rosa*), barley grains.

VOICE and CALLS. Less noisy than Redbilled Chough; calls of same general pattern, pleasant and high-pitched, more reminiscent of Starling than of Jackdaw. Usual note, uttered also during the aerial frolics, a high-pitched musical *quee-ah* or *cree-ah*. Full-grown young have a curious persistent mewling note exactly like the *cheep* of a half-grown domestic chicken.

BREEDING. *Season*, chiefly May-June. *Nest*, in holes in vertical cliff faces and precipices, usually inaccessible, thus not authentically described in the Indian range. Presumably as of Redbilled Chough, a platform of sticks lined with sheep's wool. *Eggs* (c/3 or 4?), indistinguishable from 1046-7, q.v., but averaging slightly smaller, c. 39 × 29 mm. Breeding biology little recorded.

MUSEUM DIAGNOSIS. Entire plumage black faintly glossed with green, more particularly on wings and tail.

Juvenile. Like adult, but body plumage softer and more sooty brown.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	274-298	34-38	42-48	174-193 mm
♀♀	262-273	32-36	41-46	165-178 mm
				(HW)

Weight 3 ♂♂ 223-244; 4 ♀♀ 203-213 g (Paynter, GD). 1 ♀ (September) 234 g — SDR.

COLOURS OF BARE PARTS Adult. Iris dark brown. Bill yellow; mouth livid greenish yellow, bluish posteriorly. Legs and feet dull coral-red; claws black. **Juvenile.** Iris dark brown. Bill horny livid. Legs and feet olive-brown mottled with dark brown; claws black (HW). 2 specimens (♀) recorded with legs and feet 'almost as black as the feathers' (Fulton, JBNHS 16: 46).

PYRRHOCORAX PYRRHOCORAX (Linnaeus)

Key to the Subspecies

Wing more pointed, primaries and rectrices narrower.....*P. p. centralis*
Wing more rounded, primaries and rectrices broader.....*P. p. himalayensis*
Cf. Rand, A. L. & Fleming, R. L., 1957, *Feldiana: Zoology* 41 (1): 111-13.

Extralimital. Russian Turkestan (Djarkent, western Tien Shan, Ferghana, Bukhara, Alai and Pamirs — Vaurie). The species in several races extends over Europe, N. Africa, central and eastern Asia.

GENERAL HABITS. Very similar to 1045, q.v. Often collects in huge flocks of several hundred during winter to grub in fallow barley fields around upland villages and on yak pastures even partly under snow, in company with Yellowbilled Choughs, Turkestan- and Snow pigeons, and sometimes ravens. Quite tame and fearless near habitations perching freely on rooftops, prayer-flag posts, etc. but less inclined than 1045 to feed on scraps and refuse among the houses and nomadic encampments. The birds roost gregariously in caves and fissures in high precipitous cliffs, as well as on ledges and under eaves etc. of Buddhist monasteries and dzongs.

FOOD. Insects (wireworms, crickets, beetles, grubs); apparently no carrion *contra* 1045. Berries (*Hippophae*, *Ephedra*, *Berberis*); barley grains. In winter occasionally destructive to ripened barley crop, taking a head and thrashing out the grain from the ears by blows of the bill.

VOICE and CALLS. A shrill, rather musical, plaintive-sounding *chido*, *chido* described as between caw of jackdaw and scream of Large Parakeet, at times sounding in the distance like the *piu, piu, piu* of Pied Crested Cuckoo (*Clamator jacobinus*, 570). Other call-notes, high-pitched and rather squeaky, *khew* and *jack* and *chee-o-kah* and *kor-quick*. Far-carrying and often with a curious ventriloquial effect; audible from immense heights when the bird itself is a mere speck in the sky. Sometimes a loud clear *queit* (alarm?).

BREEDING. *Season*, March-May. *Nest*, a large cup or platform of stick and twigs lined with wool; sometimes minus the sticks, merely a thick pad of wool and hair. Placed in holes and fissures of inaccessible rock cliffs or in walls of derelict or inhabited houses, monasteries and dzongs in mountain villages. Occasionally several nests close to one another in a colony. In soft sandstone cliffs, holes up to a metre or so deep may be excavated by the birds themselves. The same sites are commonly used year after year. *Eggs*, 3 or 4, indistinguishable from 1045, variable, white, sometimes with a faint blue or green tinge, or pinky white or pale salmon-pink, blotched, spotted and speckled with reddish brown or dark brown and secondary markings of lavender and grey; scattered all over the surface but tending to coalesce into a cap at the broad end. Average size of 36 Kashmir and Ladakh eggs 39.2 × 27.6 mm (BBO). Both sexes take part in building the nest, incubation and tending the young. Incubation period undetermined.

MUSEUM DIAGNOSIS. Adult. Entire plumage glossy black; gloss greenish on wings and tail, bluish elsewhere.

Juvenile. Like adult but body plumage softer and brownish black.

First-year birds slightly duller and more brownish on the worn wings and tail retained from juvenal dress.

P. p. centralis differs from east Himalayan *himalayensis* (1047) in having a shorter tarsus, more pointed wing and narrower primaries and tail-feathers. Distance between tips of 5th and 6th primaries (as.) 25-30 mm (c. 15-20 mm in 1047). (For other details see Vaurie, 1954, *Am. Mus. Nat. Hist.*, No. 1638: 1-7.)

COLOURS OF BARE PARTS. Iris dark brown. Bill coral-red; mouth orange-salmon. Legs and feet coral-red, darker than bill; claws black. Juvenile. Iris dark brown. Bill black, gape and tip salmon; mouth fleshy salmon. Legs and feet black; soles and interstices of scales salmon (HW).

1047. East Himalayan Redbilled Chough. *Pyrrhocorax pyrrhocorax himalayanus* (Gould)*Fregilus himalayanus* Gould, 1862, Proc. Zool. Soc. London: 125

(Himalaya Mountains = Kumaon, restricted by Meinertzhagen, 1927, Ibis: 372) Baker, FBI No. 48 (part), Vol. 1: 68

LOCAL NAME. Chumboo (Lepcha).

SIZE. House Crow \pm ; length c. 45 cm (17½ in.).

FIELD CHARACTERS. As in 1046, q.v. See Museum Diagnosis.

x c. 1

STATUS, DISTRIBUTION and HABITAT. Resident at high altitudes with appreciable winter-summer altitudinal movements. From about Garhwal and Kumaon eastward through Nepal, Darjeeling dist., Sikkim, Bhutan and NEFA, between c. 2400 and 4800 m; occasionally down to c. 1600 m in winter and up to 6000 m in summer. Affects moist- and dry-temperate high mountain biotope near and above tree-line, with precipitous cliffs, alpine meadows, steep pastures, etc.

Extralimital. W. Sinkiang, W. Kun Lun, Karakoram, SE. Tibet, N. Burma (?), N. Yunnan eastward to W. Szechuan (Vaurie).

GENERAL HABITS, FOOD, VOICE and CALLS. As in 1046.

BREEDING. Season, nest and eggs (c/3 or 4) as in 1046. Eggs somewhat larger; average size of 17 eggs 42.75 x 28 mm (Ludlow).

MUSEUM DIAGNOSIS. Differs from *centralis* (1046) in having the wings and tail glossed with bluish rather than greenish; tarsus longer; primaries and rectrices

CROWS, MAGPIES, JAYS

splendens (1049).

protegeus (1050).

maledivicus (1051).

and Jammu. From plains level to c. 1600 m. Affects all types of country in and around human habitations, especially towns and cities.

Extralimital. Coastal and southern Iran.

GENERAL HABITS, FOOD, VOICE and CALLS. As in the nominate form 1049.

BREEDING. Season, May to July. In Kashmir Valley principally May, in Rawalpindi dist., second half June; occasionally some in November. Nest and eggs (c/5) as in 1049. Average size of 17 Kashmir eggs 39 x 26.6 mm (BBO). Willow and poplar trees and groves near villages favoured for nesting in Kashmir.

MUSEUM DIAGNOSIS. Differs from nominate *splendens* (1049) in having a much paler collar and underparts: pale smoke-grey in fresh plumage, ashy sandy white in worn dress. No difference in size.

MEASUREMENTS: ♂ ♀ Wing 255-290 mm (CBT).

Coloration in Indian forms glossy black or black and grey. Bill stout; nostrils placed far forward, about one-third length of bill from forehead, entirely concealed by stiff straight bristles that reach almost to middle of bill. Tail shorter than wing, slightly graduated or rounded at end. 1st primary (as.) at least half as long as 2nd; 3rd and 4th primaries longest. Primaries exceed longest secondaries by more than length of tarsus; four outermost primaries with inner webs sinuated.

CORVIDAE

1049. Indian House Crow. *Corvus splendens splendens* Vieillot

Corvus splendens Vieillot, 1817, Nouv. Dict. d'Hist. Nat. 8: 44 (Bengal) Baker, FBI No. 11, Vol. 1: 33

Plate 70, fig. 6

LOCAL NAMES. Kowwā, Dīsi kowwā (Hindi); Kāolā (Marathi); Kāgo (Gujarati); Kāg, kāk (Bengali); Pāt kākori (Assamese, Nowgong); Manchi kākī (Telugu); Nāllā kākā, Mariyen kākāi (Tamil).

SIZE. Pigeon \pm ; length c. 43 cm (17 in.).

FIELD CHARACTERS. A medium-sized crow: glossy black with dusky grey or mouse-grey nape, neck (all round), upper breast and upper back. Forehead, crown and throat contrasting glossy black. Sexes alike. Colour pattern similar to Jackdaw (1053), which is smaller and has whitish eyes.

STATUS, DISTRIBUTION and HABITAT. Resident; subject to altitudinal and/or seasonal movement in northern cold-winter areas; common to excessively common locally. All India except Kerala (cf. 1050) east and south of a line roughly from Himachal Pradesh to Kutch (including lowlands of Nepal, Sikkim, Bhutan and Assam); Laccadive Is. (introduced ?); East Pakistan; from sea coast and plains level up to c. 2100 m. Inseparable from human habitations; abundant to pest proportions in many urban and metropolitan areas. Absent or rare at small hill-stations, but quickly spreading to them with population growth and increased garbage potential. Introduced in the Andamans c. the 1860s but has not become established.

Extralimital. Arakan (Burma). Introduced and now well established in Zanzibar, Aden and Mauritius.

GENERAL HABITS. A confirmed commensal of man, almost an element of his social system. Very useful as a municipal scavenger and an indispensable ally to neglectful or incompetent sanitary administrations! Intelligent, inquisitive and impudently familiar, yet excessively wary and alert at all times, possessing an uncanny capacity for scenting and avoiding danger and distinguishing a harmless human from one not to be trusted. Gregarious, sociable, clannish, cunning, and omnivorous — other essential qualifications for successful co-existence with man. Moves on the ground with a perky walking gait and sidling hops, accompanied by a constant uneasy flicking of the wings. Normal flight with unhurried shallow wing-flaps, straight, and with tail closed. Much given to the same sort of aerial gambolling as choughs. In urban localities numbers collect at sunset on top of a tower or high building especially when a stiff wind is blowing, and engage in a variety of amusing and spectacular games, supplanting one another from some coveted vantage-point, or vying in fantastic aerobatics — shooting down through space with wings closed or with lightning twists, turns and sidslips and somersaulting and looping-the-loop, thoroughly enjoying themselves. While commuting long distances to and from the communal roost, especially across wide rivers, flies very high up in the sky. When over its destination shoots steeply down at tremendous velocity in a series of the same remarkable aerobatic evolutions. Has 'traditional' community roosts in ancient banyan trees, mangrove jungle, coconut and forest plantations and the like, where vast numbers, sometimes maybe thousands, converge at sunset flying in a steady stream of straggling rabbles

over considerable distances from all points of the compass. Roosts commonly shared with parakeets and mynas who contribute to the deafening clamour that precedes sleep. The birds disperse before sunrise, radiating in disorderly groups each headed towards its respective scavenging ground. Besides intelligence and a limited capacity for seeming ratiocination, possesses a distinct sense of humour. Revels in puckish antics such as playfully tweaking tails of other birds, or ears of sleeping cow or dog, or toes of flying foxes hanging on their diurnal roosting-trees, with no apparent object other than to enjoy their annoyance and discomfort! Monogamous and evidently pairing for life; even in non-breeding season pairs will often sit on a shady branch during daytime snuggled lovingly together, first one bird scratching the other's lowered head then presenting its own to be similarly scratched by its mate, turn by turn, for ten minutes or more at a time.

FOOD. All-embracing: practically everything that can be eaten. Recorded items include grain, groundnuts, fruits, flower-nectar (*Salmalia*, *Erythrina*, *Butea*, *Sesbania*, *Spathodea* and others), eggs and young or sickly birds (very destructive in heronries; systematically marauds Baya nests in colonies), lizards, small rodents (mice, squirrels, gerbils in semi-desert areas), fish (stranded by receding floods, filched from protesting fishwives' baskets or curing yards, or captured from near the surface while flying above water (Acharya, JBNHS 50: 169), insects (winged termites hawked by ungainly aerial sallies from roof-tops with awkward zigzags and contortions), and crabs (*Paratelphusa*) inland, fiddler crabs (*Uca*) on seashore, kitchen scraps, garbage, offal and carrion. In an intensely cultivated area in Bihar stomach contents of 42 birds, in addition to other matter, contained 226 insects: 1 beneficial, 153 injurious, 72 neutral. Among them were crickets and grasshoppers (Orthoptera: *Schizodactylus monstrosus*, *Gryllotalpa africana*, *Chrotogonus* sp., *Brachytrypes achatinus*), beetles (Coleoptera, largely Tenebrionidae and Scarabaeidae: *Opatrum* sp., *Gymnopleurus miliaris*, *Mesomorpha villiger*, *Catharus sabaeus*, *Onthophagus spinifer*, *Onitis distinctus* and *Oniticellus pallipes*), also ants (Hymenoptera, Formicidae) and noctuid larvae (Heterocera). Economic status in agricultural areas evaluated as on the whole neutral.

VOICE AND CALLS. Ordinary call-note a rather shrill *quah quah* (or nasal *kaan, kaan*) softer than that of Jungle Crow. When resting contentedly and relaxed on a shady branch, soliloquizes in a rather musical *kurrrrrr* lasting half to one second, suggestive of the running down of a watch spring. When bringing up food from throat-pouch into bill for courtship feeding to female, a short distinctive caw; female accepts in crouching pre-copulatory posture, emitting a subdued *kree-kree-kree* and flirting her wings. In addition has a very large expressive and eloquent vocabulary to suit every mood and emotion — suspicion, alarm, anger, invitation to copulate (given by female), announcement of food finding, contentment, 'distress' at losing mate, and so on. During night some roosting individuals occasionally emit a single drawn-out caw unlike anything heard during daytime, but somewhat resembling the courtship-feeding caw (talking in sleep? or nightmare?!).

BREEDING. Season, overall March-April to July-August, chiefly April, May and June, but peak periods varying locally. Some birds (probably of previous year, c. 15 or 16 months old) breed October-December.

FIELD CHARACTERS. As of 1049, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident: common and abundant, from sea coast and off-shore islets to c. 1600 m locally in the hills. Ceylon and Kerala. Intergrades into nominate *splendens* in southwestern Tamil Nadu, in the southern Nilgiris and Palghat Gap area. Affects lowland urban areas everywhere, but in Kerala especially the vicinity of the home-steads and copra drying yards along the coastal backwaters.

GENERAL HABITS, FOOD, VOICE AND CALLS. As in the nominate form (1049).

BREEDING. Season, in Ceylon May to August-September, chiefly June; in Kerala January to June, chiefly March to May, before the onset of the SW. monsoon squalls. *Nest, eggs* (c/3-5) and breeding biology as in *splendens*. Average size of 100 eggs 34.8 x 25.6 mm (Baker). As elsewhere, nests regularly brood-parasitized by Koel (*Eudynamis scolopacea*).

MUSEUM DIAGNOSIS. Differs from the nominate race (1049) of the rest of India in having the paler (greyish) parts much darker, presenting less contrast with rest of plumage.

Juvenile and First-year, as in 1049.

MEASUREMENTS	Wing	Bill (from skull)	Tarsus	Tail
♂♂	225-284	49-55	45-48	147-169 mm
♀♀	219-264	42-50	45-48	128-155 mm

1051. **Maldivian House Crow.** *Corvus splendens maledivicus* Reichenow
Corvus splendens maledivicus Reichenow, 1904, Wiss. Ergebn. Deutsch. Tiefsee Exped.: 356 (Maldives)
Not in Baker

LOCAL NAME. *Kārlu* (Maldivian).

SIZE. Pigeon +; length c. 43 cm (17 in.).

FIELD CHARACTERS. As of 1049, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident. Abundant on Malé and throughout the Maldivian Archipelago excepting Addu Atoll. 'Their numbers seem to be kept in check largely by the Koels' cuckolding and by the Maldivian custom of shooting them on Friday afternoons' (Phillips).

GENERAL HABITS, FOOD, VOICE AND CALLS. Not specifically recorded; doubtless as in the Indian bird.

BREEDING. Season, between May and September, i.e. during the SW. monsoon (Gardiner, 1903); also December and January and probably throughout most of the year (Phillips). *Nest, eggs*, etc. as in *splendens*.

MUSEUM DIAGNOSIS. Practically identical in colour with *prolegatus* of Ceylon. 'Grey of nape and neck almost imperceptibly clearer in tone' (Phillips). Eye of faith! Slightly larger in size, but subspecies equivocal.

MEASUREMENTS	Wing	Bill (culmen)	Tail
3 ♂♂	262-274	50-54	158-172 mm
3 ♀♀	256-269	47-49	158-168 mm
			(Phillips)

COLOURS OF BARE PARTS. As in 1049 and other races.

Nest, an untidy platform of sticks and twigs sometimes largely mixed with or entirely of iron wire or hoop iron — with a cuplike depression in the centre lined with tow, coir, and other fibres. Normally placed in the fork of a branch at any height from 3 or 4 metres up, not colonially but sometimes 3 or 4 nests in the same tree. Mango trees frequently selected, but apparently has no special preferences. Ornamental roadside trees along city thoroughfares freely patronized. Nests sometimes built on ledges on exterior of buildings. *Eggs*, 4 or 5, pale blue-green, speckled and streaked with brown. Average size of 200 eggs 37.2 x 27 mm (Baker). Both sexes share in building the nest, incubation, and tending the young. Incubation period 16-17 days (Lamba). Contrary to the deep-rooted popular belief, copulation takes place in the normal manner of birds ('treading') either on the ground or a branch, or very commonly while the female is sitting on the nest. Copulating pairs are frequently mobbed by other crows, and there is good circumstantial evidence for more than occasional promiscuity in the mating. Nests regularly and extensively brood-parasitized by Koel (*Eudynamis scolopacea*, 590). For a good account of the breeding biology of the House Crow see Lamba, B. S., 1963, JBNHS 60: 122-33.

MUSEUM DIAGNOSIS. In worn dress the mouse-grey parts of the plumage become slightly paler, but never the pale cream tint found in *zugmayeri*.

Juvenile. Crown, chin and throat blackish with little gloss, rest of plumage almost uniform deep mouse-grey, slightly glossed on mantle; practically no contrast between nape, ear-coverts and upper breast and rest of body plumage. Wings and tail as adult, but less black and less glossy. Outer rectrices less square-cut at end, and narrower. Postjuvenile moult of body, lesser and most or all median coverts.

First-year birds recognized by rather browner, less glossed wings and tail, with narrower and more pointed (less square-ended) outer tail-feathers. In worn plumage wings and tail practically glossless, the feathers becoming much browner and usually more ragged at tips than in adult at same time of year.

MEASUREMENTS	Wing	Bill (from skull)	Tarsus	Tail
♂♂	266-284	51-56	45-51	162-175 mm
♀♀	252-282	45-50	44-48	154-175 mm
				(HW, SA)

Wing ♂♀ 256-294 mm (CBT)

Weight 2 oo? 266, 280 g (SA). 2 ♂♂ 310, 362; 5 ♀♀ 252-304 g (Paynter).

COLOURS OF BARE PARTS. Iris brown. Bill black; mouth brownish slaty. Legs, feet and claws black. Gape in juvenile pink.

1050. **Ceylon House Crow.** *Corvus splendens protegatus* Madarász
Corvus splendens protegatus Madarász, 1904, Orn. Monatsb. 12: 195
(Mt Lavinia, W.P., Ceylon)
Baker, FBI No. 14, Vol. 1: 35

LOCAL NAMES. *Kaputā*, *Kolamba kākā* (Sinhala); *Oor kākām* (Tamil); *Kākkā* (Malayalam).

SIZE. Pigeon +; length c. 43 cm (17 in.).

1052. **Rook.** *Corvus frugilegus frugilegus* Linnaeus
Corvus frugilegus Linnaeus, 1758, Syst. Nat., ed. 10, 1: 105 (Sweden)
Corvus frugilegus lichenii Hartert, 1903, Vög. pal. Fauna 1: 14 (Gilgit)
Baker, FBI No. 9, Vol. 1: 30
Plate 70, fig. 5

LOCAL NAMES. None recorded.

SIZE. House Crow +; length c. 48 cm (19 in.).

FIELD CHARACTERS. A glossy jet-black crow. Adult distinguished from Jungle Crow by bare unfeathered face and chin, straighter and slenderer

pointed bill, and shaggy-feathered ('trousered') thighs, particularly noticeable when bird walking on ground. Sexes alike.

Young (immature), duller black with face normally feathered. Confusable with Jungle Crow, but see Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor and/or passage migrant varying in abundance year to year. West Pakistan and India, in NE. Baluchistan, NW. frontier dists. (Mardan to Kohat), Hazara, Chitral, Gilgit, Kashmir and south to the Rawalpindi plateau and Sialkot. Regular visitor to the Punjab plains north of the Salt Range: occurs about Gujranwala, Lahore and Lyallpur, occasionally east to Hoshiarpur and Ludhiana, c. 76°E. Affects cultivation round human habitations — irrigated fields etc.

Extralimital. Breeds in Europe (except the northernmost parts and the Mediterranean region) and a large part of western and central Asia. Winters also in N. Africa, Egypt, Arabia, Iraq, Afghanistan, etc. (For details see Vaurie, 1959, 2: 167.)

GENERAL HABITS. Arrives in October-November; mostly gone by end March, a few immature birds (with feathered faces) remaining till as late as mid April. In winter keeps in large flocks usually associated with jackdaws and starlings, grubbing in ploughed and irrigated fields or scavenging on outskirts of towns and cantonments. Roosts communally at night in vast congregations in large trees and groves, like the House Crow, converging on them at sunset in a succession of loose flocks from all directions. The roosts are often shared by Jackdaws and House Crows.

FOOD. Practically all-embracing, but is less of a municipal scavenger. Ascertained food items in an agricultural area in West Pakistan (Lyallpur) included wheat and other grains, tender shoots of gram, and other vegetable

CROWS, MAGPIES, JAYS

249

Corvus frugilegus

matter; insects: ants, gram caterpillars, cutworms, beetles, etc. (Husain & Bhalla, JBNHS 39: 832).

VOICE AND CALLS. Normal calls *kaa, kaa* similar in type to the House Crow's but mellow and distinctive. Also possesses a large vocabulary to express various emotions and situations.

BREEDING. Extralimital. Nest, eggs and breeding biology as in the House Crow (1049), but nests gregariously in large colonies or rookeries.

MUSEUM DIAGNOSIS. Adult. Chin and upper throat more or less covered with greyish brown down-like feathers. Rest of plumage glossy black; gloss on head purple-blue, on rest of upper- and underparts purple-violet, on primaries and lateral rectrices greenish. Wing-formula: 2nd primary (as.) = 5th or 6th (cf. Carrion Crow, 1058).

Juvenile. Upperparts brownish black with slight gloss on head, mantle and scapulars which are more bluish less purple; underparts brownish black practically glossless; nasal bristles well developed; face feathered; otherwise as adult. Post-juvenal moult of body, lesser, median, and innermost greater coverts.

First-year birds with face feathered; face moulted January to May, nasal bristles being the last to go (HW).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	301-314	61-65	52-61	165-177 mm
♀♀	291-309	57-64	50-56	157-180 mm (HW)

COLOURS OF BARE PARTS. Iris dark brown. Bill, legs, feet and claws black.

CROWS, MAGPIES, JAYS

251

distance like clouds, commute very long distances daily to and from their outlying feeding grounds shortly before sunrise and at sunset, these spectacular mass flights being one of the sights of Srinagar town during the winter months. Flight less leisurely-looking than House Crow's, and with quicker wing-flaps.

FOOD. Insects, larvae, slugs, worms, small frogs, small fruits, cereal grains, and occasionally eggs and nestlings of small birds. Feeds mostly on ground; flying insects (winged ants, termites) sometimes captured in the air, fly-catcher style, by awkward vertical leaps and volplaning back to perch, like a bulbul or starling; also takes crumbs and untidy picnickers' leavings. Is more or less omnivorous, but less of a town scavenger and normally also avoids carrion.

VOICE AND CALLS. A single note *chack* or *jack* or *kwai*, softer and more musical than other crows'; sometimes varied by quick repetition or in different keys.

BREEDING. Season, in Kashmir April to June, principally May. Nest an untidy collection of sticks and twigs lined with wool, rags, hair, grass and other rubbish. Built in roofs of houses or in holes in walls, ruined buildings, earth cliffs, etc., or in hollows in trunks and boughs of ancient chenar (*Platanus*) and suchlike trees; sometimes several nests in the same tree. In smaller holes the sticks are dispensed with, only the softer materials used. Eggs, 4 to 6 (rarely 7), pale bluish sea-green, sparsely speckled and spotted with dark brown and purple. Average size of 55 Kashmir eggs 35.1 × 24.8 mm (BBO). Both sexes take part in building the nest and feeding the young. Incubation by both sexes but apparently mostly by female. Incubation period recorded as 17-18 days. The birds evidently pair for life; even when in flocks during non-breeding season pairs often keep and forage together.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Juvenile. Like adult, but body plumage dull dark brown; little gloss on lesser and median coverts, and less gloss on rest of wings and tail; flight-feathers browner.

First-year birds distinguished by less gloss on wings and tail and browner flight-feathers, especially when worn; hind-collar usually not prominent (HW).

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♀	230-250	32-34	c. 44	c. 135 mm (Baker)

Weight 1 ♂ 265; 1 ♀ 235 g (Paynter).

COLOURS OF BARE PARTS. Iris pale greyish white. Bill, legs, feet and claws black.

CORVUS MACRORHYNCHOS Wagler

The races of the Jungle Crow within our limits show rather unsatisfactory and clinal distinctions. There is a gradual intergradation from a small-billed bird in Ceylon to large birds with comparatively small bills in the Himalayas and a medium-sized bird with stout deeply bowed bill in Bengal. Examples can seldom be confidently assigned to a particular race without knowledge of their provenance. Individual variation is great, and responsible for the lengthy discussions and divergent conclusions reached by earlier authors. Eastward, in the Australasian Region, confusion is still more confounded! However, *C. m. intermedius* and *C. m. tibetensis* of the higher Himalayas

Corvus soemmerringii Fischer, 1811, Mém. Soc. Imp. Nat. Moscou 1: 3 (Moscow)

Baker, FBI No. 15, Vol. 1: 36

Plate 70, fig. 3

LOCAL NAME. *Kāṭā* (Kashmiri).

SIZE. Dove; length c. 33 cm (13 in.).

FIELD CHARACTERS. A small slaty black crow — a passable miniature of House Crow in general effect — distinguished by a broad silvery grey hind-collar, rather short thick neck and greyish white eyes which give it a distinctly 'wall-eyed' look. Sexes alike.

In flight the short thick neck with a slight hump, shorter bill, quicker wing-beats and fanned-out tail (rather pigeon-like in silhouette) distinguish it from House Crow.

STATUS, DISTRIBUTION AND HABITAT. Resident and/or winter visitor and passage migrant. Breeds abundantly in Kashmir (in main Srinagar valley, Lolab and side valleys) normally between c. 1700 and 2100 m. Disperses after breeding, c. August, adults and young then straggling up to the higher margs or upland pastures above tree-line, to c. 3500 or higher. Chiefly winter visitor and/or passage migrant in N. Baluchistan (Quetta Valley), along the W. Pakistan-Afghanistan border, Chitral, Gilgit, Ladakh, Punjab; most abundant, though in variable numbers year to year, in the Rawalpindi and Jhelum districts arriving c. mid October, departing towards end February or early March; occasionally reaches the plains near Amritsar and Ambala. Frequents damp meadows and pastures, camping grounds, neighbourhood of cultivation and habitations (e.g. in the Vale of Kashmir) with ancient chenar groves and the like, and willow beds bordering the waterways.

Extralimital. N. Afghanistan, Russian Turkestan, Tien Shan. The species in several rather ill-defined races ranges widely from the Yenisey westward through Siberia, W. Asia and Europe.

GENERAL HABITS. Gregarious, sociable and inquisitive; can be both tame and impudent or excessively shy and alert as conditions dictate. Usually keeps in flocks, sometimes of huge proportions, consorting with rooks and other crows and starlings to grub on damp pastureland and flooded meadows. Struts about with a characteristic upright carriage on its longish legs with the short tail held well off the ground. Digs into the turf for food with energy and purpose, often while still partially blanketed by snow. Commonly in attendance on grazing sheep and cows or following the plough in company with starlings and mynas for the insects and grubs turned up with the soil. Roosts communally in hollow tree-trunks, holes in old houses and walls — also in willow-beds and groves of ancient trees, often sharing these with House Crows. In winter enormous close-packed hordes, looking in the

CORVIDAE

252

are our largest birds, while *C. m. culminatus*, especially from the southernmost part of the Peninsula and Ceylon, is the smallest. *C. m. leucillanti* of Bengal, Assam and the Andamans is intermediate in size and has, moreover, a heavy deeply bowed raven-like bill. (For a discussion of the Indian races see Whistler & Kinnear, 1932, JBNHS 35: 510-13; of the Burmese-Javanese forms Mayr, E., 1940, *Ibis*: 694-5.) Cf. also Vaurie, C., 1959, 2: 168-70.

1054. Himalayan Jungle Crow. *Corvus macrohynchus intermedius* Adams

Corvus intermedius Adams, 1859, Proc. Zool. Soc. London: 171

(Kashmir, Daghai and Simla, restricted to Kashmir by Stresemann, 1916,

Verh. Orn. Ges. Bayern 12: 282)

Baker, FBI No. 7, Vol. 1: 28

LOCAL NAMES. *Kār*, *Dira kār*, *Pantsāl kār* (Kashmiri); *Kāk* (Paharia).

SIZE. House Crow +; length c. 50 cm (20 in.).

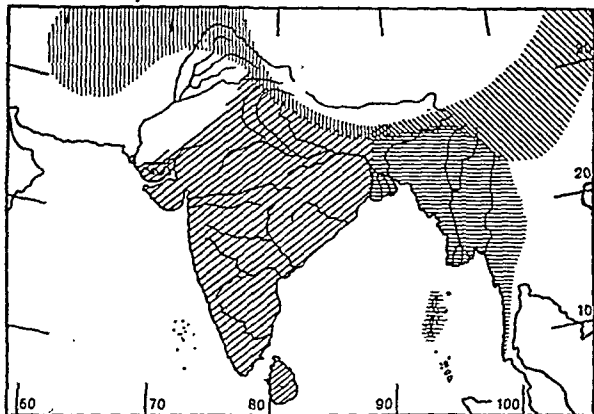

FIELD CHARACTERS. A large uniformly black crow with metallic purplish sheen and heavy black bill. Sexes alike.

× c. 1

Caw deeper and hoarser than House Crow's or of Jungle Crow of the plains (*culminatus*) — more raven-like. In overhead flight tail distinctly wedge-shaped in this race. Indistinguishable from Carrion Crow unless in the hand. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident, with slight summer-winter altitudinal movements. West Pakistan and India from Baluchistan north through NW. frontier area and eastward along the Himalayas from Gilgit, Chitral and Kashmir through Himachal Pradesh, Garhwal, Kumaon,

Corvus macrorhynchos

Distributional ranges

culminatus (1057)

leuallantii (1055)

tibetosinensis (1056)

intermedius (1054)

Nepal, Darjeeling dist. (W. Bengal), Sikkim and Bhutan¹, between c. 1800 and 4500 m. Affects oak-rhododendron-conifer forest biotope keeping around upland hamlets up to tree-line, and shepherds' encampments and alpine pastures beyond. Recorded following Everest climbers up to their camp at 6400 m (Hingston, JBNHS 32: 320).

Extralimital. Adjacent Afghanistan (Safed Koh and Kafirstan) to southern Tadzhikistan and southern Transcaspia; reportedly also to eastern Iran in the Paropamisus and Scistan (Vaurie).

GENERAL HABITS. Largely as in 1057, q.v., but is pre-eminently a mountain bird hence with consequential peculiarities. In summer follows herds of goats and sheep driven to upland pastures, and accompanies traders' caravans to the highest Himalayan passes. Small parties, sometimes larger flocks of up to 50 birds or so, associate with choughs at the higher altitudes. Like them is extremely fond of gambolling high up in the air over deep valleys, switchbacking and gliding on outspread motionless wings (tips upturned), tumbling, side-slipping, nose-diving and zooming effortlessly upward again, taking full advantage of every wind-current and eddy. Pairs or trios will often perform a variety of other spectacular aerobatics — 'formation-flying', one bird slightly behind another or wing-tip to wing-tip, wheeling and banking in unison with sudden twists and turns; this even in the coldest weather and all purely for fun. Is quite at

¹ Birds from NE. Nepal (Khumbu), and presumably the Sikkim-Darjeeling area, are intermediate between *intermedius* and *tibetosinensis*; those from NW. Bhutan tend more towards *tibetosinensis*.

Above, *C. m. culminatus* (1057)
Below, *C. m. leuallantii* (1055)
x c. 1

Extralimital. Burma, northern Thailand.

GENERAL HABITS, FOOD, VOICE AND CALLS. Largely as in 1057, q.v. A deep, heavy caw, less hoarse or 'wooden' than of Himalayan birds but of a markedly different 'dialect' from Indian *culminatus* (1057). Call of Manipur birds noted as 'a short, quick-repeated distinctly nasal quānk, quānk, etc. reminiscent of Walt Disney's Donald Duck!' (SA).

BREEDING. Season, overall November to April in W. Bengal, Assam and E. Pakistan, chiefly January to March. *Nest, eggs* and breeding biology as in the peninsular form *culminatus* (1057).

MUSEUM DIAGNOSIS. A large bird with a markedly heavy, deeply-bowed bill. Plumage deeper and more glossy black than in other forms. Base of nape-feathers dusky grey (darker than in *intermedius*).

MEASUREMENTS (Bengal)	Wing	Bill (from skull)	Tarsus	Tail
♂♂	308-335	61-69	53-59	181-197 mm
♀♀	280-329	55-65	53-57	165-192 mm
				(HW, RAF)

Weight 3 ♂♂ 554-626; 9 ♀♀ 419-566 g (Paynter).

COLOURS OF BARE PARTS. As in 1057.

home in deep snow even in mid winter, e.g. at Gulmarg (Kashmir) c. 3000 m, scrounging round restaurants and ski-ing huts etc. and then very tame, feeding almost from the hand.

FOOD. As in 1057, all-embracing: both animal and vegetable matter.

VOICE AND CALLS. Markedly deeper and hoarser than of *culminatus* of the plains; guttural and rather raven-like. Rendered by Whistler as *help, help, help!* When sitting completely relaxed, utters a peculiar *krredk* in the nature of a soliloquy, as of a hollow bamboo drawn across the wooden spokes of a wheel (or like a wooden rattle) with many amusing variations but all of same tone quality (SA).

BREEDING. Season, March to May, chiefly April and May. *Nest*, as in 1057, of sticks thickly lined with wool and hair placed 7 to 18 m up in a poplar, deodar or similar tree at edge of forest; usually up to c. 3000 m altitude, rarely even to 4000 m. *Eggs* (c/4 or 5) as in 1057. Average size of 14 Kashmir eggs 42.5 x 29.7 mm (BBO). Breeding biology as in 1057.

MUSEUM DIAGNOSIS. A large bird with comparatively weak bill. Plumage comparatively dull greyish black with little gloss on hindneck and underparts. Base of nape-feathers usually whiter than in the other forms. Nasal plumes well developed but at base of culmen, in centre, rather short and all lying parallel (cf. Carrion Crow, 1058). Throat hackles moderate and not reaching pectoral region (cf. Carrion Crow). Nape and pectoral region silky and glossless.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	311-378	54-73	53-62 (65)	194-242 mm
♀♀	292-343	54-65	51-59	174-224 mm
				(HW, Stresemann, SA)

Weight 7 ♂♂ 460-582; 10 ♀♀ 392-495 g (RAP).

COLOURS OF BARE PARTS. As in 1057.

1055. Eastern Jungle Crow. *Corvus macrorhynchos leuallantii* Lesson

Corvus leuallantii Lesson, 1831, *Traité d'Orn.*: 328 (Bengal)

Corvus andamanensis Tytler = Beavan, 1866, *Ibis*: 420 (Port Blair, Andamans) Baker, FBI Nos. 5 & 8, Vol. 1: 27, 29

LOCAL NAMES. *Kāgh* (Bihar); *Dānd kāk*, *Jāngli kowwā* (Bengali); *Kāk sorāi*, *Jāngla kāk sorāi* (Assamese); *Dhora kaari* (Assam, Nowgong); *Hagroni dao-kāk* (Cachari); *Inrai kāk* (Kacha Naga); *Vo kāk* (Kuki); *Kiēk* (Manipur).

SIZE. House Crow +; length c. 48 cm (19 in.).

FIELD CHARACTERS. As of 1054 and 1057. A large glistening jet-black crow with heavy black bill. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident, with slight local altitudinal movements. Eastern India in W. Bengal, lowlands of SW. Bhutan, Assam, Nagaland, Manipur; also E. Pakistan and Andaman Islands. Plains, duars and foothills, normally up to c. 1000 m (Gangtok, c. 1850 m). A specimen from eastern Nepal terai (Fleming, JBNHS 65: 330). Affects a forest biotope — outskirts of forest villages and outlying hamlets, as well as of towns and cities.

1056. Tibetan Jungle Crow. *Corvus macrorhynchos tibetosinensis* Kleinschmidt & Weigold

Corvus macrorhynchos tibetosinensis Kleinschmidt & Weigold, 1922, *Abh. Ber. Zool. Mus. Dresden* 15 (3): 2 (Southeast Tibet in the Sifan region)

Cf. Ali, Sâlim & Ripley, S. D., 1949, JBNHS 48: 36-7 Not in Baker FBI

LOCAL NAMES. *Ulkā*, *Ōlā* (Bhutaneese); *Ulakpho* (Lepcha).

SIZE. House Crow +; length c. 50 cm (20 in.).

FIELD CHARACTERS. As of 1054: a large uniformly jet-black crow with heavy black bill, deep hoarse raven-like caw and rather wedge-shaped tail in overhead flight, similar to *intermedius* (1054), q.v. Sexes alike. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident, with some altitudinal movements: N. Sikkim, N. Bhutan¹ and NEFA in the Mishmi Hills. A high-elevation form met with up to c. 3800 m. Affects forested uplands chiefly around clearings, yak pastures and habitation.

Extralimital. SE. Tibet adjoining NEFA, Ningsia (Aia Shan), Kansu and Tsinghai, south through Sikang and mountains of W. Szechuan to N. Yunnan, NE. Burma (Vaurie).

GENERAL HABITS, FOOD, VOICE AND CALLS. Like the western mountain form *intermedius* (1054) in its aerobatics etc.; like it also has a much hoarser, deeper and more 'wooden' call than *culminatus* of the plains.

BREEDING. Not recorded within our limits. Doubtless as in 1054.

MUSEUM DIAGNOSIS. Plumage very black and glossy; bases of nape-feathers from grey to dusky. Bill large and raven-like, totally different from *intermedius*.

MEASUREMENTS

CROWS, MAGPIES, JAYS

257

SIZE. House Crow +; length c. 48 cm (19 in.).

FIELD CHARACTERS. A uniformly glossy jet-black crow with a heavy black bill and deep guttural voice. Sexes alike. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Resident. The Gangetic Plain, all peninsular India south to Kanyakumari, and Ceylon; from the sea coast up to c. 2000 m in Ceylon and c. 2300 m in S. India (Nilgiris — breeding). Virtually absent from desert and semi-desert areas west of Delhi. Affects well-wooded country, outskirts of forest villages and hamlets, as well as of towns and cities.

GENERAL HABITS. Less gregarious and sociable than House Crow, usually keeping singly or in pairs and small scattered parties; occasionally larger gatherings where food abundant. Chiefly a rural bird but everywhere being increasingly lured into urban surroundings and commensalism with man by prospects of profitable scavenging. Less sophisticated, cunning or alert than House Crow, but curious and inquisitive as rest of family, and as audacious on occasion. Is a regular marauder of birds' nests, and often becomes a serious menace to poultry keepers as chicken-lifter, especially so when rearing its own nest-young. Serves as a useful indicator to sportsmen and vultures of the presence of tiger- or panther kills hidden within forest. Has the usual evening and morning flights to and from communal roosts which are often shared with House Crows, mynas and other birds. In keeping with family tradition collects in disorderly rabbles to 'weep' noisily over brethren who have come to grief. Frequently indulges in puckish pranks, apparently with no object other than fun, such as surreptitiously tweaking its fellows' wing-tips or toes, or a sleeping dog's tail, and enjoys chivvying and annoying birds of prey and any other creatures that can be subjected to such indignity. Normal flight like House Crow's, with deliberate rather shallow wing-beats. Aerobatics, chiefly in the hilly districts, less frequent and less spectacular than in its Himalayan congeners, qq.v. Peculiar short flights commonly observed with neck outstretched, wings held vertically back to back above body level, only their tips flapping through a small arc, the bird cawing the while in a high-pitched key. The significance of this behaviour not properly understood.

FOOD. Practically all-embracing: animal as well as vegetable matter. Items recorded include carrion (from animal carcasses and audaciously filched from vulture nest-young regardless of protesting parents); garbage and offal; birds' eggs, young and sickly birds, chicks of poultry; rats, mice, squirrels; lizards (*Calotes*); and frogs; land and sand crabs (*Paratelphusa* and *Ogypode*); centipedes; insects [dung and other beetles, locusts, grasshoppers, moths, ants (*Camponotus*), winged termites clumsily hawked in air, swarming caterpillars, etc.]. Wild and orchard fruits; cereal grains (*Sorghum*, *Oryza*, *Pennisetum*, *Triticum*, *Zea*, etc.), entire cobs often wrenched off; groundnuts (*Arachis*) dug up from fields; flower-nectar and petals (*Salmatia*, *Bombax*, *Erythrina*, *Butea*, *Grevillea*, *Spathodea*, etc.).

VOICE and CALLS. More raucous and guttural than House Crow's, and distinct in 'dialect' from that of the mountain-inhabiting forms *intermedius* and *tibetensis*: less hoarse and 'wooden'. Like House Crow has a wide vocabulary expressive of various moods and situations (over 10 distinct calls noted). When completely relaxed and resting on a shady

1058. Eastern Carrion Crow. *Corvus corone orientalis* Eversmann

Corvus orientalis Eversmann, 1841, Add. Pallas Zoogr. 2: 7
(Naryn R., Turkestan)

Baker, FBI No. 4, Vol. 1: 24
Plate 70, fig. 8

LOCAL NAMES. *Kelāgh* (Persian); others same as for Jungle Crow (1054) where applicable.

SIZE. House Crow +; length c. 47 cm (18½ in.).

FIELD CHARACTERS. A glossy jet-black crow, indistinguishable from Jungle Crow unless in the hand. Sexes alike. See Distribution and Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Resident and/or winter visitor in small numbers; from c. 2400 to 3600 m. N. Baluchistan (Quetta, winter; Shinghar and Takht-i-Suleiman, breeding), NW. frontier districts (upper Kurram Valley, breeding; Bannu, winter), Gilgit (breeding), Ladakh (breeding in Indus Valley from c. Kargil to Himis, and side valleys — Shingo, Suru), Baltistan (Braldu Valley and Shigar, winter; possibly breeding), Kashmir north of main Himalayan Range (winter; breeding?). Affects rather open barren country with patches of irrigated cultivation and *chilgoza* pine and alpine forest; often keeping near nomadic encampments and upland habitations.

EXTRALIMITAL. Siberia from the Yenisey to Anadyr and from Kashgaria, Afghanistan and E. Turkestan through N. Mongolia to China and N. Vietnam. (For details see Vaurie, 1959, 2: 171-2.) It is the breeding crow of most parts of Afghanistan, hybridizing with Hooded Crow (1058a) in a zone along the northwestern border of the country (Paludan, 1959). The species, in other races, has a wide range in Europe east of c. 10°E., exclusive of Scandinavia.

GENERAL HABITS. Usually shy and unobtrusive, keeping in pairs and feeding around upland settlements and cultivation, and traders' and nomadic shepherds' encampments.

FOOD. More or less omnivorous as other crows. Ascertained items include barley, maize, insects, caterpillars and other larvae.

VOICE and CALLS. Very different to that of Jungle Crow: harsher and more raven-like in comparison. When bird resting and relaxed, said to utter another, softer, note 'in meditative fashion'.

BREEDING. *Season* (in N. Baluchistan c. 2500 and Ladakh c. 3300 m) April-May. *Nest*, of typical crow pattern, a platform of sticks and twigs mixed with a little earth, lined with hair, wool and sometimes a few feathers; built c. 8-10 metres up in *chilgoza* pine (*Pinus gerardiana*), chenar (*Platanus*), willow or poplar trees usually growing near habitations. *Eggs*, 4 or 5, indistinguishable from Jungle Crow's (1057). Average size of 21 Ladakh eggs 42.5 × 28.1 mm (BBO). For bionomics and breeding biology etc., of the slightly smaller nominate race, see Witherby, 1938, 1: 14-17.

MUSEUM DIAGNOSIS. Gloss much as in Jungle Crow (1054) but variable on body; on the whole less glossy. Throat more violet-blue than greenish blue. Bill smaller and weaker than Jungle Crow's and lacking the rounded arch to the culmen which gives it that heavy appearance. Nasal plumes well developed, those at base of culmen inclined to cross over from each side of the centre (cf. Jungle Crow). Base of nape-feathers pale grey but variable. Hackles of throat moderate and extending to pectoral

258

CORVIDAE

branch emits, in the nature of a soliloquy, some curious soft and amusing gurgling chuckles and short musical croaks *kaa-kāk* . . . *kaa-kāk* etc., or just a single *kaa*, from time to time, head lowered neck stretched horizontally, bill open, and throat puffed with the feathers standing away. The wing-tips stick out in a point behind rump, and the tail bobs deeply at each call. These vocalizations are responded to by mate nearby with short undertone croaks with throat puffed and a peculiar retching motion. This chiefly with approaching breeding season.

BREEDING. *Season*, overall February to June varying locally: chiefly March-April in northern India, earlier in the south; in Ceylon April to September, chiefly May to July. *Nest*, a platform of sticks and twigs with a neat central cup, c. 15-18 cm in diameter and 10-14 cm deep, lined with coir, tow, hair or wool. Placed 7 to 10 metres up in a forking branch or crotch in a mango, casuarina, *Millingtonia*, sheesham or suchlike large tree (sometimes in the head of a coconut or palmyra palm) growing on the outskirts of habitation. *Eggs*, 3 to 5, similar to those of House Crow but larger: pale blue-green speckled and streaked with brown. Average size of 60 eggs 38 × 28.1 mm (Baker). Both sexes partake in building the nest, incubation and tending the young though major share in incubation believed to be female's; period 17-19 days, normally 18; young fledge and leave nest in 3 or 4 weeks. (For more details of breeding biology see Lamba, B. S., 1965, JBNHS 62: 425-33.) Nests commonly brood-parasitized by Koel (*Eudynamis scolopacea*, 590) though less frequently than House Crow's. Nine koels' eggs recorded in a single nest along with 4 of the owner's (Jones, JBNHS 24: 370).

MUSEUM DIAGNOSIS. A small bird with a comparatively strong bill. Plumage black and glossy. Base of nape-feathers dusky.

First-year birds retain shorter (brownier) wings and tail unmoulted from juvenal plumage. No difference in size of bill and tarsus, but age for age female smaller in all measurements.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	273-319	55-67	49-59	156-189 mm
♀♀	260-301	52-63	49-55	147-183 mm (HW, SA)

Weight 3 oo? 320-352 g (SA).

COLOURS OF BARE PARTS. Adult. Iris brown. Bill black; mouth slaty black. Fledgling. Iris bluish grey (like jackdaw's). Gape, baldish chin, and mouth pink; tongue blotched with black.

1058a. Eastern Hooded Crow. *Corvus corone sharpii* Oates

Corvus sharpii Oates, 1889, Fauna Brit. India, Bds. 1: 20

('Siberia, Turkestan, Afghanistan and a portion of India').

Type from Mardan, Punjab, *sic* Ticehurst, 1926, JBNHS 31: 93)

Baker, FBI No. 10, Vol. 1: 32

Plate 70, fig. 9

LOCAL NAMES. None recorded.

SIZE. House Crow +; length c. 47 cm (18½ in.).

FIELD CHARACTERS. Unmistakable with any other crow by its pale drab-grey mantle and underparts. Head, wings, tail and rest of plumage glossy black, the crown contrasting sharply with grey hindneck. Sexes alike. See Distribution and Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Rather uncommon but regular winter visitor, arriving about November, departing by end March. NW. frontier districts of W. Pakistan (Peshawar, Mardan, Hazara, Bannu, Kohat). Also Gilgit, Ladakh, Baltistan, Kashmir (rare); between c. 2000 to 3500 m. Affects open barren country with patches of irrigated cultivation and upland habitations.

EXTRALIMITAL. Breeds in western Siberia from the Urals to Yenisey R. and Lake Baikal and to W. and N. Iran, N. Afghanistan, W. Turkestan. Winters also in S. Afghanistan, N. Baluchistan (?), S. and E. Iran, etc. (For details see Vaurie, 1959, 2: 172-3.) Hybridizes with Carrion Crow (1058) in a zone along the northwestern border of Afghanistan (Paludan 1959).

GENERAL HABITS. Very like Carrion Crow's. Keeps in pairs or small parties, often in association with it and with rooks, but prefers the wilder more open parts.

FOOD. Varied, comprising both animal and vegetable matter — insects, maize, barley, etc.

VOICE and CALLS. Doubtfully distinguishable from Carrion Crow's.

BREEDING. Extralimital. Largely as 1058.

CROWS, MAGPIES, JAYS

261

MUSEUM DIAGNOSIS. Nasal plumes (black) well developed and, as in Carrion Crow (q.v.) inclined to cross over culmen from either side of its base. Whole head, neck, central part of upper breast, throat, wings, under wing-coverts and thighs black, more or less glossy; upper tail-coverts black mixed with grey. Rest of plumage drab-grey; shafts of feathers of upperparts black, of underparts brown. Gloss on crown and throat purple-blue as also on lesser, median, and greater coverts and secondaries; gloss on primary-coverts and primaries greenish, on tail purplish blue, the laterals more greenish. Structure and wing-formula ($2 = 6/7$) as in Carrion Crow.

Juvenile. Like adult but head, throat and upper breast dark brown; the drab-grey of adult slightly paler and less pure; thighs sooty. Postjuvenile moult of body, and lesser and median coverts.

First-year bird hardly distinguishable from adult; but when worn, wings less glossy and browner.

MEASUREMENTS

263

Stragglers recorded from Vidarbha in Maharashtra (D'Abreu, JBNHS 38: 95) and Mhow in Madhya Pradesh (Briggs, *ibid.* 35: 382). Affects the vicinity of towns and villages as well as outlying hamlets and nomadic herders' settlements in desert and semi-desert canal areas.

Extralimital. Afghanistan and Iran to Syria, Israel and Jordan; Kashgaria and W. Turkestan plains to Transcaspia and Dzungaria. (For details see Vaurie, 1959, 2: 176-7.)

GENERAL HABITS. Less social and gregarious than Rook or House Crow. Usually seen in pairs, but fair numbers will collect where an abundance of food attracts. Commonly joins kites, neophrons and other vultures to feast on animal carcasses. Feeds chiefly on the ground, stalking about with a rather waddling gait or moving in clumsy loping hops. Is curious and inquisitive as other crows and wary and suspicious, but can be bold and audacious on opportunity. Quite tame in out-of-the-way desert habitations and along caravan routes, scrounging for scraps around the nomadic encampments in close proximity of the occupants. Has communal roosts in selected trees often shared with kites and house crows (on old buildings or even the ground in desert tracts) at which considerable numbers will congregate at sunset, flighting in twos and threes from various directions. Flight strong and direct, the stiff wing-quills producing a peculiar creaking noise well likened to the rustle of a silk dress. Occasionally pairs or small parties rise aloft on thermals to circle on motionless wings and disport themselves in remarkable aerobatics. Monogamous, pairing for life, and exceptionally long-lived (one in captivity authenticated to be over 70 years old).

FOOD. All embracing: animal as well as vegetable matter — carrion, eggs and young or sickly birds, small mammals, lizards, fish (left high and dry by receding floods), frogs, insects (locusts, grasshoppers, ants, gram caterpillars, cutworms, beetles and larvae recorded); ripening fruits and cereal grains; kitchen scraps and refuse.

VOICE AND CALLS. A deep, hoarse, frequently uttered *prāk, prāk* reminiscent of a wooden cow-bell. Like other crows has a large vocabulary of variants to express different situations, some calls quite pleasing and musical.

BREEDING. *Season*, December to March, chiefly February. *Nest*, a platform of sticks as in 1060, placed near the top of a solitary tree (*Dalbergia*, *Acacia*, *Prosopis*, *Tamarix* or other) standing in a field; also in gardens and along roadsides. Not colonial. In semi-desert often in stunted trees hardly more than 3 or 4 metres high. Nests also built near tops of rock- or earth cliffs; in many cases the same site used year after year. Unconventional sites such as the platform of a railway signal tower and iron girders of a railway bridge have been recorded. *Eggs*, $c/4-6$, as in 1060. Average size of 100 eggs 50.7×33.6 mm (Baker). Both sexes take part in all the domestic chores. Incubation period said to be 17-18 days but requires confirmation.

MUSEUM DIAGNOSIS. Whole plumage steely blue-black, becoming somewhat brownish on nape, mantle and throat with wear; then separable from *ruficollis* (1061) by larger size. Bases of nape-feathers grey. Throat hackles shorter and sharply pointed *v.* long and blunt in the larger subspecies *tibetanus* (1060). Nasal bristles well developed. 2nd primary (as.) = 5.6.

First-year birds, especially when worn, have browner wings and tail, and less gloss.

Below, *C. corax orientalis* (1058)
 $\times c. 1$

In flight large size, peculiar creaking noise of wing-quills and wedge-shaped outline of tail very striking.

STATUS, DISTRIBUTION AND HABITAT. Locally resident (breeding) and/or winter visitor in variable numbers. N. Baluchistan (Quetta Valley), Sind (Jacobabad — abundant, Khairpur, Nawabshah, Sukkur, Thar Parkar districts, Khirthar Range), Punjab (Bahawalpur, Hissar, Ludhiana, Batala dists., Salt Range and foot of outer Himalayas up to c. 600 m, only occasionally higher*), NW. frontier districts (Kohat, Rawalpindi, Peshawar), W. Rajasthan (Jaisalmer, Jodhpur, Bikaner dists., Sambhar Lake, Ajmer), Delhi (occasional, rare), Kutch (borders of Great and Little Ranns).

* See Eates, K. R., 1939, 'The Distribution and Nidification of the Indian (Punjab) Raven (*Corvus corax laurentei* Hume) in Sind.' JBNHS 40: 747-50.

* There is apparently a wide gap in the distribution of this subspecies and *tibetanus* (1060) between the outer and main Himalayan ranges, which includes all Kashmir proper.

264

CORVIDAE

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♂	419-448	66-74	—	—
♀ ♀	399-430	—	—	(HW)
2 ♂ ♂	420, 448	74, 78	65 (1)	229, 242 mm
2 ♀ ♀	410, 413	69, 74	62 (1)	220, 223 mm
				(SA)

Weight ♂ ♂ 2 lb. to 2 lb. 2 oz. (c. 907-964 g); ♀ ♀ 1 lb. 12 oz. to 1 lb. 14 oz. (c. 794-850 g); heaviest bird out of c. fifty 2 lb. 5 oz. (1049 g) — Hume.

COLOURS OF BARE PARTS. Iris brown. Bill, legs, feet and claws black.

1060. Tibet Raven. *Corvus corax tibetanus* Hodgson

Corvus Tibetanus Hodgson, 1849, *Ann. Mag. Nat. Hist.* 3: 203 (Tibet) Baker, FBI No. 2, Vol. 1: 23.

LOCAL NAMES. *Nika uāk*, *Phoro* or *Oro* (Tibetan); *Botin kāv* (Kashmiri); *Foreg* (Lahuli).

SIZE. Kite +; length c. 71 cm (28 in.).

FIELD CHARACTERS. As of 1059; a large, heavy jet-black high-altitude crow with a massive bill. Sexes alike. In overhead flight the wing-quills look slate coloured, contrasting strongly with the jet-black under wing-coverts.

STATUS, DISTRIBUTION AND HABITAT. A high-altitude, essentially trans-Himalayan form normally resident between c. 4000 and 5000 m in typical Tibetan plateau facies or the transition zone. May descend south of the main axis to c. 3000 m in exceptionally severe winters. Ladakh (specially numerous round Leh), Baltistan, Spiti, Lahul, Garhwal, Sikkim, Bhutan, NEFA. Recorded by the First Mt Everest Expedition round their Camp 3 at c. 6400 m (Hingston, JBNHS 32: 320). Affects dry rocky desert country above tree-line.

Extralimital. Pamirs, Altai, Tien Shan, E. Bokhara, Tibet to Kansu, mountains of C. Asia.

GENERAL HABITS. More or less as in 1059 with some differences consequential to high mountain living. Usually met in pairs, but sometimes a dozen or more together feeding in cornfields round upland habitations or Buddhist monasteries. Naturally wild, wary and suspicious but becomes bold and almost familiar when scavenging round villages or searching for scraps and carrion in the vicinity of nomadic traders' encampments. Consorts with griffon vultures and lammergeiers to feast on carcasses of pack animals along the well-worn caravan routes. With a high wind blowing, pairs or trios revel in spectacular aerobicatic gambolling like choughs, gliding in formation at speed, wing-tip to wing-tip or one bird close behind the other, suddenly turning, twisting, sidestepping, looping-the-loop or nose-diving deep into the valley below and then zooming effortlessly up again, quite obviously enjoying the exercise.

GROWS, MAGPIES, JAYS

265

FOOD. As in 1059, practically all vegetable and animal matter that can be procured, dead or alive. Has been observed to stoop on and carry off a full-grown Tibetan Partridge (Ludlow) and to maraud a chough's nest and snatch a half-fledged young regardless of repeated onslaughts by the frantic parents (Osmaston). As with other Corvidae pellets of undigested hair and bones etc. are cast up.

VOICE AND CALLS. As in 1059. The hoarse, wooden bell-like quick-repeated *prük, prük* sometimes sounds in the distance curiously like bits of the call of Banded Jungle Owlet (*Glaucidium radiatum*, 636) minus its resonance. Another common call is a high-pitched guttural, almost musical, *kretük* or *kretah* reminiscent of Brown-headed Gull (*Larus brunnecephalus*, 454).

BREEDING. An early breeder, often while the country still under snow at 3300 to 4500 m and, *vide* Meinertzhagen, sometimes up to at least 5800 m. *Season*, February to early April. *Nest*, a rough platform of sticks with the central cup thickly lined with wool, yak and other mammals' hair. Usually placed near the top of an inaccessible cliff in a cleft or niche in the vertical face. *Eggs*, 3 to 6, variable in shape from broad to long ovals, practically glossless; pale bluish green with smudges and clouds of pale grey and pale sepia, and spots and streaks of deep blackish brown. Average size of 60 Punjab eggs 47.5 × 33.1 (HW), of 14 from SE. Tibet 51.75 × 35.5 mm (Ludlow). Breeding biology as in 1059.

MUSEUM DIAGNOSIS. The largest of our three races. Like *subcorax* (1059) but with the throat hackles strongly lanceolate—long and blunt *v.* short and sharply pointed; bases of nape-feathers dark to medium grey. Also distinguished by its even more massive bill.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
2 ♂♂	461, 477	78, 87 (depth at angle 26, 28)	69, 70	266, 288 mm
3 ♀♀	448-465	73-78 (depth at angle 26-27)	64-69	257-260 mm

(HW)

COLOURS OF BARE PARTS. Iris brown. Bill, legs, feet and claws black. Mouth in adult black; in juvenile whitish fleshy with a black mark on tongue.

1061. Brown-necked Raven. *Corvus corax ruficollis* Lesson*Corvus ruficollis* Lesson, 1830, *Traité d'Orn.*: 329(Cape Verde Islands *vide* Hartert, 1921)

Baker, FBI No. 3, Vol. 1: 23

Plate 70, fig. 10

LOCAL NAMES. None specifically recorded.**SIZE.** Kite ±; length c. 58 cm (23 in.).

FIELD CHARACTERS. As of 1059, but smaller and with the black plumage tinged with brown and a slenderer bill. Sexes alike. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident and/or winter visitor or vagrant (?). Sind (Larkana and Jacobabad dists.). Baluchistan (coastal

WAXWINGS

267

FIELD CHARACTERS. A dumpy chestnut and pinkish brown myna-like bird with long full crest and short yellow-tipped tail. Wings dark, boldly marked with white and yellow, with brilliant scarlet drop-shaped waxy tips to the secondaries. Throat black; rump grey; under tail-coverts chestnut.

Bushy crest, black throat, brilliant wing-pattern and yellow-tipped tail make its identity unmistakable.

Female paler with the yellow on wings whiter, and tipping of tail narrower.

STATUS, DISTRIBUTION AND HABITAT. An irregular and erratic vagrant during winter. Odd individual specimens have been collected between January and March (between 2000 and 2500 m) on the NW. frontier (Bannu—Magrath, Samana Range—Whitehead), Baluchistan (Quetta—

Bombycilla garrulus

Breeding

For intralimital winter occurrences see text

Meinertzhagen), Kashmir (Dachigam Nala nr. Srinagar—Ward) and the most recent in Nepal (Kosi-Gandak watershed at c. 3650 m, December, Fleming, Jr., 1968, JBNHS 65: 488). Apart from these only one sight record of a flock 'upwards of 20' at Quetta in March 1947 (T. J. Phillips, JBNHS 47: 160).

Extralimital. Widely distributed in the Holarctic Region, migrating erratically in winter *inter alia* to Asia Minor, N. and SW. Iran. For details see Vaurie, 1959, 2: 178.

GENERAL HABITS. Mainly arboreal, feeding in tree-tops as well as low bushes; occasionally on ground. Keeps in parties and flocks in non-breeding season. The Nepal birds were in association with *Mycerobas carpinus* (1985) and *Turdus r. ruficollis* (1764) in a mixed forest of *Rhododendron*, *Magnolia*, *Juniperus* and *Abies* at c. 3650 m altitude. Usually quiet, and tame and sluggish. Flight strong and direct, rather starling-like.

266

BOMBYCILLINAE

and central Makran, Chagai, Quetta. (scarce, winter). Straggler to Peshawar Valley (BBO), Bahawalpur (?) — SA. Replaces *subcorax* (1059) in pure desert facies.

Extralimital. Afghanistan, desert parts of Transcaspiia to Kyzyl Kum, E. Iran, E. and S. Arabia, Sinai, etc.; also Africa (Sahara south to N. Nigeria etc.). For details see Vaurie, 1959, 2: 173-4.

GENERAL HABITS, FOOD, VOICE AND CALLS. As in 1059 and 1060, but is essentially a bird of pure desert facies scavenging round nomadic encampments etc. where quite tame. Replaces the other subspecies ecologically, therefore often found within the same general area or even district.

BREEDING. Very little authentic data. Nests reported from the Sind-Baluchistan frontier hills and the Kalat area of Baluchistan, January and March, but confirmation desirable; also clarification of its status within our limits. Elsewhere nests mostly on ledges of clay cliffs etc.; sometimes on trees: *Eggs* (c/3-6) as of 1059. Average size of 44 eggs 45 × 30.9 mm (Baker).

MUSEUM DIAGNOSIS. Like *subcorax* (1059) but smaller in size and with a brownish (coppery) tinge over whole head and body (accentuated in worn dress). Nasal plumes often shorter and bill usually slenderer.

Juvenile. 'Like adult but with only a trace of the coppery tinge' (Meinertzhagen).

MEASUREMENTS, very variable.

10 ♂♂ (India and Iran) Wing 370-413. Bill (from skull) 62-70; depth at angle 21-25.5 mm (RM)

5 ♀♀ (Makran) Wing 360-372. Bill (from skull) 61-69 mm (CBT)

COLOURS OF BARE PARTS. Iris brown. Bill, legs, feet and claws black.

Family BOMBYCILLINAE

Subfamily BOMBYCILLINAE: Waxwings

For description see Van Tyne, J. & Berger, A. J., 1959: 529; Greenway, J. C., Jr., 1964, Article 'Waxwing' in Thomson, A. L. (ed.), *New Dict. Birds*. London & New York.

Genus BOMBYCILLA Vieillot

Bombycilla Vieillot, 1808, *Hist. Nat. Ois. Amér.* Sept. 1: 88.Type, by monotypy, *Bombycilla cedrorum* Vieillot

Characters as of the Subfamily. Remarkable for its full long crest and the wax-like prolongation of the shafts of the secondaries whence the name Waxwing. Wing long and pointed, of 10 primaries: 1st primary (as.) minute. Tail, of 12 feathers, short and square. Bill short and stout, slightly curved and notched. Tarsi very short.

1062. Waxwing. *Bombycilla garrulus garrulus* (Linnaeus)*Lanius Garrulus* Linnaeus, 1758, *Syst. Nat.*, ed. 10, 1: 95

(in Europa et America boreali = Sweden)

Baker, FBI No. 1140, Vol. 3: 223

Plate 66, fig. 16

LOCAL NAMES. None recorded.**SIZE.** Bulbul —; length c. 18 cm (7 in.).

268

HYPOCOLIINAE

FOOD. Insects and berries (of juniper etc.). Flying insects sometimes taken in the air.

VOICE AND CALLS. 'A high *zeeee zeeeee* given when about to fly' (Fleming).

BREEDING. Extralimital. *Nest*, a cup of twigs etc. usually in coniferous forest. A ♂ procured at Bannu (33°N., 70°40'E.) on 20 March (1907) reported as excessively fat and with much enlarged gonads.

MUSEUM DIAGNOSIS. For description of plumages and structure (also bionomics) see Witherby, 1938, 1: 296-9.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	112-120	10-11.5	20-22	59-67 mm
♀♀	112-119			

(Witherby)

2 ♀♀ (Nepal) Wing 114, 116 mm (Fleming)

COLOURS OF BARE PARTS. Iris brown or reddish brown. Bill blackish, flesh-coloured at base of both mandibles. Legs and feet black.

Subfamily HYPOCOLIINAE: Hypocolius

For description see Greenway, J. C., Jr., 1964, Article 'Hypocolius' in Thomson, A. L. (ed.), *New Dict. Birds*. London & New York.

Genus HYPOCOLIUS Bonaparte

Hypocolius Bonaparte, 1850, *Consp. Gen. Av.* 1: 336.Type, by monotypy, *H. ampelinus* Bonaparte

Bill stout and broad at base, about half the length of head. Nostrils small, oval, exposed. Rictal bristles weak but always clearly visible. Wing short, pointed: 1st primary (as.) minute, 2nd reaching to tip of wing. Tail long and slightly graduated. Tarsus very short and stout, shorter than middle toe and claw; coarsely scutellated.

1063. Grey Hypocolius or Shrike-Bulbul. *Hypocolius ampelinus* Bonaparte*H. (Hypocolius) ampelinus* Bonaparte, 1850, *Consp. Gen. Av.* 1: 336('ex California' = NE. Africa (Botta coll.), restricted by Baker *et al.*)*Hypocolius ampelinus orientalis* Koelz, 1939, *Proc. Biol. Soc.*

Washington 52: 64 (Kandahar, Afghanistan)

Baker, FBI No. 378, Vol. 1: 357

Plate 66, fig. 19

LOCAL NAMES. None recorded.**SIZE.** Bulbul +; length c. 25 cm (10 in.).

FIELD CHARACTERS. A glaucous blue-grey bird strongly reminiscent of a shrike (or bulbul), with a distinctive black band from lores running backward through eyes over ear-coverts and looping round nape. Wing-quills black broadly tipped with white. Tail longish blue-grey with a broad black terminal band. When nape and crown feathers erected on excitement, eye-band becomes enlarged and very prominent. Female more isabelline-grey above.

HYPOGOLIUS

269

dirty cream coloured below, lacking the black eye- and nape-band. Primaries grey-brown with black terminal ends and white tips.

Wing ♂, x c. 1/2 (after Hartert)

STATUS, DISTRIBUTION and HABITAT. Rare vagrant. Individual examples seen and collected within our limits only at long intervals, all between November and April: Sind-Baluchistan boundary (Mazarani Nai in the Kirthar Range), S. Kalat (Nal), Sind (Karachi), Gujarat (Kuar Bet in Great Rann of Kutch), and Maharashtra (Kihim, Kolaba dist.). In semi-desert and open deciduous scrub jungle.

Extralimital. S. Iran, Afghanistan, Iraq, Arabia, N. Africa. For details of range see Vaurie, 1959, 2: 180.

GENERAL HABITS. Superficially very suggestive of Grey Shrike (*Lanius e. lahtora*, 933), but in non-breeding season, in its native land, keeps in flocks of 5 to 20 individuals. Chiefly arboreal, active and restless, feeding in trees and bushes, occasionally dropping to the ground like a shrike to pick up an insect and back again. Movements and actions in shrubbery more babbler-like. Perches low on a branch with feathers of underside fluffed; erects head-feathers when excited like Whitechecked Bulbul (*Pycnonotus l. leucotis*, 1123). Flight strong and direct, without undulations.

FOOD. Stomachs of specimens examined in India showed berries exclusively: *Lantana aculeata*, *Salvadora persica* and *Zizyphus (juzuba ?)*. In Iraq said to live largely on fruits (dates, figs) with a small quantity of insects (beetles etc.).

VOICE and CALLS. Not recorded in India. Elsewhere described as an 'unmistakable squeaking note' (Ticehurst); 'very pleasing and liquid, nothing like harsh cry of shrike' (Cumming). During flight utters a call-note rather reminiscent of Bee-eater (*Merops apiaster*, 746) — Paludan. Is usually silent except when in flocks, then very noisy and can be heard a long way off.

BREEDING. Extralimital. Season (in Iraq and S. Iran) chiefly June-July. Nest, large, cup-shaped, like bulbul's, 1 to 3 metres or so up in a bush or on leaf of small date palm. Eggs, 4 or 5, white, with or without brownish blotches at broad end, resembling those of *Lanius e. lahtora*. Size c. 26 x 19 mm. (For more details see Cumming, W. D., JBNHS 12: 760-5; Ticehurst, C. B., *ibid.* 28: 381-2.)

MUSEUM DIAGNOSIS. Juvenile. 'Pale sandy brown all over without black or white in the primaries, but with black terminal band on tail' (RM).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♀	96-106	14-15	23-25 (SA, Koelz, Paludan)	96-109 mm

CUCKOO-SHRIKES, MINIVETS

5

1066. Ceylon Pied Flycatcher-Shrike. *Hemipus picatus leggei* Whistler

Hemipus picatus leggei Whistler, 1939 (May 15), Bull. Brit. Orn. Cl., 59: 101 (Ohiya, Ceylon)
Hemipus picatus insulæ Koeltz, 1939 (June 5), Proc. Biol. Soc. Washington, 52: 69 (Wavenden, Ceylon)
Baker, FBI No. 724 (part), Vol. 2: 306

LOCAL NAMES. *Paru-kurullā* (Sinhala); *Asurappottan* (Malayalam).
SIZE. Sparrow ±; length c. 14 cm (5½ in.).
FIELD CHARACTERS. As of 1065. The sexes are alike in Ceylon, but apparently dimorphic in Kerala.

STATUS, DISTRIBUTION and HABITAT. Resident, southern Kerala (where it intergrades with *picatus*) and Ceylon. It is found in forest, or well-wooded country up to 1800 m; rare and local in the low country, especially in the Dry zone.

GENERAL HABITS. A bird of the tree canopy met with in pairs or family parties, often in company with other species in the roving hunting parties.

FOOD. Insects, chiefly caterpillars.

VOICE and CALLS. 'Its song sounds like *tirity tirity tirity*, and it has other little chirps besides' (Henry).

BREEDING. Season, February to August, chiefly March and April; apparently single-brooded. The favourite site for the nest is a dead, lichenous and gnarled branch, high up in a tree (up to 12 metres) with no foliage to hide it except the overhead leaf-canopy. Nest as that of *picatus*. When the young are fledging, they look like a part of the branch owing to their 'lichenous' coloration and their normal attitude, which suggest a broken-off snag (Henry). They sit facing one another, with their bills pointing upward and nearly touching in the centre, their eyes kept half-closed. For details of nesting, see W. W. A. Phillips, *Ibis* 1940: 450-4. Eggs, 3, buffy-white in colour evenly speckled all over with pale brown and grey, measuring c. 15 × 12 mm. Both parents incubate and tend the young.

MUSEUM DIAGNOSIS. The Ceylon population differs from *picatus* in that its sexes are not dimorphic, i.e. both male and female are black-backed like male *picatus*. Complete postnuptial moult takes place from the end of July to October. There is presumably no spring moult.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♀	61-65	15-17	11-13	53-60 mm (HW)

COLOURS OF BARE PARTS. Iris brown. Bill, legs and feet black.

Genus *TEPHRODORNIS* Swainson

Tephrodornis Swainson, 1832 (Feb.) (1831), Fauna Boreal-Amer., Birds, App.: 482.

Type, by original designation, *Lanius virgatus* Temminck = *Lanius gularis* Raffles.

Bill very stout, about three-quarters length of head, strongly hooked and notched. Nasal bristles very numerous, entirely concealing the nostrils. Wing rather rounded; tail short and square. Feathers of rump very ample, but soft and not spinous as in *Pericrocotus*. Sexes more or less alike.

CUCKOO-SHRIKES, MINIVETS

7

Tephrodornis gularis

Distributional ranges

▨ *peltica* (1067). ■ *sylvicola* (1068).

the ground. An active and restless bird but quite tame. Hunts for insects on branches, moving slowly along them in a series of clumsy hops. Also launches short flycatcher-like sallies after insects. The individuals follow one another among the trees, gracefully volplaning from branch to branch. It is usually found in small parties of four to six often in association with minivets, drongos and other insectivorous birds; in winter in larger flocks often up to thirty individuals, which break up into pairs in April and May.

VOICE and CALLS. Harsh notes resembling those of Shrikes, vaguely reminiscent also of *Nucifraga* (SA); others rendered as a mellow *tra-a-a* and *thul, thul* (Fleming). Also a rather musical *kew-kew-kew* quickly repeated four to six times. The latter calls noted as appreciably different in dialect from those of the Western Chats race, q.v. (SA).

FOOD. Insects, especially, mantids, crickets, grubs and caterpillars including hairy ones.

BREEDING. Season, April and May. Nest, placed in a bare, outlying horizontal fork, three to eight metres up in medium-sized trees standing in forest. It is built on top of the bough where it broadens out at the point of division, so that very little is discernible from below. It is a shallow saucer made of fine grass-stems and roots, beautifully interwoven, the outer wall well plastered with cobwebs. It is reminiscent of minivets' nests but is usually without the adornment of lichen and moss. Betts remarks that the bird sits with the head back and bill pointing vertically upwards; with its grey plumage it looks just like a broken stub of the tree itself. Eggs 2 to 4, white faintly tinged with green or brown, marked with small irregular blotches of inky brown scattered all over the surface or more restricted to the larger

Baker, FBI No. 727, Vol. 2: 309

LOCAL NAMES. *Vohpigli* (Mikir); *Ramun-pho* (Lepcha).

SIZE. Myna; length c. 23 cm (9 in.).

FIELD CHARACTERS. A short and square-tailed grey-brown shrike, distinguished from *T. pondicerianus* by its larger size and brown outer rectrices.

Male. Above, crown and nape ashy grey changing to ashy brown on back, wings and tail, the last tipped blackish and rufous. A broad black band from lores through eye to ear-coverts, which are whitish. Rump and upper tail-coverts fluffy, whitish and ashy brown, barred with black and with a pure white band across. Below, chin, throat and breast pale ashy fawn, fading to white on centre of abdomen.

Female. Like male, but with crown same colour as back, and eye-band brown.

Young (fledgeling) when leaving nest speckled grey all over, especially on head.

STATUS, DISTRIBUTION and HABITAT. Resident; any movements are local or altitudinal. From Nepal (terai and duns up to c. 1000 m), Sikkim (duars and foothills up to 1500 m), Bhutan (to at least c. 1200 m), Assam (throughout the plains and in Cachar and Khasi Hills), Nagaland, Manipur, E. Pakistan (in the eastern foothills and Chittagong region). South in Bihar and Orissa to the Eastern Ghats and northern Andhra up to 1000 m. Shows a preference for evergreen forest but is also found in open deciduous secondary jungle and other types of well wooded country.

EXTRALIMITAL. Other races south through India and east in the Indochinese and Malaysian subregions.

GENERAL HABITS. Arboreal. Keeps to the tree-tops more than *T. pondicerianus* does, and unlike the latter, only very occasionally descends to

8

CAMPEPHAGIDAE

end where they form an indistinct ring; very like those of minivets. Average size of nine eggs 22 × 17.6 mm (Baker). The male assists in incubation.

MUSEUM DIAGNOSIS. Male. Forehead, crown and nape ashy grey; back, scapulars and lesser coverts ashy brown; rump ashy brown tipped white or obscurely barred brown; the shorter upper tail-coverts white, the longer ashy brown; nasal plumes and head band thence through eye to nape, black; part below this, chin, belly and under tail-coverts white; rest of underparts very pale cinereous, tinged with buff or vinaceous on breast; tail ashy brown with a rufous tinge and very narrow whitish tips. The shafts reddish brown; median and greater coverts and the flight-feathers ashy brown with lighter tips, with obsolete darker bars on outer edges of three inner secondaries; under-wing and axillaries brown.

Female. Like male but forehead, crown and nape like back; band through eye pale brown in front, darker brown behind.

Young. Much as in juvenile *pondicerianus* (1070) q.v. The tail is like that of the adult but the feathers are narrower and more pointed and the dark subapical contour lines are more marked. The postjuvinal moult includes body, all coverts except primary, tertials and tail. First-year males indistinguishable from females but all first-year birds recognizable by pale tips to primary coverts. Breeds also in subadult plumage.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♂	115-124	23-29	20-23 (once 26)	82-91 mm
♀ ♀	115-124	25-29	20-23	81-92 mm (SA, BB)

Weight 2 ♂♂, 2 ♀♀ 38-46 g (SA).

COLOURS OF BARE PARTS. Iris ♂ golden yellow, ♀ glaucous blue; bill ♂ black, ♀ horn brown, flesh at gape (Whistler). Iris yellowish brown; upper mandible brownish black with brownish horny on base; lower mandible brownish horny, paler on base; legs and feet dull plumbeous, claws black; pads yellowish grey (Biswas).

1068. Malabar Wood Shrike. *Tephrodornis gularis sylvicola* Jerdon

Tephrodornis sylvicola Jerdon, 1839, Madras Jour. Lit. Sci., 10: 236 (Malabar Coast)
Baker, FBI No. 728, Vol. 2: 311

Plate 71, fig. 13

LOCAL NAMES. *Pūhāri lōlōra* (Hindi); *Asurakkātan* (Malayalam).

SIZE. Myna; length c. 23 cm (9 in.).

FIELD CHARACTERS. As of 1067, q.v.

STATUS, DISTRIBUTION and HABITAT. Resident and fairly common in well-wooded regions. Gujarat from the Narbada river south through Maharashtra to Tamil Nadu (confined to the western part), western Mysore (Malnaad) and Kerala. Found up to c. 1300 m in the Kerala hills and 1800 m in the Nilgiris and Palnis but is rare so high. Affects tall trees in evergreen and moist-deciduous forest, shade trees in cardamom plantations; sometimes even the drier zone in old teak plantations.

CUCKOO-SHRIKES, MINIVETS

9

Extralimital. See 1067.

GENERAL HABITS. Met with in small flocks, sometimes in the mixed hunting parties, flitting or parachuting from branch to branch after insects, making lithe aerial sallies after winged prey and returning to the same perch or moving on to the next. But their favourite hunting grounds are the trunks and branches where they will often cling to the bark and pry into the fissures for lurking insects. The flight is undulating with slow, sailing wing-beats; at times reminiscent of Spotted Owlet's — a few rapid flaps followed by a downward dip. In the evening the flocks may be seen bathing in a pool or stream, swooping down and dipping on the wing as flycatchers and drongos do (Betts).

VOICE AND CALLS. A loud, clear and musical quick-repeated *witoo-witoo-witoo* (4 to 6 times), occasionally punctuated by a harsh querulous single *chack* or *chrr*.

FOOD. Insects of the largest size, big moths, locusts and caterpillars.

BREEDING. Season, December to June, chiefly March and April. During the breeding season they become shy and secretive and the nests are hard to find. They are built on horizontal forks of branches six to nine metres from the ground. *Nest*, a shallow saucer about 10 cm in diameter made of roots, fine twigs and tendrils fastened together with cobweb and felted lichen, and secured with cobweb to the upper surface of a bough where it widens into a fork. The lining is of grass and leaf-stems. Two eggs appear to be the normal clutch (Betts); they are pale greenish white or buff, blotched and spotted with brown and with secondary markings of neutral tint. Average size of nine eggs 22 × 18 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *pelica* in having the crown and upperparts bluish grey merging gradually into dark ashy brown. Below it is a much darker vinous-ashy on the breast and flanks. Female also darker generally. Birds from Thailand and Malaysia are closer to *gylciola* than to their adjacent race *pelica*.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	112-120	25-30	19-21	79-84 mm
♀♀	111-121	23-27	19-20	80-88 mm (SA, HW)

COLOURS OF BARE PARTS. Male. Iris lemon-yellow or greenish yellow. Bill horny black. Legs and feet plumbeous (SA). Female. Iris khaki. Bill pale horn brown (Whistler).

(Londa, Bombay Presidency)
Baker, FBI No. 729, Vol. 2: 312
Plate 71, fig. 10

LOCAL NAMES. *Keroula* (Hindi); *Tariti-taiya* (U.P.); *Tentha*, *Tentheca* (Nepal); *Chudukka* (Bengal); *Anurattan* (Malayalam); *Ulapilla* (Telugu).

SIZE. Bulbul ±; length c. 16 cm (6½ in.).

FIELD CHARACTERS. A short and square-tailed plain greyish brown shrike-like bird with a dark stripe below the eye from lores to ear-coverts, and a conspicuous whitish supercilium; outer tail-feathers nearly all white. Sexes alike, only female has the eye-streak paler.

STATUS, DISTRIBUTION AND HABITAT. Resident and common over most of its range, south and east of a line from Cambay to Kumaon, Nepal (terai and up to c. 450 m), Assam and East Pakistan. Intergrades with *pallidus* in the Jodhpur area. Locally distributed in the Deccan. A bird of the lowlands avoiding hills though it may be abundant at their bases, exceptionally up to c. 1000 m (Kerala) but usually below 200 m. Replaces *T. gularis* in the dry zone and affects scrub and secondary jungle, lightly wooded country (sal, teak and other deciduous forest), roadside avenues and rambling jungly gardens in and around towns and villages.

Extralimital. Extends east to Thailand and Laos; replaced by *orientis* in Cambodia and Vietnam, *pallidus* in northwestern India and West Pakistan, and *affinis* in Ceylon.

GENERAL HABITS. A quiet, tame bird met with in pairs or small parties of 5 or 6 in trees and bushes, creeping about the leaves and branches like loras, hopping or volplaning from one to another and moving from tree to tree in follow-my-leader fashion. At times descends to the ground, or takes insects on the wing like a flycatcher. Frequently seen in mixed hunting parties. It has a superficial resemblance to shrikes, but is much closer to minivets in habits and behaviour.

FOOD. Beetles, moths, caterpillars and other insects, and spiders.

VOICE AND CALLS. Male has several pleasant, rather plaintive whistling notes *wret-wret*, followed by a quick interrogative *whi-ehi-ehi-ehi-ehi*?. Also some soft trills in the breeding season.

BREEDING. Season, mainly March and April but extends from February to July especially in the more southern parts. *Nest*, a neat, thick-sided cup

10

CAMPEPHAGIDAE

1069. Sind Wood Shrike. *Tephrodornis pondicerianus pallidus* Ticehurst

Tephrodornis pondicerianus pallidus Ticehurst, 1920, Bull. Brit. Orn. Cl., 41: 56
(Larkhana, Sind)

Tephrodornis pondiceriana freta Van Tyne & Koelz, 1936, Occ. Papers, Mus. Zool., Univ. Michigan, No. 334: 5 (Bhadwar, Kangra Dist., Punjab)
Baker, FBI No. 731, Vol. 2: 314

LOCAL NAME. *Keroula* (Hindi).

SIZE. Bulbul ±; length c. 16 cm (6½ in.).

FIELD CHARACTERS. As of 1070, q.v.

STATUS, DISTRIBUTION AND HABITAT. Resident in West Pakistan (Baluchistan [Hab Valley, Las Bela (?) and Sibi Plain (?)], Sind, and NW. frontier districts). Also Punjab, Delhi, western U.P., Rajasthan, Saurashtra and Kutch, south to a line from Cambay north and east to Kumaon. In

Tephrodornis pondicerianus

Distributional ranges
 ▨ *pallidus* (1069). ▨ *pondicerianus* (1070). ▨ *affinis* (1071).

babool and scrub jungle, better cultivated parts of arid regions, and groves of babool in the desert. In the plains generally and up to 900 m (Simla), rarely to 1400 m along the Duala Dhar.

GENERAL HABITS, VOICE AND FOOD. Those of the species (see 1070).

BREEDING. Season, February to June, mainly March and April. *Nest*, mostly under 3 m above the ground. Breeding biology otherwise much as in the nominate race. *Eggs*, 3 exceptionally 4; in a series, darker and duller than those of *pondicerianus* and often with a distinctly brownish buff ground. Average size of 30 eggs 18.9 × 15.1 mm (Baker).

12

CAMPEPHAGIDAE

of soft bark, fibres, etc., cemented with cobwebs and draped on the exterior with bits of paper-like bark or lichen which render it inconspicuous, and lined with silky vegetable down and fibres. Comparatively small for the size of the bird and as a rule difficult to find; diameter of cup c. 5 cm, depth 3 cm. It is entirely exposed, wedged tightly into the angle of a horizontal forked branch of a leafless tree, or sometimes concealed in thick foliage, from two to six, occasionally up to nine metres above the ground. It is usually completed in a week or ten days. *Eggs*, usually 3, rarely 4, pale greenish grey or cream with brown specks forming a ring round the broad end. Average size of 50 eggs 19 × 15.1 mm (Baker). Both parents build the nest, incubate, and feed the young; these are clad in grey down, exactly the colour of the nest and the lichen-covered bough on which it is built. Copulation on nest with one fresh egg has been observed (SA).

MUSEUM DIAGNOSIS. Sexes almost alike. Upperparts and lesser wing-coverts ashy brown, the rump-feathers white at base and at tips; upper tail-coverts black; broad supercilium whitish; lores, cheeks and ear-coverts dark brown (paler in ♀); underparts ashy, whiter on throat and belly; under tail-coverts white; flight-feathers and wing-coverts ashy brown; two outer pairs of tail-feathers white, the bases brown and a brown patch near the tip; the rest dark brown, the median tinged ashy.

Juvenile. Supercilium fulvous white; upperparts, lesser and median coverts brown with fulvous white triangular tips; upper tail-coverts dark brown with faint pale tips, greater coverts, tertials and innermost secondaries pale brown with pale edges and tips and an irregular dark contour line; primary-coverts dark brown with pale tips; ear-coverts dark brown; underparts white with obsolete brown streaks on breast and running up at side of throat to gape; tail as in adult, but feathers narrower and more pointed. Postjuvenile moult includes body, all coverts except primary, three or four innermost secondaries and tertials and whole tail. First-year as adult, except for light margin of unmoulted inner secondaries and pale tips to primary-coverts.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	82-94	19-23	(17) 19-22	59-73 mm
♀♀	80-89	18-23	(16) 19-21	56-71 mm (SA, HW)

Tail tends to be shorter in South Indian birds: ♂♂ 59-67; ♀♀ 56-63 mm.

Weight 9 ♂♂ 18-27 (av. 22) g—SA.

COLOURS OF BARE PARTS. Iris greenish brown. Bill horny brown, darker on culmen and at tips; mouth greyish pink. Legs and feet horny brown, claws darker. Juvenile. Iris brown. Bill horny brown; gape cream colour; mouth pale lemon-yellow. Legs and feet bluish slate; claws brown.

1071. Ceylon Wood Shrike. *Tephrodornis pondicerianus affinis* Blyth

Tephrodornis affinis Blyth, 1847, Jour. Asiat. Soc. Bengal, 16: 473 (Ceylon)
Baker, FBI No. 730, Vol. 2: 313

LOCAL NAMES. None recorded.

SIZE. Bulbul; length c. 16 cm (6½ in.).

CUCKOO-SHRIKES, MINIVETS

13

FIELD CHARACTERS. As in 1070, q.v.
STATUS, DISTRIBUTION and HABITAT. Ceylon, in all zones up to 1500 m, rarely higher and then only as a straggler. Edges of jungle, low spreading trees round village compounds, by the sides of roads, well-wooded country but not in dense forest. Commonest in the Dry zone.
GENERAL HABITS. As of 1070.
VOICE and CALLS. 'A frequently uttered whistle *twééé twee twee twee* on a descending scale which has a peculiar peevish quality' (Henry).
FOOD. Caterpillars, green crickets and other insects.
BREEDING. Season, January to August, mostly March to May. Nesting as in nominate race. Eggs, 2 or 3. Average size of fifty 19 × 15.1 mm (Baker).
MUSEUM DIAGNOSIS. Differs from *pondicerianus* in being much more grey and in having the white supercilium smaller. Tail shorter.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	81-88	21-23	16-18	54-59 mm
♀♀	81-86	21-23	16-18	54-58 mm (HW)

COLOURS OF BARE PARTS. Iris yellowish brown. Bill dark horn. Legs and feet dusky slate.

Genus CORACINA Vieillot

Coracina Vieillot, 1816, *Analyse nouv. orn.*: 37. Type, by subsequent designation, *Corvus papuensis* Gmelin (Gray, 1840)

Cf. Ripley, S. D., 1941, *Auk*, 58: 381-95; Delacour, J., 1951, *Amer. Mus. Novit.*, No. 1497: 1-15.

Contains birds in which the predominating colour is grey. Bill slightly bent down at tip and notched. Nostrils nearly concealed by plumes. Wing pointed; rectrices graduated.

CUCKOO-SHRIKES, MINIVETS

15

Pakistan. Extends to Mount Abu in Rajasthan but is absent in the desert portions. In plains and lower hills up to 1000 m (1200 m in Kerala). Well but rather patchily distributed in open wooded country such as gardens, cultivations with tall trees, groves often near villages, rubber plantations, light deciduous and mixed forest on the edge of evergreen.

GENERAL HABITS. A bird of the tree-tops found in pairs or loose parties which 'follow-my-leader', the flight being undulating with a few strokes of the wings alternated with short glides. Upon alighting on a branch it flicks up one wing, then the other, repeating this in 'a way reminiscent of a nervous gentleman tugging at his tie, an action rendering its identification easy at a distance' (SA). It indulges in this behaviour when courting, calling as it does so. In the breeding season it is a common sight to see a pair following one another from tree to tree uttering their distinctive shrill screaming calls to the accompaniment of a slight fluttering of the wings. Though keeping mainly to high trees, at times descends to bushes and even the ground to forage among dead leaves. Moves about a great deal locally in the non-breeding season.

FOOD. Mantids and other large insects and their larvae. Among stomach contents the following have been identified: weevils (*Astyce* and *Myloceus* spp.), bugs (*Nezara viridula*), crickets (*Gryllotalpa africana* and *Gryllodes melanoccephalus*) (Mason & Lefroy, 1912). Also feeds largely on the figs of the various wild *Ficus* spp.; caterpillars are fed to the young.

VOICE and CALLS. A very noisy bird. A long bisyllabic whistle *tee-treee* or *ti-tee*, of shrill parrot-like quality with the accent on the second syllable, frequently uttered as they fly among the tree-tops. See also General Habits.

BREEDING. Season, overall January to October, but mainly March to July. In western India there appear to be two periods of breeding, first February to April and again August to October. Nest, a shallow and rather flimsy saucer-shaped structure of twigs and grass coated exteriorly with cobweb, without lining, wedged or welded into the fork of a horizontal branch up to 18 metres above the ground, usually at more moderate heights; it is decidedly small for the size of the bird, about 13 cm in diameter and 3 cm deep. The normal clutch appears to be three in the Peninsula and two in Bengal. Ground colour yellowish buff — sometimes pale green — blotched with chocolate-brown markings distributed evenly over the surface. Average size of 22 eggs 31 × 22.4 mm (Baker).

MUSEUM DIAGNOSIS. Adult male has dark ear-coverts and black lores; throat and breast uniform grey, abdomen and flanks barred; centre of abdomen, vent and under tail-coverts white. In adult female lores dark coloured same as ear-coverts; throat, breast, abdomen and flanks barred, the barring usually extending further down than in the male, sometimes almost absorbing the white area.

First-year male and female after the postjuvinal moult alike and similar to adult female. He may however be distinguished from her by two points: (1) the primary coverts are more or less uniform in colour with a white edge running round the whole of the tip. In adults (both sexes) these coverts are blackish with marked grey edges and a white edge only on the outer side of the tip; (2) the outer tail-feather on each side is narrow and pointed, being of course retained from the juvenal plumage.

CAMPEPHAGIDAE

1072. Indian Large Cuckoo-Shrike. *Coracina novaehollandiae macei* (Lesson)

Graucalus macei Lesson, 1830, *Traité d'Orn.*: 349 (Calcutta, Bengal)

Baker, FBI No. 758, Vol. 2: 343

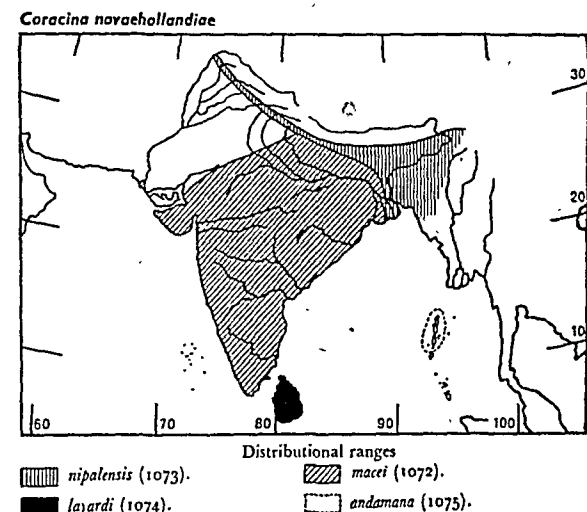

Plate 71, fig. 11

LOCAL NAMES. *Kāya* (Hindi); *Khāki popiya* (U.P.); *Kābāri* (Bengal); *Prāda ekurai* (Telugu); *Māṭā kārio* (Gujarati); *Bāhrām* (Saugar dist, M.P.).

SIZE. Pigeon —; length c. 28 cm (11 in.).

FIELD CHARACTERS. Male grey, whitish underneath, with a broad dark eye-streak. Wings and tail black. Heavy slightly hooked bill. Female has the eye-streak less conspicuous and her underparts are barred grey and white. Perches upright. The white rump-patch is conspicuous in flight.

STATUS, DISTRIBUTION and HABITAT. Resident but subject to local migrations in the non-breeding season. The entire Peninsula roughly south of a line from Kutch and Deesa (c. 24°N.) in northern Gujarat, east through northern Madhya Pradesh and Bihar to southern West Bengal and central East

16

CAMPEPHAGIDAE

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	153-173	27-31	24-27	111-134 mm
♀♀	156-167	26-30	23-27	108-135 mm

Tail tends to be shorter in S. Indian birds: Kerala ♂♂ 111-119, ♀♀ 108-119 mm (SA, HW)

COLOURS OF BARE PARTS. Adult: Iris reddish or orange-brown. Bill, legs and feet brownish or slaty brown. Juvenile. Iris brown. Bill slate, paler at base of lower mandible. Legs and feet bluish slate.

1073. Himalayan Large Cuckoo-Shrike. *Coracina novaehollandiae nipalensis* (Hodgson)

Graucalus Nipalensis Hodgson, 1836, *Ind. Rev.*, 1(8): 327 (Nepal)

Coracina jarensis lushaiensis Koelz, 1954, *Contrib. Inst. Regional Exploration*, No. 1: 15 (Sangau, Lushai Hills [= Mizo])

Baker, FBI No. 759, Vol. 2: 344

LOCAL NAME. *Talling-pho* (Lepcha).

SIZE. Pigeon —; length 30 cm (12 in.).

FIELD CHARACTERS. Like *macei* (1072) but larger; in addition, the adult female and the first-year male and female have the chin, throat and breast grey, followed by a certain amount of barring on the belly; the adult male is without any barring.

STATUS, DISTRIBUTION and HABITAT. Resident, nomadic, and apparently seasonal local migrant. The Himalayas from Rawalpindi (up to c. 1000 m) in West Pakistan east to Nepal, Sikkim, Assam, and East Pakistan to the Chittagong region; from the plains normally to 1800 m. In Nepal it ascends the hills up to 2400 m in summer, and is found up to 1800 m in winter, occasionally to 2400 m (Proud). Affects different types of forest. Generally keeps to openly wooded country but frequents also scrub jungle, and in Assam scanty scrub on the Brahmaputra *churs*. There is a withdrawal from the higher levels in winter.

Extralimital. Other races in southern China and south across Malaysia to Australia.

BREEDING. Season, April to June. Nest and eggs as in *macei*, the latter averaging 33.6 × 23.4 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *macei* (1072) in being larger. Adult female and first-year birds (both sexes) have the throat and breast grey, followed by a certain amount of barring; they are practically identical with the adult male of the nominate form though the amount of barring is somewhat less. Adult male uniform grey from throat to the white ventral patch, without any barring.

MEASUREMENTS

	Wing	Bill (from skull)	Tail
♂♂	175-193	30-34	126-148 mm

1077. **Dark Grey Cuckoo-Shrike.** *Coracina melaschistos melaschistos* (Hodgson)

Velocivora Melaschistos Hodgson, 1836, Ind. Rev., 1 (8): 328 (Nepal)
Baker, FBI No. 753, Vol. 2: 337
Plate 71, fig. 16

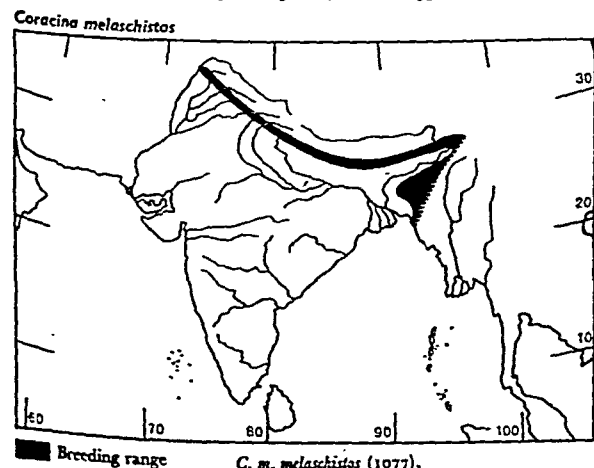

LOCAL NAME. *Kubasi* (Bengal).

SIZE. Between bulbul and myna; length 22 cm (9 in.).

FIELD CHARACTERS. Male. A dark bluish grey bird with dark eye-stripe; wings black; tail black, the central rectrices narrowly, the lateral ones broadly tipped white.

Female similar but paler grey and often with barred underparts as in the young. A roundish white patch under each wing, and white terminal margin to the tail conspicuous in flight, the latter particularly when the bird is alighting. Adult superficially confusable with adult Plaintive Cuckoo (584).

STATUS, DISTRIBUTION AND HABITAT. An altitudinal migrant in the Himalayas from Murree in West Pakistan (up to 2000 m) east through the outer ranges of Garhwal, Nepal and Sikkim (up to 1800 m), Bhutan (between 1000 and 1900 m), Assam (from 750 to 1500 m and up to 2100 in the Naga hills), and the hills of East Pakistan (winter). Does not breed in the lower foothills. In most of its range, particularly in the western part and in Nepal, it is a summer visitor in the hills from the end of March to October, wintering in the terai, duars and adjacent plains, and straggling in the Peninsular

CAMPEPHAGIDAE

18

BREEDING. Season, May and June. Nest undescribed, presumably as in *macei*. Eggs 2.

MUSEUM DIAGNOSIS. Adult ♂ of *nipalensis* type, but slightly paler and hardly different in colour from *siamensis* of Burma and Thailand.

Adult ♀ also like *nipalensis*, but paler, more especially on underparts, the grey throat and breast merging into pale indistinct barring on the underparts, which, however, does not extend as far down the abdomen.

First-year birds, paler above and below than *siamensis*; barring on underparts fainter, but extending from chin to lower breast.

MEASUREMENTS. Wing ♂♂ 173-176, ♀♀ 167-174 mm (HW).

COLOURS OF BARE PARTS. As in *macei*.

1076. **Barred Cuckoo-Shrike.** *Coracina striata dobsoni* (Ball)

Gauculus dobsoni Ball, 1872, Jour. Asiat. Soc. Bengal, 41: 281 (Andamans)
Baker, FBI No. 762, Vol. 2: 346
Plate 71, fig. 17

LOCAL NAMES. None recorded.

SIZE. Myna +; length c. 26 cm (11 in.).

FIELD CHARACTERS. Very similar to *novaeollandiae* but vent, under tail-coverts, face and throat grey. Furthermore, in the female the underparts below the breast, lower back, rump and upper tail-coverts are barred with black and white. The male has the flanks and rump faintly barred.

STATUS, DISTRIBUTION AND HABITAT. Resident. Andaman Islands, apparently confined to forest.

Extralimital. Other races in the Malay Peninsula and the islands of Malaysia to Celebes and the Philippines.

GENERAL HABITS. Unlike *novaeollandiae* exclusively a forest bird never venturing into the open fields. Often in association with mynas, minivets, drongos, etc. in the itinerant mixed hunting parties. Flight undulating and seldom extended beyond tree to tree or branch to branch, and is weaker than that of the Large Cuckoo-Shrike. Keeps fairly high up in the trees, usually in pairs.

FOOD. Unrecorded.

VOICE AND CALLS. A quiet bird without the noisy whistle of the Large Cuckoo-Shrike and has a pleasing short song (A. L. Butler).

BREEDING. No definite data. A nest with one egg, doubtfully of this species, recorded by Baker as taken in the latter half of April — a shallow cup well bound with cobweb, placed high in a tree. The egg measured 34 × 22 mm.

MUSEUM DIAGNOSIS. See Key to the Species; for details of plumage Baker, loc. cit. Postjuvinal moult of body, lesser, median and greater coverts. First-year bird distinguished by retention of juvenal characters in primary coverts, tertials and outer rectrices.

MEASUREMENTS. Wing ♂♂ 153-170, ♀♀ 151-172 mm (Baker, Richmond).

COLOURS OF BARE PARTS. Iris crimson. Bill, legs and feet black.

CAMPEPHAGIDAE

20

through Orissa, Madhya Pradesh and Andhra as far south as Mysore (Londa, c. 15°30'N.). Affects open forest, riverine bamboo jungle, pine forest, oak and chestnut woods, abandoned land, and groves.

Extralimital. Central and eastern China, Formosa and Indochinese subregion.

GENERAL HABITS. Arboreal. For the most part keeps well up in trees although it might be seen working through rough undergrowth. Once observed hopping about on the ground under tea bushes. Normally singly or in pairs, often associating with drongos and minivets in the itinerant hunting bands. Their general actions and behaviour — hopping and volplaning from branch to branch, upright stance when perched, and fluttering or hovering in front of leaf-sprigs to take insects — are all strongly reminiscent of the minivets and wood shrikes.

FOOD. Insects.

VOICE AND CALLS. A descending three- or four-note song *do-la-fa* (Fleming) syllabled as *pi-yo-to-be* or *twet-twet-twee-or*, fairly loud but rather monotonous and plaintive, uttered from a branch or in flight. Song period in Nepal, beginning of March till end of September (Proud).

BREEDING. Season, chiefly May to June. Nest, a shallow cup of pliant twigs, roots and fibres matted together with cobwebs, draped on the outside with lichens and bits of bark. Jones describes it as an extraordinary structure made almost entirely of caterpillars' web with their droppings still adhering to the exterior, while Osmaston describes a nest as a flimsy structure composed almost entirely of the dead deciduous shoots of *Phyllanthus* woven with cobwebs and decorated with lichen. It is fixed on or in the fork of a branch from three to eight metres above the ground. Eggs, usually 3, sometimes 2, rarely 4, pale olive-grey longitudinally blotched all over with pale brown. Average size of 30 eggs 24.3 × 17.4 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Species.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	118-128	19-23	21-24	111-123 mm (once 95, once 96)
♀♀	114-124	19-22	21-24	109-120 mm (SA, BB, SDR)

The sexes do not differ in size significantly.

Weight 4 ♂♀ 35-42 g (SA).

COLOURS OF BARE PARTS. Iris reddish-brown. Bill, legs, feet and claws black; soles dirty white, sometimes with a yellowish tinge (Biswas).

CORACINA MELANOPTERA (Rüppell)

Baker, FBI No. 756, Vol. 2: 340

LOCAL NAMES. None recorded.
SIZE. Bulbul; length c. 20 cm (8 in.).
FIELD CHARACTERS. As of 1079, q.v.
STATUS, DISTRIBUTION and HABITAT. Resident and local migrant; from Hoshiarpur and Kangra districts — possibly also adjoining submontane districts of W. Pakistan Punjab — (April to September) east to the Himalayan districts of U.P., up to c. 1000 m in the foothills. Winters in the adjacent

plains (exact localities not recorded). Affects open deciduous forest and scrub jungle.
Extralimital. Replaced by *sykesi* in peninsular India and Ceylon.
GENERAL HABITS, FOOD and VOICE. As of 1079.
BREEDING. Season, presumably July and August, but nesting unrecorded.
MUSEUM DIAGNOSIS. Differs from *sykesi* in being larger and darker on the back and upper tail-coverts, lower breast and belly.
MEASUREMENTS. Wing ♂ 107–112 mm; tail 85–92 mm (Koelz).
COLOURS OF BARE PARTS. Not recorded.

CUCKOO-SHRIKES, MINIVETS

23

wheel wheel wheel (Henry). The female has a monosyllabic chirp. One call is also described as 'a lazy buzzing snarl' (Nichols).
BREEDING. Season, chiefly March to May in Ceylon, April–May in the southern Peninsula, June to August in the Deccan, and June to September in the northern parts of its range. Nest, a shallow saucer c. 8 cm in diameter, made of dry grasses, lightly bound with cobweb, forming a compact and firm structure, but lacking the finish of the nests of minivets and wood shrikes, and devoid of any lining. Very small for the size of the bird and difficult to find; placed in the fork or on a bare branch of a large tree from two to eight metres above the ground. Eggs, 2 in Ceylon, and 3, sometimes 2 in the Peninsula; greenish white thickly blotched and streaked throughout with shades of pale brown, particularly towards the large end. Average size of 50 eggs 22.4 × 16.2 mm (Baker). The male shares incubation.
MUSEUM DIAGNOSIS. Differs from *melanoptera* in being smaller and paler on the back and upper tail-coverts, lower breast and belly.
MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	98–110	18–20	19–22	72–84 mm (once 94)
♀♀	98–104	17–20	20–22	71–80 mm (SA, HW, BB)

Weight 19 ♂♀ 24–36 g (SA).
COLOURS OF BARE PARTS. Iris dark brown. Bill, legs and feet horn brown.

1079a. **Nicobar Pied Cuckoo-Shrike.** *Coracina nigra davisoni* (Kloss)
Lalage nigra davisoni Kloss, 1926, Jour. Malay Branch Roy. Asiat. Soc., 4: 159 (Nicobar Islands)
Baker, FBI No. 757, Vol. 2: 341
Plate 71, fig. 15

LOCAL NAMES. None recorded.
SIZE. Bulbul; length c. 18 cm (7 in.).
FIELD CHARACTERS. Male. Above, forehead and superciliaries white; crown and mantle glossy black; back and rump pale grey; tail black with white tips; wings black and white. Below, white; breast washed with grey. Female brown above; dirty white lightly barred with black below. Young (immature) brownish, mottled above and streaked below.
STATUS, DISTRIBUTION and HABITAT. Resident; Nicobar Islands (Trinik, Camorta). Not yet recorded from Car Nicobar or Little and Great Nicobar. Affects forest edges and secondary growth.
Extralimital. Other races in the Malay Peninsula and the islands of Malaysia to Celebes and the Philippines.
GENERAL HABITS. Found in pairs or small parties in low scrubby undergrowth, feeding close to the ground.
FOOD. Insects.
VOICE and CALLS. Unrecorded.
BREEDING. Season? Eggs have been found in May. Nest, described as a slight structure of fine sticks fastened to a small branch with cobwebs, and

CAMPEPHAGIDAE

1079. **Peninsular Blackheaded Cuckoo-Shrike.** *Coracina melanoptera sykesi* (Strickland)
Lalage sykesi Strickland, 1844, Ann. Mag. Nat. Hist., 13: 36 (Calcutta, *ride* Baker = Dukhun, Sykes, 1832, Proc. Zool. Soc. London, pt. 2: 77, 87)
Baker, FBI No. 756, Vol. 2: 340
Plate 71, fig. 14

LOCAL NAMES. *Jungli kāsya* (Hindi); *Chhota bahram* (Saugar dist., M.P.); *Chirra akurayi* (Telugu); *Kālā mātāhāo kāsio* (Gujarati); *Karimtoppi* (Malayalam).
SIZE. Bulbul; length c. 19 cm (7½ in.).
FIELD CHARACTERS. Male, light grey with black head, wings and tail, the latter conspicuously white-tipped on all but the middle pair of rectrices; abdomen and vent white.
Female and young (immature) browner, with no black on head, the underparts buff-white, barred with dark brown except on the abdomen, vent and under tail-coverts.
STATUS, DISTRIBUTION and HABITAT. Resident, subject to considerable seasonal local movements. But silent in non-breeding season and then liable to be overlooked. Ceylon and the whole of the Indian peninsula east of a line from Kutch and northern Saurashtra roughly through Mount Abu to Barcilly. Nepal duns (one record, Hitaure May 21, Biswas), West Bengal (monsoon, June to September), Assam south of the Brahmaputra, Nagaland, Manipur, and East Pakistan (winter), in the plains and hills up to 1500 m. A rare resident in the Nilgiri Hills, found up to 2100 m but chiefly as a winter visitor (October to April). In Ceylon locally distributed in the lowlands, ascending to 1650 m on the eastern side but less high in the wetter western aspect. Affects secondary jungle, open light deciduous or mixed forest, thick hedges, fruit gardens, mango groves, young date scrub, mangroves.
Local Migration. Movements unclear. A marked passage has been recorded in June and again in September–October at Dhulia (Khandesh dist., Maharashtra) and Belgaum (Mysore). In Mysore and Kerala it is most common as a winter visitor.
GENERAL HABITS. Found singly, in pairs or small parties, often in association with the roving hunting flocks of tree-picks, babblers, wood shrikes, Grey Tits, minivets, etc. According to Wait the males are solitary out of the breeding season, the females and the young associating in small troops. The birds fly from bush to bush or tree, searching methodically the leaves and twigs as they proceed from branch to branch. They prefer tall trees and only occasionally do they descend to the ground in search of insects, progressing by long hops like a thrush.
Display. As the breeding season approaches, the male seems to become exceedingly vociferous and quarrelsome, darting repeatedly at his mate with outspread wings and tail and uttering all the while a sharply repeated chattering cry (E. H. N. Gill).
FOOD. Mostly insects; also berries (*Lantana*, *Ficus* figs, etc.).
VOICE and CALLS. The song consists of some clear mellow whistling notes followed by a quick-repeated *pit-pit-pit*, heard only during the hot weather and rains. Also rendered as *twit wit wūt tuy tuy tuy tuy* and *wit wit wheel*

CAMPEPHAGIDAE

24

covered with lichen externally; taken in very dense forest. Eggs 2, similar to those of 1079 but rather brown. Two eggs measure 21.8 × 16 and 22.1 × 15 mm.
MUSEUM DIAGNOSIS. See Key to the Species; for details of plumage Baker, loc. cit.
MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
3 ♂♂	88–92	18–19	19–21	65–72 mm
2 ♀♀	88, 89	18, 19	20, 22	69, 73 mm (Grubb)

COLOURS OF BARE PARTS. Iris brown or reddish brown. Bill, legs and feet black.

Genus PERICROCOTUS Boie

Pericrocotus Boie, 1826, Isis, col. 972. Type, by monotypy, *Muscicapa miniata* Temminck
Genus remarkable for its brilliant coloration in which reds and yellows predominate. Bill about half length of head, strong, hooked and notched. Nostrils concealed by plumes. Wing long and pointed; tail long and steeply graduated. Feet weak.

1080a. Andaman Scarlet Minivet. *Pericrocotus flammeus andamanensis* Beavan

Pericrocotus andamanensis 'Tytler' = Beavan, 1867, Ibis: 382 (Andaman Islands)
Baker, FBI No. 736, Vol. 2: 322

LOCAL NAMES. None recorded.

SIZE. Bulbul; length c. 21 cm (8½ in.).

FIELD CHARACTERS. As of 1080.

STATUS, DISTRIBUTION AND HABITAT. Resident. Andaman Islands, in forest. 'Not uncommon about Mt Harriet, Aberdeen, and other localities in the vicinity of Port Blair' (Hume, 1874, SF 2: 208).

GENERAL HABITS. As in *flammeus* (1081). Frequents the crowns of trees in small parties.

FOOD. Insects.

VOICE AND CALLS. None recorded.

BREEDING. Unrecorded.

MUSEUM DIAGNOSIS. The black extending over the whole length of the central rectrices is a distinctive character. First three primaries of adult male unspotted; first four primaries of adult female and young male unspotted.

MEASUREMENTS

LOCAL NAMES. Pākāri būlāchāshn (Hindi); Kēsariyo rājālāl (Gujarati); Māmbēla kūrri, Pētkūrri (Tamil); Gīri-kūrulla (Sinhala); Teekūrri (Malayalam).

SIZE. Bulbul; length c. 20 cm (8 in.).

FIELD CHARACTERS. As of 1080, q.v.

STATUS, DISTRIBUTION AND HABITAT. Resident. From about the Tapi river in Gujarat south through Maharashtra, Mysore and western Tamil Nadu to Kerala, east to the Shevaroy Hills. More common in the hills than in the plains; in the Nilgiris up to 1800 m; in the Palnis to the top of the hills. Ceylon, in the hills up to c. 2100 m and locally in the low country. Affects deciduous, mixed and evergreen forest.

GENERAL HABITS. Arboreal. In flocks of up to 20 birds or more in the non-breeding season, often in mixed hunting parties. Flits restlessly among the forest canopy hovering in front of a sprig or flower to capture insects

26

CAMPEPHAGIDAE

east through Nepal, Sikkim, Bhutan (common in the foothills), and the hills of Assam north of the Brahmaputra south to the Patkai Hills; breeding from c. 900 m up to at least 1800 metres (common from 1500 to 2700 m in Nepal — Proud, 1955, JBNHS 53: 62). Recorded in the plains at Lucknow

Pericrocotus flammeus

Distributional ranges

speciosus (1080). fraterculus (1082). semiruber (1083).
flammeus (1081). andamanensis (1080a).

(U.P.), Madhubani (N. Bihar) and in the Jalpaiguri district (northern W. Bengal). Affects forest only; in winter it may be seen in mango tops.

GENERAL HABITS, FOOD AND VOICE. As in *flammeus* (1081).

BREEDING. Season, April to July. Breeding biology as in *flammeus*. Average size of 13 eggs 22.4 × 16.8 mm (Baker). According to him the male also incubates.

MUSEUM DIAGNOSIS. See Key to the Subspecies. First two primaries in male unspotted (first three in female). In specimens from the western Himalayas the red of the central rectrices is usually absent. In the eastern Himalayas the red is more often found and is greater in extent though it seldom reaches the shaft.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	95-110	19-21	17-19	96-113 mm
♀♀	96-108	19-22	17-19	94-110 mm

Weight ♂♂ ♀♀ 28-37 g (SA).

COLOURS OF BARE PARTS. Iris brown. Bill black. Legs, feet and claws blackish brown.

28

CAMPEPHAGIDAE

and spiders and also makes short aerial sallies in pursuit of winged prey. Flight direct, with the graduated tail frequently spread, the flock flitting from tree to tree in follow-my-leader style.

Display. A display flight has been recorded in which the male — or both sexes — soars up with outspread wings, then spirals down, wings still outstretched, and alights on the top of a tree, the performance being repeated.

FOOD. Caterpillars, green crickets, cicadas and other insects.

VOICE AND CALLS. A sweet-toned clear double whistle *tree-tree* repeated every 2 or 3 seconds. Also *twety-tree-twety-tree-twety*, similar to that of *Hemipus* but somewhat irregular and readily distinguishable from the latter. The song is merely a more elaborate version of the same sounds, a shrill pleasant warble not often heard.

BREEDING. Season, in Ceylon mainly February-May, with a second brood in August-September; an occasional occupied nest may be found in other months (Henry); in Kerala nests are found in February and from June to September, therefore presumably having two broods; in Mysore from June to September, and in Maharashtra July-August. Nest, a neat small cup of lichens bound together with cobwebs, plastered with flakes of bark and spiders' egg-cases, and lined with mid-ribs of dry leaves harmonizing perfectly with the supporting branch; usually at a considerable height — 6 to 18 metres from the ground. Favourite sites are a tree growing on the edge of jungle or tall trees in tea plantations. Eggs, 2 or 3, pale blue-green, freckled with pale yellowish brown, lavender and grey; they measure about 23 × 17 mm. Incubation by female only, feeding of young by both sexes. When nest-young in danger from predator, e.g. tree pie, both parents observed fluttering frantically from branch to branch, screeching piteously as if wounded. The male with fluffed plumage even fell fluttering to the ground to heighten the effect.

MUSEUM DIAGNOSIS. Underparts in male more orange than scarlet; the first three primaries lack the red spot, and the central rectrices are wholly black; in the female the first three primaries lack the yellow spot.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	87-97	17-20	16-17	82-101 mm
♀♀	87-96	16-19	16-17	86-96 mm (SA, HW)

Weight 3 ♂♂ 25-27; 1 ♀ 25 g (Rensch, SA).

COLOURS OF BARE PARTS. Iris brown. Bill black; mouth pink, yellowish pink or brown and greyish pink. Legs, feet and claws black; soles yellowish.

1082. Burmese Scarlet Minivet. *Pericrocotus flammeus fraterculus* Swinhoe

Pericrocotus fraterculus Swinhoe, 1870, Ibis: 244 (Hainan)

LOCAL NAMES. Dās rīti gāḍā (Cachari); Ingōrā (Kacha Naga); Vēshēnē (Mikir); Sōrā pākhi (Comilla, E. Pakistan).

CUCKOO-SHRIKES, MINIVETS

29

SIZE. Bulbul; length c. 22 cm (8 in.).
FIELD CHARACTERS. As of 1080, q.v.
STATUS, DISTRIBUTION and HABITAT. Resident. Garo, Khasi, Cachar and Naga hills of Assam, Manipur (?) and south to the East Pakistan hills, from plains level to c. 1800 m. Affects open deciduous and evergreen forest.
GENERAL HABITS, FOOD and VOICE. As in *flammeus*. In courtship, described by McCann (JBNHS 34: 1061-2), a female flew up from branch high into the air accompanied by a feeble whistle. The male pursued and seized her tail-tip in his bill, both birds then spiralling down through space thus — 'like a plane "spinning"'. Male released female before returning to the same perch. These antics were soon repeated.
BREEDING. April to June. Breeding biology as in the nominate race. Egg measurements: 23 × 14.3 to 23 × 15.8 mm (Baker).
MUSEUM DIAGNOSIS. See Key to the Subspecies. In the adult male, the first two primaries lack the red spot and the central rectrices are wholly black; in the female the first three rectrices lack the yellow spot.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	90-97	13-14	c. 18	78-81 mm (Baker)

Wing ♂♂ 96-103; ♀♀ 93-101 mm (Deignan).
COLOURS OF BARE PARTS. As in *flammeus*.

1083. East Indian Scarlet Minivet. *Pericrocotus flammeus semiruber* Whistler & Kinnear

Pericrocotus speciosus semiruber Whistler & Kinnear, 1933, Jour. Bombay nat. Hist. Soc., 36: 340 (Sankrametta, Vizagapatam)

LOCAL NAME. *Sāyāli* (Bengali).

SIZE. Bulbul; length c. 22 cm (8½ in.).

FIELD CHARACTERS. As of 1080, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Resident. From western Madhya Pradesh (Betul) to Orissa, southern Bihar and West Bengal, and northern Andhra. Affects moist-deciduous and evergreen forest of the hill tracts.

GENERAL HABITS, FOOD and VOICE. As in *flammeus*. The males are said to have a 'superb courtship flight above the tree-tops in April and May'.

BREEDING. Season, presumably May and June as sexual display was observed during the latter end of April in the Visakhapatnam and Betul districts. Nesting as in *flammeus*.

MUSEUM DIAGNOSIS. Differs from *speciosus* in the greater amount of red in the tail. First two primaries unspotted in the male, first three (usually) in the female. The red on the central pair of rectrices usually occupies the terminal two-thirds of the outer webs. *P. f. fraterculus* has the central rectrices wholly black and is slightly smaller.

CUCKOO-SHRIKES, MINIVETS

31

Pericrocotus brevirostris

P. b. brevirostris (1084).

Extralimital. Extends to western Burma and western Yunnan. The species ranges to Kwangtung and North Vietnam.

GENERAL HABITS and FOOD. Similar to those of *ethologus*, q.v.

VOICE and CALLS. The following notes are described by Lister (JBNHS 52: 47) for *brevirostris*, but identity not absolutely certain. A shrill persistent *tiwi-twi* (first note lower) given by both sexes when perched or in flight. A churring *shrrri...shrrrei* (rising)... *twi-twi* (last note lower)... A loud *shi-chi-wi-chi-wi-chi-wau* (high-rising-low) with variations given by a female. *Twai-twi-twi* — *swit-twee* (high-low-low-rising) with variations given by male when flying round; also a more complicated song too involved and too rapid to record phonetically; the basis is a loud *switi* (pitched fairly high) with many variations and often run together to form phrases. Also recorded: a highpitched *se-sei* while foraging, a soft *wi...wi* given by both sexes, and calls in flight rendered as *re-wa-wa-wui* and *whi-whi-whi-see*. A comparative study of the vocalizations of *P. brevirostris* and its 'double', *P. ethologus*, seems desirable.

BREEDING. Unknown.

MUSEUM DIAGNOSIS. Adult male. Generally a deeper more crimson-red underneath than *P. ethologus*. Gloss of upperparts more purplish. Black of throat deeper, more glossy and extending farther down the throat. First primary all black. Distinguished from it mainly by the black secondaries, without a red margin. The central rectrices are narrowly margined with red on the outer webs. In the next pair, the red stretches not only on the outer web right up to the tip, but also over much of the inner web, so that the tip is wholly red with a black wedge-shaped zone from the base towards the edge ending about 25 mm before the tip.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	100-106	20-21	18-19	94-102 mm
♀♀	96-102	19-20	18	92-101 mm (HW)

COLOURS OF BARE PARTS. As in *flammeus*.

1084. Shortbilled Minivet. *Pericrocotus brevirostris brevirostris* (Vigors)

Muscipeta brevirostris Vigors, 1830, Proc. Zool. Soc. London: 43 (Himalayas = Sikkim foothills, *ride* Mayr, 1940)

Phaenicornis affinis McClelland, 1840 (1839), Proc. Zool. Soc. London: 157 (Sadiya, Assam)

Pericrocotus brevirostris sanguineus Koelz, 1952, Jour. Zool. Soc. India 4: 42 (Shillong Peak, Khasia Hills)
Baker, FBI No. 739, Vol. 2: 324, Plate 71, fig. 5

LOCAL NAMES. *Lālī rāja sorāi* (Assam); *Dao ribi kashiba* (Cachari).

SIZE. Bulbul —; length c. 17 cm (7 in.).

FIELD CHARACTERS. Male, a black and scarlet bird with a broad scarlet band running through the black wing, black throat, a black and scarlet steeply graduated tail, and a scarlet rump. Very similar to *ethologus* and difficult to distinguish from it in the field; in the latter the red extends down along the outer webs of the secondaries, forming a rough, inverted U on the wing.

Female has a grey back, yellow throat, and all the red parts of male replaced by yellow.

Young (first-year) male resembles female. Wing pattern of females is practically similar.

P. brevirostris may be distinguished by the more extensive yellow of the forehead (extending to the top of head) and on the sides of neck. Voice is probably different but comparative data are wanting. The slightly larger species *flammeus* is distinguished by the red spots on the secondaries (yellow in the female) separated from the larger wing-patch by a black band. Male of *solaris* has a dark grey, not black throat; female has a whitish throat contrasting with the remaining yellow underparts. *P. cinnamomeus* is smaller, has grey head, back and throat and yellow-orange belly; the female has the underparts whitish and an orange-red rump. *P. roseus* has grey upperparts and rosy red underparts. Except for the latter two species, shades of red in minivets cannot be appraised in the field.

STATUS, DISTRIBUTION and HABITAT. Resident, subject to vertical movements; much less common than *P. ethologus*, at least in the Himalayas. From west central Nepal (two records) to Sikkim, Bhutan, NEFA, Assam south to the Mizo Hills, Nagaland, Manipur and the hills of East Pakistan; from c. 1800 to 2400 m descending to the foothills in winter. Affects open deciduous forest, edges of evergreen, and secondary growth near cultivation.

32

CAMPEPHAGIDAE

In the female the throat is yellow, concolorous with the underparts; the yellow on forehead extends to the crown to the level of the eyes. This species is also a little smaller than *ethologus* with a relatively shorter tail.

MEASUREMENTS

	Wing	Bill (from skull)	Tail
♂♂	85-91	15	88-103 mm
♀♀	85-90	15	90-100 mm

Tail c. 105% of wing. (Stresemann, Mayr, BB)
Weight ♂♀ 16-17 g (SDR).

COLOURS OF BARE PARTS. Iris dark brown. Bill, legs and feet black.

Baker, FBI No. 738, Vol. 2: 323
Plate 71, fig. 6

LOCAL NAMES. *Wozul mini* (Kashmiri); *Chhōta pāhāri bālāchāsh* (Hindi); *Rājālsāi* (♂), *Rāni chāra* (♀) (Paharia).

SIZE. Bulbul —; length c. 18 cm (7 in.).

FIELD CHARACTERS. Male, a slim glossy black and deep scarlet bird with a large scarlet patch on the black wing, black throat and a black-and-scarlet graduated tail.

Female has a yellow throat and all the red parts of the male replaced by yellow. For distinction between this species and *P. brevirostris* as well as other members of the genus, see 1084 (under Field Characters).

STATUS, DISTRIBUTION and HABITAT. Mostly a summer visitor (March to October) along the Himalayas from the Sated Koh (Whitehead, *Ibis* 1909: 30), Chitral and the Kaisargarh Range (Stockley, JBNHS 34: 575; Christison, *ibid.* 43: 487 (recorded as '*speciosus*' or '*brevirostris*') east through Gilgit, Kashmir to central Nepal where it intergrades with *latus* (Büwas, JBNHS 58: 457). Breeds from c. 1200 to 3000 m; in east Nepal from 1500-3400 m (Diesselhorst). Birds recorded as high as 3900 m in northwestern Nepal (Lowndes); optimum zone 1800-2400 m. Winters (October to March) in the foothills, usually below 1000 m (up to 1500 m in Kathmandu Valley) and in the plains from Peshawar, the Salt Range and Bahawalpur east through Uttar Pradesh and Madhya Pradesh south to Betul, Seoni and Jabalpur. Straggles south to Sind (Malir near Karachi), Baluchistan (Sibi), Jodhpur, Mount Abu, Maharashtra (Sangola), Gujarat

CUCKOO-SHRIKES, MINIVETS

33

Pericrocotus ethologus

Distributional ranges

▨ *ethologus* (1085). ■ *laetus* (1086). ▤ *mariae* (1087).

(Deesa). Affects open forest (mainly pine forest in the western parts of its range) and trees bordering cultivated areas; in the plains in winter visits wooded compounds, mango groves, forest and tamarisk jungle.

Extralimital. A summer visitor to Nuristan (Afghanistan).

MIGRATION. No ringing data. Arrives in its breeding grounds at the end of March or early in April; after the breeding season, flocking starts in July and a leisurely descent takes place from August to November. Usually the foothills are reached by September and the plains by November though a few may come as early as September in the more northern plains. Some are found however in the hills up to 2000 m during the winter.

GENERAL HABITS. Highly gregarious except when breeding, parties of 20 to 40 or more individuals being met with as they fly from tree-top to tree-top. One of the conspicuous birds of the Himalayas. Strictly arboreal; flits from sprig to sprig, sometimes hovers in front of a flower and occasionally hawks insects in the air; seldom if ever descends to bushes. Sits upright while at rest.

FOOD. Ascertained food consists of spiders, orthoptera, hymenoptera, beetles, diptera and various larvae as well as buds of acacias and fruits.

VOICE AND CALLS. Notes recorded with certainty for this species are a finch-like *chib-chib* (Schäfer), also rendered as a mellow, interrogative *wee-twee?* (SA). Other calls recorded as *tig-tig-per-wa-lee* (Fleming), *switswit-swititit* and *swisweet-sweet-sweet* (Magrath) and a tit-like chatter when travelling along the tree-tops. Also a frequent 3-syllabled call well rendered by the word *minivet* (Diesselhorst). See also 1084.

BREEDING. *Season*, April (once in March) to June. *Nest*, a beautiful cup of grass bents, fine twigs or rootlets, thickly coated on the outside with

CUCKOO-SHRIKES, MINIVETS

35

the foothills and extending into the plains as far as southeast Orissa (Russell-konda), West Bengal and the Brahmaputra valley. Affects open forest, deciduous or evergreen.

GENERAL HABITS, FOOD AND VOICE. As in 1085.

BREEDING. As in 1085.

MUSEUM DIAGNOSIS. Male. Generally more orange or scarlet-red below than *P. brevirostris*. Gloss of upperparts more bluish or even greenish blue. Black of throat duller and more restricted to upper throat. Second innermost rectrix black except for a narrow red line along the outer web and an occasional small red spot on the inner web. Size generally larger; tail relatively longer. Distinguished from it mainly by the red margin on the secondaries; first primary with a whitish or pink margin along the outer web (all black in *brevirostris*). Female has a narrower yellow area on the forehead and a whitish or pale yellow upper throat.

Male (adult) is similar to that of *ethologus*, but the red in general somewhat deeper; very slightly smaller, the tail somewhat shorter.

Female (adult), crown of a pure dark grey with very little yellow on forehead, back almost solid olive-green; feathers around the eye white or yellowish white; yellow of underparts richer, more cadmium yellow, but upper throat still distinctly paler than breast and abdomen; ear-coverts greyish.

MEASUREMENTS

	Wing	Bill (from skull)	Tail
♂♂	89-95	15-16	101-107 mm
♀♀	86-92	15-16	98-108 mm

(Mayr, Stresemann, BB)

Tail c. 113% of wing.

Weight 1 ♂ 18; 1 ♀ 18 g (SA).

COLOURS OF BARE PARTS. Iris brown. Bill, legs, feet and claws black.

1087. Nagaland Longtailed Minivet. *Pericrocotus ethologus mariae* Ripley

Pericrocotus ethologus mariae Ripley, 1952 (May 20), Jour. Bombay nat. Hist. Soc. 50: 486 (Phek, eastern Naga Hills)

Pericrocotus brevirostris curvus Koelz, 1952 (Sept.), Jour. Zool. Soc. India 4: 42 (Himnitha, Lushai Hills)

Not in Baker, FBI

LOCAL NAME. *Dao ribi kashiba* (Cachari).

SIZE. Bulbul —; length c. 18 cm (7 in.).

FIELD CHARACTERS. As in 1085, q.v.

STATUS, DISTRIBUTION AND HABITAT. Resident subject to vertical movements. Nagaland, Manipur, southern Assam in Cachar and Mizo Hills, and East Pakistan in the Chittagong Hill Tracts; up to at least 1800 m. Affects open forest, deciduous or evergreen.

Extralimital. The Chin Hills of Burma. The species ranges east to central Vietnam and north to Manchuria.

GENERAL HABITS, FOOD AND VOICE. As in 1085.

BREEDING. Unrecorded.

MUSEUM DIAGNOSIS. Compared to *laetus*, the adult female is deeper and more pure grey on the upperparts, lacking the olive-green wash; rump and upper

CAMPEPHAGIDAE

34

cobweb and lichen. There is no real lining but occasionally a few feathers, down or hair are found. Placed towards the extremity of a horizontal branch high up in tall trees, usually between 15 and 24 metres from the ground, sometimes as low as 5 m. Eggs, 3 or 4, white usually tinged with pale green, spotted and blotched with light brown to blackish brown, with secondary marks of pale lavender and inky grey. Average size of 15 eggs 19.8 × 15.1 mm (Baker). Both parents build the nest and feed the young. One brood is reared. While their nest was being examined, the birds have been observed to 'turn their tail inward between their legs, spread out their wings, and flutter down from a neighbouring tree on to the ground just as a young bird which could scarcely fly would do' (Dodsworth).

MUSEUM DIAGNOSIS. Male (adult) similar to *laetus*; however differences are bridged over by individual variation (Mayr).

Female (adult) back very greyish with only a slight greenish tinge; a fair amount of yellow on forehead; underparts variable but generally pale lemon-yellow.

Young, upperparts, median and lesser coverts dark grey, rump and upper tail-coverts yellowish and all except last with subterminal blackish bars and narrow white tips; ear-coverts grey with darker bars; underparts greyish white, suffused with yellow and with dark bars; under tail-coverts pale yellow; greater coverts and tertials yellowish white at tip; rest of wing and tail as in adult. Postjuvinal moult includes body, all wing-coverts except primaries, and tertials. First-year males resemble females.

MEASUREMENTS

1086. East Himalayan Longtailed Minivet. *Pericrocotus ethologus laetus* Mayr

Pericrocotus ethologus laetus Mayr, 1940, Ibis: 717 (Jeyluck, Sikkim)
Not in Baker, FBI

LOCAL NAMES. None recorded.

SIZE. Bulbul —; length c. 18 cm (7 in.).

FIELD CHARACTERS. As in 1085, q.v.

STATUS, DISTRIBUTION AND HABITAT. Resident, subject to vertical movements. The Himalayas from central Nepal east to Sikkim, Bhutan, NEFA, Assam in the Khasi Hills and East Pakistan in the northeastern hills. Ludlow's report of '*P. brevirostris affinis*' as frequent between 1500 and 3300 m in Bhutan (Ibis 1937: 283) as well as Stevens's records of '*affinis*' up to 3600 m in winter in Sikkim probably pertain to *P. ethologus*. This species breeds in a higher zone than *P. brevirostris* but previous records are mixed up. The breeding zone appears to be between c. 1500 and 3300 m (up to 3500 m in Tibet). Most birds descend to lower altitudes in winter, reaching

CAMPEPHAGIDAE

36

tail-coverts somewhat richer, more orange-yellow. Below there is a rich, strong orange-yellow wash particularly on the lower throat, breast and abdomen. Adult male slightly deeper red. For distinguishing from *P. brevirostris* see 1086.

MEASUREMENTS. Wing 1 ♂ 88, 2 ♀ 85, 86; tail ♂ 100, ♀ 104 mm.

COLOURS OF BARE PARTS. As in 1086.

1088. Yellowthroated Minivet. *Pericrocotus solaris solaris* Blyth

Pericrocotus solaris Blyth, 1846, Jour. Asiat. Soc. Bengal, 15: 310 (Darjeeling)

Baker, FBI No. 742, Vol. 2: 326

Plate 71, fig. 4

LOCAL NAMES. *Dao tisha raja gaherba*, *Dao ribi gaherba* (Cachari).

SIZE. Bulbul —; length c. 17 cm (7 in.).

FIELD CHARACTERS. Male. Above, crown and back dark slaty, not black; rump and upper tail-coverts deep scarlet; wings and tail black and red. Below, chin greyish white; throat orange-yellow; rest of lower plumage bright scarlet.

Female. Above, crown, neck and upper back ashy grey, changing to olive-green on lower back and to dark yellow on upper tail-coverts. Wing and tail as in male but red replaced by yellow. Below, chin greyish white, rest of underparts yellow.

The male of this race differs from other minivets by the whitish chin and orange-yellow wash on the throat; the female by the whitish chin and absence of yellow on the forehead.

STATUS, DISTRIBUTION AND HABITAT. Resident, subject to vertical movements. Nepal where it appears to be scarce [observations and specimens from Deorali (Biswas, JBNHS 58: 457) are the only post-Hodgsonian records], Sikkim common and recorded up to 3000 m, Bhutan, common from 1500 to 3000 m (Ludlow, Ibis 1937: 283), the hills of Jalpaiguri district (W. Bengal), Assam (Abor, Cachar, Khasi and Manipur hills) and the hills of East Pakistan, up to the highest peaks. An old Kashmir record is very doubtful (Hume, SF 11: 97). Affects open forest.

Extralimital. Ranges east to northern and western Burma. The species extends through the Indochinese subregion, south China, Sumatra, Borneo and Formosa.

GENERAL HABITS. Little known. Essentially a montane species; arboreal like other minivets but seems to keep in smaller flocks and frequents the tops of tall trees.

FOOD. Insects.

VOICE. Unrecorded.

BREEDING. The only two nests recorded were found by Baker in June (the pairs form in April). *Nest*, a cup of twigs, roots and grass stems well interwoven and matted with cobweb, more or less covered with grey lichen, looking like an excrescence of the branch on which it is placed. Eggs 3, pale yellow-brown, marked with blotches of dark brown and purple-grey, or pale sea green flecked with tiny specks of pale reddish; size about 19 × 14 mm. Males also breed in subadult female plumage.

37

MUSEUM DIAGNOSIS. See Key to the Species.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♀	78-90	14-16	15-17	83-102 mm (BB, SA)

Weight 2 ♂♂ 11, 17; 2 ♀♀ 12, 16 g (SA).

COLOURS OF BARE PARTS. Iris deep brown. Bill, legs and feet brownish black.

1089. Rosy Minivet. *Pericrocotus roseus roseus* (Vieillot)

Muscicapa rosea Vieillot, 1818, Nouv. Dict. d'Hist. Nat., nouv. ed., 21: 486 (Bengal)
Baker, FBI No. 744, Vol. 2: 328

Plate 71, fig. 1

LOCAL NAME. *Dao ribi* (Cachari).

SIZE. Bulbul —; length c. 18 cm (7 in.).

FIELD CHARACTERS. Male, upperparts ashy brown; rump and upper tail-coverts rosy pink; wings and tail much as in other minivets but scarlet replaced by deep pink. Underparts from chin to vent rosy pink which distinguishes it from other species of the genus.

Female, like male but rosy and red parts replaced by pale yellow. Differs from other ♀ minivets in having an olive or olive-yellow, not bright yellow rump, but may be easily confused with immature ♀ Shortbilled Minivet (1084) on a casual sighting.

STATUS, DISTRIBUTION AND HABITAT. A partial migrant. Breeding in the lower zone of the outer Himalayas from N.W.F.P. eastward, and through the hills of Assam and Manipur, from 600 to 1800 metres (down to plains level in Upper Assam). There are no records from Nepal since Hodgson's days, one winter record from the Sikkim terai and no records from Bhutan, but it is reported as a fairly common resident in the hills and duars of Jalpaiguri district (W. Bengal). Obtained at 1000 m in December in the Naga Hills (Ripley). All records from the eastern Himalayas are from April to October. Winters widely but sporadically over the Peninsula, recorded west to Sind (once) and south to Delhi (once), Andhra (Godavari Valley), Maharashtra (Bombay environs, Aurangabad dist., Nagpur) and Kerala (no recent records), and appears to be rare. Not uncommon in Orissa and eastern Madhya Pradesh (Bastar dist.). All records from the Peninsula are from winter months except in the Visakhapatnam Ghats whence there are some April data. La Personne found them uncommon at Sankrametta and obtained specimens on 4 April, while Whistler thought 'the breeding season was commencing, to judge by the organs of the specimens collected' (Sankrametta, 4 April).¹ Affects deciduous or evergreen forest; also lightly wooded country and gardens.

¹ Possibly belated migrants?

♀♀	90-94	15-17	15-16	89-91 mm (SA, HW)

Weight 2 ♂♂ 14, 18; 2 ♀♀ 18, 19 g (GD).

COLOURS OF BARE PARTS. Iris dark brown. Bill, legs and feet black.

1089a. Ashy Minivet. *Pericrocotus divaricatus divaricatus* (Raffles)

Lanius divaricatus Raffles, 1822, Trans. Linn. Soc. London, 13: 305 (Singapore)
Baker, FBI No. 751, Vol. 2: 334 (= *cinereus*)

Plate 71, fig. 7

LOCAL NAMES. None recorded.

SIZE. Bulbul —; length c. 18 cm (7 in.).

FIELD CHARACTERS. A slim grey and white minivet distinguished from all others in having no red in the plumage.

Male. Above, forehead white; posterior crown and nape black; back and rump grey; tail black with white outer rectrices. Below, including sides of neck, white. A white patch on wing visible in flight.

Female, similar to male, but upperparts entirely grey, no black on crown; forehead faintly whitish.

STATUS, DISTRIBUTION AND HABITAT. An accidental winter vagrant recorded twice: near Port Blair, Andamans, 19 November 1897 (Butler, JBNHS 12: 394), and at Karnala, near Bombay, 31 January 1965 (Navarro, ibid. 62: 303). The latter, one of a pair, was collected in a rather thick patch of forest. Another pair was observed the same day.

Extralimital. Breeds in Amurland, Manchuria, Korea, central Japan and Formosa. Winters south to southern Tenasserim, Malaysia, Sumatra, Borneo and the Philippines.

GENERAL HABITS. Keeps in pairs or small flocks in association with other species. The Andaman bird was found in company with *P. flammeus*; the Bombay birds were in pairs in a mixed party of warblers and flycatchers and were moving in the light foliage canopy in forest about six metres from the ground.

FOOD. Insects.

VOICE AND CALLS. Navarro describes their calls as resembling the harsh voice of a shrike rather than the melodious and pleasant trilling call of other minivets. According to Austin (*Birds of Korea*), the rattling but somewhat musical call easily distinguishes them. Calls uttered when perched or in flight.

MUSEUM DIAGNOSIS. See Key to the Species; for details of plumage Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	95-101	c. 16	c. 17	86-94 mm (Baker)

COLOURS OF BARE PARTS. Iris dark brown. Bill and feet black.

38

CAMPEPHAGIDAE

Pericrocotus roseus

■ Breeding range Broken line = winter extension of *P. r. roseus* (1089).

Extralimital. Extends east through northern Burma and southern China to North Vietnam. *P. r. cantonensis* is found in China north of the range of *roseus*.

GENERAL HABITS. Little recorded. Gregarious after the breeding season and somewhat erratic in winter. Arboreal and rather more sluggish than other minivets, often sitting still on the tops of the trees.

FOOD. Insects.

VOICE AND CALLS. A squeaky whistling *whiririri-whiririri-whiririri*, very similar to the calls of the Pied Flycatcher-Shrike (1065).

BREEDING. Season, principally May and June (c/3 near Mussooree on 9 April, Mackinnon). Nest, much as that of *brevirostris* (1084) — a deepish cup — perhaps not so profusely plastered exteriorly with cobwebs or decorated with lichen although some nests are lined inside as well as outside with lichen. Main materials are roots, long needle-like twigs and stems of grass. Generally placed on a moss- or lichen-covered branch, from 3 to 10 metres above the ground, usually at a fair height and in dense or open forest; rarely in clumps of trees in open country or in a garden. Eggs, 3 or 4, nearly white, pale clay or olive-stone marked with blotches of dark brown and lavender, often decidedly more numerous at the large end. Average size of 40 eggs 19.4 × 15.2 mm (Baker). Nest building chiefly by female, as in other minivets, but male accompanies her when gathering material and putting it together.

MUSEUM DIAGNOSIS. See Key to the Species. Postjuvénal moult of body, lesser, median and most of the greater coverts and the tertials. First-year male like female but underparts have some pinkish feathers (perhaps not always).

West Pakistan along the valley of the Indus to Jammu, and southwest Punjab, up to c. 600 metres in the Himalayan foothills. Has been obtained in Baluchistan at Quetta in August, and quite possibly occurs in Sibi plains and Las Bela. Intergrades with *peregrinus* in Kutch, central Rajasthan (Mount Abu) and Kangra district, Punjab. Affects clumps of thorn (*Acacia*, *Prosopis*, etc.) and subtropical dry forest, scrub jungle, mango topes, sheesham plantations and wooded compounds.

Extralimital. A male collected in Khorasan (Iran) by Captain Watson was received by Baker (Bull. Brit. Orn. Cl., 40: 115, 1920).

GENERAL HABITS, FOOD AND VOICE. As in *peregrinus* (1093).

BREEDING. Season, March–April and August–September. Nest and eggs as in *peregrinus*.

MUSEUM DIAGNOSIS. ♂ Throat grey. Compared with the nominate race, the grey of the upperparts is paler; the flame colour of rump and upper tail-coverts less intense and yellower. Lower plumage white; yellow and red confined to a narrow band below the throat and a wash on the upper flanks. Wing-spot largely white; tail tips very pale. In the female, the upperparts, wing-spot and tail tips are paler even than in ♀ *peregrinus*.

MEASUREMENTS 'as in other races' (Baker).

FIELD CHARACTERS. As for the nominate race (1093) q.v.

STATUS, DISTRIBUTION AND HABITAT. Resident, the commonest of the minivets. From East Punjab (plains and Himalayan foothills up to 600 metres) where it intergrades with *pallidus*, east to Bihar along the Nepal terai where it intergrades with *viridis*, and south to northern Madhya Pradesh and northern Orissa. Affects open forest, scrub and bush country interspersed with small trees, roadway avenues, mango topes and orchards, and trees in cultivation.

CUCKOO-SHRIKES, MINIVETS

43

FIELD CHARACTERS. Male, head, throat and back dark grey, rump orange-red; wings black with a yellow-orange patch; a long tail, black above, yellow-orange below; breast bright orange becoming yellow on belly.

Female, upperparts as in male but paler; underparts whitish grey suffused with yellow (no black throat); wings as in male but yellow patch smaller and less bright; tail as in male.

STATUS, DISTRIBUTION AND HABITAT. Resident. From Saurashtra (Gujarat), southern Rajasthan, Madhya Pradesh and southern Orissa south through the Peninsula to Tamil Nadu and Ceylon, exclusive of the range of *malabaricus*. In plains and hills up to c. 1500 m; in Ceylon up to c. 1200 m in the Wet zone and 1650 m in the drier eastern regions. Affects deciduous forest, open scrub, groves of trees in cultivation, etc.

GENERAL HABITS, FOOD AND VOICE. As in *peregrinus*.

BREEDING. Season, in the Peninsula overall February–March to August–September varying locally; newly fledged young observed in November in central Maharashtra. In Ceylon main season February to May but an occasional nest may be found outside these months. Breeding biology as in *peregrinus*.

MUSEUM DIAGNOSIS. See Key to the Subspecies. The first-winter male at the postjuvinal moult assumes a plumage similar to that of the adult female. Almost immediately after the moult, however, odd feathers of the chin, throat and upper breast are accidentally lost and replaced by corresponding adult feathers, the process being accelerated by a partial spring moult of those parts. First-summer males are therefore distinguishable by a piebald black and grey throat with a slight nimbus of flame colour, and they breed in this state moulting to adult plumage in the postnuptial moult.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	66–72	13–14	16–18	66–76 mm
♀♀	65–71	13–14	16–18	68–75 mm (SA, HW)

Weight 1 ♂ 12 g (SA).

COLOURS OF BARE PARTS. Iris dark brown. Bill black. Legs, feet and claws horny black.

1094. Malabar Small Minivet. *Pericrocotus cinnamomeus malabaricus* (Gmelin)

Parus malabaricus Gmelin, 1789, Syst. Nat., 1: 1012 (Malabar Coast, type locality restricted to Mahé by Deignan)
Baker, FBI No. 747 (part), Vol. 2: 331

LOCAL NAME. *Techinnan* (Malayalam).

SIZE. Sparrow —, with longer tail. Length c. 15 cm (6 in.).

FIELD CHARACTERS. As of 1093, q.v.

STATUS, DISTRIBUTION AND HABITAT. Resident. Kerala north to north-western Mysore as far as Belgaum and Goa. Affects deciduous and mixed

42

CAMPEPHAGIDAE

GENERAL HABITS. A bird of the plains and less a forest species than *P. flammeus*. Purely arboreal; goes about in small flocks of 8 to 10 or so in the non-breeding season, frequently in mixed company of wood shrikes, flycatchers and others. Flits about in the foliage, hunting insects among the leaves, sometimes fluttering before a sprig or launching short aerial sallies in pursuit of winged prey.

FOOD. Moths, caterpillars and other insects.

VOICE AND CALLS. In flight and when foraging, the birds give a constant chorus of high feeble whistles, *swee-swee* . . .

BREEDING. Season, overall March to September, presumably a first brood in March to May and a second in July to September. Nest, a deep little cup of fine twigs, grass stems, chips of lichen, dead leaves or bark bound together with cobwebs and welded to the upper surface of a branch or in a fork, and lined with rootlets; walls extremely thin though firm and strongly woven. Diameter of the nest about 5 cm; invisible from below and appears to be a part of the branch itself. Eggs, usually 3, sometimes 2, exceptionally 4, pale blue or greenish white with stipples of red-brown which in some tend to form a zone at the broad end. Average size of 80 eggs, 16.4 × 13.1 mm (Baker). Both sexes share in construction (chiefly female) and in tending the young; incubation apparently by female alone; she is fed on the nest by the male.

MUSEUM DIAGNOSIS. ♂ Throat blackish or sooty grey. In intensity of colours, this subspecies is intermediate between *pallidus*, *cinnamomeus* and *viridis*. See also 1093, Museum Diagnosis.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	63–72	12–14	14–16	65–77 mm
♀♀	64–72	12–13	14–16	65–78 mm

COLOURS OF BARE PARTS. Iris dark brown. Bill black; mouth pinkish orange. Legs and feet horny brown.

1093. Southern Small Minivet. *Pericrocotus cinnamomeus cinnamomeus* (Linnaeus)

Motacilla cinnamomea Linnaeus, 1766, Syst. Nat., ed. 12, 1: 335 (Ceylon)

Pericrocotus peregrinus ceylonensis Whistler & Kinnear, 1933, Jour. Bombay nat. Hist. Soc., 36: 344 (Cocawatte, Ceylon)

Pericrocotus cinnamomeus sidhoutensis Koelz, 1939, Proc. Biol. Soc. Washington, 52: 69 (Sidhout, Cuddapah, Madras)

Pericrocotus peregrinus dharmakumari Koelz, 1950, Amer. Mus. Novit., No. 1452: 6 (Jambala, Junagadh, Kathiawar)

For discussion on nomenclature and taxonomy, see R. S. Van Schauburg, *Treubia*, 11: 309–12, 1930.

SIZE. Sparrow —, with a longer tail. Length c. 15 cm (6 in.).

44

CAMPEPHAGIDAE

forest, plantations and cultivated areas; from the plains up to c. 1000 m in the hills.

GENERAL HABITS, FOOD AND VOICE. As in *peregrinus*. A courtship is described as consisting largely of the male chasing the female, uttering a feeble but excited *swee-swee* . . .

BREEDING. Season, overall March to October; as in *cinnamomeus*, there appear to be two main periods one from March to May, the other in July–August. Nest as in *peregrinus*. Eggs 3, rarely 4 or 2. Average size of 30 eggs, 16.6 × 13.4 mm (Baker). A pair and a third bird (♀-plumaged) have been observed working together at nest-building, all three later feeding the chicks cooperatively (Neelakantan, JBNHS 49: 554–5).

MUSEUM DIAGNOSIS. Differs from *cinnamomeus* in being considerably darker and more richly coloured, with the chin and throat glossy black instead of dark grey or sooty grey (in male).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	69–75	12–14	16–17	66–74 mm
♀♀	68–76	13–14	c. 15	67–70 mm (SA)

COLOURS OF BARE PARTS. Iris brown. Bill, legs and feet blackish brown; mouth pale flesh to slaty pink (in juvenile, gape and mouth pale orange-brick colour).

1095, 1092. Eastern Small Minivet. *Pericrocotus cinnamomeus viridis* Baker¹

Pericrocotus cinnamomeus viridis Baker, 1920, Bull. Brit. Orn. Cl. 40: 114 (Attaran River, Amherst Dist., Tenasserim Div., Burma, restricted to Pabyouk, 22 m. SE of Moulmein, by Deignan)

Pericrocotus peregrinus thai Deignan, 1947, Jour. Washington Acad. Sci. 37: 254 (Amphoe Chom Thong = Ban Luang, Chiang Mai Province, northwestern Siam)
Baker, FBI No. 746, Vol. 2: 331

LOCAL NAMES. *Ghōlō sāl sōyālī* (Bengali); *Das ribi gejo-i-cha* (Cachari); *Igerai* (Kacha Naga).

SIZE. Sparrow —, with longer tail. Length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 1093, q.v.

STATUS, DISTRIBUTION AND HABITAT. Resident, not common. From the western Nepal terai where it intergrades with *peregrinus* (Ripley, JBNHS 49: 382; Rand & Fleming, *Fieldiana* 41: 102), West Bengal, Orissa south to extreme northeastern Andhra Pradesh where it intergrades with *cinnamomeus* (Whistler, JBNHS 36: 342), east through the duars and Assam north

¹ Further examination of series of this form from India, Burma, Thailand and the Andamans convinces us that this is a population of varying amounts of colour on the underparts including the throat in the male. In addition two male specimens (one the unique type of *superstus* Deignan, 1947, the other a male from the Andamans) have large bills. Other Andaman birds have moderate bills equivalent in size to the mainland population, and the pale underparts of Andaman females can be matched in series. We believe that *thai* Deignan, 1947 and *superstus* Deignan, 1947 (Tenasserim) are therefore synonymous with *viridis*.

and south of the Brahmaputra, Nagaland, Manipur, East Pakistan and the Andaman Islands. From the plains up to c. 1600 m, in forested areas, open country and gardens; also mangroves in the Andamans.

Extralimital. Extends to Burma, Thailand and Laos; other subspecies in Vietnam, Cambodia, Malaysia, Indonesia and Palawan.

GENERAL HABITS, FOOD AND VOICE. As in *peregrinus*.

BREEDING. Season, February to June, chiefly March and April; May to July in the Andaman Islands. The nest is placed high in trees, up to 12 metres. Other nesting habits as in *peregrinus*. Eggs, usually 3 sometimes 2 or 4. Average size of 50 eggs 16.8 × 13.8 mm (Baker).

MUSEUM DIAGNOSIS. Darker and browner above than *peregrinus*, the throat rather a blacker grey and the lower parts brighter yellow with the red of the breast extending further down. Separable from *pallidus*, *peregrinus* and *cinnamomeus* by the absence of white on the underparts; from *malabaricus* by its breast being less flame-coloured and chin less consistently black.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	66-72	12-14	16-18	66-76 mm
♀♀	65-71	13-14	16-18	68-75 mm

COLOURS OF BARE PARTS. As in *peregrinus*.

1096. **Whitebellied Minivet.** *Pericrocotus erythropygius erythropygius* (Jerdon)
Muscicapa erythropygia Jerdon, 1840, Madras Jour. Lit. Sci., 11: 17 (S. India = Ajanta)
Baker, FBI No. 749, Vol. 2: 332
Plate 71, fig. 2

LOCAL NAMES. *Kābārōrājālāl* (Gujarati); *Sāfid rājālāl* (Hindi, Madhya Pradesh).
SIZE. Sparrow —, with a longer tail. Length c. 15 cm (6 in.).

FIELD CHARACTERS. Male, distinguished from other minivets by its contrasty black and white or pied coloration, and white wing-patch, forming a V-shaped design when seen from the rear. Rump orange-red; tail black and white. Below, breast orange-red; rest of underparts white.

In the female the black parts are replaced by dark brownish grey; forehead and lower plumage white; rump white and orange.

STATUS, DISTRIBUTION AND HABITAT. Resident. Locally distributed in peninsular India southeast of a line from Ambala, Jodhpur and Kutch, south and east to Belgaum, Hyderabad, the Chota Nagpur plateau, southwest Bihar and southeast U.P. Reported by Baker to occur in the dry districts of West Bengal. His record (*apud* Stewart) of its breeding, or even occurrence, in Kerala (loc. cit. and *Nidification*, 2: 300) lacks confirmation, but it has been observed at the foot of the Nilgiris (W. Davison, SF 10: 366). One record only north of the Ganges: Tirhut, north Bihar, in April (Hume collection). Apparently an occasional wanderer to Sind in winter (Karachi, Ticehurst, 1922, *Ibis*: 614). Affects babool, *Prosopis* and *Butea* jungle in broken stony country; also semi-desert facies interspersed with bushes of *Salsadora*, *Euphorbia*, etc. and open grassy forest in the drier regions.

¹ The illustration is of the extralimital Burmese race *albifrons* (male) from which ours differs in having no white on the forehead, and black sides of head, and throat.

Pericrocotus erythropygius

Distributional range of *P. e. erythropygius* (1096)

Extralimital. *P. e. albifrons* is found in central Burma.

GENERAL HABITS. Less arboreal than other minivets and much more addicted to open grassy scrub-and-bush country than they. Keeps in small parties of six to eight individuals in the non-breeding season. Has been noted hovering over and dropping into grass, and also pecking at weeds a foot or so high. Perches erect. Flight very like a wagtail's or bunting's — a few flaps followed by a dipping glide. The sexes appear to segregate outside the breeding season; somewhat erratic in winter.

FOOD. Insects and spiders.

VOICE AND CALLS. 'A whistle often reminiscent of a wagtail's *teept-teept*. Also a short sweet song' (Dharmakumarsinhji). Agitated alarm-notes, e.g. when nest in danger, very like the *chit-chit* of the Baya (*Ploceus philippinus*) but slightly more musical.

BREEDING. Season, June to October, mainly between July and September. Nest, a little cup of fibres composed inside of fine flowering stems of grasses and coated outside with silky vegetable down and cobwebs; as a rule not ornamented with moss or lichen as in other minivets; placed fairly low down in bushes one or two metres from the ground, always in a vertical or horizontal fork; apparently not on the upper side of horizontal branches. Eggs, normally 3, greyish white or rarely greenish grey densely covered with longitudinal blotches of grey-brown with paler secondary marks of grey. Average size of 30 eggs 17.3 × 13.5 mm (Baker). Both sexes build, incubate and tend the young *sic* J. Davidson. 'Female alone incubates. Male was often seen feeding female while she was incubating' (Dharmakumarsinhji).

MUSEUM DIAGNOSIS. See Key to the Species and Field Characters. Postjuvinal moult includes body, lesser, median and greater coverts.

49

GENERAL HABITS, FOOD, VOICE AND BREEDING. As in *humei* and other races.

MUSEUM DIAGNOSIS. Compared with the nominate subspecies (1098), this race is much yellower on the crown and on the rest of upperparts, more gold on the throat and upper breast. The outermost rectrices often have broad edges of yellow and the black inner rectrix of the male is washed broadly on the distal end with green-yellow. The bill averages larger and the wing longer.

MEASUREMENTS. Wing 4 ♂ 63-65, 3 ♀ 63-65 mm.

COLOURS OF BARE PARTS. As in *tiphia*.

1098. Common Iora. *Aeginthina tiphia tiphia* (Linnaeus)

Molacilla Tiphia Linnaeus, 1758, Syst. Nat., ed. 10, 1: 186

(Benghala = neighbourhood of Calcutta)

Baker, FBI No. 362, Vol. 1: 340

SIZE. Sparrow; length c. 14 cm (5½ in.).

FIELD CHARACTERS. Male. A showy black and yellow tit-like arboreal bird with two white bars across the wing.

Female. Yellowish green throughout with greenish brown wings instead of black, also with two white bars.

In non-breeding plumage the male resembles the female, but retains his black tail. See Museum Diagnosis.

× c. 1

STATUS, DISTRIBUTION AND HABITAT. Resident

and common in most of its range subject to erratic movements in the non-breeding season. The Himalayan foothills from Uttar Pradesh east through Nepal (terai, duns and foothills up to c. 2000 metres even in winter; visits the Nepal Valley from mid July to the beginning of September), Sikkim (exceptionally up to c. 1700 m), Bhutan (recorded at Diwangiri = Deothang, c. 800 m and in central Bhutan), West Bengal, East Pakistan and Assam. Affects open forest, forest edges, cultivation, outskirts of villages and scrub-jungle.

Extralimital. Arakan (Burma); the species extends through the Indo-chinese subregion, Sumatra, Java, Bali and Borneo.

GENERAL HABITS AND FOOD. As in *humei* and other races.

VOICE AND CALLS. The call-note is rendered as *chee-chit-chit-chit*; also a sparrow-like call. Song very varied; one is described by Heinrich as composed of two syllables, the first an extraordinarily long, high and thin whistle, the second a sharp accentuated whistle beginning on the same tone as the first and quickly falling to a lower tone. It has been rendered as *we-e-e-tu*. According to Roseveare, it is a three-syllable whistle reminding one of an oriole's *oh, here we are*. See also Display under General Habits of *Ae. t. humei*.

FAIRY BLUEBIRDS, IORAS, ETC.

51

Display. The male fusses around and about his seemingly uninterested mate, stopping still at frequent intervals to fluff out the white rump-feathers, cock his tail, droop his wings and raise his head skywards in a stately posture—a picturesque flaunting of black, white and gold. Each time the head is raised the throat swells and gives vent to a very faint but clear, sweet and musical whistle, or a long-drawn sibilant *chee*. The scene changes suddenly, and in a paroxysm of excitement, he flits from branch to branch to the accompaniment of a loud twittering and fluttering of wings, to spring perpendicularly into the air a metre or two, hovering, fluffing out and parachuting down like a ball of feathers on to some nearby perch. The same spectacular antic is repeated again and again.

FOOD. Insects and larvae; spiders. Among the insects specifically identified in stomach contents are the beetles (Coleoptera) *Myllocerus discolor* and *M. blandus*, *Tanymericus hispidus*, *Scymnus nubilans*, *Rhyssalus germanus*, and the ant *Camponotus compressus* (Formicidae) (Mason & Lefroy, 1912).

VOICE AND CALLS. Has a wide repertoire of sweet clear whistles common to all races but in markedly different dialects, e.g. as between northern and southern birds. The Hindi name *Shaubeggi* is onomatopoeic of one of the commonest calls. Some other familiar ones may be syllabified thus:

1. If you-PLEASE repeated several times (about once per second) alternated by one or two interrogative *SEE me-please?*

2. A mellow whistle *piyou* or *peyou* repeated (about twice in three seconds) 20 times or more, followed by a similar run of softer long-drawn sibilant whistles *whetee-choo*. This kept up almost unbrokenly for 30 minutes or more at a time.

3. A plaintive, querulous *chee-where? chee-where?* and so on, quickly repeated (about twice in three seconds).

4. For long stretches throughout the day, especially in the monsoon and when overcast and drizzling, a loud mellow whistle *My... DADDY* repeated monotonously for over 15 minutes at a stretch, interlarded after every two or three calls with *phero* (by accompanying female?). The pair keeps in touch with each other by mellow whistles and short musical chirrups. See also 1098, and Display under General Habits (above).

BREEDING. Season, May to September, chiefly July and August. Nest, a neat compact cup of fine grasses or fibres, well plastered over with cobwebs, placed in a crotch of twigs at heights from 1 to 9 metres, most often between 2 and 4 metres. The supporting twigs are either worked into the wall of the nest or firmly wound round with cobwebs. Mango, citrus, *Bauhinia* and *Zizyphus* trees are largely favoured. Eggs, almost invariably 3, but sometimes, probably in the case of second laying, 2; pale pinkish white, blotched with purplish brown, with a wide range of variations. Average size of 20 eggs 17.5 × 13.5 mm (Baker). Both sexes partake in building the nest. In one case the nest took five days to complete and there was a pause of a day before the first egg was laid. Eggs laid at intervals of about 24 hours, evidently in the early morning. Incubation starts with the first egg but it is fitful and irregular until the clutch is completed; incubation period about 14 days. Both sexes incubate and tend the young. Only the female was found brooding at night (SA). During the first five days after hatching, the female alone observed to brood the young for about ten minutes

50

IRENIDAE

BREEDING. As in *humei*. Eggs, 2 or 3, exceptionally 4; normally pale pinky white, blotched with purplish brown, but highly variable. For descriptions see Baker, *Nidification*, 1: 318. Average size of 60 eggs 17.6 × 13.9 mm.

MUSEUM DIAGNOSIS. Male. Upperparts mainly black, head and back usually with some yellow, rump greenish yellow; two white wing-bars; underparts yellow. Many breeding males have practically no black on upperparts other than the wing and tail. In winter the male becomes similar to the female but the tail remains black and the underparts are rather brighter.

Female, almost entirely greenish yellow with brown wings; duller and greyer than in *humei*. Also has two wing-bars.

Young (imm.) male. Summer and winter plumage normally alike, a rather dull dark green, the black on the upper plumage in winter being obsolete (Punjab), confined to faint traces of mottling or occasional black feathers (U.P.), or patches (Bengal). Lower plumage duller and greyer in winter and less bright yellow in summer. Female duller and greener than in *Ae. t. humei*.

MEASUREMENTS

	Wing	Bill (from skull)	Tail
♂♂	62-66	18-19	49-52 mm
♀♀	60-65	18-19	50-59 mm (BB, SDR)

Weight 1 ♂ 12; 1 ♀ 15 g (BB).

COLOURS OF BARE PARTS. Iris pale yellow. Bill bluish slate, black on culmen and whitish on tip of upper mandible. Legs and feet plumbeous; claws bluish slate; soles white (BB). Iris whitish grey, bill slate grey, culmen black; legs slate grey (SDR).

1099. Central Indian Iora. *Aeginthina tiphia humei* Baker

Aeginthina tiphia humei Baker, 1922, Fauna Brit. Ind., Bds. 1: 342 (Raipur, M.P.)

Baker, FBI No. 364, Vol. 1: 342

LOCAL NAMES. *Shauberga* or *Shaubeggi* (Hindi); *Shobinga* (Gujarati); *Cheroka* (Marathi).

SIZE. Sparrow; length c. 14 cm (5½ in.).

FIELD CHARACTERS. As of 1098, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident. From Saurashtra, Mount Abu, the plains of Uttar Pradesh and Bihar (where it intergrades with *tiphia*), south to lat. 20°N. and east to northern Orissa and southwestern West Bengal. In cultivated country interspersed with large trees, groves about villages, roadside avenues and wooded compounds in towns as well as light deciduous forest. Where the evergreen and deciduous types of vegetation are intermingled, the Iora invariably keeps to the deciduous facies, in thin jungle and scrub.

GENERAL HABITS. Usually found in pairs, often in the mixed hunting parties, searching for caterpillars and insects among the foliage, hopping from twig to twig and frequently clinging sideways or upside down to peer under the leaves.

52

IRENIDAE

every third time she fed them, her wings outstretched to protect them against the sun. A very large proportion of eggs and chicks suffer destruction from house and jungle crows, crow-pheasants, snakes, monitor and *Calotes* lizards.

MUSEUM DIAGNOSIS. Male in summer with black predominant in the upper plumage and often considerable traces of a yellow collar on the hindneck. Male in winter plumage, and female, a clearer and paler green than *Ae. t. tiphia*.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	61-69	16-20	18-22	44-55 mm

Weight 4 ♂ 13-17; 8 ♀ 12-15 g (SA).

COLOURS OF BARE PARTS. As in nominate race.

1100. Peninsular Indian Iora. *Aeginthina tiphia deignani* Hall

Aeginthina tiphia deignani Hall, 1957, Ibis, 99: 148 (Yawdwin, Pakokku dist., Central Burma)

Baker, FBI No. 362 (part), Vol. 1: 340

LOCAL NAMES. *Patsu-jitta* (Telugu); *Pachapera*, *Sinna mampala-kūrūi* (Tamil).

SIZE. Sparrow; length c. 14 cm (5½ in.).

FIELD CHARACTERS. As of 1098, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident in the low country and up to about 1000 metres. The Indian Peninsula south of lat. 20°N., excluding southern Kerala. Affects light deciduous forest and semi-cultivation.

Extralimital. Northern and central Burma excluding Arakan.

GENERAL HABITS, FOOD AND VOICE. As in *humei* (1099). Courtship noted to be in general progress about mid December.

BREEDING. Season, overall January to August, chiefly April and May. Nest, a shallow cup, about 6 cm in diameter, built of shreds of bark, so thickly covered externally with cobweb as to appear almost white, and lined with a little grass. Placed from one to nine metres from the ground in bushes or trees, slung in the horizontal fork of an outlying twig or in an upright crotch. Both birds assist in building and incubation; in one case the male did not feed the young himself but handed over the caterpillars which he brought to the hen for distribution. Eggs, 2 or 3, rarely 4, similar to those of other subspecies. Average size of 20 eggs 17.5 × 13.5 mm (Baker). Nest frequently parasitized by the Baybanded Cuckoo (*Cacomantis sonneratii*, 582).

MUSEUM DIAGNOSIS. Head and back of male in non-breeding dress grey-green, intermediate between the pale green washed with white of *humei* and the dark green washed with black of *multicolor*—a greyer green than of nominate *tiphia*. The same differences appear in the green rump and lower back in breeding plumage, and in a lesser degree in the green of the female. Breeding plumage of males always with some black, intermediate between the gold-and-black collared *humei* and the solid black of *multicolor*.

MEASUREMENTS AND COLOURS OF BARE PARTS. As in *humei* (1099).

FAIRY BLUEBIRDS, IORAS, ETC.

53

1101. Ceylon Iora. *Aegithina tiphia multicolor* (Gmelin)*Fringilla multicolor* Gmelin, 1788, Syst. Nat., 1: 924 (Ceylon)*Motacilla zeylonica* Gmelin, 1788, Syst. Nat., 1: 964 (Ceylon)Baker, FBI No. 363, Vol. 1: 342 (= *zeylonica*),

LOCAL NAMES. *Dadi-dee* (Malayalam); *Nambala chittu* (Tamil); *Pattra-jitta* (Telugu); *Ca-kurullā* (= yellow bird), *Panu-kurullā*, *Kirikaye* (Sinhala).

SIZE. Sparrow; length c. 14 cm (5½ in.).

FIELD CHARACTERS. As of 1098, q.v.

STATUS, DISTRIBUTION and HABITAT. A common resident up to c. 900 m, occasionally up to 1500 m or higher. Kerala from southern Malabar district, south of the Palghat Gap (where it intergrades with *deignani*), Rameswaram Island and Ceylon. Affects light deciduous forest, mixed bamboo jungle, mango and cashew gardens around villages and homesteads; prefers the dry zone and avoids evergreen.

GENERAL HABITS. Keeps in pairs, searching assiduously for caterpillars and insects among the leaves of bushes and trees. The flight is a straight flutter from tree to tree. Other habits and display as in *humei*, q.v.

FOOD. Insects, especially caterpillars.

VOICE and CALLS. The birds keep in touch with each other by frequently calling in a variety of sweet-toned whistles which have a rather drowsy quality. The song is a long-drawn crescendo *weee-e-e-e-ee-oo*, the last syllable dropping suddenly; other variations are *wee-wee-to* and *whip-wee-bird-ee* (Henry). See also under 1099.

BREEDING. Season, overall January to August, chiefly April to June. Nesting as in *deignani*. Eggs, 2 rarely 3, matt white with bold streaks and blotches of slate-grey and brown which tend to run longitudinally and to form a zone around the large end. Average size c. 18 × 13 mm.

MUSEUM DIAGNOSIS. Male in summer plumage darker, with the black of the upperparts more extensive and less broken by yellow bases; second wing-bar generally absent. Lower plumage very bright canary yellow. Male in winter plumage a dark and duller green, in some specimens washed with black producing a curious sooty appearance not found in the other Indian races.

Female on the average darker than in other races.

MEASUREMENTS and COLOURS OF BARE PARTS. As in *humei* (1099).

1102. Marshall's Iora. *Aegithina nigrolutea* (Marshall)*Iora nigrolutea* Marshall, 1876, Stray Feathers, 4: 410 (Meerut)*Aegithina nigrolutea sulfurea* Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 9 (Sihor, Saurashtra)

Baker, FBI No. 368, Vol. 1: 346

Plate 72, fig. 5

LOCAL NAMES. *Hārēwā* or *Sābē hārēwā* (Hindi, Nepali); *Hārēwā* (Bengali); *Skalem-pho* (Lepcha).

SIZE. Bulbul; length c. 19 cm (7½ in.).

FIELD CHARACTERS. An active leaf-green arboreal bird with orange forehead, blue shoulder-patches and slightly curved black bill; lores, around eye, ear-coverts and lower throat black; chin and cheeks dark blue. Can be distinguished from the very similar *cochinchinensis* by its orange forehead; from *hardwickii* by its green belly, green tail, and black of throat not extending to breast.

STATUS, DISTRIBUTION and HABITAT. Resident, subject to some local movements. Himalayan foothills up to c. 1800 m, from Garhwal and Simla to Nepal and Assam south to Chota Nagpur and the Rajmahal Hills, Bihar, Orissa and East Pakistan. Affects deciduous and evergreen forest in lightly wooded open country and secondary scrub.

Extralimital. The species extends to the Indochinese subregion and Sumatra.

GENERAL HABITS. Entirely arboreal, keeps in pairs or small parties to thick foliage of trees where its plumage blends perfectly with the green leaves, making it difficult to spot. Hunts systematically among the foliage for insects, clinging upside down and in all manner of acrobatic positions, sometimes swinging itself round and round a twig like a trapeze performer. Flight strong and rapid. Is a great bully, adopting aggressive dog-in-the-manger tactics to keep away other birds from its feeding tree.

All chloropses are important 'flower-birds' and responsible for pollinating the blossoms of numerous species of trees and shrubs in their quest for nectar.

54

IRENIDAE

black with broad white tips, instead of black in male and green in female. The green plumage of both sexes is paler and more suffused with white.

STATUS, DISTRIBUTION and HABITAT. Resident. Replaces the Common Iora in West Pakistan and northwestern India, from the N.W.F.P. through West and East Punjab, southern Uttar Pradesh south through western Madhya Pradesh to and including the Satpuras, west to Kutch and Rajasthan. May occur in southeastern Sind. Specimens showing *nigrolutea* characters collected within the range of *Ae. tiphia* may be variants of the latter; such specimens have been obtained from southern Bihar, West Bengal, Khandesh, Tamil Nadu and Mysore. Two adult specimens collected in Gwalior are intermediate between *Ae. t. humei* and *Ae. nigrolutea* and one specimen from Ceylon is intermediate between the latter and *multicolor*. The status of *Ae. nigrolutea* as a distinct species is not settled. 'It is a problem that presents a challenge to geneticists and field workers alike' (Hall, loc. cit. *supra*). But see Voice and Calls. Marshall's Iora affects sparse scrub, thorn jungle and groves of trees.

GENERAL HABITS and FOOD. As in *humei* (1099); the display is also similar.

VOICE and CALLS. Commonly *whetzi whetzi*, quite distinct from those of the Common Iora, though of the same general pattern. The sibilant whistles of the male are more plaintive-sounding, and rather reminiscent of the Quaker Babbler. The harsh alarm-notes recall those of the Wood Shrike, particularly the large *Tephrodornis gutturalis*. 'I found the notes of the two so distinct, in fact, that after having met the Common Iora all through Gujarat, I detected the presence of this species at Deesa at once by ear' (SA).

BREEDING. Season, June to August. Breeding biology as in *Ae. t. humei*. Nest, usually in low shrubs 1-2 metres from the ground. Eggs, 2 or 3, indistinguishable from those of the Common Iora. Average size of 20 eggs 17.5 × 13.5 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters. The juvenal plumage is indistinguishable from that of *humei*.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	62-65	14-18	17-19	43-47 mm
♀♀	61-64	14-17	c. 19	45-51 mm (SA)

Weight 8 ♂♂ 11-14; 9 ♀♀ 10-14 g (SA).

COLOURS OF BARE PARTS. Iris dark brown; bill horny plumbeous, the culmen darker; legs and feet light plumbeous (Baker).

Genus CHLOROPSIS Jardine & Selby

Chloropsis Jardine & Selby, 1827, Ill. Orn., Pt. 1, text to pl. 5. Type, by original designation, *Turdus Cochinchinensis* Gmelin

Arboreal birds, predominantly green. Bill slender and curved, about as long as head, well adapted for nectar eating, notched at tip; nostrils oval; rictal bristles weak; frontal feathers advanced up to the nostrils; wings rounded; tarsi very short.

56

IRENIDAE

Chloropsis aurifrons

Distributional ranges
 ■ *aurifrons* (1103). ■ *frontalis* (1104). ■ *insularis* (1105).

FOOD. Berries, insects including flying ants, spiders, nectar of many flowers (*Erythrina*, *Loranthus*, *Salmalia*, etc.).

VOICE and CALLS. Normal call-note, a musical drongo-like *swich-chick-chick-wee* (accent on first syllable, last much prolonged whistle-like — SA). Also a repeated *tzik* and a *chup-chaw* (Fleming). Is an accomplished mimic; very convincing imitations of various birds' calls are given in quick succession (see also *C. a. frontalis*).

BREEDING. Season, May to August. Nest, a loose cup or shallow saucer of fine twigs, grass, leaves and moss, semi-pensile, attached near the tip of an overhanging branch by shreds of grass and strips of bamboo leaves, lined with rootlets and fine grass-stems; reinforced exteriorly with cobweb. Nests built between upright twigs are similar in construction but often deeper. Favourite site usually high up in a tree, nine to twelve metres from the ground, and on very thin branches; sometimes on smaller saplings and trees. Eggs, 2 or 3, pale cream or buffy cream, freckled or lightly blotched all over with pale reddish, usually more so towards the large end, but not forming rings or caps. Average size of 20 eggs 23.4 × 15.5 mm (Baker).

MUSEUM DIAGNOSIS. Distinguished from other races by its blue chin and throat.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	90-103	24-26	18-20	65-77 mm
♀♀	89-94	24-25	—	65-70 mm (BB, Fleming)

Weight 1 ♂ 35 g (Rensch); 1 ♀ 29 g (BB).

FAIRY BLUEBIRDS, IORAS, ETC.

57

COLOURS OF BARE PARTS. Iris dark brown; bill black; legs greenish slate; feet plumbeous; claws black; soles yellowish white (BB).

1104. **Southern Goldfronted Chloropsis.** *Chloropsis aurifrons frontalis* (Pelzelin)

Phyllornis frontalis Pelzelin, 1856, Sitzungs. math. Acad. Wiss. Wien, 20: 157, pl. 2, fig. 1, ex Natterer MS. (Khelgate, near Goa)

Chloropsis aurifrons davidsoni Baker, 1920, Bull. Brit. Orn. Cl., 41: 8 (Malabar) *nom. nov.* for *Turdus malabaricus* Gmelin, 1788, preoccupied
Baker, FBI No. 369 (part), Vol. 1: 348

LOCAL NAMES. *Chhōta hārīāl* or *hārīāl* (Hindi).

SIZE. Bulbul; length c. 19 cm (7½ in.).

FIELD CHARACTERS. As for *aurifrons* (1103) but chin black.

STATUS, DISTRIBUTION and HABITAT. Resident, common in the western parts of its range, rarer in the east. S. Gujarat and Maharashtra from the Tapi river south through Goa, western Mysore (Malnaad), western Tamil Nadu to the Palghat Gap, and the Eastern Ghats in Tamil Nadu and Andhra Pradesh; from plains level to about 1200 m, in the Nilgiris up to 1800 m. Affects heavy scrub, dense evergreen forest and open deciduous and secondary jungle, and teak plantations. Seems to prefer more thickly wooded country than *cochinchinensis*.

GENERAL HABITS. As in the nominate race, q.v.

FOOD. Insects, spiders, berries and the flower nectar of *Erythrina*, *Loranthus*, *Butea*, *Salmalia*, *Musa*, *Woodfordia*, *Firmiana* and numerous other plants.

VOICE and CALLS. A very loud and voluble rattle. This species is such an accomplished mimic of the calls of other birds that it frequently passes for them and is overlooked. It has been heard imitating to perfection the following species: Tailor Bird, Redwhiskered Bulbul, Black Drongo, Iora, Whitebreasted Kingfisher, Rufousbacked Shrike and Magpie-Robin. The calls are often intriguing since they are produced long after the originals have left the locality on seasonal migration. The different imitations follow one another in quick succession without a break, its own song of several notes being wedged in between the imitations; thus a single chloropsis hidden in a leafy tree will often fool the listener into imagining a whole concert of mixed species within! (SA). Call-note, a shrill whistle.

BREEDING. Season, overall February to August, chiefly June-July. Nest and eggs, as in *aurifrons*.

MUSEUM DIAGNOSIS. Differs from *insularis* by its larger size, and from *aurifrons* by its black chin. As in the nominate race, female very much like male but distinguishable by smaller, duller patch of orange on forehead, smaller blue carpal patch, and slightly smaller size.

59

1106. **Orangebellied Chloropsis.** *Chloropsis hardwickii hardwickii* Jardine & Selby

Chloropsis hardwickii Jardine & Selby, 1830, Ill. Orn., Add., 2: 1 (Nepal)
Baker, FBI No. 371, Vol. 1: 349

Plate 72, fig. 4

LOCAL NAME. *Dao-gurum ho gatang* (Cachari).

SIZE. Bulbul; length c. 19 cm (7½ in.).

FIELD CHARACTERS. Male. Above, leaf-green with a pale greenish blue shoulder-patch and dark purplish blue wings and tail appearing black at a distance. Below, dull orange belly, blue-black throat and chin and sides of head with a dark blue moustachial streak. The orange belly and blackish tail distinguish it from other chloropses.

Female, almost entirely green, a pale blue shoulder-patch; orange of underparts paler and less extensive, blue moustachial streak. Tail green; no black on throat.

STATUS, DISTRIBUTION and HABITAT. A common resident, subject to altitudinal movements in the Himalayas, from Simla east through Nepal, Sikkim, Bhutan, Assam, Manipur and the hills of East Pakistan; from c. 600 to 2250 m (Nepal) and from 1200 to over 2400 m (Naga Hills), optimum zone around 1200 m. Occupies a higher zone than *aurifrons*; descends lower in the non-breeding season when it is found in the plains of Assam. Affects open scrub, dry- and wet-deciduous and evergreen forest; more partial to the last than other chloropses.

Extralimital. Extends east to northern Thailand and northwestern Indochina. Represented by other races in southern China, Hainan, Malaysia and Sumatra.

GENERAL HABITS. Arboreal. Keeps generally in pairs or in small parties to the foliage canopy, occasionally gathering in larger parties at blossoming trees in company with sibilas, spiderhunters, sunbirds, white-eyes, etc. Inseparable from parasitic *Loranthus*-infested trees. Very acrobatic in its movements as it hops about and clings amongst the clumps to probe into flowers for nectar.

FOOD. Insects, spiders, berries and nectar (*Loranthus*, *Bassia*, etc.).

VOICE and CALLS. A remarkably versatile songster and like its congeners an accomplished mimic. Has perhaps the fullest, longest and sweetest song of the genus. This may be heard the year round but more regularly from March to May and from October to December (Proud). Its vocabulary includes the notes of bulbuls, drongos, tits, and the call of the Crested Serpent Eagle. Some song phrases (noted by Lister):

1. *tshwatshishi-watshishi-watshishi*

2. A soft, tit-like *titi-titi-titi-titi-ti*

3. A low *tp-tp-tp-tp*

4. A loud, rapid *ti-ti-tyi*, the latter note repeated about seven times and followed by a prolonged hoarse, scolding note

5. *piti-piya-piya-piti*

6. *tyacil-tyacil-tya*, repeated.

BREEDING. Season, May to August. Nest, similar to that of the Goldfronted Chloropsis: a cradle of roots and fibres suspended near the end of

58

IRENIDAE

In first-winter plumage both sexes lack the orange forehead, while the black gular patch and the blue moustachial streaks of the adult are replaced by pale green.

MEASUREMENTS

♂♂	87-101	23-26	18-20	69-77 mm
♀♀	83-95	23-25	18-20	64-71 mm (HW)

Weight 1 ♂ 36 g (Rensch).

COLOURS OF BARE PARTS. As in *insularis*.

1105. **Ceylon Goldfronted Chloropsis.** *Chloropsis aurifrons insularis* Whistler & Kinnear

Chloropsis aurifrons insularis Whistler & Kinnear, 1932, Jour. Bombay nat. Hist. Soc. 35: 752 (Cotta, N.P., Ceylon)
Baker, FBI No. 369 (part), Vol. 1: 348

LOCAL NAMES. *Nil-kurullā*, *Girā-kurullā* (Sinhala); *Pachai kūrūri* (Tamil); *Ilakkili* (Malayalam).

SIZE. Bulbul —; length c. 18 cm (7 in.).

FIELD CHARACTERS. As for *aurifrons* but chin black.

STATUS, DISTRIBUTION and HABITAT. Resident. Widely but locally distributed, in moderate numbers, in Kerala south of the Palghat Gap¹ (c. 10° 45' N.), also Palni Hills, and Ceylon throughout the lowlands and lower hills to c. 1200 m. Affects mixed deciduous and evergreen forest; commonest in damper hill districts.

GENERAL HABITS. As in the nominate race, q.v.

FOOD and VOICE. As in *frontalis*.

BREEDING. Season, January-February; in Kerala a bird was observed feeding a full-fledged juvenile on 30 November. Nest, presumably as in the nominate race. Two eggs are described as being pale cream, variously spotted or blotched with pale reddish or red-brown; size c. 21 × 15 mm.

MUSEUM DIAGNOSIS. As *frontalis* but smaller. There is a cline in size from south to north. See also 1104, Museum Diagnosis.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	86-94	22-25	18-20	65-70 mm
♀♀	87-88	22-24	18-20	59-64 mm (HW, SA)

COLOURS OF BARE PARTS. Adult, iris hazel brown. Bill ♂ black, ♀ horny brown; mouth pinkish flesh to slaty pink. Legs and feet grey or plumbeous; claws brown. Juvenile, bill pale horny brown; mouth livid pink; rest as in adult (SA).

¹ Boundary fixed arbitrarily for convenience.

60

IRENIDAE

an overhanging branch 6 to 9 metres above the ground, rarely below 3 m. Eggs, similar to those of *aurifrons*; average size of 22 eggs 22.8 × 15.9 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Species. Juvenile entirely green with little or no orange-yellow on the belly. Postjuvenile moult includes body, lesser, median and inner greater coverts and inner two tertials, but apparently not wings and tail.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	93-100	21-26	19-21	73-79 mm
♀♀	88-94	22-25	18-19	65-72 mm (BB, Fleming, SA, SDR, Stresemann)

Weight ♂♂ 32-40; ♀♀ 25-34 g (SDR).

COLOURS OF BARE PARTS. Iris dark brown; Bill black. Legs bluish grey; feet bluish slaty; claws black; soles white (BB).

CHLOROPSIS COCHINCHINENSIS (Gmelin)

Key to the Subspecies

Outer webs of primaries blue.....*C. c. cochinchinensis*
Outer webs of primaries green.....*C. c. jerdoni*

1107. **Jerdon's Chloropsis.** *Chloropsis cochinchinensis jerdoni* (Blyth)

Phyllornis jerdoni Blyth, 1844, Jour. Asiat. Soc. Bengal, 13: 392 (Central India)
Baker, FBI No. 374, Vol. 1: 352

LOCAL NAMES. *Hārīcā* (Hindi); *Wanna bojanum* (Telugu); *Ilakkili* (Malayalam); *Nil-kurullā*, *Girā-kurullā* (Sinhala).

SIZE. Bulbul —; length c. 18 cm (7 in.).

FIELD CHARACTERS. Male, very similar to *aurifrons* but lacks the orange forehead which is yellowish green; black area of chin and throat smaller and not extending behind eye; yellow ring (penumbra) around black throat broader.

In female, black chin and throat of male replaced by pale bluish green; cheek-stripe bright greenish blue.

STATUS, DISTRIBUTION and HABITAT. Resident, on the whole fairly common, more so in the hills; rather patchily distributed in the plains. From the Gulf of Cambay to central Uttar Pradesh, east to West Bengal, south throughout the Peninsula and Ceylon, normally up to c. 1000 metres (1200 m in the Palnis). Affects secondary scrub jungle, forest edges, groves, and large leafy trees on village outskirts or standing amidst cultivation and grazing land. Prefers somewhat more open and drier country than Goldfronted Chloropsis, but the two species often overlap.

GENERAL HABITS. Arboreal, usually frequenting the foliage canopy, admirably camouflaged among the leaves. Behaviour much as *aurifrons*. Keeps solitary or in pairs; family parties for some time after the young are fledged. Most often seen feeding among *Loranthus* clumps and flowering trees. A pugnacious bird chivvying and driving away other nectar-seekers

FAIRY BLUEBIRDS, IORAS, ETC.

61

Chloropsis cochinchinensis

Distributional ranges

jerdoni (1107).

cochinchinensis (1108).

from its feeding tree even though in a remote part of it. Flight undulating and rapid. For a note on anting, see JBNHS 38: 628-31.

FOOD. Insects such as green tree-crickets, red ants, mantises, caterpillars; berries and wild figs (*Ficus*); nectar of *Loranthus*, *Helicteres*, *Salmaia*, *Erythrina*, coconut and many other flowers.

VOICE AND CALLS. A wide range of harsh as well as lively whistling notes, similar in general pattern to those of *aurifrons* but a few characteristic. Also a very good mimic, imitating to perfection drongos, bulbuls, tailor birds, tree pies, jungle babblers, shrikes, cuckoo-shrikes, etc., even the Shikra and the Striped Squirrel. Its own distinctive notes are occasionally wedged in between the mimicry. These given one after another in quick succession over long periods (once timed 40 minutes — SA).

BREEDING. Season, poorly defined; nests have been found every month, mainly between November and May in the more southern parts of its range (in Ceylon February to May; occasionally October — Phillips); from March to September in the north. *Nest*, a fairly deep cup of fine rootlets, plastered on the outside with cobwebs and vegetable fibres; suspended hammock-wise between leaf-stems or branching end-twigs at the extremity of a bough, usually six to nine metres from the ground. *Eggs*, normally 2, rarely 3, pale creamy or pinkish white sparingly marked with specks, blotches and hair-lines of blackish, purplish and reddish brown, chiefly about the broader end. Average size of 31 eggs 21.1×15.1 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Subspecies and Field Characters. Immature birds (both sexes) differ from adult female by absence of yellow wash on forehead,

FAIRY BLUEBIRDS, IORAS, ETC.

63

Genus *IRENA* Horsfield

Irena Horsfield, 1821, Trans. Linn. Soc. London, 13: 153. Type, by original designation, *Coracias puella* Latham

Bill shorter than head, stout, curved, slightly notched at tip; nostrils oval, partly concealed by frontal plumes; rictal bristles well developed. A few hairs (filoplumes) spring from nape. Wing long but rounded, 4th quill (as.) longest. Tarsus short and stout. Upper and under tail-coverts very long.

1109, 1110. Fairy Bluebird. *Irena puella puella* (Latham)¹

Coracias puella Latham, 1790, Index Orn., 1: 171 (India, restricted to Travancore [S. Kerala])

Plate 72, fig. 14

Cf. Delacour, J., in Peters's Check-list, vol. 9, 1960: 307, footnote.

LOCAL NAMES. *Pena-kara-kürüci* (Telugu); *Lalita* (Malayalam); *Deo gateng* (Cachari).

SIZE. Myna +; length c. 27 cm (11 in.).

FIELD CHARACTERS. Male. Above, brilliant ultramarine blue; below, deep velvety black with blue under tail-coverts.

Female. Dull blue-green with blackish lores.

STATUS, DISTRIBUTION AND HABITAT. Resident subject to seasonal wanderings. Range disjunct — as follows:

- (1) Heavy rainfall area of south-western India from about Ratnagiri district in Maharashtra, south to the southern parts of the Western Ghats in Kerala, from the plains to c. 1800 metres, and the hills of western Tamil Nadu (Nilgiris, Palnis, etc.); on the east it has been reported only from the Chitteri range. Betts records it as a cold-weather visitor to the central plateau of Coorg, arriving in November. There are old records from Mahableshwar, Khandesh and Vidarbha (Berar). Extinct in Ceylon where the last record appears to have been in 1877.

- (2) Southeastern Nepal foothills (Jhapa dist. — Fleming), Sikkim and Bhutan foothills, Jalpaiguri duars, Assam, Manipur and the East Pakistan hills; also Andaman and Nicobar islands.

¹ No. 1110, *I. p. sikkimensis*, is considered a synonym; see Museum Diagnosis.

Chloropsis cochinchinensis chlorus Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 10 (Hahim Bazaar, Assam)
 Baker, FBI No. 372, Vol. 1: 350

Plate 72, fig. 6

LOCAL NAME. *Dao-bulip gurrio* (Cachari).

SIZE. Bulbul; length c. 18 cm (7 in.).

FIELD CHARACTERS. As in *jerdoni*; see also 1103.

STATUS, DISTRIBUTION AND HABITAT. Resident, fairly common. Assam hills south of the Brahmaputra, Manipur, and East Pakistan; from just above plains level up to c. 1800 metres. A bird of the damp, hot valleys, replaced higher up by *C. hardwickii*; affects deciduous and evergreen forest (penetrating well into the interior), gardens, kampongs, and groves of trees on village outskirts.

Extralimital. Ranges east through Burma, Thailand and the Indo-chinese countries. Other races in Malaysia and Indonesia.

GENERAL HABITS, FOOD AND VOICE. As in *jerdoni*. Frequently in company of bulbuls and *C. aurifrons*.

BREEDING. Season, April to August (Baker); nest and eggs, as of *jerdoni*. Average size of 16 eggs 22.3×15.5 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Subspecies; for detailed description Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from skull)	Tail
♂♂	84-90	21-22	65-72 mm
♀♀	76-84	20-22	61-68 mm
			(HW)

Tarsus c. 18 mm (Baker).

COLOURS OF BARE PARTS. As in *jerdoni*.

64

IRENIDAE

Irena puella

Disjunct distributional range of *I. p. puella* (1109).

Affects heavy moist-deciduous and evergreen forest, sholas, coffee plantations and deep jungle.

Extralimital. Extends through Burma and the Indochinese subregion. Other subspecies in Malaysia, Sumatra, Borneo, Java and the Philippines.

GENERAL HABITS. In the non-breeding season keeps in small parties of six to eight birds, rarely more, usually to tree-tops but readily descending to bushes where food attracts. Always on the move, hopping from branch to branch and flying from tree to tree, uttering their distinctive call as they go.

FOOD. Fruit, berries and nectar. Especially fond of the various species of figs; probes into the blossoms of *Erythrina* and *Grevillea* for nectar. Insects are also taken.

VOICE AND CALLS. As they dodge about the trees, utter characteristic, liquid, percussive notes variously rendered as *wee-wee*, *be-quick*, *peepit*, *what's it* repeated every few seconds. According to Betts, the male has an explosive, liquid, bubbling whistle of two notes *whit-tu*, *whit-tu* [a different rendering of the above?]; as it calls the tail is jerked up sharply. A sharp *chichichichik* given in flight every few seconds has also been noted.

BREEDING. Season, overall January to June, but most nests have been found from February to April. Unlike most forest birds they do not select

BULBULS

65

open glades or banks of streams but breed in the heart of the thickest and most humid places. *Nest*, described by Betts as very distinctive and unmistakable for that of any other bird: a rough platform of straight dead twigs 16 to 19 cm long and remarkably thick, often at least 5 mm in diameter. On this is spread a layer of green moss and a scanty lining of rootlets and leaf-ribs. It is placed in a fork well within a dense and shady tree, from five metres up; exceptionally in bushes as low as one metre. The hen does all the building, the cock accompanying her, calling loudly. *Eggs*, almost invariably 2, exceptionally 3, olive-grey or greenish white with irregular streaky blotches of brown scattered over the surface, more densely and forming a cap at the large end. Average size of 40 eggs 28.2 × 20.2 mm (Baker). Incubation of eggs (period?) and brooding of young by female alone; feeding by both parents. Young clothed in a thick coat of dark grey-brown fluffy down.

MUSEUM DIAGNOSIS. Specimens from southwest India have a slightly shorter wing (an average of less than 4 mm), but birds from farther east are intermediate. Andaman birds have slightly longer tails (within the range of the species average) and slightly heavier bills; these small differences do not warrant subspecific recognition (*vide* Delacour *in litt.*). There is no difference in plumage.

The juvenal plumage is a dull edition of the female's except that the wings and their coverts have very little of the blue-green wash. First-winter males are indistinguishable from the adult female except for the presence of odd, accidentally moulted, feathers of the adult plumage; postjuvinal moult of body, lesser, median and probably greater coverts.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	125-134	26-30	18-19	99-110 mm
♀♀	118-128	27-30	18-19	95-104 mm
			[South India (HW, SA)]	
12 ♂♂	123-141	26-30	18-19	97-112 mm
6 ♀♀	124-130	29-32	—	92-112 mm
			[Northeast India (HA, HW, SA)]	
3 ♂♂	129-133	25-26	—	106-110 mm
1 ♀	130	25	—	108 mm
			[Andamans (HA)]	

COLOURS OF BARE PARTS. Iris claret. Bill black (♂), brownish black (♀); mouth greyish pink. Legs, feet and claws black.

Family PYCNONOTIDAE: Bulbuls

B Hairs springing from nape numerous and at least as long as tarsus.....	<i>Criniger</i> 100

BULBULS

67

FOOD. Seeds, fruit and insects.

VOICE AND CALLS. Alarm-note, a strident but not unmelodious *pür-pür-pür-pür-pür-pür*, the last three syllables only added when the bird is very excited; another call is described as *krit-krit-krit*... *tir-tirrr*... *pit* with strong emphasis on the last note (Heinrich). Typical bulbul notes — full, soft and distinct; also has a curious chattering note (Whistler).

BREEDING. Season, April through July. *Nest*, rather shallow, cup-shaped, very distinctive, apparently always made of narrow curly corkscrew-like tendrils of some vine, occasionally with a few fine twigs added, and sometimes lined with scraps of bracken or grass. Built in low bushes preferably in tangles of wild raspberries (*Rubus*); sometimes in small saplings up to three metres. *Eggs*, 2 or 3, rarely 4, dull pink marked with numerous freckles of pinkish red to deep brownish red, often confluent and forming a well-marked cap or ring around the large end. Average size of 100 eggs 25.7 × 17.6 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters. Postjuvinal moult complete.

MEASUREMENTS

	Wing	Bill (from skull)	Tail
♂♀	90-102	16-19	89-99 mm
			(HW, SDR)

Wing 10 ♂♂ 93-99, 10 ♀♀ 90-94 mm (Heinrich).

Tarsus c. 18-19 mm (Baker).

Weight 1 ♂ 44 g (SDR).

COLOURS OF BARE PARTS. Iris reddish brown. Bill yellowish horn above, very pale yellowish green below. Legs and feet brownish flesh (HW).

Genus SPIZIXOS Blyth

Spizixos Blyth, 1845, Jour. Asiat. Soc. Bengal, 14: 571. Type, by monotypy, *Spizixos canifrons* Blyth

Differs from other bulbuls by its finch-like bill, otherwise a typical member of the family in its habits, breeding and voice. Crest thick and long but not much pointed; bill short and deep, culmen gently curved throughout; edge of mandibles slightly sinuate and notched near the tips; tail square; tarsus short and weak.

1111. Finchbilled Bulbul. *Spizixos canifrons canifrons* Blyth

Spizixos canifrons Blyth, 1845, Jour. Asiat. Soc. Bengal, 14: 571 (Khasia Hills)

Plate 73, fig. 1

LOCAL NAME. Deo bulip-bulu (Cachari).

SIZE. Redvented Bulbul; length c. 20 cm (8 in.).

FIELD CHARACTERS. A green bulbul with yellowish belly, broad dark terminal band on tail, slaty head and throat with whitish patch on sides of neck, and pointed blackish crest. Sexes alike. The pale yellow thick bill looks whitish in the field and very distinctive.

Young (immature), forehead greenish yellow, crown and crest dark olive; throat and ear-coverts dull yellowish; indications of a dusky moustache; rest as adult but duller with terminal tail-band shadowy. Bill blackish.

STATUS, DISTRIBUTION AND HABITAT. A resident montane species, subject to some seasonal altitudinal movement. Assam hills south of the Brahmaputra, Nagaland, Manipur (and East Pakistan in the Chittagong Hill Tracts?) from c. 1400 to 2500 metres, descending in winter to 900 m. Affects cut-over scrub, semi-cultivation, deciduous and evergreen forest.

Extralimital. Chin Hills and Arakan. The species extends east through northern Burma, Yunnan and northern Thailand to N. Vietnam.

GENERAL HABITS. Found in parties, sometimes large groups of more than 50 individuals. Affects low scrub and abandoned hill-cultivation clearings overgrown with brambles and ringal bamboo; sometimes high trees whence it may be seen 'fly-catching' in the air for insects and returning to the same perch. A typical bulbul in its habits.

PYCNONOTIDAE

68

Bill moderately thick and long for the group; colours and pattern very variable; feathers on the crown erectile and either elongated or normal in length.

Cf. Ticehurst, C. B., 1939, *Ibis*, 81: 563.

Plate 73, fig. 7

LOCAL NAMES. Deo-bulip-garaju (grey phase), Deo-bulip-garasha (normal phase) (Cachari). The two names mean male and female although the difference is not one of sexes but of colour phases.

SIZE. Redvented Bulbul —; length c. 18 cm (7 in.).

FIELD CHARACTERS. Two colour phases. Normal phase. Above, head glossy black; upperparts olive, mottled with black on rump; wings olive

× c. ½
Tail. Dotted line to show much lengthened upper tail-coverts

and black; tail olive with a black subterminal band and a broad yellow terminal band. *Below*, throat and upper breast glossy black; lower breast olive becoming yellow on belly and undertail surface. Uncrested black head, and rounded tail with bright yellow terminal band are leading clues.

In Grey phase all olive or yellow parts replaced by ashy grey; terminal band of tail white. This phase crops up here and there, but rarely (less than 1 per cent). Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Resident, common where it occurs. Assam south of the Brahmaputra (including Nagaland and Manipur) and the eastern and southeastern parts of East Pakistan, in lowlands and foothills up to c. 700 m. Affects deciduous forest, scattered or light jungle and gardens.

Extralimital. Burma and throughout the Indochinese subregion, Malaysia, the Sunda islands, Borneo and Palawan.

GENERAL HABITS. Arboreal, descending to bushes when food attracts; may inhabit thick bushes and undergrowth, and cane brakes in the breeding season. Picks berries while hopping from branch to branch in small or large parties. Sometimes hawks flying insects by aerial sorties from tree-tops. Rather quarrelsome.

FOOD. Mostly berries; also insects (flying ants etc.).

VOICE AND CALLS. Very distinct and unlike those of other bulbuls. Ordinary call-note, a lively, sharp but pleasant single chirp uttered when flying from tree to tree, hopping among the branches or at rest. Song, a melancholy double whistle not unlike that of a sibia (Davison); 'very mournful, like the rain-weather call of the Iora but deeper and softer'—Baker. It is uttered when sitting quietly especially in the morning and evening.

BREEDING. Season, April and May. *Nest*, rather bulky for the size of the bird, well built and compact 'more like a flycatcher's than a bulbul's' (J. C. Hopwood); made of fine stems, twigs, dead leaves and grass, lined with fine grass-stems; placed in upright forks of branches or cane fronds, part of the material being wound around the supporting twigs; always in bushes and nearly always quite low down. *Eggs*, 2 or 3, typical of *Pycnonotus* but having a definite character of their own, pale pink with a violet tinge marked with speckles or small blotches of reddish brown or purple-brown forming a ring or cap at the large end. Average size of 17 eggs 21.1 × 15.9 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Subspecies and Field Characters.

Young (immature), head and throat dull brown; base of rump-feathers brown, tail-coverts shorter; rest as in adult but darker and duller. Primary and tail characters present, postjuvinal moult complete. This species is dichromatic, the grey phase lacking carotenoids (see also SF 6: 319).

STATUS, DISTRIBUTION AND HABITAT. Resident; fairly common but rather local. A very limited range in the heavy rainfall area along the southwestern side of India from Belgaum and Goa south through Kerala, and east to the Nilgiris and Palnis (JBNHS 55: 159), western Mysore and Coorg; from the plains to c. 1000 m, rarely to 1800 m; optimum zone between 600 and 900 m. Affects dense evergreen cane-brakes in swampy jungle, and lantana thickets in abandoned forest clearings—a biotope similar to that of Rubythroated Bulbul (1116), but preferentially more humid fancies with denser growth.

GENERAL HABITS. Arboreal, keeping chiefly to the foliage canopy of trees and tall vine-draped shrubs. Met with singly, in pairs or in small parties; commonly consorts at a feeding tree with bulbuls, orioles, barbets, fairy bluebirds and other frugivorous species.

FOOD. Berries and fruits, e.g. *Ficus*, *Lantana*, *Zizyphus oenopia*; also insects.

VOICE AND CALLS. A clear, rather squeaky whistling note *cheek* or *penk*, single or repeated every second or so punctuated from time to time by a wheezy long-drawn *chik* (SA). Fairly noisy.

BREEDING. Season, March to July. *Nest*, a rough, shallow cup of dead grass, bark, bamboo leaves and rootlets, lined with the latter, loosely attached to a branch with cobwebs and placed in low bushes in thick jungle. *Eggs*, usually 1, sometimes 2, quite distinctive though of bulbul type: pale pink faintly tinged with violet, lightly flecked and stippled with pale pinkish red with secondary frecklings of pinkish lavender more numerous at the larger end. Average size of 6 eggs 21.7 × 15.5 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Species. Some individuals have the crown, nape, ear-coverts and throat olive-green as the rest of plumage, instead of slaty as in normal specimens. The upper surface of the tail also has the grey largely replaced by green. This variation does not seem to be a mark of either age or sex but is probably a phase similar to that found in the allied species *P. atriceps* (1112).

Young much as adult; black marks in tail less sharply defined; primary and tail characters present; postjuvinal moult complete.

MEASUREMENTS

	Wing	Bill (from skull)	Tail
♂♂	75-79	14-17	70-79 mm
♀♀	75-77	14-16	70-73 mm

(SA, HW)

COLOURS OF BARE PARTS. Iris grey. Bill greenish yellow; mouth pink with brownish patches, or yellow and pink, varying according to age (? or season). Legs and feet pale dusky orange-yellow; claws paler (SA).

COLOURS OF BARE PARTS. Iris pale blue; bill black; legs and feet plumbeous.

1113. Andaman Blackheaded Bulbul. *Pycnonotus atriceps fusciflavescens* (Hume)

Brachypodius fusciflavescens Hume, 1875, Stray Feathers, 1: 297
(Port Mouat and Mount Harriet, Andamans)
Baker, FBI No. 440, Vol. 1: 425

LOCAL NAMES. None recorded.

SIZE. Redwhiskered Bulbul —; length c. 18 cm (7 in.).

FIELD CHARACTERS. Above, olive-green, dusky on crown and sides of head, with a few black feathers on rump, and a dark band across tail which is broadly tipped with yellow. Below, chin and upper throat black gradually becoming olive on breast and bright yellow on belly and under tail surface. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Resident, rather rare; South and Middle Andaman islands in light deciduous forest and thick jungle.

GENERAL HABITS AND FOOD. Presumably as in 1112. A quiet and unobtrusive bird. 'Almost always in pairs' (A. L. Butler).

VOICE AND CALLS. Has no song but a characteristic call (Osmaston).

BREEDING. Unrecorded.

MUSEUM DIAGNOSIS. Differs from the Blackheaded Bulbul (1112) in having the whole head dusky olive-green; black tail-band narrower; primaries, except first two, edged olive-green.

MEASUREMENTS AND COLOURS OF BARE PARTS. As in 1112.

1114. Greyheaded Bulbul. *Pycnonotus priocephalus* (Jerdon)

B. (rachypus) priocephalus Jerdon, 1839, Madras Jour. Lit. Sci., 10: 246
(Peria Pass, Malabar)
Baker, FBI No. 441, Vol. 1: 425
Plate 73, fig. 3

LOCAL NAME. *Prakuruv* (Malayalam).

SIZE. Redvented Bulbul —; length c. 19 cm (7½ in.).

FIELD CHARACTERS. A grey-headed olive-green bulbul curiously reminiscent of a miniature green pigeon, with the rump barred black and yellow. Above, head grey with greenish forehead; back olive-green mottled with brown and grey on rump; upper tail-coverts and centre of tail grey; outer rectrices dark brown tinged with olive, broadly tipped with grey. Below, chin blackish, belly olive-green. Broad square tail characteristic, and light-coloured iris conspicuous. Sexes alike.

1115. Blackcrested Yellow Bulbul. *Pycnonotus melanicterus flaviventris* (Tickell)

Vanga flaviventris Tickell, 1833, Jour. Asiat. Soc. Bengal, 2: 573
(Dampara in Dholbhum)
Baker, FBI No. 413, Vol. 1: 397
Plate 75, fig. 4

LOCAL NAMES. *Zard bulbul* (Hindi); *Pādhriyā kāngdhāra* (Gorakhpur); *Mendiph-lur* (Lepcha); *Hagrani dao-bulip* (Cachari).

SIZE. Redvented Bulbul ±; length c. 18 cm (7½ in.).

FIELD CHARACTERS. Entire head, throat and crest glossy black; rest of upperparts olive-yellow, tail largely brown. Underparts yellow, darker on breast. Pale yellow eyes conspicuous at short range. Sexes alike. Distinguished from the Blackheaded Bulbul (1112) by its erect pointed crest, and the absence of yellow in tail.

STATUS, DISTRIBUTION AND HABITAT. Fairly common resident along the lower Himalayas from Simla through Nepal, Sikkim, Bhutan, Assam hills, Nagaland, Manipur, and East Pakistan; terai and duars and up to an altitude of c. 1500 m, rarely to 2400 m, extending in the plains to Gonda

Pycnonotus melanicterus

■ *flaviventris* (1115). ■ *gularis* (1116). ■ *melanicterus* (1117).

(U.P.) and Bettiah (N. Bihar); also the forests of Madhya Pradesh (Pachmarhi, Chhindwara and Bastar districts), Orissa and northeastern Andhra Pradesh. Affects forest with plenty of undergrowth, dense secondary jungle, and scrub country about terraced cultivation, orchards and villages.

Extralimital. This subspecies extends to Arakan, northern Burma and western Yunnan; other races throughout the Indochinese subregion, Sumatra, Java and Borneo.

BULBULS

73

GENERAL HABITS. Arboreal, seldom coming near the ground. Usually singly or in pairs, but may consort in numbers in fruit-bearing trees. Like other bulbuls often hawks flying ants in the air from tree-tops.

FOOD. Mainly fruits, also insects. Observed feeding on fruit of *Solanum xanthocarpum* growing along forest path (SA).

VOICE and CALLS. Similar to those of the Rubythroated Bulbul (1116), q.v. Some notes also resemble those of the Black Bulbul (1148). Song rendered as *tree-tree-trippp-weet*, the last three syllables repeated twice or more.

BREEDING. Season, overall March to September, chiefly April to June. *Nest*, a flimsy cup of yellow dead leaves bound with a little cobweb and shreds of bark; a first rough lining of coarse grass stems, fine twigs and rootlets, and a finer lining, in most cases composed only of the finer stems of tan-coloured grass, occasionally of fine moss-roots or other vegetable fibre; placed in a thick bush or sapling 30 to 250 cm from the ground. *Eggs*, 3 or 4, sometimes 2, faint pinkish white covered with numerous freckles of dull lilac-pink, dull reddish or reddish pink with secondary freckles of pale grey, sometimes forming a ring around the large end. Average size of 100 eggs 24.2 × 16.4 mm (Baker). Both birds take part in incubation; period unrecorded.

MUSEUM DIAGNOSIS. Differs from *gularis* and *melaniterus* in having a crest and a black throat.

Young (immature) like adult but head dull black and crest shorter; upperparts greenish olive; underparts much paler yellow; edges to wing and tail less distinct; primary and tail characters present. Postjuvénal moult complete.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	85-95	14-17	15-17	82-90 mm
♀♀	83-89	14-16	16-17	79-86 mm

(HW, BB, SA, Fleming)

Weight 4 ♂♂ 30-34; 2 ♀♀ 28-31 g (SDR, BB).

COLOURS OF BARE PARTS. Iris pale lemon-yellow. Bill black. Legs and feet dark plumbeous; claws darker; soles yellowish white.

1116. Rubythroated Yellow Bulbul. *Pycnonotus melaniterus gularis* (Gould)

Brachyptus gularis Gould, 1835, Proc. Zool. Soc. London: 186 (Travancore)
Baker, FBI No. 431, Vol. 1: 415
Plate 73, fig. 5

LOCAL NAME. *Mānikāntān* (Malayalam).

SIZE. Redvented Bulbul ±; length c. 18 cm (7½ in.).

FIELD CHARACTERS. An olive-yellow and bright yellow bulbul with black uncrested head, conspicuous whitish eye and ruby-red throat. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Resident. Goa (?) and western Mysore from Belgaum south through Kerala and adjacent parts of Tamil

BULBULS

75

VOICE and CALLS. 'A plaintive, minor-key whistle on an ascending scale, something like *yer, yer ye or yer yer yer* each syllable higher than the last' (Henry).

BREEDING. Season, ill-defined: February to June; mostly March and April (Phillips) with a second period in August-September (Henry); occasionally in other months. *Nest*, a rather flimsy cup of small twigs, rootlets and especially dead leaves and fern-stalks, lined scantily with fibres; placed in a small lateral fork or in twigs and well concealed among foliage in a low bush in scrub jungle, or a small tree in the outskirts of forest. *Eggs*, normally 2, dull pink, densely speckled and occasionally blotched with light red-brown. Average size of 24 eggs 20.9 × 15.7 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Subspecies.

Young (immature), similar to adult but black of head dull and glossless; rectrices narrower and more pointed.

Wing and tail moult in the adults in March and October.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
6 ♂♂	72-77	15-17	15-16	65-69 mm
5 ♀♀	72-74	15-16	15-16	62-65 mm

(HW)

COLOURS OF BARE PARTS. Iris dull red (♂) or dark brown (♀). Bill black. Legs and feet blackish (♂) or deep lead colour (♀).

Pycnonotus jocosus (Linnaeus)

(Kumaon bhabar)

Baker, FBI No. 410 (part), Vol. 1: 394

LOCAL NAMES. *Kānārā bālbāl*, *Pāhārī bālbāl* (Hindi).

SIZE. Redvented Bulbul ±; length c. 20 cm (8 in.).

PYCNONOTIDAE

74

Nadu. In the lowlands and foothills of the Ghats up to c. 1000 m (1200 m in Coorg dist., rarely higher). Affects edges of evergreen forest, thickets along rivers, mixed bamboo and evergreen, and old forest clearings overgrown with secondary jungle and tangles of *Mimosa*, *Lantana*, etc. Avoids cultivation.

GENERAL HABITS. Arboreal, finding most of its food in the forest canopy. Keeps in pairs during the breeding season, in small parties otherwise. Rather silent and shy and retiring.

FOOD. Berries, figs and insects.

VOICE and CALLS. The birds keep in touch with each other by a low, churring note constantly uttered. Song, a half-dozen tinkling notes recalling the song of *Rhipidura aureola* but of the pattern and richness of the Redwhiskered Bulbul's; closely resembling also song of 1115.

BREEDING. Season, ill-defined: overall January to August, chiefly February to April. *Nest*, a very small cup of yellow dead leaves bound lightly with cobweb and grass stalks with a slight lining of grass, looking like a casual wind-blown accumulation of rubbish (Betts). The choice of yellow leaves as a nest material, as also in the Blackcrested Bulbul, is stressed by Betts. Placed in low bushes between 1 and 3 metres from the ground. *Eggs*, invariably 2, similar to those of *flaviventris*. Average size of 4 eggs 20.9 × 15.2 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Subspecies. Young undescribed.

MEASUREMENTS

♂♂	74-79	15-16	68-74 mm
♀♀	73-79	15-16	67-69 mm

(HW, SA)

Tarsus c. 15 mm (Baker).

COLOURS OF BARE PARTS. Iris creamy white to yellow. Bill brownish black; mouth yellowish pink. Legs, feet and claws brown.

1117. Blackcapped Yellow Bulbul. *Pycnonotus melaniterus melaniterus* (Gmelin)

Muscicapa melanitera Gmelin, 1789, Syst. Nat., 1: 941 (Ceylon)
Baker, FBI No. 429, Vol. 1: 414
Plate 73, fig. 6

LOCAL NAME. *Kāhā kondāyā* (Sinhala).

SIZE. Redvented Bulbul —; length c. 18 cm (7½ in.).

FIELD CHARACTERS. Above, uncrested head black; back, rump and wings olive-green; tail brown tipped white. Below, throat and rest of underparts lemon-yellow with an olive wash on breast. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Resident, Ceylon. Widely distributed except in the arid parts, in moderate numbers up to at least 1200 m. Affects well-wooded areas but prefers forest varied by open country to dense forest.

GENERAL HABITS and FOOD. As in *gularis*.

PYCNONOTIDAE

Otocompsa fuscicaudata Gould, 1866 (1865), Proc. Zool. Soc. London, pt. 3: 664 (Southern India and Madras, restricted to the Nilgiri Hills by Whistler & Kinnear, 1932, JBNHS 35: 756)

Baker, FBI No. 411, Vol. 1: 396

LOCAL NAMES. *Pāhāri būlbūl*, *Kāmērā būlbūl* (Hindi); *Sipāhi būlbūl* (Gujarati); *Turaka-pigli-pitta* (Telugu); *Konda-kloti-kūriwi* (Tamil); *Irattattalachi* (Malayalam).

SIZE. Redvented or Whitechecked Bulbul ±; length c. 20 cm (8 in.).

FIELD CHARACTERS. An unmistakable bird, hair-brown above with a pointed black crest (carried erect except when flying), crimson tufts behind the eyes, white underparts with a dark collar, and scarlet under tail-coverts. Young birds lack the red 'whiskers' and have a pale orange-rufous vent. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Common and widespread resident. Western India from the Tapi river and Madhya Pradesh (apparently absent from its northern parts), south to Cape Comorin, including Maharashtra, Mysore, Kerala, western Tamil Nadu and the western half of Andhra Pradesh. Chiefly in the Ghats and associated hills (Nilgiri, Palni, etc.) up to c. 1800 m; rare in the central tableland. Affects open scrub jungle, cultivation and urban gardens; avoids heavy forest but prefers a more humid habitat than either *leucogenys* or *cafer*, often to the exclusion of *cafer* see JBNHS 39: 102.)

GENERAL HABITS. A familiar bird of gardens, often even in the heart of noisy cities. Usually in pairs, occasionally in loose feeding flocks of 30 or more in the non-breeding season, and in association with other bulbuls. Largely sedentary, each pair usually remaining in the neighbourhood of its breeding haunts throughout the year. Feeds mostly on trees and bushes but also descends to the ground, hopping about to pick ants and other insects. At times will make aerial sorties from a bush- or tree-top to capture winged termites and moths. Frequently does damage to ripening fruit in orchards, and is a minor scourge of the kitchen garden and to flower-buds and seedlings. Flight strong and well sustained though slow and jerky in character.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	81-95	17-20	20-23	78-87 mm
♀♀	80-85	18-19	—	77-81 mm (HW, SA)

Weight 20 ♂♂ 25-31 (av. 27.4) g — SA.

COLOURS OF BARE PARTS. Iris hazel-brown to brown. Bill horny black; mouth orange-yellow and pink. Legs, feet and claws horny brown.

1121. Bengal Redwhiskered Bulbul. *Pycnonotus jocosus emeria* (Linnaeus)

Melocitta emeria Linnaeus, 1758, Syst. Nat., 1: 187 (Benghala)

Baker, FBI No. 410 (part), Vol. 1: 394

Plate 72, fig. 7

LOCAL NAMES. *Kāmērā* or *Pāhāri būlbūl* (Hindi); *Sipāhi būlbūl* (Bengal); *Chinā būlbūl* (Calcutta bird market).

SIZE. Redvented Bulbul ±; length c. 20 cm (8 in.).

FIELD CHARACTERS. As in 1120, q.v.

STATUS, DISTRIBUTION and HABITAT. Common and widespread resident; from West Bengal southeastwards through East Pakistan to Lower Burma, and southwestwards through Orissa, eastern Andhra Pradesh, eastern Tamil Nadu and Rameswaram Island (absent from Ceylon); in the Eastern Ghats up to c. 1000 m, rarely below 750 m. Affects scrub jungle, forest edges and semi-cultivation.

Extralimital. Ranges through lower Burma, central Tenasserim and southwestern Thailand; other subspecies throughout the Indochinese sub-region, Kwangtung and Kwangsi. Introduced into Mauritius, Florida (*emeria*) [in 1961] and New South Wales (*jocosus*).

GENERAL HABITS, FOOD and VOICE. As in 1120.

BREEDING. Season, early March to late September, chiefly April to June. Breeding biology as in 1120. Eggs, almost invariably 3; may be separated from those of *cafer* by the uniformity of markings, consisting of numerous spots, specks and minute blotches scattered profusely all over as compared with the large, irregular blotches of the other. Average size of 200 eggs (including those of *monticola*) 22.2 × 16.2 mm (Baker). Incubation period c. 12 days.

MUSEUM DIAGNOSIS. See Key to the Subspecies.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	80-88	17-19	18-20	75-84 mm
♀♀	78-84	16-19	18-20	72-79 mm (HW)

COLOURS OF BARE PARTS. As in 1120.

A pair will become greatly excited at an intruder near the nest, flitting from branch-to branch with rump-feathers fluffed and 'swearing' angrily till the danger is cleared. Normally unafraid of humans when nesting near habitations. Makes an engaging pet, becoming exceedingly tame and confiding, following its master about and flying long distances to him when called.

Display. *Courtship*. Male postures before his mate, flattening himself on the perch, lowering his head in a continuous bow, spreading his tail, drooping his open wings loosely at the sides, and gently fluttering or quivering them to the accompaniment of subdued croaks. Female seemingly quite indifferent to these advances, but cooperative in copulation when he thus hops on to her back.

Distraction. Female (?) feigns injury to draw away intruder from nest-young, dragging herself on her belly on ground with outspread beating wings, screaming piteously the while; the effect greatly heightened by her mate flitting about her concernedly with noisy agitated chattering.

FOOD. Fruits, berries (especially *Lantana*), figs, flower-buds, nectar, insects and spiders. Nest-young fed mostly with soft-bodied insects and caterpillars; with drupes and berries as they grow older.

VOICE and CALLS. A noisy species with a variety of cheery notes, rather more musical than those of *cafer*. One song is a rollicking phrase sounding like the rice must be finished off uttered particularly while displaying. Agitated sad-sounding swearing notes, a harsh *leeeee*, often uttered for considerable periods towards sunset when preparing to roost. One of its commonest calls is a lively *pettigrew* or *kick-pettigrew*, or *Pleased-to-meet-you* (accent on meet).

BREEDING. Season, ill-defined: chiefly March to July in the north, December to June in the south with a second period in September after the monsoon, but odd nests may be found in any month; two or three broods are reared. Nest, a shallow, fairly neat cup of twigs and dead leaves bound with cobwebs especially around the rim; lining nearly always of roots and grass, occasionally hair. A great variety of sites is chosen, even a thatched roof or a wall; most usually placed in a low bush or creeper often growing on a latticed veranda, seldom more than 3 metres from the ground, sometimes under 15 cm; well concealed when in thickets of *Lantana* or other scrub, but frequently very conspicuous when in garden bushes. Position of nest usually betrayed by the peculiar fussy last-minute departure of incubating bird. Both sexes share in construction of nest, rearing of young and presumably also in incubation. Three or four days are required for building; there is usually a pause of a day, or two, before the first egg is laid; these are laid at intervals of about 24 hours, and in the early morning. Incubation sometimes starts with the first egg, but nest is left unattended through long periods of the day and during night until full clutch has been laid. Incubation period, 12 to 14 days. Eggs, 3, less commonly 2, pinkish, heavily freckled and mottled uniformly all over with small purple, red or reddish brown spots; very variable. Average size of 100 eggs 24.4 × 16.1 mm (Baker). Eggs and nestlings suffer very heavy predation principally by cats, crows, crow-pheasants and *Calotes* lizards.

MUSEUM DIAGNOSIS. See Key to the Subspecies.

1121a. Assam Redwhiskered Bulbul. *Pycnonotus jocosus monticola* (McClelland)

Ixos monticola McClelland, 1840, Proc. Zool. Soc. London, pt. 7: 160 ('Kasia mountains, Assam')

Baker, FBI No. 410 (part), Vol. 1: 394

LOCAL NAMES. *Dao-bulip-gajao-bi* (Cachari); *Innu-bulib-gaherba* (Kacha Naga); *Kenda* (Sylhet); *Khoining* (Manipur, all bulbuls); *Dukshoh* (Dafila); *Prajo* (Naga); *Jango* (Mishmi); *Jadbo* (Abor).

SIZE. Redvented Bulbul ±; length c. 20 cm (8 in.).

FIELD CHARACTERS. As in 1120, q.v.

STATUS, DISTRIBUTION and HABITAT. Common resident. Bengal duars (Jalpaiguri district), Bhutan foothills east through Assam and the NEFA foothills up to 1100 m. Affects scrub jungle and clearings near villages.

Extralimital. Extends to northern Burma, the Shan States, Yunnan and Indochina (Deignan).

GENERAL HABITS, FOOD and VOICE. As in 1120. Flocks of over 100 were seen associated with *P. cafer* (Mishmi Hills. SA & SDR). Very abundant also in NEFA.

BREEDING. Season, March to July, chiefly May and June. Nest, as in 1120. Eggs, 3, rarely 4; for description and size see under *emeria*.

MUSEUM DIAGNOSIS. See Key to the Subspecies.

MEASUREMENTS. Wing ♂♂ 84-95, ♀♀ 80-91 mm.

Weight 4 ♂♂ 30-42; 4 ♀♀ 30-36 g (SDR, BB).

COLOURS OF BARE PARTS. As in 1120.

1122. Andaman Redwhiskered Bulbul. *Pycnonotus jocosus whistleri* Deignan

Pycnonotus jocosus whistleri Deignan, 1948, Jour. Washington Acad. Sci., 38: 280 (Cinque I., Andaman Is.)

Not in Baker, FBI

LOCAL NAMES. None recorded.

SIZE. Smaller than myna; length c. 20 cm (8 in.).

FIELD CHARACTERS. As in 1120, q.v.

STATUS, DISTRIBUTION and HABITAT. Common resident in South and Middle Andaman islands. Introduced into the Nicobars from Port Blair; now found on Trinkat and Camorta, probably also Nancowry. Affects open country and towns.

GENERAL HABITS. Those of the species. 'Especially common at Port Blair where it frequently enters the houses taking the place of the common sparrow' (Osaston, 1906, JBNHS 17: 156).

BREEDING. Season, March to May. Nesting as in 1120. Eggs, 2 or 3, like those of *emeria*.

MUSEUM DIAGNOSIS. See Key to the Subspecies; barely distinguishable from *emeria* of Orissa but ear-tuft and crest shorter, bill heavier.

MEASUREMENTS and COLOURS OF BARE PARTS. As in 1120.

1 Crest moderate, brownish black; back dull olive-brown....	<i>P. l. humii</i>	83
2 Crest long, brown; back greenish olive-brown.....	<i>P. l. leucogenys</i>	83

1123. White-eared Bulbul. *Pycnonotus leucogenys leucotis* (Gould)

Ius leucotis Gould, 1836, Proc. Zool. Soc. London: 6 (Karachi, Sind)
Baker, FBI No. 406, Vol. 1: 390
Plate 72, fig. 11

LOCAL NAMES. *Kūshāndra* (Punjab); *Bhooroo* (Sind); *Jogido* (Kutch); *Kānārī būlbūl* (Gujarati).

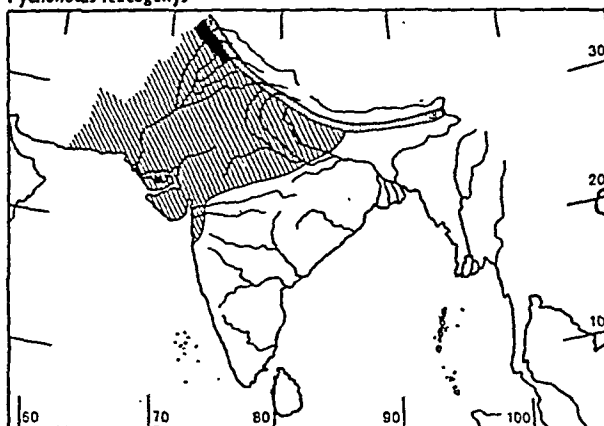

SIZE. Redvented Bulbul \pm ; length c. 20 cm (8 in.).

FIELD CHARACTERS. A grey-brown bird with crestless black head, black throat and a large white cheek-patch; under tail-coverts yellow, tail dark

brown tipped white. Distinguished from the Redvented Bulbul by the white cheek-patches, white underparts and yellow vent. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Common and widespread resident, subject to some local movements. West Pakistan in Baluchistan (Makran coast and inland up to 1800 m in the hills), Sind and West Punjab where

Pycnonotus leucogenys

Distributional range

■ *humii* (1124). □ *leucogenys* (1125). ▨ *leucotis* (1123).

it intergrades with *humii*, east to Rajasthan, East Punjab, Uttar Pradesh and northern Madhya Pradesh, south to Gujarat (including Kutch and Saurashtra), and northern Maharashtra (Bombay) where it has apparently spread in the last 40 years. Affects semi-desert tracts, scrub, urban gardens, cultivated areas and coastal mangroves. Spreads with the extension of gardens and groves; when found side by side with the Redvented Bulbul its preference for semi-desert facies is noticeable; closely associated with *Capparis* and *Salvadora*.

EXTRALIMITAL. Southern Afghanistan and southern Iran; the species ranges to Iraq and Saudi Arabia.

GENERAL HABITS. As in *leucogenys* (1125).

FOOD. Berries (especially *Capparis* and *Salvadora*), caterpillars, ants and other insects; flower-nectar.

VOICE AND CALLS. As in *leucogenys*.

BREEDING. Season, March to September; may be influenced by rainfall and consequent supply of food. Nesting, as in *leucogenys*. Eggs, normally 3, sometimes 2 or 4, not so well and darkly marked as those of the White-checked Bulbul (1125). Average size of 100 eggs 21.6 × 15 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Subspecies; differs from *leucogenys* also by the lack of superciliary streak, greyish brown (c. earth-brown) back, large white cheek-patch and deeper chrome-yellow under tail-coverts; complete postnuptial moult c. September.

SIZE. Redvented Bulbul \pm ; length c. 20 cm (8 in.).

84

PYCNONOTIDAE

FIELD CHARACTERS. A sprightly earth-brown bulbul with a forwardly curving pointed crest, short thin superciliary stripe, white cheek-patches, black throat, yellow under tail-coverts and white tail-tip. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Common resident subject to some local movements. The Himalayan foothills from Chitral (reaching northeast Afghanistan in the Kunar river valley) to Kashmir, East Punjab hills, Himachal Pradesh, Uttar Pradesh hills, Nepal (entering the Langtang Valley up to 2400 m), Sikkim, Bhutan and NEFA as far as the Dihang river; from c. 300 m commonly up to c. 2100 m, occasionally 2400 m in the western, drier part of its range [west of central Nepal where it has been recorded at 2400 m in December (Fleming)]; there appears to be some upward movement after the breeding season; not found above 1800 m east of Nepal where it is restricted to the drier valleys. Affects open scrub jungle and hillsides dotted with wild raspberry and *Berberis* bushes, secondary growth, hedgerows, cultivation and environs of towns and villages.

GENERAL HABITS. Usually in pairs or small parties, occasionally in large flocks in winter. A very familiar bird in Kashmir where it enters houses, house-boats and verandas, even stealing scraps from the table. Particularly tame and confiding in winter when scarcity of natural food increases its dependence on man. Crest always jauntily curved forward over the beak; tail and wings incessantly flicked as it moves restlessly about; continually bows and postures on top of bushes, uttering its cheerful rollicking notes. Often descends to the ground for food, sometimes catches insects on the wing. Display similar to that of *P. jocosus* and *P. cafer*, qq.v.; for more details see *Pavo* 2: 26-36.

FOOD. Fruit, berries — *Berberis*, *Rubus*, *Lantana*, *Zizyphus* and 'boquain' or Neem (*Melia*) are amongst the most favoured. Nectar, seeds and insects (ants, grubs, beetles) also taken. Is apt to do some damage in gardens to buds, fruit and green peas.

VOICE AND CALLS. Similar in pattern and variations to the Redvented and Redwhiskered bulbuls'. Song, three or four melodious phrases in an endless variety of combinations; two phrases commonly heard are *tea for two* and *take me with you* (B. T. Phillips). Agonistic notes: *pit-pit*, *pit-lo* and chattering *pit-pit-it-it-it* or *pititititit* (Short). Some notes confusable at a distance with those of the bee-eater *Mercops apiaster*.

BREEDING. Season, March to June; a few nests are found as late as August; at least two broods are reared. Nest, a cup of grass-stems and fibres lined with rootlets and finer grasses of the same colour; variable in bulk and depth; placed in low bushes from 30 cm to about 3 metres from the ground, sometimes in low branches of trees, pollarded willows, garden creepers, or tucked into the thatch of a dwelling, often inside a room; on the whole well concealed but sometimes with no attempt at concealment. Eggs, usually 3, sometimes 2 and often 4, occasionally 5 (Bates), pinkish white, thickly speckled, streaked or blotched with various shades of red, with tiny spots and clouds of underlying pale inky purple. Average size of 33 eggs 22.8 × 16.7 mm (Osmaston). Laid at 24-hour intervals; incubation period c. 12 days.

MUSEUM DIAGNOSIS. See Key to the Subspecies. For description of hybrids *leucogenys* × *cafer* see the latter species (1126, Museum Diagnosis).

Plate 72, fig. 9

LOCAL NAMES. *Būlbūl*, *Gūldūm* (Hindi); *Pigli-pitta* (Telugu); *Konda-lati*, *Konda-kūru* (Tamil); *Nāitu būlbūl* (Malayalam).

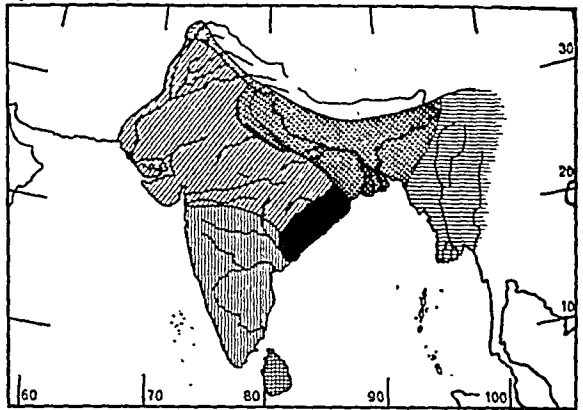

SIZE. Myna —; length c. 20 cm (8 in.).

FIELD CHARACTERS. A perky earth-brown bird with slightly tufted black head, black throat and scale-like markings on back and breast. White rump, scarlet vent and white-tipped blackish tail, particularly conspicuous in flight. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Common resident. The southern Indian peninsula north to the Godavari river in the east and to c. 18°N. lat. in Maharashtra in the west; plains and hills normally up to c. 1500 m, following human settlements and cultivation. Affects light scrub, gardens, secondary jungle and light deciduous forest. Almost entirely restricted to deciduous biotope; where evergreen and deciduous patches occur, it is confined to the latter while the former are occupied by *P. jocosus*.GENERAL HABITS. On the whole very similar to those of Redwhiskered Bulbul (1120), q.v. A sprightly and rather noisy, familiar bird, usually seen in pairs, but often in small parties in the non-breeding season, and large congregations at fruiting *Ficus* trees or in *Lantana* patches. Arboreal but occasionally descends to the ground to pick up black ants and winged termites emerging from their underground retreats, or launches out for flying insects from a bush-top, springing up a metre or two vertically and tumbling back to the perch. Flight quick and strong though seldom sustained for any distance.

SIZE. Myna —; length c. 20 cm (8 in.).

FIELD CHARACTERS. As in 1128, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident. From the Indus Valley and West Punjab east to and along the Jumna river to eastern

PYCNONOTIDAE

88

Display. The male spreads out his wings above his head and slowly flutters them up, and down while the tail is spread out and at the same time depressed (Dharmakumarsinhji). When challenging a rival, utters defiant calls, drops bunch of crimson under tail-coverts to stand out laterally, pointing down and backward. Both combatants assume agonistic postures before coming to grips. See also 1120 and 1129 (General Habits), and *Pavo* 2: 26-36.FOOD. Fruits and berries (of *Loranthus*, *Lantana*, *Zizyphus*, *Ficus*, *Santalum*, *Salvadora* and others), flower nectar (of *Erythrina*, *Capparis*, *Salmalia*, *Woodfordia*, *Loranthus*, etc.). May be locally destructive in gardens to fruit, flowers or peas, but is an efficient pollinating and seed-disseminating agent. Also feeds largely on insects including many major pests (caterpillars, moths, ants, termites, etc.) and defoliators, thus further redeeming the damage. For some specific insect items see under 1131. Has been frequently observed bibbing toddy from pots hung for its collection on coconut palms. Among food brought to the nestlings, a young lizard (*Calotes versicolor*) 9 cm long has been recorded, which caused the death of a 5-6 day old chick attempting to swallow it (Richards, JBNHS 25: 503).VOICE AND CALLS. Similar to Whitecheeked Bulbul's. Cheery call-notes *peep-peep-peep* may be rendered as *Be care-ful* (accent on last syllable) or *Be quick-quick*; alarm-note a loud, sharp *peep*. Agonistic notes: *Peep-a*, *peep-a-lo* and slow *peet-wit-wit-wit-wit* or rapid *pitititit* chattering notes. 'Peep' notes perhaps longer and less sharp than Whitecheeked Bulbul's (Short). Usually amongst the first to give the alert on the appearance of a marauding hawk or cat, its agitated 'ware hawk' calls being well understood by all other birds. Distinct 'dialects' are discernible, e.g. between northern and southern birds. See also 1129 (Voice and Calls).BREEDING. Season, overall February to November; chiefly during the monsoon. Nest, a cup of rootlets, fine twigs and midribs of dead leaves neatly woven, bound on the outside with cobweb and lined with grass and hair; similar to that of *P. jocosus*, but can be recognized with a little practice. Placed in shrubs, hedges, stunted date-palms, on slender branches of trees, at the end of a pollarded branch, or sometimes inside buildings, normally at heights between one and nine metres, most often under 3, exceptionally up to 12 metres; usually higher than that of *P. jocosus*. Eggs, 2 or 3, pinkish white, more or less profusely blotched with purplish brown or claret. Average size of 100 eggs, 21.1 × 15.5 mm (Baker). Eggs laid in the morning at about 24-hour intervals. Incubation starts with first egg, thus accounting for disparity between sizes of nestlings. Incubation period c. 14 days. Normally male shares in building, incubation and tending the young. Two or three broods commonly reared. For further details on breeding, see *Pavo* 1: 19-31, 1963.MUSEUM DIAGNOSIS. See Key to the Subspecies; differs from *haemorrhousus* in being paler and less blackish on the nape and upperparts; nape-feather edgings more whitish, less fuscous; grey feathers anterior to the white rump less smoky. Differs from *humayuni* in being darker with narrower greyish white fringes to the feathers, slightly smaller; *uetmorii* (= *saturatus*) is even darker, with less white on abdomen. All subspecies merge into one another gradually and specimens are often difficult to assign unless in freshly moulted comparable series.

There is a complete autumn moult; spring moult includes central tail-feathers, tertials, head and neck, but appears to be very irregular so that the plumage usually

BULBULS

89

has a very patchy appearance as the older feathers quickly fade to a dull brown whilst their pale edges wear down. Postjuvenile moult includes wings and tail but is similarly patchy and irregular.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	90-99	19-21	21-23	74-89 mm
♀♀	85-98	19-21	19-22	74-83 mm (HW, SA)

Weight 10 ♂♂ 28-40 (av. 31.1) g — SA.

COLOURS OF BARE PARTS. Iris dark brown. Bill black; mouth, a mixture of grey, yellow and pink. Legs and feet brownish black.

MISCELLANEOUS. Before the law prohibiting animal fights came into force, these bulbuls were trained for fighting in some provinces. They were fed a special diet to produce extra courage and pugnacity. The two adversaries were placed facing each other on T-shaped perches, at a distance calculated to allow the most powerful blows. The birds were tethered by a cord fastened to a soft string round the body [pili or 'braces'], 'this fact transforming the fight to a duel "to the finish"'. In the meantime the spectators placed heavy bets' (G. Babault). Notwithstanding the ban, bulbul fighting still continues as a popular rural sport at fairs and on high days and holidays in some parts of the country. Considerable sums change hands over the mains, and champion birds fetch high prices.

1129. Ceylon Redvented Bulbul. *Pycnonotus cafer haemorrhousus* (Gmelin)

Muscicapa haemorrhousa Gmelin, 1789, Syst. Nat., 1, pt. 2: 941 (Ceylon)

Baker, FBI No. 398, Vol. 1: 383

LOCAL NAMES. *Kondē kūrūlla* (= top-knot bird), *Kondaya* (Sinhala); *Kondē kūrūri* (Tamil).

SIZE. Myra —; length c. 20 cm (8 in.).

FIELD CHARACTERS. As in 1128, q.v.

STATUS, DISTRIBUTION and HABITAT. Common resident. Ceylon, in the low country and hills up to at least 1800 m, in all zones except heavy forest.

GENERAL HABITS. As in *cafer* (1128).

Display: 'the male fluffs out his plumage and spreads the vermilion under tail-coverts laterally; the female reacts by depressing her crest, lowering head, wings and tail and performing curious side-to-side motions with her beak while she utters inane chirps and quivers her wings' (Henry).

FOOD. As in *cafer*.

VOICE and CALLS. As in *cafer*. Henry describes the notes as suggesting the words *ginger beer* and *sweet potatoes*; scolding-note, a loud indignant chatter; alarm-note, a loud shriek; a sweet low sub-song is commonly uttered during the afternoon.

BREEDING. Season, throughout the year but chiefly March and May and again in August-September. Breeding biology as in *cafer*. Eggs 2 or 3, similar to those of *cafer*; for detailed descriptions of eggs and nesting see W. W. A. Phillips, *Ceylon Jour. of Sci.*, 21: 243-6. According to this author (loc. cit.), birds from the cooler zone in the hills would appear to lay three eggs more often than two, the opposite being true for the lowlands birds;

BULBULS

91

SIZE. Myra —; length c. 20 cm (8 in.).

FIELD CHARACTERS. As in *cafer* (1128).

STATUS, DISTRIBUTION and HABITAT. Common resident; from Kumaon and the plains of Uttar Pradesh east through Nepal, Sikkim, Bhutan, Bihar, West Bengal, East Pakistan, Assam and NEFA. Intergrades with *intermedius* in Kumaon, *humayuni* in southern U.P., *wetmorei* in northern Orissa and *stanfordi* in the hills of extreme eastern Assam. Generally reaches an altitude of c. 1800 m. Affects cultivation, gardens, scrub, secondary growth and forest edges.

Extralimital. Introduced into the Fiji Islands.

GENERAL HABITS, FOOD and VOICE. As in *cafer*. Among the stomach contents analysed at Pusa (Bihar) the following insects have been identified: beetles *Myloccerus* (chiefly species *blandus*, *discolor* and *maculosus*), ants *Camponotus compressus*, and other Coleoptera and Hymenoptera (Mason & Lefroy, 1912).

BREEDING. Season, April to August. Nesting as in *cafer*. Eggs, usually 3, similar to those of the nominate race but often more richly coloured. Average size of 100 eggs 22.9 × 16.9 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Subspecies.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

92

PYCNONOTIDAE

GENERAL HABITS, FOOD and VOICE. As in *cafer*.

BREEDING. Season, April to August. Nesting as in *cafer*. Eggs, as in *cafer* but often more richly coloured. Average size of 200 eggs 22.6 × 16.2 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Subspecies.

MEASUREMENTS and COLOURS OF BARE PARTS. As in *bengalensis*.

Weight 1 ♂ 47 g (SDR).

PYCNONOTUS STRIATUS (Blyth)

Key to the Subspecies

Blackish shading on breast-feathers heavier and carried farther down on abdomen..... *P. s. arctus*
Blackish shading on breast-feathers lighter and not carried as far down on abdomen..... *P. s. striatus*

1133. Striated Green Bulbul. *Pycnonotus striatus striatus* (Blyth)

Trichophorus striatus Blyth, 1842, Jour. Asiat. Soc. Bengal, 11: 184 (Darjeeling)

Baker, FBI No. 397, Vol. 1: 379

Plate 73, fig. 2

LOCAL NAMES. *Semin-plek-pha* (Lepcha); *Chichiem* (Bhutan).

SIZE. Redvented Bulbul ±; length c. 20 cm (8 in.).

FIELD CHARACTERS. A crested olive-green bulbul with yellow-streaked underparts. Above, olive-green with fine white streaks; an upstanding brownish olive crest; wings and tail largely olive and brown, the latter yellowish on the underside and tipped with pale yellow on outer rectrices; lores yellow, a pale yellow rim around the eye. Below, throat yellow with dark stipples; breast dark grey becoming olive on belly, heavily striped with pale yellow; under tail-coverts yellow. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Resident with some downward movement in the cold season; fairly common but locally distributed, from central Nepal (Chandragiri and Godavari) east to Sikkim, Bhutan, NEFA as far as the Abor Hills, and Assam in the Khasi, Cachar and Manipur hills, from c. 1200 to 2400 m (recorded at 3000 m in the Chumbi Valley), moving down to the foothills in winter. Affects evergreen jungle, oak and rhododendron forest; prefers tree jungle and bushes, but not too dense or too high.

Extralimital. Ranges into western Burma; the species is found in the hills of the Indochinese subregion.

BULBULS

93

Pycnonotus striatus, *P. xantholaemus* and *P. penicillatus*

Distributional ranges
■ *P. s. striatus* (1133). ▨ *P. s. arctus* (1134).
▩ *P. xantholaemus* (1135). ▤ *P. penicillatus* (1136).

GENERAL HABITS. Found in flocks of 6–15 in non-breeding season, on fruit-bearing forest trees and shrubs, the birds ‘flowing’ from one to another in loose follow-my-leader style.

FOOD. Chiefly berries, but also insects which are sometimes taken on the wing.

VOICE AND CALLS. Typical bulbul call-notes but easily distinguished from those of *P. jocosus* or *P. cafer*. ‘Calls: *tyi-wut* rather sharp and given continually; a loud *pyik . . . pyik*. Song: a party often keeps up a continual series of full, clear, pleasant warbling notes, rather disjointed but even so of the warbling type’ (Lister). Other notes rendered as ‘loud, mellow *chee-tu*, sometimes *chee-whittu* or *chee-tu-ti-ti-ti-twee-oo* quite distinctive from any other bulbul’ (Desirée Proud). ‘Short song of characteristic bulbul pattern, a musical *chikoo* (*chick-koo*) followed by *weeweeeweeewee* like nut-hatch’s but richer’ (SA). Also a chattering as of Black Bulbul.

BREEDING. Little known. *Season*, May and June. *Nest*, a fairly compact cup of twigs, fern roots and weed stems, lined with very fine shreds of grass. Concealed rather low down in bushes or bamboo clumps. *Eggs*, 3, very pale cream faintly suffused with brown at the large end, marked with rather bold blot and small blotches of dark reddish brown and deep purple, scattered over the whole surface but more numerous and forming a ring at the large end; secondary markings of grey and neutral tint of similar character and distribution. Average size of 12 eggs 22.05 × 16.3 mm (Baker).

MUSEUM DIAGNOSIS. See diagnosis under *P. s. arctus*.

BULBULS

95

STATUS, DISTRIBUTION AND HABITAT. Resident, uncommon and patchily distributed. Orissa (?), southern Andhra Pradesh, Tamil Nadu, Mysore in the dry Chitaldrug and Bangalore districts. One old record in Kerala (Anamalai Hills) — Wm. Davison, 1886, *Ibis*: 146; from c. 600 to 1200 m. Affects sparse thorn scrub jungle interspersed with some large trees among broken stony hillocks. (See map, p. 93.)

GENERAL HABITS. Little known. Very skulking, shy and restless; keeps in pairs ‘to the upper parts of trees’ (Roscoe Allen, JBNHS 18: 905). Often associated with Redvented Bulbuls.

FOOD. Berries (stomachs examined contained drupes of *Phyllanthus* and *Santalum*). Also insects.

VOICE AND CALLS. ‘Its percussive notes when taking to wing are unmistakably like those of *P. luteolus* but higher pitched and somewhat softer; some of its other calls resemble those of the Redvented Bulbul with which it is commonly found in association’ (SA). ‘A very pleasing note, louder and mellower than that of any other bulbul’ (R. Allen).

BREEDING. *Season*, May to July. *Nest*, a shallow cup of coarse twigs bound together with cobwebs and lined with fine fibres. Of the few nests known, one was placed in a dwarf date palm (*Phoenix humilis*), another on the ground among dead leaves on a sloping hillside between two overarching boulders. *Eggs*, 2 or 3, white, blotched and marked with purple and brick red, the markings forming a ring around the large end. Size c. 21 × 17 mm.

MUSEUM DIAGNOSIS. See Field Characters and Key to the Species.

MEASUREMENTS	Wing	Bill (from skull)	Tarsus	Tail
3 ♂♂	89–92	17	20	85–86 mm
2 ♀♀	87	17	—	85–86 mm
				(SA, HW)

COLOURS OF BARE PARTS. Iris brown or orange-brown. Bill, legs and feet black.

1136. Yellow-eared Bulbul. *Pycnonotus penicillatus* Blyth

Pycnonotus penicillatus Blyth, 1851, Jour. Asiat. Soc. Bengal 20: 178 (Ceylon)

Baker, FBI No. 443, Vol. 1: 426

Plate 73, fig. 10

LOCAL NAMES. *Gala-gudawō*, *Kāhā kondāyā* (Sinhala).

SIZE. Redvented Bulbul ±; length c. 20 cm (8 in.).

FIELD CHARACTERS. Above, forehead and crown brown, a white line extending from nostril to over the eye, a yellow tuft projecting behind the eye; cheeks brown and grey with a yellow spot; rest of upperparts olive-green. Below, yellow except white chin. The yellow tufts behind the eyes make it unmistakable. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Species peculiar to Ceylon. Resident, common in the higher central hills, above 900 metres. Affects jungle, wooded ravines and well-wooded gardens. (See map, p. 93.)

× c. 1

PYCNONOTIDAE

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	102–114	20–24	21–25	98–106 mm
♀♀	98–107	19–22	21–25	97–103 mm
			(BB, SDR, SA, Fleming)	

Weight 4 ♂♂ 47–60; 6 ♀♀ 45–59 g (BB, SA).

COLOURS OF BARE PARTS. Iris deep red-brown. Bill black. Legs and feet greenish brown or plumbeous brown.

1134. Mishmi Striated Green Bulbul. *Pycnonotus striatus arctus* Ripley

Pycnonotus striatus arctus Ripley, 1948, Proc. Biol. Soc. Washington, 61: 101

(Dreyi, Mishmi Hills)

Baker, FBI No. 397 (part), Vol. 1: 379

LOCAL NAMES. None recorded.

SIZE. Redvented Bulbul ±; length 20 cm (8 in.).

FIELD CHARACTERS. As in *striatus* (1133).

STATUS, DISTRIBUTION AND HABITAT. Resident. NEFA and eastern Assam in the Mishmi, Patkai and Naga hills and extralimally in the adjacent areas of northern Burma, from 1500 to 2400 m, in deciduous and evergreen forest.

GENERAL HABITS, FOOD AND VOICE. As in *striatus*.

BREEDING. Unrecorded; presumably as in 1133.

MUSEUM DIAGNOSIS. Differs from the nominate race by having darker more pronounced tips to the feathers of the crown as well as darker shading on the webs of crest-feathers. White shaft-streaks on crown and back tend to be slightly narrower and margined on the back with darker olive-green. Blackish shading on tail more intense and heavier. Blackish shading on breast heavier and carried farther down on the abdomen. Bill tends to be larger.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail

1135. Yellowthroated Bulbul. *Pycnonotus xantholaemus* (Jerdon)

Brachypus xantholaemus Jerdon, 1844, Madras Jour. Lit. Sci., 13: 122

(Eastern Ghats west of Nellore)

Baker, FBI No. 430, Vol. 1: 415

Plate 73, fig. 8

LOCAL NAME. *Kondapoda pigli* (Telugu).

SIZE. Redvented Bulbul ±; length c. 20 cm (8 in.).

FIELD CHARACTERS. A plain uncrested grey and yellow bulbul with bright yellow crown, chin and throat. Thighs and under tail-coverts yellow; wings and tail brown, the latter tipped with pale yellow. Sexes alike.

96

PYCNONOTIDAE

GENERAL HABITS. Arboreal; keeps to lower trees and undergrowth, usually in pairs, sometimes in small flocks.

FOOD. Berries and insects.

VOICE AND CALLS. Alarm, a low *err-err*; call, a loud but sweet-toned whistle *wheet wit wit*, usually uttered in flight (Henry).

BREEDING. *Season*, end of February to beginning of May and again from late July to early November; presumably double-brooded. *Nest*, more substantial than that of other Ceylon bulbuls; made largely of moss with some leaf-matter, bits of dead grass and plant stems, and rootlets, lined with fine fern and rootlets, midribs of decayed leaves or fern stems, usually either black or reddish brown. Exterior size, c. 12 cm in diameter by c. 7.5 cm in height; diameter of cup c. 6 cm, depth c. 4 cm; favoured sites are upright forks, collections of twigs or pollarded branches, three to four metres from the ground, among the denser foliage towards the top of tall shrubs or bushy saplings in or on the outskirts of dense forest; sometimes placed in bushes as low as one metre. *Eggs*, invariably 2, white with moderate-sized blotches, spots and specks of purple-brown and secondary markings of the same character, of deep inky grey, usually forming a zone around the large end (Phillips). Average size of 40 eggs 23.4 × 16.7 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS	Wing	Bill (from skull)	Tarsus	Tail
6 ♂♂	81–87	17–19	21–22	78–81 mm
6 ♀♀	76–81	17–19	21–22	72–78 mm

Weight 2 ♀♀ 36, 37 g (SDR).

COLOURS OF BARE PARTS. Iris red. Bill black. Legs blackish blue.

1137. Blyth's Bulbul. *Pycnonotus flavescens flavescens* Blyth

Pycnonotus flavescens Blyth, 1845, Jour. Asiat. Soc. Bengal 14: 568 (Arakan)

Xanthinus flavescens fugens Koelz, 1952, Jour. Zool. Soc. India 4: 40 (Karong, Manipur)

Baker, FBI No. 408, Vol. 1: 392

Plate 73, fig. 9

LOCAL NAME. *Das bulip-gurmo* (Cachari).

SIZE. Redvented Bulbul ±; length c. 20 cm (8 in.).

FIELD CHARACTERS. A rather nondescript olive bulbul with bright yellow under tail-coverts, greyish brown head with white lores and short supercilium, the latter characters diagnostic. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Resident; rather scarce but widely scattered; locally not uncommon. The hills of Arakan south of the Brahmaputra, Nagaland, Manipur and East Pakistan in the Chittagong Hill Tracts. Breeds between c. 900 and 2100 metres, descending to 450 m in the cold weather. Affects tree-forest with ample undergrowth, scrub jungle, thick regrowth on abandoned cultivation, dense bushes in pastures and cut-over scrub; inhabits much the same biotope as *P. melanicterus* (1115).

Extralimital. Western Burma; the species ranges east to central Vietnam; also Borneo.

BULBULS

97

Pycnonotus florescens and *P. luteolus*

Distributional ranges

▨ *P. f. florescens* (1137) ▤ *P. l. luteolus* (1138). ■ *P. l. insulæ* (1139).

GENERAL HABITS. Rather shy; keeps to high trees or tall bushes, hunting about inside cover. Assembles in flocks of up to 30 individuals in cold weather.

FOOD. Berries and insects.

VOICE and CALLS. On the whole rather silent except when quarreling. Song, sweet, typical bulbul, of two bold notes followed by a short trilling run; alarm, a harsh churring note like a laughing thrush's (SDR).

BREEDING. *Season.* April to July. *Nest,* a shallow cup of fern-roots, tendrils, twigs and dead leaves, strengthened here and there with cobweb, and lined with flowering ends of grasses. Placed in upright forks or between two or more vertical twigs, generally low down in bushes, rarely as high as three metres. The bird sneaks very quickly off the nest when disturbed and does not remain in the vicinity. *Eggs,* 2 or 3, one as often as the other, rarely 4, of *Pycnonotus* type: pale cream, with the whole surface minutely and profusely speckled with primary markings of light reddish, and numerous secondary freckles of light grey. On the whole they have a strong tint of violet or lilac characteristic of the species. Average size of 150 eggs, 22.1 × 16.4 mm (Baker). Both birds take part in incubation.

MUSEUM DIAGNOSIS. See Key to the Species.

Young (immature) like adult but upperparts rustier, under tail-coverts paler. Primary and tail characters present; postjuvinal moult complete.

MEASUREMENTS. Wing ♂♂ 85-89, ♀♀ 82-87 mm (Heinrich).

COLOURS OF BARE PARTS. Iris brown to red-brown. Bill black. Legs and feet dark reddish brown to black.

BULBULS

99

MUSEUM DIAGNOSIS. See Key to the Species. Has 3 or 4 long filoplumes growing from nape.

Young (immature), similar to adult but upper plumage slightly duller and browner with less olive-green tinge; supercilium less distinct; ear-coverts uniform olive-brown; chin tinged with yellow, breast dull brown similar to upperparts; rectrices narrower and more pointed. Postjuvinal moult includes whole body plumage, all remiges except the three outer primaries and their coverts and one or two of the longest inner secondaries, and central pair or two or three pairs of rectrices, but not rest of tail.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	82-93	18-20	22-24	75-86 mm
♀♀	86-90	18-20	20-24	74-82 mm
				(HW, SA)

Weight 10 ♂♂ 28-43 (av. 34.7) g—SA.

COLOURS OF BARE PARTS. Iris reddish brown to blood red. Bill black; mouth yellowish pink, pinkish grey or bright yellow. Legs and feet dark plumbeous or slaty black (SA).

1139. Ceylon Whitebrowed Bulbul. *Pycnonotus luteolus insulæ* Whistler & Kinnear

Pycnonotus luteolus insulæ Whistler & Kinnear, 1932, Jour. Bombay nat. Hist. Soc. 35: 759 (Tellula, Ceylon)

Baker, FBI No. 433 (part), Vol. 1: 417

LOCAL NAMES. *Gala-gudurā* (Sinhala); *Kākā kullā* (Tamil).

SIZE. Redvented Bulbul ±; length c. 20 cm (8 in.).

FIELD CHARACTERS. As in 1138, q.v.

STATUS, DISTRIBUTION and HABITAT. Race peculiar to Ceylon. Common resident in the entire low country, and hills up to c. 1000 m, (see map, p. 97). Affects scrub jungle particularly *Lantana*, bush country, glades and clearings, and along roads and stream-beds in forest areas, especially in the Dry zone; one of the commonest and most widely distributed birds in the Island.

GENERAL HABITS, FOOD and VOICE. As in 1138.

BREEDING. *Season,* overall December to June, mainly March to May and in December; an occasional nest may be found during other months. *Nest,* a shallow cup, similar to that of the Redvented Bulbul, but generally slightly larger; made of fine plant-, flower- or creeper stalks, grass-stems and rootlets, loosely and irregularly put together, scantily lined with fine grass, or occasionally with rootlets or wing fern-stalks, quite red in colour; sometimes flimsy with the contents visible through the bottom. More or less suspended in a small fork, or placed among a few twigs or in an upright crotch and frequently bound to the supports with cobweb; sited in low bushes, usually between one and two metres from the ground. *Eggs,* normally 2, very similar to those of the Redvented Bulbul; coloration and size as in 1138.

Smaller and slightly darker, wing ♂♀ c. 78-88 mm... *P. l. insulæ*

1138. Whitebrowed Bulbul. *Pycnonotus luteolus luteolus* (Lesson)

Haematomis luteolus Lesson, 1841, Rev. Zool.: 354 (Bombay)

Baker, FBI No. 433 (part), Vol. 1: 417

Plate 73, fig. 13

LOCAL NAMES. *Khar būlūl* (Marathi); *Peda figli* (Telugu); *Manjat kondai kūraṇi* (Tamil).

SIZE. Redvented Bulbul; length c. 20 cm (8 in.).

FIELD CHARACTERS. A sober-coloured uncrested olive bulbul with pale underparts and conspicuous white forehead and supercilium. Sexes alike. A slight tuft noticeable when bird calling.

STATUS, DISTRIBUTION and HABITAT. Resident, commoner in the eastern side of the Peninsula than in the west where it is more local. Peninsular India roughly south of 23°N. lat.—south of a line from Ahmedabad (Gujarat) through southern Madhya Pradesh to Midnapur (West Bengal)—easternmost record c. Hooghly river east of Burdwan (Law, JBNHS 38: 620-1). In the Eastern Ghats up to c. 1200 m, but does not ascend the heavy-rainfall hills of Kerala and the Western Ghats. Affects dry, open scrub country, grazing grounds with scattered *Lantana* brakes, gardens, and euphorbia thickets near villages; avoids moist forest as well as extensive cultivation. Replaces the Yellowbrowed Bulbul (1143-4) in dry scrub jungle. (See map, p. 97.)

GENERAL HABITS. Mostly in pairs; very shy and skulking, more often heard than seen as it seems to prefer dense thickets.

FOOD. Fruits and berries (*Zizyphus*, *Lantana*, *Mimusops*, *Streblus* and various figs) and flower-nectar (*Erythrina*, *Salmalia*, etc.); also spiders and insects.

VOICE and CALLS. Very noisy. Song distinctive—a loud, explosive burst of pleasant, lively rattling (whistled) notes, frequently uttered from within dense shrubbery. Subsong recorded in sultry weather in April, May and November—a quiet warble, mimicking songs of chloropsis, drongo, and other species (Neelakantan, JBNHS 52: 616). Alarm-note a subdued throaty *churr* or *hrr-hrr*.

BREEDING. *Season,* overall January to November, mainly April to August, less well-defined and earlier in the south; probably double-brooded. *Nest,* like that of *P. jocosus* but more loosely built; composed mostly of twigs bound together and fastened to supporting twigs with some cobweb; hair, rootlets or other materials also used; sometimes scantily lined with fine grass. Placed in thick bushes, as a rule under 1.5 m, rarely as high as 4 m above the ground. *Eggs,* invariably 2, similar to those of *P. jocosus*: reddish white, thickly speckled and blotched with reddish brown, sometimes coalescing into a zone at the large end. Average size of 60 eggs 22.9 × 15.8 mm (Baker).

100

PYCNONOTIDAE

MUSEUM DIAGNOSIS. Slightly darker and smaller than *luteolus*; but see remarks by H. Whistler in *Spolia Zeylanica* 23, pts 3 and 4, p. 142.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

♀♀	78-85	18-20	20-22	70-75 mm
				(HW)

Weight 1 ♂ 34 g (SDR).

COLOURS OF BARE PARTS. As in 1138.

Genus CRINIGER Temminck

Criniger Temminck, 1821, Pl. Col. d'Ois., livr. 15. Type, by monotypy, *Criniger barbatus* Temminck

Distinguished from all other bulbuls by the presence of a long pointed crest and very long hairs or filoplumes springing from the nape and hindneck. Bill strong, about half the length of the head, culmen curved throughout. Wing blunt, tail short and rounded, rufous in the Indian species. Tarsus short but very strong. Plumage very soft. Female smaller than male.

1140. Whitethroated Bulbul. *Criniger flaveolus flaveolus* (Gould)

Trichophorus flaveolus Gould, 1836, Proc. Zool. Soc. London: 6 (Nepal, ride Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 10)

Criniger flaveolus viridulus Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 10 (Sangau, Lushai Hills)

Criniger flaveolus caeruleus Koelz, 1954, ibid. No. 1: 10 (Kohima, Naga Hills)

Baker, FBI No. 380, Vol. 1: 363

Plate 73, fig. 16

LOCAL NAMES. *Kusup-enchip-pha* (Lepcha); *Das-bulip-garmo-didi* (Cachar).

SIZE. Myna ±; length c. 23 cm (9 in.).

FIELD CHARACTERS. A large crested bulbul. Above, olive-green with rufous-brown wings and tail. Loes and sides of head grey; a whitish supercilium, but not always conspicuous. Below, lemon-yellow with white chin and throat. Sexes alike. Perches with tail well fanned out.

STATUS, DISTRIBUTION and HABITAT. Resident subject to vertical movements; common except in the westernmost part of its range. Central Nepal east through Sikkim, Bhutan, NEFA, Assam south to Tripura, the hills of East Pakistan, Nagaland, Manipur, south to the Chin Hills in Burma. Breeds

¹ Baker and Syme both list Garhwal as the westernmost point of the range. The authority for this record is unknown; the species has not been recorded west of central Nepal.

BULBULS

101

at moderate elevations, up to 1800 m, optimum zone 600 to 1200 m, descending to the foothills, terai, duns and the plains of Assam in the cold weather. Entirely restricted to evergreen facies; affects shrubby undergrowth in heavy forest, and secondary jungle.

Extralimital. Extends to Arakan, central and northeastern Burma. *C. f. burmanicus* is found in southeastern Burma and western Thailand. A member of the *pallidus-bres-ochraceus* species-group.

GENERAL HABITS. A gregarious bulbul, more like a laughing thrush in habits. Creeps and clambers about bushes in chattering parties of 6 to 15, the individuals 'flowing' one after another from patch to patch of dense jungle; flight strong and direct. Feeds in bushes and tree canopy, but usually keeps within about three metres of the ground.

FOOD. Berries and wild figs; also insects, at times taken on the wing.

VOICE AND CALLS. A noisy species. Has loud, harsh, nasal frog-like croaks *kak-kak* or *chake chake* (SA); loud and clear *teek, da-té-ek, da-té-ek* (Fleming); other calls have been described as sharp, whip-like notes, or loud, sweet notes.

BREEDING. Season, overall April to July, chiefly May and June. Nest, a heavily-built cup of dead leaves, fine roots and bamboo leaves fastened together with a few hair-like roots and stems of weeds and lined with dark fern-roots; the weed-stems are cleverly wound round the supporting twigs in and out of the other materials. Placed among masses of weeds, brambles and similar cover in a small bush or tangle of vines, usually within one metre from the ground (exceptionally higher) often close to a stream. Eggs, 3 or 4, rosy pink or carmine-pink, marked with broad scrawls, small and large irregular blotches of deep purple-red or reddish black, with similar secondary markings of brick-red, and faint spots of lavender and violet; markings occasionally form caps or rings at the broad end; among the most beautiful of all bulbul eggs. Average size of 60 eggs 26.9 × 18.6 mm. Incubation takes 13 days; both birds take part in incubation and perhaps construction of nest (Baker). Baker remarks that nestlings are apparently left untouched by leeches, however numerous.

MUSEUM DIAGNOSIS. See Key to the Species and Field Characters.

Young (immature), upperparts and head brown; upper tail-coverts and wings more rufescent; underparts suffused with brown; under tail-coverts fulvous. Primary and tail characters present; postjuvinal moult complete.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	101-107	20-25	19-24	92-102 mm
♀♀	98-105	20-23	25 (1)	88-93 mm
			(BB, SA, SDR)	

Weight 10 ♂♂ 38-54 (av. 48.3); 4 ♀♀ 38-48 g—BB, SA.

COLOURS OF BARE PARTS. Iris brown. Bill whitish grey to greyish slate. Legs yellowish white (one) to fleshy brown, yellowish brown or greyish brown (SA, SDR).

Genus *HYPSIPETES* Vigors

Hypsipetes Vigors, 1831, Proc. Zool. Soc. London: 43. Type, by monotypy,

Hypsipetes Psaroides Vigors

BULBULS

103

BREEDING. Season, the few nests known have been taken in May. Nest, a compact cup of the type of *Pycnonotus cafer* (1128) but more bulky; chief materials are long tough strips of bark and many fine elastic twigs, some dead leaves attached to the exterior; the whole fastened together and to the supports by cobwebs and lined with black fern-roots, long reddish fibres or tendrils. Placed in horizontal or vertical forks in bushes at about 1.5 m from the ground, with no attempt at concealment. Eggs, 3, like small eggs of *Pycnonotus cafer*. Size of three eggs, 23.1 × 16.3, 22.2 × 16.5 and 22.4 × 16.2 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Species and Field Characters; for details of plumage, Baker loc. cit.

Young (immature), more rusty on upperparts and on edges of wing and coverts; under tail-coverts paler. Primary and tail characters present; postjuvinal moult complete.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♀	78-85	18-20	16-17	71-77 mm
				(HW)

COLOURS OF BARE PARTS. Iris brown. Bill horn-brown, dark above, pale below. Legs and feet brownish flesh (HW).

1142. Nicobar Bulbul. *Hypsipetes nicobariensis* Moore

Hypsipetes nicobariensis Moore, in Horsfield & Moore, 1854, Cat. Bds. Mus. E.I.

Co. 1: 257 (Nicobars)

Baker, FBI No. 423, Vol. 1: 408

Plate 73, fig. 14

LOCAL NAMES. None recorded.

SIZE. Redwhiskered Bulbul; length c. 20 cm (8 in.).

FIELD CHARACTERS. Above, uncrested head, nape, wings and tail dark brown, back olive; below, throat and breast whitish grey faintly streaked with yellow; belly and under tail-coverts pale yellow, the latter with brown centres. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Common resident. Nicobar Islands except Car Nicobar. Apparently restricted to Central Nicobars (Abdulali, JBNHS 64: 182). Affects forest and gardens.

GENERAL HABITS. Found singly, in pairs or small parties, sometimes congregating in assemblies of 50 or more in some large feeding tree, where they make a great chattering and uproar.

FOOD. Unrecorded; doubtless as in other bulbuls.

VOICE AND CALLS. 'Chattering notes very similar to the other *Hypsipetes*' [Davison, SF 2: 224, presumably meaning Black Bulbul (1148-9) q.v.].

BREEDING. Very young birds have been collected in February (Davison). Nesting unrecorded.

MUSEUM DIAGNOSIS. See Key to the Species and Field Characters.

PYCNONOTIDAE

102

Microscelis Gray, 1840, List Gen. Bds.: 28. Type, by subsequent designation, *Hypsipetes amaurolis* (Temminck)

Iole Blyth, 1844, Jour. Asiat. Soc. Bengal 13: 286. Type, by monotypy,

Iole olivacea Blyth = *I. viridescens* Blyth

Bill slender, about as long as the head, culmen carinated. Tarsus very short. Feathers of crown often pointed and lengthened. Colour more uniform than in *Pycnonotus*.

Microscelis viridescens cacharensis Deignan, 1948, Proc. Biol. Soc. Washington 61: 3

('Chutla Bhil', Surma Valley and Hill Division, Cachar)

Baker, FBI No. 420, Vol. 1: 406 (= *Iole olivacea viridescens*)

Plate 73, fig. 12

LOCAL NAME. *Dao-bulip-gurmo* (Cachar).

SIZE. Redvented Bulbul ±; length c. 19 cm (7½ in.).

FIELD CHARACTERS. A plain-coloured crestless bulbul. Above, olive, with rufous-brown tail; below, greyish yellow: brighter on belly, tawny on under tail-coverts. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Uncommon resident. Manipur, Assam in Khasi Hills and Cachar, East Pakistan in Sylhet south to Chittagong district; from the plains to c. 900 m. Affects well-wooded ravines, dense and humid evergreen forest and regrowth on abandoned cultivation.

Extralimital. The species ranges through Burma to the Shan States, central Tenasserim and southwestern Thailand. A member of the *pinguis-charlottae* species-group.

GENERAL HABITS. A bird of the canopy especially where trees are festooned with climbers. Usually singly or in pairs and small parties; sometimes large flocks of over a hundred individuals. Tends to be shy and is difficult to see.

FOOD. Berries; doubtless also insects.

VOICE AND CALLS. A nasal or creaking, constantly repeated *chuaa* or *jer-wee*, characteristic and arresting (Smythies). Also a soft whistling note resembling that of *Pycnonotus finlaysoni* of Burma (HW).

Criniger ictericus Strickland, 1844, Ann. Mag. Nat. Hist. 13: 411

(East Indies = Mahabaleshwar)

Baker, FBI No. 419 (part), Vol. 1: 405

LOCAL NAMES. None recorded.

SIZE. Redvented Bulbul; length c. 20 cm (8 in.).

FIELD CHARACTERS. As in 1144, q.v.

STATUS, DISTRIBUTION AND HABITAT. Resident, locally common. Western Ghats from the Poona and Satara districts (Khandala, Mahabaleshwar, etc.) south to Belgaum and Goa, from c. 600 to 1900 m, optimum zone around 1000 metres. Affects secondary jungle, undergrowth of evergreen, edges of thicker jungle, and occasionally gardens.

GENERAL HABITS, FOOD AND VOICE. As in 1144.

BREEDING. Similar to that of the nominate subspecies.

MUSEUM DIAGNOSIS. Differs from *indicus* in having the upperparts more greyish green, the underparts duller, paler yellow.

MEASUREMENTS

BULBULS

109

foothills from between Simla and Mussooree east through Nepal, Sikkim, Bhutan, NEFA, the hills of Assam and East Pakistan, Nagaland and Manipur. From c. 700 to c. 1600 m, descending to foothills and sparingly penetrating the plains in the cold weather. Keeps to deep or secondary forest, occasionally entering tea plantations; in winter frequents fairly open country, roadsides and edges of forest and cultivation.

Extralimital. Extends to northeastern and southwestern Burma. The species ranges to Fukien, Kwangtung, the Indochinese subregion, Sumatra and Borneo.

GENERAL HABITS. A forest bulbul. Arboreal and sociable, and very like Black Bulbul (1148-9) in behaviour. Keeps in noisy flocks in winter, which break up into pairs in the breeding season. Frequents bushes as well as high trees, sometimes launching short aerial sallies after insects.

FOOD. Berries, flower-nectar, and insects.

VOICE AND CALLS. A flute-like note and a pleasant jerky song that may be heard all the year. A soft musical *daddy, leave-it*; sometimes *daddy* repeated 3 or 4 times followed by a single concluding *leave-it* (SA). Many calls very similar to the Black Bulbul's, q.v.

BREEDING. *Season*, May and June. *Nest*, a rather deep cup of grass stems, dead leaves and fine twigs. Placed in bushes, usually within two metres of the ground (Assam, Baker) or up to twelve metres on large trees (Kumaon, Whyzner). *Eggs*, 2 or 3, rarely 4, very pale creamy covered with numerous speckles of light brick-red. Average size of 100 eggs 24.3×17.3 mm (Baker). Male shares incubation and probably also construction. Incubation period 13 or 14 days.

MUSEUM DIAGNOSIS. See Key to the Species and Field Characters.

Young (immature), like adult but upperparts browner; outer webs of secondaries paler yellow; cheeks not so black. Primary and tail characters present; postjuvinal moult complete.

MEASUREMENTS

Distributional ranges

- psaroides* (1148).
 nigrescens (1151).
 ganesa (1149).
 humii (1150).

individuals, invading tree-tops in boisterous bands, seldom ever descending to undergrowth. Often perches on highest tips of trees, launching short aerial sallies after insects. Does not remain long on one tree, the birds of a party flying from one tree to another in loose, irregular order. Flight strong and swift.

Display, the male flutters from one tree to the next, his body held stiff and slightly bowed while uttering a rather melodious, excited *pip-per-tree*.

FOOD. Mainly fruits and berries (*Melia*, *Viburnum*, mulberries, etc.). Also insects. Visits flowers of *Erythrina*, *Salmalia*, rhododendron, etc. for nectar and insects.

VOICE AND CALLS. Song, a long series of monosyllables of varying tone and pitch, punctuated at frequent intervals by a single, high, bell-like note; call, a loud, rapid *wurkyu* repeated several times (Lister). See also Display above. Also a large variety of squeaky notes as the birds chase each other; a frequent call is a long drawn-out *weenh* likened to the squeal of a distressed pig; other notes described as *whew whe* or *whew whe* similar to the creaking of a gate-hinge, usually preceded by a drongo-like *squeaky-squeak*; another note, rarely heard, sounds like *geagluck* (Magrath).

BREEDING. *Season*, from the latter half of April to September, chiefly May, June and early July. *Nest*, a neat but flimsy cup of grasses, dead leaves, moss, bark fibres or lichen strengthened by cobweb, lined with rootlets, fine grass, bark-shavings or pine needles. Placed in the fork of a horizontal branch usually between seven and ten metres up, sometimes as low as two

LOCAL NAMES. *Wān būlbūl*, *Kruhū būlbūl* (Kashmir); *Bān būlā* (Mussooree); *Darkal* (Chamba); *Phaki-pho* (Lepcha); *Kāki* (Paharia).

SIZE. Redvented Bulbul ±; length c. 23 cm (9 in.).

FIELD CHARACTERS. A slate-grey bird with black crest, slightly forked tail and bright red bill, legs and feet. Sexes alike.

Young (immature), no crest; throat, lower breast and belly white, rest grey; bill and feet brown.

STATUS, DISTRIBUTION AND HABITAT. Common resident subject to vertical movements; summer visitor only to the higher parts of its range. The Himalayas from the Kunar Valley (Afghanistan) and Chitral (N.W.F.P.) east through Kashmir south of the main range, Himachal Pradesh, northern Uttar Pradesh, Nepal, Sikkim, Bhutan and NEFA to the Dafia Hills where it intergrades with *nigrescens*. Breeds between 1000 and 2400 m in the western part of its range and up to c. 3000 m in the east; optimum zone 1800 to 2100 m. Descends in winter, reaching the foothills in the west and commonly entering the plains in the east. Recorded at 3000 m in Sikkim in winter. Has straggled to Kohat, Ambala and Lahore. Affects tall forest, in particular of oak, pine and rhododendron; also enters gardens.

GENERAL HABITS. Arboreal, very noisy. In the non-breeding season, keeps in parties of six to ten, but sometimes numbering up to a hundred

112

PYCNONOTIDAE

metres or as high as fifteen metres. *Eggs*, normally 3, sometimes 2, exceptionally 4, very faint pink covered all over with small primary blotches of deep red-brown, chocolate-brown or purple-brown with similar secondary small blotches of lavender and inky grey. Average size of 52 eggs 26.2×19.1 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Subspecies.

Young (immature). No crest; crown dark grey, rest of upperparts grey with a brownish cast. Below, throat, lower breast and belly white, rest grey; pale fulvous edges to wings and coverts. Primary and tail characters present; postjuvinal moult complete.

♂♂	116-130	26-29	20-22	102-116 mm
♀♀	111-124	26-28	20-21	93-111 mm

(BB, Schäfer, Fleming, SDR, SA)

Weight 10 ♂♂ 44-60; 6 ♀♀ 48-61 g (SA, BB, RAP).

COLOURS OF BARE PARTS. Iris dark brown. Bill coral-red. Legs pale orange, feet deep [scarlet-] orange; claws pale brown; soles white to pale orange (BB).

1149. South Indian Black Bulbul. *Hypsipetes madagascariensis ganesa* Sykes

Hypsipetes Ganesa Sykes, 1832, Proc. Zool. Soc. London: 86 (Ghauts, Dukhun)
Baker, FBI No. 389, Vol. 1: 372

LOCAL NAMES. *Asmū-būlbūl* (Kerala); *Karuppu kondai kūrūri* (Tamil).

SIZE. Redvented Bulbul ±; length c. 23 cm (9 in.).

FIELD CHARACTERS. As in 1148, q.v.

STATUS, DISTRIBUTION AND HABITAT. Resident but prone to local movements in the non-breeding season; locally abundant. Western Ghats from Matheran (near Bombay) in Maharashtra, south through western Mysore, the hills of Kerala and western Tamil Nadu and the Shevaroy Hills (Tamil Nadu). An old record from Berar is possibly erroneous. In the hills from c. 1000 m to the top, reaching the foothills in the cold weather. Affects evergreen forest, especially sholas, and eucalyptus or other shade-trees in tea, coffee and cardamom estates.

GENERAL HABITS. As in *psaroides*. A common member of mixed hunting parties of *Zosterops*, *Sitta*, *Garrulax*, *Muscicapa*, etc. each species keeping to its particular stratum.

FOOD. Mostly fruits and berries (*Zizyphus*, *Eugenia*, *Vaccinium*, etc.). Visits flowers of *Erythrina*, *Loranthus*, etc. and introduced *Grevillea* and *Eucalyptus* for nectar and insects.

VOICE AND CALLS. Loud screechy whistles as in *psaroides*. One call often heard is rendered as *chirp, chee-chee-chee* (Nichols).

BREEDING. *Season*, March to June. At least two broods. *Nest*, as of *psaroides*. *Eggs*, almost invariably 2, rarely 3, white speckled with red-brown or purple-brown spots; blotched eggs are exceptional as are those with pinkish ground colour. Average size of 45 eggs 26.6×19.6 mm (Baker).

BULBULS

113

MUSEUM DIAGNOSIS. Differs from *psaroides* in being darker, having less white on belly, no grey spot over lores, no black streak around ear-coverts; black crown does not contrast so much with rest of plumage; tail hardly forked.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	112-124	26-29	16-18	98-105 mm
♀♀	107-123	24-28	16-17	92-104 mm
				(HW, SA)

Weight 25 ♂ ♀ 35-49 (av. 42.9) g — SA.

COLOURS OF BARE PARTS. Adult, iris orange-brown. Bill bright deep orange; mouth orange and pink. Legs and feet yellowish orange; claws brown. Young, iris olive-brown. Bill brown, paler at tip; gape yellow; mouth yellowish pink. Legs and feet yellowish brown; claws brown.

1150. Ceylon Black Bulbul. *Hyphantornis madagascariensis humii* (Whistler & Kinnear)

Microscelis psaroides humii Whistler & Kinnear, 1932, Jour. Bombay nat. Hist. Soc. 35: 754 (Ceylon).

Baker, FBI No. 389 (part), Vol. 1: 372

LOCAL NAMES. *Kala kondaya* (Sinhala); *Karuppa kond-kuruti* (Tamil).

SIZE. Redvented Bulbul \pm ; length 23 cm (9 in.).

FIELD CHARACTERS. As in 1148, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident. Ceylon, in the low-country Wet zone and hills up to at least 1600 m; local and uncommon in the Dry zone. Affects tall forest but often visits the neighbouring low-country Dry zone and the highest hills when berries and fruits are ripening.

GENERAL HABITS. As in *psaroides* (1148).

FOOD. As in *ganeesa* (1149).

VOICE AND CALLS. Some notes are rendered as *squeek squeek squeedlet-ee* or *cheek, creeeter* and a scolding, cat-like *meete* (Henry). Others as in 1148 and 1149.

BREEDING. Season, March to May and July to September, a break occurring during the southwest monsoon. The great majority breed during the spring; it would appear, therefore, that some birds are double-brooded in the spring while others await the autumn before rearing their second broods (Phillips). Nest and eggs, as in *ganeesa*; clutch size, 2.

MUSEUM DIAGNOSIS. Differs from *ganeesa* in having a larger and heavier bill.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	118-128	27-32	18-19	98-104 mm
2 ♀♀	116, 117	27, 28	18	94, 100 mm
				(HW)

COLOURS OF BARE PARTS. Iris reddish brown (once orange). Bill red or orange-red. Legs orange or dull orange-yellow (SDR).

1152. Western Spotted Babbler. *Pellorneum ruficeps punctatum* (Gould)

Cinclidia punctata Gould, 1838, Proc. Zool. Soc. London: 137

(Himalayas = Kalka, Baghat, Simla, restricted by Deignan, op. cit.)

Pellorneum ruficeps jonesi Baker, 1920, Bull. Brit. Orn. Cl. 41: 9

(Kalka, Baghat, Simla)

Baker, FBI No. 244, Vol. 1: 241

LOCAL NAMES. None recorded.

SIZE. Bulbul —; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 1154, q.v.

STATUS, DISTRIBUTION AND HABITAT. Resident; locally distributed. The Himalayan foothills from Kangra to Garhwal; from c. 300 to 1200 m. Affects heavy cut-over scrub, wooded ravines and nullahs, deciduous or evergreen jungle and tea-gardens.

GENERAL HABITS AND FOOD. As in 1154.

VOICE AND CALLS. A sweet song of four or five notes repeated two or three times, each repetition a little lower than the preceding (Osmaston). See also 1154.

BREEDING. Season, overall March to July, chiefly April to June. Nest, as in *ruficeps*. Eggs, 2 to 4, white, tinged with pale green or cream, blotched and speckled with red-brown and inky purple. Average size of 10 eggs 21.4 × 16.2 mm (Baker).

114

TIMALIINAE

1151. Assam Black Bulbul. *Hyphantornis madagascariensis nigrescens* Baker

Hyphantornis psaroides nigrescens Baker, 1917, Bull. Brit. Orn. Cl. 38: 15

(Upper Chindwin)

Baker, FBI No. 387, Vol. 1: 371

LOCAL NAME. *Deo-bulip gashim* (Cachari).

SIZE AND FIELD CHARACTERS. As in *psaroides* (1148).

STATUS, DISTRIBUTION AND HABITAT. Common resident subject to local movements in the non-breeding season. NEFA, east of the Dafa Hills where it intergrades with *psaroides*, and the hills of Assam, Nagaland, Manipur and East Pakistan; from c. 700 to at least 2400 m, reaching the foothills and plains in winter. Affects tall forest.

Extralimital. Extends to western Burma; the species ranges north and east to Szechuan, Chekiang, Formosa and the mountainous areas of the Indochinese subregion; also Madagascar, Aldabra and the Comoro Is.

GENERAL HABITS, FOOD AND VOICE. As in *psaroides*.

BREEDING. As in *psaroides*. Eggs, usually 3, often 2, occasionally 4, similar to those of *psaroides*. Average size of 64 eggs 27.1 × 19.9 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Subspecies. Differs from *psaroides* in being darker bluish grey both above and below, and having no grey patch above lores or behind eye; streak around ear-coverts present but less distinct; no contrast between crown and mantle.

MEASUREMENTS AND COLOURS OF BARE PARTS. As in 1148.

Weight ♂ ♀ 53-64 g (SDR).

Family MUSCICAPIDAE

B	Juvenal plumage unspotted		
3	Bill small, slender; legs short and weak.....	Sylviinae	Vol. 8
4	Bill very variable; legs and feet strong.....	Timaliinae	p. 114

Subfamily TIMALIINAE: Babbler

For description see Van Tyne, J. & Berger, A. J., 1959: 517 (Family Timaliidae). Cf. Delacour, J., 1946, L'Oiseau 16: 7-36.

Genus PELLORNEUM Swainson

Pellorneum Swainson, 1832, Fauna Boreali-Americana: 487. Type, by original designation, *Pellorneum ruficeps* Swainson

Terrestrial birds of thick brushwood. Tail shorter than wing (except in *P. palustre*) but equal to or longer than twice length of tarsus. Bill about equal to or a little more than three-quarters the length of head, straight and notched at the tip. Nostrils not overhung by hairs; rictal bristles very short.

116

TIMALIINAE

Pellorneum ruficeps and *P. fuscocapillum*

Distributional ranges

	<i>P. r. punctatum</i> (1152)		<i>P. r. mandellii</i> (1153)		<i>P. r. pectorale</i> (1157)
	<i>P. r. ripleyi</i> (1158)		<i>P. r. chameleum</i> (1156)		<i>P. r. rocale</i> (1159)
	<i>P. r. ruficeps</i> (1154)		<i>P. r. olivaceum</i> (1155)		<i>P. f. fuscocapillum</i> (1161)
	<i>P. f. scottellum</i> (1163)		<i>P. f. babaulti</i> (1162)		

MUSEUM DIAGNOSIS. Differs from the nominate subspecies in being darker and more richly coloured; crown dark chestnut instead of rufous. From *mandellii* differs in having the upperparts, edges of wings and tail more olive, less rufous-brown.

MEASUREMENTS. As in *mandellii* (1153).

COLOURS OF BARE PARTS. Iris red-brown. Bill brown, dusky yellow at base of lower mandible. Legs and feet fleshy.

1153. Mandelli's or Sikkim Spotted Babbler. *Pellorneum ruficeps mandellii* Blanford

Pellorneum Mandellii Blanford, 1871, Proc. Asiat. Soc. Bengal, No. 9: 216 (Sikkim)

Baker, FBI No. 243, Vol. 1: 240

LOCAL NAMES. None recorded.

SIZE. Bulbul —; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in *ruficeps* (1154).

STATUS, DISTRIBUTION AND HABITAT. Common resident. The Himalayan foothills, from western Nepal through Sikkim, Bhutan and NEFA, east to the Subansiri river; from plains level up to c. 1800 m. Does not appear to move much with the seasons (Biswas); recorded in winter at 1700 m. Affects heavy brush, secondary growth, bamboo jungle and wooded ravines.

BABBLERS

117

GENERAL HABITS, FOOD AND VOICE. As in *ruficeps* (1154), but calls and song clearly distinguishable in dialect.

BREEDING. Season, March to July, chiefly April to June. Nest, as in *ruficeps*. Eggs, 3 or 4, very exceptionally 5, white, sometimes tinged with buff, marked with red-brown, brown, purplish brown or blackish brown specks and small blotches scattered profusely over the whole surface, usually more at the large end. Average size of 200 eggs 22.4 × 16.3 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *ruficeps* in having the neck and back of head streaked with black and buff; crown brighter, near chestnut, ear-coverts darker; breast and belly suffused with ochraceous; spots on underparts darker, not so broad; upperparts, edge of wings and tail more rufous-brown. Differs from *punctatum* in having the upperparts, edges of wings and tail less olive, more rufous-brown.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	63-75	18-21	27-28	70-77 mm
♀♀	66-72	18-20	27-28	62-70 mm
				(BB, SA)

Weight 3 ♂♂ 24-28; 2 ♀♀ 28, 29 g (SA, BB).

COLOURS OF BARE PARTS. Iris crimson to deep crimson (reddish brown in juvenile). Bill: upper mandible dark brown; lower mandible light yellow on posterior half, bluish white on the anterior half, with dusky tip. Legs, feet, claws and soles fleshy (BB).

1154. Peninsular Spotted Babbler. *Pellorneum ruficeps ruficeps* Swainson

Pellorneum ruficeps Swainson, 1832, Fauna Boreali-Americana: 487

(India = Coonoor, Nilgiris, restricted by Deignan, op. cit.)

Baker, FBI No. 240, Vol. 1: 238

Plate 75, fig. 20

LOCAL NAMES. *Saruhanu kūrūvi* (Tamil); *Adavi lika jittu* (Telugu).

SIZE. Bulbul —; length c. 15 cm (6 in.).

FIELD CHARACTERS. A small terrestrial babbler. Above, brown with a darker chestnut-brown cap, a light superciliary stripe extending well behind the eye; ear-coverts brown. Below, throat white, rest of underparts buff, boldly streaked and spotted with dark brown. Legs pale fleshy. Sexes alike. A passable miniature of the European Song Thrush (*Turdus ericetorum*).

STATUS, DISTRIBUTION AND HABITAT. Common resident. The hills of the Indian peninsula (Satpuras, hill tracts of Bihar and Orissa, Western and Eastern Ghats and their associated ranges, from the Narbada river and the Rajmahal Hills (west central Bihar) south to the Palghat Gap and the Chitteri Hills; from sea level to c. 1350 m. Not recorded from the Deccan plateau. Affects scrub, bamboo groves, sholas, thickets in ravines and along watercourses.

GENERAL HABITS. In pairs or small parties in dense thickets, undergrowth and bamboo in well-wooded areas. Feeds on the ground like Jungle Babbler, rummaging among dead leaves. Progresses by long thrush-like hops

BABBLERS

119

1155. Kerala Spotted Babbler. *Pellorneum ruficeps olivaceum* Jerdon

Pellorneum olivaceum Jerdon, 1839, Madras Jour. Lit. Sci. 10: 255

(Trichur, Cochin State, restricted by Deignan, op. cit.)

Pellorneum ruficeps granti Harington, 1913, Bull. Brit. Orn. Cl. 33: 81

(Mynall, Travancore)

Baker, FBI No. 242, Vol. 1: 240

LOCAL NAME. *Ganarūj* (Malayalam).

SIZE. Bulbul —; length c. 16 cm (6½ in.).

FIELD CHARACTERS. As in *ruficeps* (1154). See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident, generally distributed. The low country and hills of Kerala and presumably also of adjoining western Tamil Nadu (Palnis etc.), north to the Palghat Gap; from near sea level to 1800 m. Affects evergreen sholas, steep hillsides along nullahs, dry ravines and watercourses littered with rotting bamboo and brushwood and overgrown with thickets of *Acacia*, *Zizyphus*, etc.

GENERAL HABITS, FOOD AND VOICE. As in *ruficeps*.

BREEDING. Season, November to May. Nest and eggs, as in 1154. Average size of 7 eggs 21.9 × 16.3 mm (Baker).

MUSEUM DIAGNOSIS. Like *ruficeps* but darker and more richly coloured. Crown and nape dark chestnut; upperparts, edges of wings and tail darker olive-brown; spotting on lower parts heavier and darker brown; darker on flanks and sides of head.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
4 ♂♂	73-76	19-20	28-29	66-73 mm
				(HW, SA)

COLOURS OF BARE PARTS. Iris hazel-brown (immature) to reddish brown. Bill: upper mandible brown, lower mandible paler; mouth in breeding ♂ brownish pink, immature yellowish flesh. Legs and feet brownish flesh, claws dusky.

1156. Assam Spotted Babbler. *Pellorneum ruficeps chamelum* Deignan

Pellorneum ruficeps chamelum Deignan, 1947, Smith. Misc. Coll. 107: 6

(Gunjong, Cachar)

Not in Baker, FBI

LOCAL NAME. *Dao-prii-pit* (Cachar).

SIZE. Bulbul —; length c. 16 cm (6½ in.).

FIELD CHARACTERS. As in *ruficeps*, but upper back streaked. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Common resident. Assam in the Garo and Khasi Hills, Nagaland, and the hills of East Pakistan south to the Chittagong district; from the foothills to 1450 m. Affects evergreen or deciduous dense forest, bamboo and secondary growth.

Extralimital. The species ranges throughout the Indochinese subregion.

GENERAL HABITS, FOOD AND VOICE. As in 1154.

BREEDING. As in 1153.

118

TIMALIINAE

or by running like quail. Usually very quiet and retiring, and easily overlooked.

FOOD. Insects.

VOICE AND CALLS. Three or four, mellow plaintive whistling notes in an ascending scale, not unlike Iora's, variously transcribed as *he'll beat* or *he'll beat you, I'm right here, pret-by-sweet*, etc. — the first syllable short, the second low and emphasized — repeated with persistence and monotony at intervals of five seconds or so for up to 15 minutes at a stretch, especially in the mornings and evenings. Uttered from a branch inside a dense thicket; on an observer's approach, the calls suddenly cease, the bird quietly drops into the undergrowth and disappears, to start calling again fifty yards away. Song, a percussive loud and pretty phrase of several rich and spirited whistling notes up and down the scale, often sustained practically without intermission for well over a minute, and soon repeated. It is heard mostly in the early morning and late afternoon; chiefly in the breeding season but sporadic bursts may be given at all times of the year. Alarm-notes, a harsh *chr-r, chr-r* or *kraa, kraa* while the bird is slinking away. Pairs and parties keep in touch by a musical subdued contact-note *weet*. Also some chattering notes uttered when working through bushes.

BREEDING. Season, mainly during the monsoon: February to April in the south, April to June in Madhya Pradesh extending to September in the Western Ghats. Nest, a flimsy ball of dead leaves or grass about the size of a large melon, usually scantily lined with grass or fine stems of maidenhair fern; entrance on the side, always looking downhill. Placed on the ground, in drifts of dry leaves at the foot of bushes, preferably on a slope. Eggs, 2 or 3 in the south, usually 3 in the north, white, marked with numerous specks, spots and blotches of brown as a rule denser at the large end. Average size of 21 eggs 21.6 × 16.2 mm (Baker). Parents approach and leave the nest by running through the undergrowth like a mouse. Young leave the nest on the 12th or 13th day after hatching.

MUSEUM DIAGNOSIS. For differences between the nominate race and *punctatum*; *mandellii* and *olivaceum* see under those subspecies (1152, 1153, 1155).

Young (immature), upperparts similar to adult but paler, no olive, less contrast between crown and back; all but primary coverts washed with fulvous on edges; underparts dull white, washed with dull ashy fulvous on the sides, no lanceolate spots; under tail-coverts dull ashy fulvous. No white tips to tail. Primary and tail characters present.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	68-78	17-20	25-30	61-73 mm
♀♀	66-73	16-20	25-27	57-69 mm
				(HW, SA, Koelz)

Weight 15 ♂♂ 21-30 (av. 26) g — SA.

COLOURS OF BARE PARTS. Iris orange-brown. Bill brown, fleshy below; mouth pale brownish and lemon-yellow. Legs and feet yellowish flesh.

120

TIMALIINAE

MUSEUM DIAGNOSIS. Similar to *mandellii* in having sharply defined blackish brown centres to the feathers of the uppermost back, but differing in having the rufous of forehead, crown and nape, and the brown of the remaining upperparts paler and greyer.

MEASUREMENTS. As in 1153.

Weight ♂ 31; ♀ 26-28 g (SDR).

COLOURS OF BARE PARTS. ♂ upper mandible black, lower basally yellow, distally grey; ♀ upper mandible basally black, distally greyish brown, lower basally yellow, distally grey (SDR).

1157. Mishmi Spotted Babbler. *Pellorneum ruficeps pectorale* Godwin-Austen

Pellorneum pectorale Godwin-Austen, 1877, Jour. Asiat. Soc. Bengal 46: 41

(Sadiya, Assam)

Not in Baker, FBI

LOCAL NAMES. None recorded.

SIZE. Bulbul —; length c. 16 cm (6½ in.).

FIELD CHARACTERS. As in 1154 but upper back streaked. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident in NEFA in the Mishmi Hills and the Sadiya Frontier Tract, probably extending west to the Subansiri river. Affects clearings in dense evergreen or deciduous forest.

GENERAL HABITS, FOOD, VOICE AND BREEDING. As in *mandellii* (1153), Q.V.

MUSEUM DIAGNOSIS. Differs from *mandellii* in having the rufous of forehead, crown and nape much deeper in tone (rufous-chestnut); brown of the remaining upperparts darker; underparts more heavily washed with a richer buff. Differs from *chamelum* by its more saturate coloration above and below.

Young, edges of wings and tail more rusty; no white tip to tail; underparts fulvous white with dusky shadows on breast.

MEASUREMENTS

	Wing	Bill (from skull)	Tail
♂♂	70-76	18-20	67-74 mm
♀♀	66-71	17-19	62-68 mm
			(SDR, SA)

COLOURS OF BARE PARTS. Iris brown or red-brown. Bill: upper mandible brown, lower yellow at base, pale brown at tip. Legs and feet fleshy.

1158. Lakhimpur Spotted Babbler. *Pellorneum ruficeps ripleyi* Deignan

Pellorneum ruficeps ripleyi Deignan, 1947, Smith. Misc. Coll. 107: 7

(Margherita, Assam)

Not in Baker, FBI

LOCAL NAMES. None recorded.

SIZE AND FIELD CHARACTERS. As in 1154 but upper back streaked. See Museum Diagnosis.

BABBLERS

121

STATUS, DISTRIBUTION and HABITAT. Resident. Northeastern Assam in the Lakhimpur district south of Brahmaputra river. Same habitat as adjacent subspecies.

GENERAL HABITS, FOOD, VOICE and BREEDING. As in 1154, q.v.

MUSEUM DIAGNOSIS. Differs from *mandellii* (1153) in having the rufous of the forehead, crown and nape slightly richer in tone; brown of remaining upperparts more strongly rufescent; underparts more heavily washed with a richer buff.

MEASUREMENTS and COLOURS of BARE PARTS. As in *pectoreale* (1157).

1159. Manipur Spotted Babbler. *Pellorneum ruficeps vocale* Deignan

Pellorneum ruficeps vocale Deignan, 1951, Postilla, Yale Peabody Mus., No. 7: 2 (Kanglatongbi, Manipur)
Not in Baker, FBI

LOCAL NAMES. None recorded.

SIZE and FIELD CHARACTERS. As in 1154 but upper back streaked. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Resident. Valley of central Manipur. Same habitat as *chamelum*.

GENERAL HABITS, FOOD, VOICE and BREEDING. As in *mandellii*.

MUSEUM DIAGNOSIS. Underparts like *chamelum* but differs in having the forehead, crown and nape chestnut rather than rufous; blackish brown centres to the feathers of the uppermost back obsolescent (*contra* sharply defined); brown of remaining upperparts deeper in tone.

MEASUREMENTS and COLOURS of BARE PARTS. As in *pectoreale* (1157).

1160. Marsh Spotted Babbler. *Pellorneum palustre* Gould

Pellorneum palustre Gould, 1872, Bds. Asia 3: pl. 65, pt. 24 (Cachar, Assam)
Baker, FBI No. 246, Vol. 1: 242
Plate 75, fig. 19

LOCAL NAME. *Dao-priti-pit kashiba* (Cachar).

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. Upperparts and tail olive-brown; lores whitish; sides of neck, flanks and a band across the breast ochraceous, more or less streaked with brown; chin white; throat and upper breast white streaked with brown; centre of belly white, sides olive-brown; under tail-coverts ochraceous. Sexes alike.

Distinguished from *P. ruficeps* by its uniformly coloured upperparts, and from *P. albiventris* by its heavily striped throat.

STATUS, DISTRIBUTION and HABITAT. An endemic species. Resident, locally common. NEFA from the Miri Hills to the Mishmi Hills and Sadiya, Assam in the plains of the Brahmaputra, the plains and upland grass hills of Cachar and Khasi Hills, and East Pakistan in Sylhet and the Chittagong region; from the plains to 800 m. Affects great tracts of reeds and coarse high grass alongside swamps and rivers, elephant-grass and also bushes and low tree-jungle on marshy ground.

BABBLERS

123

VOICE and CALLS. Very similar to those of the Spotted Babbler. A monotonously repeated, clear whistle rendered as *prii-tee dear* or *to meet you*, the middle note pitched higher. Song, uttered during the breeding season, a quaint little lilting song, whistling up and down the scale. Both call and song are easily imitated, thus the calling bird may be deceived within view. Alarm-note, a sharp *wit* or rapid *quit-it-it*; scolding note a low *chr chr chr*.

BREEDING. Season, February to April and September to December; chiefly March-April. *Nest*, a ball of dead leaves loosely put together, with a large entrance at one side, sometimes taking up almost the whole of the side; lined with a few semi-decayed leaves and fine leaf- or fern-stalks neatly pressed around the inside. Usually placed on the ground among a litter of fallen leaves in which it blends perfectly, more generally at the foot of a large tree or cardamom clump, occasionally under a tea bush, or in a decayed hollow in a tree near the ground; once in a crevice in a bank, about one metre from the ground. The site is almost always in heavy forest. *Eggs*, generally 2, sometimes 3, white or nearly so, exceptionally tinged with buff or greyish green, profusely speckled or with small blotches of brown, red-brown, purplish brown or blackish brown, slightly more numerous at the large end, sometimes forming a ring or cap (Phillips). Average size of ten eggs 22.2 × 16.2 mm (Baker). The bird sits very closely and the majority of nests are found as it flies out suddenly at one's feet. Male shares in incubation.

MUSEUM DIAGNOSIS. See Key to the Subspecies.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
3 ♂♂	73-75	18-19	27-28	66-69 mm
3 ♀♀	67-70	17-18	25-26	57-60 mm (HW)

Weight 1 ♂ 30 g (SDR).

COLOURS of BARE PARTS. Iris red. Bill: upper mandible brown, lower pink. Legs and feet pinkish brown.

1162. Pale Brown capped Babbler. *Pellorneum fuscicapillum babaulti* (Wells)

Scotocichla fuscicapilla babaulti Wells, 1919, Bull. Brit. Orn. Cl. 39: 69 (Trincomalee, Ceylon)
Baker, FBI No. 250, Vol. 1: 245

LOCAL NAMES. As in 1160.

SIZE. Bulbul —; length c. 16 cm (6½ in.).

FIELD CHARACTERS. As in 1160.

STATUS, DISTRIBUTION and HABITAT. Common resident. Ceylon, in the low-country Dry zone. (See map, p. 116.) Affects scrub and undergrowth.

GENERAL HABITS, FOOD and VOICE. As in 1160.

BREEDING. Season, March and December. *Nest* and *eggs*, as in 1160.

MUSEUM DIAGNOSIS. Differs from the nominate race (1161) in its paler coloration throughout. Crown and nape chocolate-brown instead of blackish; remainder of

122

TIMALIINAE

GENERAL HABITS. A great skulker, easily overlooked, though call-notes are constantly uttered. Difficult to observe; when flushed, flits in a rather lopsided manner from one patch of grass to another.

FOOD. Insects.

VOICE and CALLS. A loud double chirp *chi-chew* 'reverse of that of *Chrysomma altirostre*' (1234) (Stevens) heard in the same facies.

BREEDING. Season, during monsoon from the end of May onward. *Nest*, like that of the Spotted Babbler, a ball of grass lined with finer grass or a few rootlets, placed on the ground among grasses and roots, always more or less covered by the matted roots or fallen debris. *Eggs*, like small replicas of *P. ruficeps*. Average of 14 eggs 20.6 × 15.7 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Species and Field Characters.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♀	62-68	c. 15	c. 26	64-69 mm (Baker)

COLOURS of BARE PARTS. Iris brown. Bill: upper mandible deep brown, lower pale brown. Legs and feet fleshy brown (Hume), pale horny blue (Stevens).

PELLORNEUM FUSCOCAPILLUM (Blyth)

1161. Brown capped Babbler. *Pellorneum fuscicapillum fuscicapillum* (Blyth)

Dryococcyphus fuscocapillus Blyth, 1849, Jour. Asiat. Soc. Bengal 18: 815 (Colombo, Ceylon)
Baker, FBI No. 249, Vol. 1: 245
Plate 75, fig. 16

LOCAL NAMES. *Parandel-kurulla*, *Redi diang* ('give me cloth', onomatopoeic. Sinhala).

SIZE. Bulbul —; length 16 cm (6½ in.).

FIELD CHARACTERS. Above, brown with a darker brown cap. Below, and sides of head cinnamon; tail brown narrowly tipped with buff. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Common resident. Ceylon, from the foothills to 1650 m, from the northern Dry zone in the west to the southwest Wet zone and east through the hills. (See map, p. 116.) Affects dense forest.

GENERAL HABITS. Very similar to those of the Spotted Babbler, as are also its nesting habits and voice. Found in pairs, spending most of the time on the ground, turning over dead leaves in search of insects. Very shy but may easily be discovered by its calls (q.v.) or by the rustling of dead leaves.

FOOD. Insects.

124

TIMALIINAE

upperparts olive-brown instead of chocolate-brown. Sides of head and whole lower plumage warm brownish buff instead of chestnut-buff.

MEASUREMENTS

1164. Assam Brown Babbler. *Pellorneum albiventris albiventris* (Godwin-Austen)*Neornis albiventris* Godwin-Austen, 1876, Jour. Asiat. Soc. Bengal 45: 199 (Manipur Valley)*Turdinus nagaensis* Godwin-Austen, 1877, Ann. Mag. Nat. Hist., Ser. 4, 20: 519 (Naga Hills)

Baker, FBI No. 247 (part), Vol. 1: 243

Plate 75, fig. 15

LOCAL NAME. 'Dao-chih' (Cachari).

SIZE. Sparrow \pm ; length c. 15 cm (6 in.).

FIELD CHARACTERS. A small brown short-tailed babbler with whitish, faintly spotted throat, whitish belly with a rusty wash on breast and flanks. Sexes alike. See also Key to the Species.

The very similar Tickell's Babbler (1166) has a creamy buff unspotted throat concolorous with rest of underparts. Abbott's Babbler (1167) is also similar but larger, with an unspotted greyish white throat.

STATUS, DISTRIBUTION AND HABITAT. Resident subject to short vertical movements, locally common, more so in the higher parts of its zone. The foothills of Bhutan (Deothang) and NEFA, in the North Lakhimpur district, the hills of Assam from Margherita to Cachar, Nagaland, Manipur, and East Pakistan south to the Chittagong Hill Tracts. Affects scrub growth in low-lying forest land (winter), bamboo jungle and heavy cut-over scrub, from 500 to 1500 m, reaching the plains in winter.

EXTRALIMITAL. Extends to western Burma (Chin Hills and Mt Victoria). The species ranges east to Vietnam.

GENERAL HABITS. Little known. A great skulker; very shy and retiring. Found in pairs near the ground in thick tangles of secondary or bamboo growth; avoids dense shady forest.

FOOD. Insects.

VOICE AND CALLS. A sharp *chick*, some soft low chuckling notes, and a low clear whistle. Alarm, a low rippling note.BREEDING. Season, May to July. Nest, a globular structure, sometimes only partially domed or even just a deep cup, made of grass and bamboo leaves and lined with grass; placed in bamboo clumps, bushes overgrown with creepers or occasionally in clumps of grass or weeds, between 60 and 120 cm from the ground, seldom higher or lower. Eggs, 3 or 4, rarely 5, pale cream to warm brick-colour profusely covered by speckles and tiny blotches of brick-red. Average size of 200 eggs 20 \times 15.1 mm (Baker). Nests sometimes brood-parasitized by Hawk-Cuckoo, *Cuculus sparverioides* (Baker, JBNHS 17: 363).MUSEUM DIAGNOSIS. Differs from *ignotum* (1165) in being paler, more rufous above; throat faintly spotted, white area of belly more restricted and, except for centre, washed with tawny-olive. Young birds have the edges of secondaries and greater wing-coverts more distinctly reddish brown.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

q^7	53-58	14-15	—	40-56 mm

(Kinnear, SDR)

BABBLERS

127

FIELD CHARACTERS. A small, long-legged, short-tailed, mostly terrestrial babbler. Above, olive-brown; below, buffish white. Sexes alike. Abbott's Babbler (1167) is larger and has a greyish white throat. For distinction between this and *Pellorneum* babblers, see under Brown Babbler (1164).

STATUS, DISTRIBUTION AND HABITAT. Resident subject to vertical movements, locally common. NEFA from the Daffa Hills to the Mishmi Hills; Assam from the Garo Hills to Margherita and East Pakistan in the northeastern and Chittagong hill tracts; presumably also the Naga Hills and Manipur. From the plains to 2100 m, optimum zone 1000-1400 m; reaches the plains in winter. Affects heavy cut-over scrub, bamboo thickets near streams, open or deep forest and practically any suitable cover.

EXTRALIMITAL. Extends to northwestern Burma. The species is found throughout the Indochinese subregion and Sumatra.

GENERAL HABITS. Found in pairs skulking in dense undergrowth. Feeds on the ground; when disturbed hops to the nearest cover and flies only with reluctance.

FOOD. Insects.

VOICE AND CALLS. A sharp *tsip* (Stevens); alarm-notes, a soft rippling *chir-chir* (Baker). Call-notes, a loud *pit-you* . . . *pit-you* uttered fairly rapidly (Smythies).BREEDING. Season, March to June. Nest, a domed or semi-domed structure, much like that of *Pellorneum* species but more compact, tidy and well-built; materials are fine bamboo leaves and grass; lining scanty, of a few fine grasses. Placed on the ground or in bushes or bamboo clumps near the ground preferably in open glades by streams. Eggs, 3 or 4, of the *Pellorneum* type: pale olive-grey densely covered with freckles or small blotches of reddish brown or olive-brown. Average size of 60 eggs 19.9 \times 15.7 mm (Baker).MUSEUM DIAGNOSIS. See Key to the Species. Differs from *Pellorneum albiventris* by its buffish white underparts and unspotted throat.

MEASUREMENTS

 σ^7 q^7 Wing 64-67; tail 50-55 mm (Baker).1 σ^7 Wing 62; bill (culmen) 16; tail 51 mm (SDR).

COLOURS OF BARE PARTS. Iris reddish brown. Bill: upper mandible dark brown. Legs brownish grey.

1167. Abbott's Babbler. *Trichastoma abbotti abbotti* (Blyth)*Malacocincla Abbotti* Blyth, 1845, Jour. Asiat. Soc. Bengal 14: 601

Genus TRICHASTOMA Blyth

Trichastoma Blyth, 1842, Jour. Asiat. Soc. Bengal 11: 795. Type, by original designation, *Tr. (ichastoma) rostratum* Blyth*Malacocincla* Blyth, 1845, Jour. Asiat. Soc. Bengal 14: 600. Type, by monotypy, *Malacocincla Abbotti* BlythVery similar to *Pellorneum*, *T. tickelli* being intermediate, but bill more compressed laterally and rictal bristles well developed.

Key to the Species

Larger; throat greyish white *T. abbotti*
Smaller; throat creamy buff *T. tickelli*1166. Tickell's Babbler. *Trichastoma tickelli assamensis* (Sharpe)*Drymocaplius assamensis* Sharpe, 1883, Cat. Bds. Brit. Mus. 7: 557 (Dhollah, Assam)

Baker, FBI No. 253, Vol. 1: 248

Plate 75, fig. 17

LOCAL NAME. 'Dao-busha' (Cachari).

SIZE. Sparrow; length c. 15 cm (6 in.).

TIMALIINAE

128

SIZE. Bulbul —; length c. 15 cm (6 in.).

FIELD CHARACTERS. A brown, short-tailed terrestrial babbler. Above, olive-brown. Below, throat greyish white; centre of belly whitish, washed on breast and flanks with olive; under tail-coverts bright ochraceous. Sexes alike. Voice (q.v.) is distinctive. Tickell's Babbler (1166) is smaller and has a buffish white throat.

STATUS, DISTRIBUTION AND HABITAT. Resident, locally common. The Himalayan foothills from the terai of eastern Nepal and Sikkim east through the Bhutan foothills and NEFA to the Mishmi Hills, northern West Bengal, East Pakistan in the northeastern and Chittagong hill tracts; Assam, Nagaland and Manipur. In densely wooded valleys, ravines and broken land at the base of the hills and up to 600 m. Affects tangled thickets in wet deep jungle and original forest, especially edges of forest along the banks of streams; appears to have a predilection for the vicinity of palm-ferns.

EXTRALIMITAL. Southern Burma and central and southern Thailand. Other subspecies in the Indochinese countries, Malaysia, Sumatra and Borneo.

GENERAL HABITS. Behaves much like the Spotted Babbler. Solitary or in pairs in brushwood near the ground, and in the same limited area day after day.

FOOD. Insects.

VOICE AND CALLS. A loud distinctive call of three notes dropping in pitch on the middle note, or sometimes four notes, the first low, the other three higher and on the same pitch (Smythies). According to Fleming, this call is a duet, the male leading off with *poor'ol bear* followed by the female *dear dear*; the phrase sometimes becomes *poor'ol dear bear dear*.BREEDING. Season, chiefly April and May, extending into July. Nest, a bulky cup of dead-leaves, bracken fronds, weed-stems, a little moss and grass with a good lining of rather coarse red roots, averaging 12 to 15 cm in diameter. Placed near the ground in bushes, briars, weeds or in dwarf palm-trees at the base of the frond. Eggs, 3 to 5, bright salmon colour marked with a few bold blotches and a few short twisted lines of deep red; underlying spots of lavender. Average size of 20 eggs 21.8 \times 16.2 mm (Baker). When disturbed, the birds slip quietly over the edge of the nest but then proceed for a few yards with rather a fussy flight before reaching the ground, when they soon get out of sight with long hops. Nests sometimes parasitized by Violet Cuckoo, *Chalciter xanthorhynchus* (Baker, JBNHS 17: 755).

MUSEUM DIAGNOSIS. See Key to the Species and Field Characters.

129

Genus POMATORHINUS Horsfield

Pomatorhinus Horsfield, 1821, Trans. Linn. Soc. London 13: 164. Type, by monotypy, *Pomatorhinus montanus* Horsfield

Principal distinguishing feature is the long, slender bill, as long as or longer than the head, curved downwards, always compressed. Nostrils bare. Feathers of forehead short and rounded. Tail longer than wing, much graduated, the outer rectrices not exceeding three-quarters the length of the central pair. Noisy sociable birds. All species lay white, unspotted eggs; nest on or near the ground.

Plate 74, fig. 18

LOCAL NAMES. *Pabdoa* (Bengali); *Phoyum-pho*, *Pharreeum-pho* (Lepcha); *Bhiakuroh* (Parbutia); *Dao-buku-galao* (Cachari).

SIZE. Between bulbul and myna; length 22 cm (8½ in.).

x c. 1

P. ruficollis is smaller and the white below is restricted to throat. *P. erythrogenys* has no supercilium. *P. ochraceiceps* lacks any chestnut on the sides and has an orange bill. *P. hypoleucos* has slate-grey flanks and much longer bill and legs. *P. ferruginosus* has a coral-red bill.

STATUS, DISTRIBUTION and HABITAT. Resident, locally common. The Himalayan foothills from Kumaon through Nepal, Sikkim, Bhutan and NEFA to the Dihang river; northern West Bengal (sparingly in the plains), the Brahmaputra Valley (except for the range of *cryptanthus*), the hills of East Pakistan, Assam, Nagaland and Manipur; from the edge of the plains to 1500 m. Recorded in winter at 2000 m in Sikkim (Meinertzhagen) and above 2000 m in Nepal (Smythies). Affects heavy secondary growth, scrub jungle, undergrowth in forest, and mixed bamboo forest.

Extralimital. Northwestern Burma (Upper Chindwin district). The species, including *montanus*, is found throughout the Indochinese subregion, the Sunda Islands and Borneo.

GENERAL HABITS. Shy, secretive and a great skulker. In pairs during the breeding season, otherwise in small parties often in company with *Garrulax ruficollis* or *Gampsiornis rufulus*. Keeps to dense bushes rummaging for food among the mulch on the ground or hopping among the undergrowth, at times ascending trees.

FOOD. Insects, small seeds and berries.

130

TIMALIINAE

1168. West Himalayan Slatyheaded Scimitar Babbler. *Pomatorhinus schisticeps leucogaster* Gould

Pomatorhinus leucogaster Gould, 1838, Proc. Zool. Soc. London: 137 (Himalayas = Simla)

	<i>holdsworthi</i> (1176).		<i>melanurus</i> (1177).

thick jungle, well-wooded ravines, bamboo thickets and heavy patches of scrub. No seasonal movements.

GENERAL HABITS, FOOD and VOICE. As in 1169.

BREEDING. Season, March to August. Nest, domed, made of grass bents, dead leaves and tendrils, lined with fine rootlets, usually placed on a sloping bank among herbage. Eggs, 3 or 4, white. Average size of 12 eggs, 25.4 x 19.5 mm (Baker).

132

TIMALIINAE

VOICE and CALLS. Very similar to those of *horsfieldii* (1173) of the Western Ghats, q.v. When undisturbed and moving about in quest of food, the birds keep in touch by constant mellow, gurgling, flute-like calls and other mewing and churring notes. Ordinary call-note, a double whistle *tjoo-tjoo* or *gouk-gouk*; alarm, some very loud and shrill calls like *krry-krry-krrö-krrö-krrö* (Heinrich). Song, a series of short low whistled notes preceded by a single higher note *tji-u-u-u-u* or *woot-a-ah-hoot*. The male is easily attracted by an imitation of its song.

BREEDING. Season, from the end of March to June. Nest, domed, egg-shaped, with the entrance at the smaller end, usually lying on its side, less often standing on its broader end. Saucer-shaped nests have been reported but are exceptional. Usual materials are bamboo leaves and grass blades, but sometimes others are used such as rootlets, tendrils, strips of bark or bracken leaves, very loosely interlaced, the nest hardly bearing removal or handling. Lining is of rootlets and finer grass blades. Location varies but most often the nest is placed low down in bamboo clumps or thick bushes up to about one metre, occasionally in a clump of grass or in a bank at the foot of a tree. Eggs, 3 or 4, rarely 5, white. Average of 100 eggs 26.6 x 19.2 mm (Baker). The birds sit fairly close and when disturbed tumble out of their nest to the ground, seek refuge in undergrowth, proceeding by long hops, and within a few moments uttering their low *hoot-hoot*. Both sexes take part in building and in incubation. Making of nest averages a good ten days; incubation period undetermined.

MUSEUM DIAGNOSIS. See Key to the Subspecies.

Young, a dull edition of the adult; slightly browner above and all colours and demarcations less pronounced. Biswas describes a young bird as being reddish olive on upper side; rufous on forehead, rusty on breast and flanks. Primary and tail characters present. Postjuvinal moult complete.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

FIELD CHARACTERS. As in 1174, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident, locally common. South-western Rajasthan (Mount Abu and adjacent parts of Aravalli Range), northern Gujarat (including Saurashtra in the Gir forest — Dharmakumar-sinhji, JBNHS 48: 188), intergrading with *horsfieldii* south to the Tapi river; Madhya Pradesh in the Vindhya and Satpura ranges east to Balaghat, but eastern limit needs re-determining. Confined to the hills. Affects bamboo groves, thorn jungle, deciduous and semi-evergreen forest.

GENERAL HABITS, FOOD AND VOICE. As in 1169.

BABBLERS

135

COLOURS OF BARE PARTS. Adult. Iris reddish brown. Bill orange with variable amount of dark brown at base of upper mandible; mouth pink. Legs and feet dusky plumbeous; soles lemon-yellow. Young. Lower mandible and tip of upper mandible pinkish flesh; base of upper mandible horny; gape pinkish flesh. Legs and feet plumbeous.

1174. Kerala Scimitar Babbler. *Pomatorhinus schisticeps travancorensis* Harington

Pomatorhinus horsfieldii travancorensis Harington, 1914, Jour. Bombay nat. Hist. Soc.

23: 333 (Peermell (= Peerned), Travancore)

Baker, FBI No. 208, Vol. 1: 211

LOCAL NAME. *Cholakkutuan* (Malayalam).

SIZE. Between bulbul and myna; length c. 22 cm (8½ in.).

FIELD CHARACTERS. A dark olive-brown and white babbler of the undergrowth with conspicuous white supercilium, white throat, breast and centre of belly, and a long, curved yellow bill. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Common resident. The Western Ghats and associated hills of southwest India from Goa and northern Mysore (where it intergrades with *horsfieldii*) south through western Mysore, Kerala and western Tamil Nadu. From almost sea level to the highest elevations (up to 2400 m in the Nilgiris). Affects evergreen and deciduous forest, patches of *Strobilanthes*, thorn and *Lantana* scrub, bamboo jungle and cardamom sholas.

GENERAL HABITS. Very elusive. Found in pairs during the breeding season, otherwise in small parties of four to ten, either by themselves or in association with mixed hunting parties. Rummages under dense undergrowth in search of insects, flicking aside or turning over dead leaves or digging vigorously in the mulch with the long bill; also hops along moss-covered branches or up the trunks of trees in this quest, diving into the undergrowth when alarmed.

FOOD. Largely insects, grubs, spiders; also berries and flower-nectar.

VOICE AND CALLS. Very similar to those of the Himalayan races (see 1169). Members of a flock or pairs keep in touch by mellow bubbling or gurgling calls and duets: a musical flute-like *woot-ho-ho-ho* (*oo-pū-pū* or *oo-pū-pū-pū*) (male) immediately followed by the subdued reply of the female *kūkū* or *krokānt*, so promptly that it sounds like the ending of the same phrase. Alarm, a sharp *kir-r-r-r*.

BREEDING. Season, overall October to May, chiefly November to March. Nest, like that of the nominate race (q.v.): a loosely built ball of dead leaves, occasionally of moss, about 17 cm in diameter, lined with fine grasses or rootlets. Placed on the ground, on a sloping bank or under a bush; occasionally off the ground in a bush. Eggs, 3 or 2, white. Average size of 20 eggs 25.6 × 18.8 mm (Baker). Both sexes share in building, incubation (?) and tending the young. Incubation period undetermined.

MUSEUM DIAGNOSIS. Like *horsfieldii* but upperparts a richer olive-brown; head darker than the back; plastron edged by a broad black band (v. narrow and blackish brown in *horsfieldii*); bill shorter.

134

TIMALIINAE

BREEDING. Season, April to June. Nest and eggs, as in 1174.

MUSEUM DIAGNOSIS. Like *horsfieldii* (1173) but everywhere paler, more smoky grey; no black band separating white of breast from upper plumage. Bill longer and larger.

Young, like that of *horsfieldii* but reflects the racial differences.

MEASUREMENTS

7 ♂♂ Bill (from skull) 32-35 mm (HW); other measurements as in *horsfieldii*.

COLOURS OF BARE PARTS. Iris dark red. Bill dirty yellow, blackish on the ridge at base of upper mandible. Legs and feet dark greenish plumbeous.

1173. Deccan Scimitar Babbler. *Pomatorhinus schisticeps horsfieldii* Sykes

Pomatorhinus horsfieldii Sykes, 1832, Proc. Zool. Soc. London: 89

(Mahabaleshwar, Western Ghats)

Baker, FBI No. 206, Vol. 1: 210

Plate 74, Fig. 19

LOCAL NAMES. None recorded.

SIZE. Between bulbul and myna; length c. 22 cm (8½ in.).

FIELD CHARACTERS. As in 1174, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident, locally common. Southern Gujarat from the Tapi river south through Maharashtra in the Western Ghats complex to Goa and northern Mysore (Londa) (intergrades with *obscurus* in the north and *travancorensis* in the south); eastern Orissa hills from about Hindol (c. 21°N. lat.) south through the Eastern Ghats complex to the Krishna river in eastern Andhra Pradesh where it intergrades with *maderaspatensis*. From the foothills to c. 1000 m. Affects bamboo patches, thorn scrub, dense bush jungle, deciduous and evergreen forest.

GENERAL HABITS, FOOD AND VOICE. As in 1174. A mellow fluty *oō-pū-pū-pū* or *oō-pū-pū-pū-pū*.

BREEDING. Season, February to May. Nest and eggs, as in 1174. Average size of 24 eggs 25.7 × 19.4 mm (Baker).

MUSEUM DIAGNOSIS. Less grey than *obscurus*, less richly coloured than *travancorensis* and intermediate between the two; back dark earthy brown; dark edge of plastron blackish brown.

Young (immature), crown uniform dark olive-brown without the black lateral streaks; upperparts more golden olive-brown, especially on wings and coverts; white feathers of lower throat with faint black tips; black edging to plastron replaced by bright ferruginous and continuing behind as a diffused nuchal collar; remainder of lower plumage washed and mottled with rufous. This plumage, in a more accentuated form, resembles that of adults of the Himalayan races of *P. schisticeps*.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	91-100	29-35	31-35	95-102 mm
♀♀	89-98	29-35	31-33	92-108 mm (SA, HW)

Weight 12 ♂♂ 33-53 (av. 43) g — SA.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	90-104	27-38	33-35	94-107 mm
♀♀	85-98	28-33	33 (2)	93-100 mm (SA, HW)

COLOURS OF BARE PARTS. Iris reddish brown. Bill yellow, basal half of culmen including nostrils horny brown; mouth pinkish flesh. Legs and feet slaty or greyish brown; claws horny brown.

1175. Tamil Nadu Scimitar Babbler. *Pomatorhinus schisticeps maderaspatensis* Whistler

Pomatorhinus horsfieldii maderaspatensis Whistler, 1936, Jour. Bombay nat. Hist. Soc.

38: 699 (Kurumbapattī, Salem District, Madras)

Not in Baker, FBI

LOCAL NAMES. *Nāndla pitta*, *Dasari pitta* (Telugu).

SIZE. Between bulbul and myna; length c. 22 cm (8½ in.).

FIELD CHARACTERS. As in 1174, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Common resident. The southern Eastern Ghats and associated hills in Andhra and Tamil Nadu, from the Krishna river south to the Cauvery river; from the foothills to the highest elevations. In same biotope as *travancorensis*.

GENERAL HABITS, FOOD AND VOICE. As in 1174.

BREEDING. As in 1174.

MUSEUM DIAGNOSIS. Like *horsfieldii* but lacks the black edge to the white plastron.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	89-100	29-33	31-35	94-103 mm
♀♀	90-98	30-33	31-34	91-98 mm (SA)

Weight 7 ♂♂ (June-Aug.) 43-50 (av. 47.8) g — SA.

COLOURS OF BARE PARTS. Iris reddish brown. Bill orange-yellow, a variable area of dark brown at base of culmen; mouth pink. Legs and feet dusky plumbeous; soles lemon-yellow.

1176. Common Ceylon Scimitar Babbler. *Pomatorhinus schisticeps holdsworthi* Whistler

Pomatorhinus horsfieldii holdsworthi Whistler, 1942, Bull. Brit. Orn. Cl. 62: 51-2

(Ohiya, Ceylon)

Not in Baker, FBI

LOCAL NAME. *Parandē-korallā* (Sinhala).

SIZE. Between bulbul and myna; length c. 22 cm (8½ in.).

FIELD CHARACTERS. As in 1174, q.v. See Museum Diagnosis.

BABBLERS

137

STATUS, DISTRIBUTION and HABITAT. Common resident. Ceylon in the eastern hills and low-country Dry zone, from the plains to 1800 m. Affects deciduous and evergreen forest and well-wooded gardens.

GENERAL HABITS and FOOD. As in 1174.

VOICE and CALLS. A variety of chirps and rattles uttered while feeding or when suspicious; other notes are *pop pop-prrr* and a deep guttural *wooh wooh*. Pairs sing in duets; sonorous and pleasant notes *paup-a-paup* (male) answered by a quiet *ka-free* (female) (Henry).

BREEDING. Season, November to June, chiefly February to April. Nest, an untidy, rather deep, generally semi-domed cup of decaying leaves or dead grass, mixed with plant stems, rootlets or strips of bark. In some nests the dome is well made, in others almost lacking; a scanty lining of rootlets, grass or dead leaves. Placed almost on the ground at the base of cardamom plants or other low vegetation, or among dead leaves at the foot of a bank, occasionally in crevices and hollows in trunks of trees or in bushes, 30 to 60 cm above the ground, exceptionally up to 180 cm (once). Eggs, 3 sometimes 2, white. Average size of 32 eggs, 25.1 × 18.6 mm (Baker).

MUSEUM DIAGNOSIS. Like *melanurus* (1177) but upperparts, flanks and wings olivaceous brown instead of rufous olive-brown; crown and tail nearly black. Differs from the south Indian races in having the flanks, vent and under tail-coverts olive-brown instead of grey-brown. Also lacks the black edging to the plastron like *maderaspatensis*. Complete moult takes place between the end of June and the beginning of December.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	87-94	26-29	30-33	85-90 mm
♀♀	82-88	27-29	30-32	82-86 mm (HW)

COLOURS OF BARE PARTS. Iris reddish brown; orbital region dull blue. Bill yellow, blackish at base of upper mandible. Legs and feet plumbeous grey.

1177. Southern Ceylon Scimitar Babbler. *Pomatorhinus schisticeps melanurus* Blyth

Pomatorhinus melanurus Blyth, 1847, Jour. Asiat. Soc. Bengal 16: 481

[Uragaha (restricted by Whistler), Ceylon]

Baker, FBI No. 209, Vol. 1: 212

LOCAL NAME. *Parandel-kurullā* (Sinhala).

SIZE. Between bulbul and myna; length c. 22 cm (8½ in.).

FIELD CHARACTERS. As in 1174, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Common resident. Ceylon, in the low-country Wet zone and western hill zone from the hills east of Matale south through the Peak range to the Sinharadja Forest area, west to Uragaha and east to Ratnapura. From the plains to c. 2000 m. Affects moist-deciduous and evergreen forest.

GENERAL HABITS and FOOD. As in 1174.

BABBLERS

139

shy; when disturbed, flies up into thicker cover, soon descending to the ground again to resume activities. Often flutters up into a larger bush and stands flitting its tail, or gradually hopping further up towards the top of the bush and then flying down into lower bushes again. Flight rather heavy and ungainly.

FOOD. Insects and grubs.

VOICE and CALLS. Has the same range of harsh churring notes and pleasant flute-like calls as other scimitar babblers. When questing for mate which has become separated, utters a double-noted call very reminiscent of the Redvented Bulbul, but louder and with a thrush-like clearness, repeated persistently every few seconds while hopping around, in obvious expectancy of an answer (SA). Another call rendered as *pra—pre-deeved* (Fleming). For description of song, see 1179.

BREEDING. Season, April to June. Nest and eggs, as in *bakeri* (1180).

MUSEUM DIAGNOSIS. The nominate subspecies differs from *godwini* (1179) in being less richly coloured above and with a more rusty tinge below. Tarsus and hindclaw shorter.

Young (immature), like adult but upperparts, tail, edges of wings and streaks of underparts more rufous, less olive. Primary and tail characters present; postjuvinal moult complete. Subadult more rusty above than adult.

NOTE: This species is much subject to foxing; old skins become very rufous and look more distinct from fresh skins than from other races (Whistler).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Hindclaw	Tail
♂♀	76-83	22-23	31-34	11-12	80-87 mm (Kinnear)
♂♂	74-83	23-25	—	—	84-86 mm
♀♀	73-84	23-24	—	—	80-91 mm (BB, Fleming)

COLOURS OF BARE PARTS. Iris ♂ pale red to crimson, ♀ reddish brown to pale brown; eyelids plumbeous. Bill: upper mandible black with yellow tip, lower yellow or yellowish white. Legs brown, feet slate; soles dull yellow.

1179. Sikkim Rufousnecked Scimitar Babbler. *Pomatorhinus ruficollis godwini* Kinnear

Pomatorhinus ruficollis godwini Kinnear, 1944, Ibis 86: 79

(Chungkar, Trashigong-Duwengiri Road, SE. Bhutan, 6000 ft)

Not in Baker, FBI

LOCAL NAME. *Bhiakwuh* (Parbatiya).

SIZE. Bulbul ±; length c. 19 cm (7½ in.).

FIELD CHARACTERS. As in 1178, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Common resident, with some downwards movement in winter. Eastern Nepal from the Arun-Kosi east through Sikkim, Bhutan, south Tibet and NEFA to the Dafa Hills (and presumably farther east though records are lacking). Of the scimitar babblers, this species occupies the highest zone — from 1500 to 3000 m,

138

TIMALIINAE

VOICE and CALLS. As in 1176.

BREEDING. As in 1176.

MUSEUM DIAGNOSIS. Differs from the south Indian races in having the flanks, vent and under tail-coverts rufous olive-brown instead of grey-brown. Also lacks the black edging to plastron like *maderaspatensis*. Differs from *holdsworthi* in having the upperparts, flanks and wings rufous olive-brown.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

1178. Nepal Rufousnecked Scimitar Babbler. *Pomatorhinus ruficollis ruficollis* Hodgson

Pomatorhinus ruficollis Hodgson, 1836, Asiat. Res. 19: 182

(Nepal, restricted to Kathmandu Valley by Ripley, Synopsis)

Baker, FBI No. 214, Vol. 1: 216

Plate 74, fig. 16

LOCAL NAMES. None recorded.

SIZE. Bulbul ±; length c. 19 cm (7½ in.).

FIELD CHARACTERS. Above, olive-brown; a conspicuous white supercilium from bill to nape; a black band from lores to ear-coverts; a rufous-chestnut patch on sides of neck. Below, throat white, rest of underparts rusty brown, the breast streaked with white. Bill shorter, less curved than in other scimitar babblers. Sexes alike. For distinction from other scimitar babblers, see 1169.

STATUS, DISTRIBUTION and HABITAT. Resident, with some downwards movement in winter; locally common. The Himalayas from Kumaon (Almora and Lohaghat) east through western and central Nepal to the Arun-Kosi; from 1400 to 3300 m, descending in winter as low as 800 m. Affects thick forest, or open forest with dense undergrowth and scrub on hillsides.

GENERAL HABITS. In pairs during the breeding season, otherwise in small parties of a half-dozen individuals, sometimes in company with other babblers, working over areas of twenty or thirty metres across, usually foraging on the ground where they noisily throw up dead leaves while looking for food. Occasionally clings upside down, like a woodpecker or nuthatch, on the underside of a moss-covered branch in the quest. Very

TIMALIINAE

140

optimum zone c. 1800-2400 m. Descends in winter to 700 m, but has also been recorded as high as 3000 m at this season. Affects thick forest, scrub-covered hillsides, rhododendron shrubs and bracken at the higher altitudes, tea-gardens and edges of jungle near them.

GENERAL HABITS and FOOD. As in 1178.

VOICE and CALLS. Frequently indulge in what seems to be calling and answering each other, several individuals joining in. Call a soft, musical, double- or triple-noted *off'n on* or *off-an-on* (accent on *off*) reminiscent of call of Redvented Bulbul (*Pycnonotus cafer* — 1128), invariably followed by female's prompt squeak in response (SA). Song varied but with one or two phrases forming the basis of the theme: *poiki-wurki poiki-wurki* (rising) or *pruruti-witeu-witeu* (falling), these notes with variations often combined into phrases of fair length (Lister). A common call [same as first?] consists of three whistled notes, the first being accented, the second on the same tone, the third about three tones lower; when heard at a short distance, reminds one of some cuckoo's call (Heinrich).

BREEDING. Season, April to June. Nest and eggs, as in 1180. Average size of 13 eggs 24 × 17.9 mm (Baker).

MUSEUM DIAGNOSIS. More richly coloured than *ruficollis*; rusty tinge below much reduced. Tarsus (?) and hindclaw longer.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Hindclaw	Tail
♂♂	78-86	22-26	30-34	12-14	81-95 mm
♀♀	76-86	22-24	30-37	12-15	80-92 mm (Kinnear, SA)

Weight 8 ♂♂ 30-39 (av. 33.1); 5 ♀♀ 26-35 (av. 30.2) g — SA.

COLOURS OF BARE PARTS. Iris reddish brown. Bill yellow, basal two-thirds of upper mandible black. Legs and feet brownish plumbeous.

1180. Cachar Rufousnecked Scimitar Babbler. *Pomatorhinus ruficollis bakeri* Harrington

Pomatorhinus ruficollis bakeri Harrington, 1914, Jour. Bombay nat. Hist. Soc. 23: 336 (Shillong, Khasia Hills)

Pomatorhinus ruficollis rector Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 4 (Blue Mountain, Lushai Hills, Assam)

Baker, FBI No. 215, Vol. 1: 217

LOCAL NAME. *Moh-mera* (Angami Naga).

SIZE. Bulbul ±; length 19 cm (7½ in.).

FIELD CHARACTERS. As in 1178, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Resident, locally common. The hills of Assam, Nagaland, Manipur and East Pakistan, from 900 to 1500 m. Affects evergreen forest with dense undergrowth, open bamboo jungle, scrub-covered hillsides and thickets in scrub pastures.

Extremities. Extends to southwest Burma (on Mt Victoria mostly between 2000 and 3000 m). The species ranges east to North Vietnam, Hainan, Formosa and north to Hupeh.

BABBLERS

141

GENERAL HABITS, FOOD and VOICE. As in 1178.

BREEDING. Season, April to July. Nest, domed, made of bamboo leaves, each layer at right angle to the next, some fern leaves and grass, sometimes strengthened with a few roots or weed-stems, but usually without binding and easily falling to pieces when moved; lined with rootlets. Most nests are placed on sloping ground, sometimes low down in bushes, rarely above one metre. Humid tree-forest with a good deal of undergrowth is preferred as a site. Eggs, 3 to 5, generally 4, white. Average size of 50 eggs 23.4×17.4 mm (Baker). Birds sit close and when disturbed leap away into cover, generally remaining in the vicinity, every now and then giving an impatient hoot-hoot or chuckle.

MUSEUM DIAGNOSIS. Differs from *godwini* in being paler and olive-brown above rather than rufous-brown; below more fulvous.

MEASUREMENTS

Wing 10 ♂♂ 77-84; 9 ♀♀ 75-79 mm (Heinrich).

Weight 2 ♂♂ 31, 32; 2 ♀♀ 27, 29 g (SDR).

COLOURS OF BARE PARTS. Iris dull maroon. Bill pale yellow, dusky to about the nostrils. Legs and feet pale grey-flesh (HW).

1183. Sikkim Rustycheeked Scimitar Babbler. *Pomatorhinus**erythrogenys haringtoni* Baker

Pomatorhinus haringtoni Baker, 1914, Bull. Brit. Orn. Cl. 33: 123 (Darjeeling)

Baker, FBI No. 220, Vol. 1: 220

LOCAL NAMES. *Tongo-hut-pho* (Lepcha); *Khokiya bhekura* (Nepal).

SIZE. Myna ±; length c. 25 cm (10 in.).

FIELD CHARACTERS. As in 1181, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident, locally common. East Nepal (intergrading extensively in central Nepal with *erythrogenys*), Sikkim, northern West Bengal duars, and Bhutan; from the foothills to c. 2100 m. Affects dense scrub on the edge of forest and about abandoned cultivation, ravines and scrub-covered hillsides.

GENERAL HABITS and FOOD. As in 1181.

VOICE and CALLS. See 1181 and 1184.

BREEDING. Season, April to June. Nest and eggs, as in 1181.

MUSEUM DIAGNOSIS. Like *erythrogenys* but darker olive above; ferruginous parts darker, nearer chestnut; throat, chin and upper breast dusky grey with whitish

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	92-99	34-39	36-40	91-103 mm
♀♀	88, 93	34, 35	35, 36	96 (1) mm (SA)

Weight 8 ♂♂ 62-70; 3 ♀♀ 59-61 g (SA, BB).

COLOURS OF BARE PARTS. Iris creamy or greyish white. Bill brownish flesh, dark brown for about half basal portion. Legs and feet brownish flesh; claws pale horny. Not different from other races.

1184. Assam Rustycheeked Scimitar Babbler. *Pomatorhinus**erythrogenys maclellandi* Godwin-Austen

Pomatorhinus maclellandi Godwin-Austen, 1873, Jour. Asiat. Soc. Bengal 39: 103, pl. 2 (Khasia Hills)

Pomatorhinus erythrogenys erythrotis Koelz, 1952, Jour. Zool. Soc. India 4: 38

(Karong, Manipur)

Baker, FBI No. 221, Vol. 1: 221

LOCAL NAME. *Dao-gurru bukū* (Cachari).

SIZE. Myna ±; length c. 25 cm (10 in.).

FIELD CHARACTERS. As in 1181, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident, locally common. NEFA and the hills of Assam, Nagaland, Manipur and East Pakistan; from 750 to 1800 m and probably higher in NEFA and in the Naga Hills. On Mt Victoria (Burma) it is found between 1400 and 2400 m, exceptionally up to 2600 m. Affects dry or moist forest, scrub jungle, secondary growth in clearings or abandoned cultivation.

Extralimital. Extends to western Burma. The species ranges north to Shensi and east to North Vietnam and Formosa.

142

TIMALIINAE

occasionally higher (up to 2700 m above Chakrata). Inhabits thick scrub at the edge of forest and bramble thickets, dense overgrown nullahs and bush-clad grassy hillsides. Avoids heavy forest.

GENERAL HABITS. Spends most of its time on the ground among fallen leaves but at times will ascend trees with thrush-like hops. Mostly in pairs in summer, in parties of half a dozen in winter. When perched on a branch, the head and curved bill are held up while the tail droops down and jerks when the head is moved from side to side.

FOOD. Insects, larvae, chrysalises, seeds and berries.

VOICE and CALLS. Sing in duets. The male with neck upstretched utters a loud melodious whistle *cue-pee* or *Q-P* (accent on first syllable) and is promptly answered by the female invariably in close attendance, with *kip* or *quip*. The female's response follows so immediately that the three syllables sound as a single call coming from the same bird thus, *q-p . . quip*, *q-p . . quip*, and so on (SA); also rendered as *took-took-teek*. This duetting continues during the year except at nesting time when the female often fails to respond. See also 1184. Alarm-note, a gurgling *quwik* answered by the female's *chur*; also a variety of loud harsh quick-repeated chattering *che-che-che* notes like a jay's (*Garrulus*) when agitated.

BREEDING. Season, from mid March to June. Nest, domed or sometimes cup-shaped when well protected by thick foliage or projecting rock. Made of grass, dead fern or bamboo leaves sparingly lined with fibres. Placed on sloping ground in an earth pocket or under the shelter of a bush, rock or tussock of grass, looking very like a natural accumulation of rubbish. Breeds much more in the open than is usual with other scimitar babblers. Eggs, normally 3, white. Average size of 30 eggs 27.9×20.3 mm (Baker). Both sexes take part in nest-building, incubation and feeding the young. Incubation period undetermined.

In a pair observed, copulation followed invitation by the ♀ raising open and vibrating her wings, one at a time, uttering a soft *chut-uk*, *chut-uk*, *chut-uk*, etc. and lowering the forepart of her body whereupon the male hopped onto her back. The act, with the same preliminaries, was repeated after c. 10 minutes, both birds collecting nest material in the interval (SA).

MUSEUM DIAGNOSIS. Differs from *haringtoni* in being paler above and having the throat white. Nepal birds are intermediate and highly variable.

Young (immature), like adult but all rusty parts paler. Upperparts, edges of wings and coverts have a rusty wash. Primary and tail characters present; postjuvinal moult complete.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	95-101	36-39	36-38	96-108 mm
♀♀	90-96	35-39	—	96-99 mm

(Rand & Fleming, SDR, BB)

COLOURS OF BARE PARTS. Iris greyish white. Bill greyish or pale horny brown, ivory white at base of lower mandible. Legs and feet fleshy brown.

144

TIMALIINAE

GENERAL HABITS and FOOD. As in 1181.

VOICE and CALLS. The song is a two-syllabled rather deep and strong whistle, the first note being about four tones higher than the second (Heinrich), also answered without interruption by the female's third note *quip*. See 1181. The bird often sings for long periods of time from the crown of a tall tree, so well hidden however that it is almost impossible to discover.

BREEDING. Season, April to June. Nest, as in 1181. Eggs, 3 or 4, white. Average of 40 eggs 26.5×19.3 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *haringtoni* in having the flanks olivaceous instead of rufous, and the breast streaked with dark ashy brown.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	86-96	34-37	36-40	91-101 mm
♀♀	83-88	—	—	—

(SA, Heinrich)

Weight 7 ♂♂ 57-70; 3 ♀♀ 47-61 g (SDR, SA).

COLOURS OF BARE PARTS. Iris yellowish cream, creamy white or pale straw; orbital skin dark purplish blue; upper mandible greyish brown, blackish or dark brown at base, lower greyish or whitish brown, base yellow; legs and feet brown to greyish brown (SDR). Not different from other races.

1185. Large Scimitar Babbler. *Pomatorhinus hypoleucos hypoleucos* (Blyth)

Orthorhinus hypoleucos Blyth, 1844, Jour. Asiat. Soc. Bengal 13: 371 (Arakan)

Baker, FBI No. 224, Vol. 1: 222

Plate 74, fig. 15

LOCAL NAME. *Dao-hoot* (Cachari).

SIZE. Myna ±; length c. 28 cm (11 in.).

FIELD CHARACTERS. A large, strong-footed babbler with a long and stout curved bill. Above, olive-brown, wings and tail brown; a rusty line from eye to nape. Below, throat, breast and belly white, flanks slaty, streaked with white on sides of breast. Sexes alike. For distinction from other scimitar babblers see 1169.

STATUS, DISTRIBUTION AND HABITAT. Resident, locally common. NEFA in the Daffa and Miri Hills, the head of Assam valley, Assam, Nagaland (?), Manipur (?) and the hills of East Pakistan south and east of the Brahmaputra; in the foothills up to 1200 m, and adjacent plains. Keeps to the densest bamboo, scrub or cane jungle, reeds and elephant-grass; sometimes in heavy undergrowth in forest.

BABBLERS

145

Extralimital. Western and northern Burma. The species ranges east to Vietnam and Hainan.

GENERAL HABITS. Keeps much more to the ground than any other scimitar babbler, hopping about in a very ungainly manner. Does not fly into trees unless pressed very closely. Usually keeps in pairs, occasionally in small parties; very skulking and more often heard than seen.

FOOD. Insects, snails.

VOICE and CALLS. A short chuckling note when feeding and undisturbed. Alarm, a loud and full *hoot-hoot-hoot*.

BREEDING. Season, January to April. *Nest*, a big semi-domed structure usually made of bamboo leaves, sometimes mixed with grass or other materials, more or less scantily lined with rootlets, measuring about 35 by 25 cm. Placed on the ground in tangles of cane-brake, bamboo or scrub, looking like a mass of wind-blown bamboo leaves. When disturbed, the bird leaves the nest by huge hops. *Eggs*, 2 or 3, white. Average size of 12 eggs 30.1 × 21.7 mm (Baker).

MUSEUM DIAGNOSIS. Bill heavier, less laterally compressed, and less curved than in other scimitar babblers. See Key to the Species and Field Characters; for details of plumage Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	105-112	c. 40	c. 38	110-120 mm (Baker)
		(from skull)		
1 ♂	103	45	41	91 (worn) mm
1 ♀	102	41	41	90 " mm (Desfayes)

COLOURS OF BARE PARTS. Iris brown to deep red-brown; naked patch behind eye dull livid or bluish flesh-colour. Bill pale horny with a yellow, grey or green tinge in it. Legs and feet pale plumbeous or slaty grey (Baker).

POMATORHINUS FERRUGINOSUS Blyth

LOCAL NAMES. *Te churi*, *Pee-gongor* (Dafila); *Bhotet* (Bhutia); *Piong-kohut*, *Pomlong-kut* (Lepcha).

SIZE. Between bulbul and myna; length c. 22 cm (9 in.).

BABBLERS

147

VOICE and CALLS. Very similar to those of *schisticeps*. A number of musical flute calls — *oo-pū-pū* or *oo-pū-pū-pū*; alarm-note, a low, grating *churr*. Like other scimitar babblers, has a curious habit of calling until one is almost upon it and then quietly, without noise or exposure, disappearing, only to call again some fifty metres farther on.

BREEDING. Season, end of April to July. *Nest*, more or less oval, placed on its side, the entrance generally at the small end, measuring about 20 by 10 or 15 cm made of bamboo leaves criss-crossed in layers, grass, vegetable fibres or bracken fronds held together by tendrils and weed-stems. The lining is of fibrous strips, rootlets or fine grass. Placed on the ground or low down in scrubby bushes, tangled grass or bamboo clumps; sometimes as high as a couple of metres in bushes or saplings. *Eggs*, 3 or 4, sometimes 5, white. Average size of 50 eggs 27.1 × 19.3 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Subspecies. Similar to *phayrei* but colour denser; crown olive-brown, darker than back; lores white not rusty; a distinct black line above supercilium; colour of underparts richer.

MEASUREMENTS and COLOURS OF BARE PARTS. As in 1186.

1188. Mizo Coralbilled Scimitar Babbler. *Pomatorhinus ferruginosus phayrei* Blyth

P. (pomatorhinus) phayrei Blyth, 1847, Jour. Asiat. Soc. Bengal 16: 452 (Arracan)
Baker, FBI No. 211 (part), Vol. 1: 214

LOCAL NAMES. None recorded.

SIZE. Between bulbul and myna; length c. 22 cm (9 in.).

FIELD CHARACTERS. As in 1187.

STATUS, DISTRIBUTION and HABITAT. Resident. Assam in the Mizo (Lushai) Hills, from 900 m up to at least 1500 m. Affects dense forest, bamboo jungle and thick secondary growth.

Extralimital. Chin Hills and Arakan Yomas. The species ranges east through Burma, northwestern Thailand, northern Laos to North Vietnam.

GENERAL HABITS, FOOD and VOICE. As in 1187.

BREEDING. As in 1187.

MUSEUM DIAGNOSIS. See 1187, and Key to the Subspecies.

POMATORHINUS OCHRACEIPEX Walden

Key to the Subspecies

Underparts paler, more whitish..... <i>P. o. stenorhynchus</i>
Underparts darker, more ochraceous..... <i>P. o. austeni</i>

1189. Mishmi Longbilled Scimitar Babbler. *Pomatorhinus ochraceiceps stenorhynchus* Godwin-Austen

Pomatorhinus stenorhynchus Godwin-Austen, 1877, Jour. Asiat. Soc. Bengal 46: 43
(Near Sadiya, Assam)

Baker, FBI No. 217, Vol. 1: 219 (= *austeni*)

Plate 74, fig. 17

LOCAL NAMES. None recorded.

146

TIMALIINAE

FIELD CHARACTERS. *Above*, back and tail olive-brown, top of head black; a conspicuous white supercilium, a broad black band from lores to ear-coverts. *Below*, chin and malar stripe white, throat and breast ferruginous; rest of underparts olive-brown. Sexes alike.

The coral-red bill distinguishes it from all scimitar babblers except *P. ochraceiceps* which has a more slender and curved orange bill, and buffy underparts.

STATUS, DISTRIBUTION and HABITAT. Resident, rather scarce in the western part of its range, commoner in the east. East Nepal (there are no post-Hodgsonian records), Sikkim, Bhutan and NEFA east to the Dihang river. Normally from c. 1200 to 3800 m, the latter altitude even in winter; also recorded from the duars and at 600 m in the Abor Hills. Affects dense shrubbery and ringal bamboo jungle.

GENERAL HABITS, FOOD and VOICE. As in *formosus* (1187).

BREEDING. Season, late April to end of June. *Nest*, as in 1187. *Eggs*, 3 to 5, white. Average size of 20 eggs 25.6 × 18.8 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *formosus* and *phayrei* in having a black cap and ferruginous (not ochraceous) breast.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	87-95	27-28	29-30	99-110 mm (Baker, SA)

Weight 1 ♀ 40 g (SA).

COLOURS OF BARE PARTS. Iris yellow or golden yellow. Bill deep coral-red. Legs and feet light yellowish brown, sometimes with a greenish or leaden tint.

1187. Assam Coralbilled Scimitar Babbler. *Pomatorhinus ferruginosus formosus* Koelz

Pomatorhinus ferruginosus formosus Koelz, 1952, Jour. Zool. Soc. India 4: 39

(Tura Mountain, Garo Hills)

Baker, FBI No. 211 (part), Vol. 1: 214

Plate 74, fig. 12

LOCAL NAMES. *Dao-buku-gajao* (Cachari); *Inui-gogo* (Kacha Naga).

SIZE. Between bulbul and myna; length c. 22 cm (9 in.).

FIELD CHARACTERS. As in 1186 but crown more or less concolorous with back, not black; breast much lighter in colour, ochraceous not ferruginous.

STATUS, DISTRIBUTION and HABITAT. Resident, locally common. The hills of Assam south of Brahmaputra river, Nagaland, south to and including Manipur. From c. 900 to 1500 m; up to 2400 m in the Naga Hills. Affects thick forest and dense undergrowth, especially along streams, bamboo jungle and outskirts of forest.

GENERAL HABITS. Very elusive and easily overlooked. Found in pairs or small parties, rummaging on the ground among fallen leaves, slinking about in rat-like manner, moving from cover to cover in big hops, only taking to wing when forced to do so. Flies much like a laughing thrush with alternate sailings and flappings. Very inquisitive and may be attracted by any novel sight or sound.

FOOD. Insects and larvae.

TIMALIINAE

148

SIZE. Bulbul +; length c. 23 cm (9 in.).

FIELD CHARACTERS. As in 1190. See Museum Diagnosis.

× c. 1

STATUS, DISTRIBUTION and HABITAT. Common resident. Mishmi Hills, NEFA, and north Burma, above 1500 m but apparently descending to the foothills in winter. Affects dense forest and bamboo jungle.

Extralimital. Upper Chindwin and Myitkyina areas, Burma. The species ranges east to Vietnam.

GENERAL HABITS, FOOD and VOICE. As in 1190.

BREEDING. As in 1190.

MUSEUM DIAGNOSIS. Differs from *austeni* (1190) in being paler, more whitish on breast and centre of abdomen.

MEASUREMENTS

	Wing	Bill (from skull)
2 ♂♂	90, 94	34, 38 mm
8 ♀♀	85-94	32-38 mm (SDR)

2 ♂♂ tarsus 27, 28; tail 106, 110 mm (SA).

COLOURS OF BARE PARTS. Iris brownish grey ['bisquit colour' SA]. Bill orange; nares brown. Legs and feet yellowish brown, greenish brown or olive (SDR).

1190. Manipur Longbilled Scimitar Babbler. *Pomatorhinus ochraceiceps austeni* Hume

Pomatorhinus austeni Hume, 1881, Stray Feathers 10: 152 (E. Manipur)
Baker, FBI No. 217 and 218, Vol. 1: 218-19

LOCAL NAME. *Inui-gu* (Kacha Naga).

SIZE. Bulbul +; length c. 23 cm (9 in.).

FIELD CHARACTERS. A very slim, long-tailed babbler with a long, deeply curved orange bill. *Above*, back olive, wings and tail brown; crown and nape tawny-olive; a conspicuous white supercilium; black lores and dark ear-coverts. *Below*, chin and throat white, breast and belly creamy white washed with buff. Very similar to *P. ferruginosus* which has darker, rusty underparts and a shorter, less curved coral-red bill. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Resident. Assam in the Cachar Hills and from Margherita south through Nagaland and Manipur; between 1500 and 2400 m, probably reaching the foothills in winter. Affects dense undergrowth in evergreen or mixed forest and bamboo jungle.

GENERAL HABITS. Keeps in pairs or in parties of half-dozen individuals, in brushwood and lower branches of trees, among bushes in fairly open rocky ground as well as denser scrub; feeds on the ground but also probes into flowers of forest trees for nectar.

FOOD. Mainly insects; also nectar.

BABBLERS

149

VOICE and CALLS. A single musical call-note unlike that of any other scimitar babbler (Smythies) but recognizable as of the genus. Also described are a soft full hoot-hoot and a pleasant whistling chuckle.

BREEDING. Season, May to July. *Nest*, an oval ball of broad grass-blades, bamboo leaves and a few other dead leaves loosely put together and lined with finer materials and rootlets. Placed on the ground, nearly covered by fallen leaves, or low down in undergrowth or creepers. *Eggs*, 3 to 5, white. Average size of 30 eggs 25.2 × 18.3 mm (Baker).

MUSEUM DIAGNOSIS. See 1189, and Key to the Subspecies.

MEASUREMENTS

	Wing	Bill (from skull)	Tail
♂ ♀	84-92	31-36	— mm (SDR)
3 ♀ ♀	92	36-37	104-107 mm (Mayr)

Weight 1 ♀ 34 g (SDR).

COLOURS OF BARE PARTS. Iris dull pinkish cream. Bill orange-coral. Feet dull greenish brown (SDR).

Genus *XIPHIRHYNCHUS* Blyth

Xiphirhynchus Blyth, 1842, Jour. Asiat. Soc. Bengal 11: 175. Type, by monotypy,

Xiphirhynchus superciliosus Blyth. (Not *Xiphirhynchus* Swainson, 1827)

Xiphirhynchus Blyth, 1843, Jour. Asiat. Soc. Bengal 12: 929-47. Type, by monotypy,

Xiphirhynchus superciliosus Blyth

Only differs from *Pomatorhinus* by its extremely long, slenderer and more curved bill.

XIPHIRHYNCHUS SUPERCILIARIS Blyth

Key to the Subspecies

Crown paler	<i>X. s. superciliosus</i>

1191. Slenderbilled Scimitar Babbler. *Xiphirhynchus superciliosus* Blyth

Xiphirhynchus superciliosus Blyth, 1842, Jour. Asiat. Soc. Bengal 11: 176 (Darjeeling) Baker, FBI No. 226 (part). Vol. 1: 224

Plate 74, fig. 14

LOCAL NAME. Karriak-tamuep (Lepcha).

SIZE. Bulbul; length c. 20 cm (8 in.) including bill.

FIELD CHARACTERS. The disproportionately long, slender, curved bill makes this species unmistakable. *Above*, head slaty, a long white supercilium; bill black. Back rufous-brown, wings and tail dark brown. *Below*, throat ashy, lightly streaked with white; rest of underparts cinnamon. Sexes alike.

BABBLERS

151

1192. Assam Slenderbilled Scimitar Babbler. *Xiphirhynchus superciliosus intextus* Ripley

Xiphirhynchus superciliosus intextus Ripley, 1948, Proc. Biol. Soc. Washington 61: 105 (Dreyi, Mishmi Hills, NE. Assam)

Xiphirhynchus superciliosus argutellus Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 4 (Blue Mountain, Lushai Hills) Baker, FBI No. 226 (part), Vol. 1: 224

LOCAL NAMES. None recorded.

SIZE. Bulbul; length c. 20 cm (8 in.) including bill.

FIELD CHARACTERS. As in 1191, q.v.

STATUS, DISTRIBUTION and HABITAT. Resident, subject to vertical movements. NEFA in the Mishmi Hills, Assam in the Khasi, Cachar and Mizo (Lushai) hills, Nagaland, Manipur and East Pakistan in the northeastern and Chittagong hill tracts. Breeds up to 2700 m, descends to the foothills in winter. Affects thick secondary scrub, stunted oak forest with heavy undergrowth, oak and rhododendron forest, and bamboo thickets.

Extralimital. Probably extends to the neighbouring hills of western Burma. Other subspecies are found in Yunnan and North Vietnam.

GENERAL HABITS, FOOD and VOICE. As in 1191.

BREEDING. As in 1191.

MUSEUM DIAGNOSIS. Differs from the nominate race in having a darker, slaty ad.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail

SIZE. Sparrow ±; length c. 12 cm (5 in.).

150

TIMALIINAE

x c. 1

STATUS, DISTRIBUTION and HABITAT. Resident, subject to vertical movements, locally common. East Nepal (apparently confined to the Mai Valley), Sikkim, Bhutan and probably NEFA east to the range of *intextus*. A babbler of high altitude, breeding between 2100 and 3400 m, mostly 2400-3300 m, descending in winter to between 2000 and 600 m; it is not known whether it withdraws entirely from the summer zone. Affects thick ringal bamboo growth, bushes on steep grassy hillsides, and bramble thickets.

GENERAL HABITS. A shy and restless babbler going about in pairs or small noisy parties in follow-my-leader style, sometimes in association with other babblers. Hunts on the ground progressing by long rat-like hops, or in undergrowth, commonly mounting up into leafless *Salmalia* and other flowering trees for nectar. 'If one mounds a bush and then hops down and climbs another all the party are sure, one by one, to do just the same' (Baker).

FOOD. Beetles, ants and other insects, larvae; also berries and nectar.

VOICE and CALLS. A 3-noted rather interrogative rippling whistle and a single mellow high-pitched hoot (SA). Song, a soft hoot consisting of seven or eight notes uttered rapidly on the same tone, after the manner of *Stachyris chrysaea* (Smythies), this probably being the same as the 'pleasing ripple of whistling notes' described by Kinnear. Alarm, a harsh swearing or chattering note, not unlike a similar call uttered by *Pomatorhinus ruficollis* (Smythies). Very noisy.

BREEDING. Season, April to July. *Nest*, a large, globular structure of dry bamboo leaves and green grass, intermingled and lined with fine roots and fibres. Usually placed on, or almost on the ground. *Eggs*, 3 to 5, white. Average size of 30 eggs 23.7 × 17.8 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *intextus* in having a paler, grey crown.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♀	74-83	43-57	28-35	82-92 mm (Kinnear, Deshayes, SA)

Weight 2 ♂♂ 27, 27; 1 ♀ 30 g (SA).

COLOURS OF BARE PARTS. Iris pale grey (Ludlow), stone-yellow (Stevens). Bill black, tip of lower mandible paler. Legs and feet plumbeous.

152.

TIMALIINAE

FIELD CHARACTERS. A brown, stub-tailed, fluffy-plumaged babbler with a long slightly curved bill. *Above*, dark rufescent brown with buff shaft-streaks. *Below*, chin white, throat, breast and abdomen pale rufescent brown with whitish shaft-streaks. *Sides* of body plain rufescent brown; under tail-coverts ferruginous. Sexes alike.

x c. 1

STATUS, DISTRIBUTION and HABITAT. Scarce resident, probably subject to some vertical movements. Sikkim, Bhutan, NEFA (Miri Hills), Assam (Khasi, Cachar and Mizo hills), Manipur and, presumably, Nagaland; from 900 to 2700 m. Affects forest undergrowth and dense scrub in steep, broken country.

Extralimital. Extends to northeastern Burma. Disjunct populations in N. Vietnam and western Sumatra.

GENERAL HABITS. A great skulker; though fearless and allowing a very close approach, it excels in keeping unseen and it is extremely difficult to follow its movements for more than a brief instant. Chiefly terrestrial; hops about the ground in low shrubs in the manner of *Procygna*, rummaging among fallen leaves and mulch, possibly probing into the ground as the bills of some birds collected were caked with mud. Keeps in pairs. Flight weak; when disturbed flies only a few yards.

FOOD. Insects.

VOICE and CALLS. Said to have a 'sweet chirping whistle'.

BREEDING. Season, May and June. *Nest*, a globular structure of leaves, grass, roots, bracken fronds and other dark materials, rather loosely and clumsily put together and held by roots and weed-stems. Lining is of dry dead leaves. Placed on the ground, generally among a mass of fallen dead leaves, often at the foot of some large tree. *Eggs*, normally 4, unmistakable for those of any other species except some types of *Alcippe* eggs: white with a faint tinge of lilac, marked with blotches of deep red-brown or purple-brown with short, irregular lines and smears of the same colour. The secondary markings of lilac-grey are often more numerous than the primary markings and give the eggs a pronounced lilac tint. Average size of 30 eggs 21.2 × 15.5 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♀	57-60	22-24	23-24	25-31 mm (Baker, SA)

Weight 4 ♂♂ 18-21 g (SA).

COLOURS OF BARE PARTS. Iris light red-brown. Bill: upper mandible dark horny, blackish at base, paler at tip; gape and edge of lower mandible blackish, remainder pale horny. Legs and feet pale livid fleshy, tinted with brown; soles and claws very pale.

 Baker, FBI No. 256, Vol. 1: 251
 Plate 75, fig. 12

LOCAL NAME. *Das-puffi* (Cachari).

SIZE. Sparrow —; length c. 12 cm (4½ in.).

FIELD CHARACTERS. A small, short-tailed, wren-like babbler. Above, brown, the feathers margined with brown, producing a scaly appearance. Rump-feathers very thick and fluffy. Tail and wings brown, the greater and median coverts and secondaries tipped with buff in some individuals (young birds?). Below, throat grey-brown streaked with white. Centre of abdomen whitish, flanks, vent and under tail-coverts ochraceous. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Resident. Assam in the Garo, Khasi and Cachar hills, Lakhimpur district south of the Brahmaputra (north to Sadiya and Dening), Manipur and, presumably, Nagaland. From c. 700 to 2100 m with probably some downward movement in the cold weather, the lowest records being winter data. Affects damp and shady hill forest broken up by rocky ravines and steep slopes.

EXTRALIMITAL. Southwestern Burma. The species ranges east to Vietnam and south through the Malay Peninsula.

GENERAL HABITS. A most secretive bird, quiet and retiring rather than skulking, haunting deep forest on broken ground, apparently not scrub jungle or secondary growth as many babblers do. Runs in and out of great moss-covered boulders, very active and quick on its legs but loath to fly, scurrying away through the undergrowth rather than seeking safety by flight. Generally keeps in pairs.

FOOD. Insects.

VOICE and CALLS. Alarm, a loud *tsik* (SDR) and some chattering and churring notes. Also a mournful single *piou* (Smythies).

BREEDING. Season, May to July. Nest, domed or nearly so, made of dead leaves and grass, semi-decayed bracken and fern fronds, a little moss and grass bound together with fine roots, lined with dry dead leaves. Most of the materials are in a rotten condition. The position is upright, the

154

TIMALIINAE

entrance near the top. External measurements are roughly 17 × 11 cm, the cavity being about 7 cm in diameter. Nearly always placed on the ground, generally between boulders, but sometimes in a hollow in the face of a pile of boulders, or wedged in among the roots of a tree, or on a mossy bank with no other protection than ferns and weeds growing about it. It is well hidden in a damp situation, often so wet the outside is quite sodden. Eggs, 3 or 4, white with numerous freckles of pinkish red, denser and forming little caps at the large end. Average size of 30 eggs 21.3 × 16 mm (Baker). Both birds take part in incubation. When disturbed they slip quietly off the nest but keep close by, the two birds running about within a few metres, uttering low scolding notes.

MUSEUM DIAGNOSIS. See Key to the Species. Distinguished from species *epilepidota* also by its ochraceous flanks (not brown), the greyish brown throat streaked with white (v. white streaked with dark brown), and the lack of a supercilium.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	56-61	c. 16	c. 24	c. 44-46 mm (Baker)

COLOURS OF BARE PARTS. Iris brown. Bill dark brownish horn. Legs and feet brownish flesh.

LOCAL NAMES. *Das-majo gashim*, *Das-puffi kashiba* (Cachari).

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. A small, short-tailed, wren-like babbler. Above, dark brown with a scaly appearance; wing-coverts and secondaries tipped with light spots; a light supercilium from lores to nape. Below, throat white streaked with dark brown. Centre of breast and belly whitish buff, flanks and vent brown. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Resident, locally common, subject to vertical movements. Assam in the Cachar Hills, Nagaland and Manipur. Breeds from c. 1000 to 1800 m; reaches the plains in winter. Affects dense, dark forest wherever there are openings for streams or natural small glades; specially affects places strewn with mossy boulders, fallen trees covered with ferns and orchids, old stumps, etc.

GENERAL HABITS. Very tame. Keeps in pairs, hopping among the fallen leaves, turning them over for insects, creeping about in bracken and scrub like a true babbler, or dodging about boulders like a wren. Very reluctant to fly.

BABBLERS

155

FOOD. Insects.

VOICE and CALLS. Alarm-note, a rather shrill *chir-r-r*; song, a pleasant but low set of whistling notes (Baker).

BREEDING. Season, April to June. Nest, domed or deep cup-shaped, generally the former, made of the same semi-decayed materials used by *N. brevicaudata* from whose the nest only differs in its smaller size. Usually wedged among boulders. Eggs, usually 4, rarely 5 or 3, similar to those of *brevicaudata* but smaller. Average size of 44 eggs 19.3 × 14.8 mm (Baker).

MUSEUM DIAGNOSIS. Distinguished from species *brevicaudata* by presence of supercilium, brown flanks and white chin and throat with three black-dotted lines down to breast. See Key to the Subspecies.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	50-55	12-13	c. 18	c. 18 mm (Baker)

COLOURS OF BARE PARTS. Iris red. Bill: upper mandible dark plumbeous; tip and lower mandible paler. Legs and feet fleshy brown; claws paler (Baker).

1196. Grant's Wren-Babbler. *Nepothera epilepidota guttaticollis* (Ogilvie-Grant)

Turdinus guttaticollis Ogilvie-Grant, 1895, Ibis: 432 (Miri Hills, Assam)
 Baker, FBI No. 259, Vol. 1: 254

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in 1195.

STATUS, DISTRIBUTION and HABITAT. Scarce resident. From eastern Bhutan to the Mishmi Hills and the Patkai Range; from the foothills to c. 1500 m. Same biotope as 1195.

EXTRALIMITAL. Upper Chindwin, Burma. The species extends to Vietnam, Hainan, the Malay peninsula, Sumatra, Java and Borneo.

GENERAL HABITS, FOOD and VOICE. As in 1195.

BREEDING. Season, March and April. Nest and eggs, as in 1195. Average size of 45 eggs 19.4 × 14.8 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *roberti* (1195) in being darker and browner above. No rufous on breast and flanks.

MEASUREMENTS. As in 1195.

COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible dark horn colour, lower paler. Legs and feet horny brown.

Genus PROEYGA Hodgson

Microtus Gould, 1837, Icones Av., pl. 5. Type, by monotypy, *Microtus squarata* Gould. *Nomen oblitum*!

Procygna Hodgson, 1844, Zool. Misc.: 82. Type, by subsequent designation (Zimmer & Vaurie, 1954, Bull. Brit. Orn. Cl. 74: 41), *Tesia albiventer* Hodgson

Genus characterized by an extremely short tail of six soft feathers, completely concealed by long, ample rump-feathers. Other characters as in *Speleornis* (p. 159).

¹This name has been placed on the Official Index of Rejected Names (Opinion 695).

PROEYGA ALBIVENTER (Hodgson)

Key to the Subspecies

More olive above.....*P. a. pallidior*
 Browner, less olive above.....*P. a. albiventer*

1197. Western Scalybreasted Wren-Babbler. *Procygna albiventer pallidior* Kinnear

Procygna albiventer pallidior Kinnear, 1924, Bull. Brit. Orn. Cl. 45: 10
 (Dharmasala, Punjab, 4000 ft)
 Baker, FBI No. 471 (part), Vol. 1: 458

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in 1198, q.v.

STATUS, DISTRIBUTION and HABITAT. Resident, subject to vertical movements, common. The western Himalayas from Duala Dhar east to central Nepal where it intergrades with *albiventer*. Breeds between 2400 and 3600 m and probably higher; descends in winter to c. 1000 m. In summer affects dense undergrowth and moss-covered boulders in birch or fir forest, especially near streams; in winter it is found in small nullahs with plenty of exposed rocks and stones but keeping to thick bracken and evergreen undergrowth in damp and secluded situations.

GENERAL HABITS, FOOD and VOICE. As in 1198.

BREEDING. Season, April to June. Nest and eggs, as in 1198. Average size of 15 eggs 21.5 × 15.6 mm (Baker).

MUSEUM DIAGNOSIS. Like *albiventer* but upperparts more olive and underparts paler in the fulvous form.

MEASUREMENTS. As in 1198.

COLOURS OF BARE PARTS. Iris brown. Bill blackish brown, base of lower mandible whitish. Legs and feet pale brown.

1198. Eastern Scalybreasted Wren-Babbler. *Procygna albiventer albiventer* (Hodgson)

Tesia albiventer Hodgson, Feb. 1837, Jour. Asiat. Soc. Bengal 6: 102 [Nepal, restricted by Ripley (Synopsis: 357) to Ilam dist., eastern Nepal, re-restricted to Chandragiri above Thankot by Birwas (JBNS 59: 204-5)]

Microtus squarata Gould, Aug. 1837, Icones Av., pl. 5 (Cachar)

Procygna albiventer regala Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1:
 11 (Kohima, Naga Hills)

Baker, FBI No. 471 (part), Vol. 1: 458

Plate 75, fig. 5

LOCAL NAMES. *Marelak-bong* (Lepcha); *Imri-ba gadeta* (Kacha Naga).

SIZE. Sparrow —; length c. 10 cm (4 in.).
FIELD CHARACTERS. A plump, tail-less, squamated little wren. Dimorphic, in two colour phases; sexes alike in both.
White phase: *Above*, olive-brown with a slightly scaly appearance. *Below*, throat nearly white; breast and belly white, each feather with a dark centre and a narrow dark margin producing a very scaly effect. Flanks scaly olive-brown.
Fulvous phase: *Above*, olive-brown with a fulvous drop on each feather. *Below*, as in white phase but white replaced by fulvous. Intermediates occur, though uncommonly. Distinguished from *pusilla* (1199) only by slightly larger size.

STATUS, DISTRIBUTION AND HABITAT. Resident subject to vertical movements, common in the Himalayas, rather scarce in Assam. From central Nepal where it intergrades with *pallidior*, east through Sikkim, Bhutan (and probably NEFA since Ludlow found it common in the Tsangpo bend at 2000 m); also Assam in the Khasi and Cachar hills, Dibrugarh, and Nagaland. In the Himalayas, breeds mostly between 2700 and 3900 m, in a higher zone than *P. pusilla*, yet overlapping its upper limit. Descends in winter mostly below 2700 m and as low as 600 m (seen at 2850 m in southeast Tibet); in Assam it breeds from c. 1000 to at least 1800 m, and in the Naga Hills from 2100 to 2700 m. Affects wet ravines, thick forest with plenty of undergrowth, particularly in the neighbourhood of streams, waist-high growth of ferns, *Strobilanthes* and nettles; also cardamom plantations in winter.

EXTRALIMITAL. Extends to southwestern Szechuan, Yunnan and N. Vietnam.
GENERAL HABITS. Terrestrial; solitary in winter, in pairs during the breeding season. Creeps about in dense, tangled undergrowth, nervously flicking its wings like a *Phylloscopus*, searching for insects among the mulch, roots, fern-stems and moss-covered fallen logs. A great skulker, very difficult to observe, but also very inquisitive.

FOOD. Insects. Seeds also recorded (Stanford).
VOICE AND CALLS. Its presence in dense growth is given away by its loud, squeaky long-drawn double-noted *seck . . . sik* like an unrolled 'patla' (Indian swing bed) swinging back and forth (SA); also likened to 'nothing so realistic as an ill-mannered person loudly sucking his teeth' (Ludlow). These notes are markedly ventriloquial, the *seck* seeming to come from an entirely different direction to the *sik* that follows a half-second later. Alarm-note, a shrill, piercing whistle and a scolding, chattering *tsik, tsik* indistinguishable from that of the Brown Wren-Babbler and reminiscent also of the Nepal Wren, *Troglodytes* (SA), each time jerking its short wings. The song is short and trilling like the first part of the song of the Whitebreasted Shortwing (Heinrich); also said to remind one of *Troglodytes* (Baker).
BREEDING. Season, April to June. Nest, globular, made of green moss and rootlets, very similar to that of *Troglodytes* and, like it, placed in moss-covered banks, under a moss-clad rock or among moss growing on the trunks of large trees. Eggs, 3 to 5, white, longish ovals; apparently sometimes with a few reddish brown specks (Jones, JBNHS 47: 228). Average size of 54 eggs 19.1 x 14.1 mm (Baker). Both sexes take part in, at least, incubation. Period undetermined.

VOICE AND CALLS. Very like 1198. Utters a sharp single *tsik* every half-second or so, alternately higher and lower with a semitone difference; this note is given more frequently and over longer periods than in the case of *albiventer*. Alarm-note, a sharp, explosive, scolding *chiruk, chiruk*. Song, 'a slow, drawn-out *se-e-e-s-a-u*, each syllable a second in length, followed by a two-second interval' (Fleming).
BREEDING. Season, April to July. Nest, a little ball of moss and rootlets usually built in the moss hanging down tree-trunks or vertical rocks in shady forest, usually at a height of one to two metres from the ground, more rarely up to six metres. Eggs, as a rule apparently 4 in Assam and 3 in the Himalayas, white. Average size of 25 eggs from Sikkim 18.3 x 13.8 mm, and of 50 eggs from Assam 17.1 x 13.1 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *albiventer* only in being smaller; has the same colour dimorphism.
Young, like adult but lacks all fulvous spots on upperparts, median and greater coverts. Underparts uniform dark brown, greyish brown on throat. Postjuvinal moult of body feathers and wing-coverts.
MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♀	48-53	12-14	18-20 (SA, BB, Kinnear)	12-15 mm

No significant difference of size in the sexes.
Weight 8 ♂ ♀ 11-14 (av. 12) g—SA.
COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible blackish, lower greyish brown. Legs and feet pale brown.

Genus SPELAEORNIS David & Oustalet

Spelaeornis David & Oustalet, 1877, Oiseaux de la Chine: 228. Type, by subsequent designation, *Phoenyga troglodytoides* Verreaux
Elachura Oates, 1889, Fauna Brit. India, Bds. 1: 339. Type, by original designation, *Troglodytes punctatus* Blyth
Cf. Ripley, S. D., 1950, *Auk* 67: 390-91; 1952, JBNHS 50: 492-4; 1954, *Postilla*, Yale Peabody Mus., No. 20: 1-4.
Tail short and rounded, of 10 rectrices. Plumage soft and full. Bill straight and thin. Tarsus long and strong.

MUSEUM DIAGNOSIS. Upperparts browner than *pallidior*; underparts of the fulvous form darker.
Young. Upperparts warm rufous-brown without marks; underparts greyish olive in the white phase, golden brown in the fulvous phase. Postjuvinal moult of body, wing-coverts and ? wings.

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♀	57-65	13-15	23-25 (SA, BB, HW, Kinnear)	17-23 mm

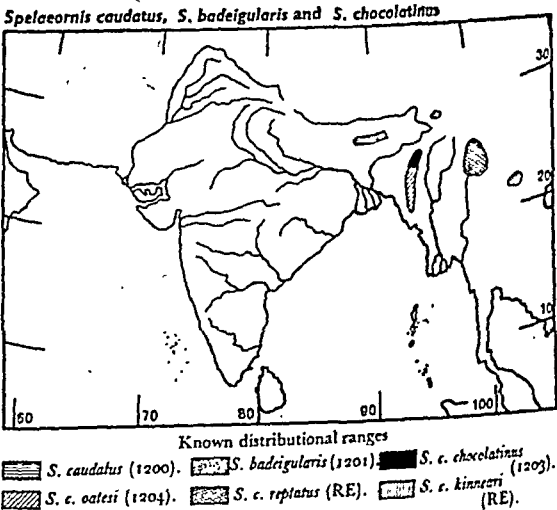

No significant difference of size in the sexes.
Weight 4 ♂ 21-23; 1 ♀ 20 g (SDR, SA). 10 ♂ ♀ 17-24 (av. 20.9) g—SA, BB.
COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible horny brown, lower brownish flesh excepting tip which is horny brown. Legs, feet and claws horny brown or brownish flesh.

1199. Brown Wren-Babbler. *Phoenyga pusilla pusilla* Hodgson
Phoenyga pusillus Hodgson, 1845, Proc. Zool. Soc. London, pt. 13: 25 (Nepal)
Phoenyga pusilla pygmaea Koelz, 1952, Jour. Zool. Soc. India 4: 40 (Karong, Manipur)
Baker, FBI No. 472, Vol. 1: 459
Plate 75, fig. 3

LOCAL NAME. *Inrui-ba gadeba* (Kacha Naga).
SIZE. Sparrow —; length c. 9 cm (3½ in.).
FIELD CHARACTERS. An exact miniature of the Scalybreasted Wren-Babbler (1198, q.v.) with the same colour dimorphism.
STATUS, DISTRIBUTION AND HABITAT. Resident, subject to vertical movements, common. From central Nepal east through Sikkim, northern West Bengal, Bhutan, NEFA, Assam in the Khasi and Cachar hills, Nagaland, and East Pakistan in the Chittagong Hill Tracts. In the Himalayas breeds in a lower zone than 1198, mostly between 1500 and 3000 m (optimum 2100-2500 m), overlapping the lower range of *albiventer* at its upper limit; in Assam it breeds from c. 1000 m up. Descends in winter to the foothills and extends into the plains; it has however been recorded as high as 3500 m in the cold season. Inhabits the same biotope as *albiventer*: wet evergreen forest with mossy boulders, fallen logs and decaying vegetation and ground nettles — particularly in the vicinity of streams.
EXTRALIMITAL. Ranges east to North Vietnam and Fukien. Other subspecies in Formosa, Central Vietnam, Malay Peninsula, Sunda Islands.
GENERAL HABITS. Similar to those of the Scalybreasted Wren-Babbler (1198). Terrestrial, solitary in winter, skulking, restless and inquisitive; has a maddening habit of appearing almost under one's feet, then dashing into dense cover, seldom flying more than a metre or two. Scuttles away mouse-like, through the tangled undergrowth when pressed, hopping from stem to stem but so lightly that hardly a leaf stirs to betray its progress. Has the same restless acrobatic habits as *Tesia*. Flicks its wings frequently and nervously like a leaf-warbler.
FOOD. Insects.

1200. Tailed Wren-Babbler. *Spelaeornis caudatus* (Blyth)
Tesia caudata Blyth, 1845, Jour. Asiat. Soc. Bengal 14: 588 (Darjeeling)
Baker, FBI No. 470, Vol. 1: 456
Plate 75, fig. 4

LOCAL NAMES. None recorded.
SIZE. Sparrow —; length c. 9 cm (4 in.).
FIELD CHARACTERS. *Above*, dark brown with a scaly appearance. *Below*, throat, breast and flanks ferruginous, spotted with black on latter two. Belly slaty, spotted with white. Sexes alike. Distinguished from other wrens by its ferruginous throat.
STATUS, DISTRIBUTION AND HABITAT. An endemic species. Scarce, resident. East Nepal (Ilam district), Sikkim, Darjeeling district, Bhutan. Appears

to breed above 2400 m. Recorded in winter at 3100 and 1800 m. Affects damp undergrowth in thick forest.
GENERAL HABITS. Typically wren-like. Terrestrial, solitary, restless, very elusive and silent.
FOOD. Insects.
VOICE AND CALLS. Has a higher-pitched *tsit* than either *Tesia* or *P. albiventer* (Fleming). Alarm-note, a low quiet *birrk birrk birrk* uttered for rather lengthy periods when disturbed (Ludlow). Song unrecorded.
BREEDING. Little known; published records not entirely reliable. Nest, described as egg-shaped, made of leaves, fine twigs, bracken and grass,

BABBLERS

161

lined with vegetable down or other matter looking like papier-mâché of earthy brown colour (Masson). Other nests are described as a dense mass of moss, cup-shaped and placed about the roots of trees or in a hole in fallen logs (Hodgson). Eggs, 3 or 4, like those of *S. longicaudatus*. Average size of 14 eggs (whether of this species?) 18.1 × 14.1 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Species.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	46-47	11	—	32 mm
♀♀	45-49	11-12	18	27-35 mm
			(SDR, Ludlow)	

Weight 1 ♂ 12; 1 ♀ 10 g (SA).

COLOURS OF BARE PARTS. Iris brown. Bill blackish. Legs and feet brown.

1201. Mishmi Wren-Babbler. *Spelaornis badrigularis* Ripley

Spelaornis badrigularis Ripley, 1948, Proc. Biol. Soc. Washington 61: 103

(Dreyi, Mishmi Hills, N.E. Assam)¹

Not in Baker, FBI

Plate 75, fig. 8

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 9 cm (4 in.).

FIELD CHARACTERS. Above, dark brown with a scaly appearance. Below, chin whitish, throat chestnut finely streaked; breast, belly and flanks olive-brown conspicuously spotted with white. Distinguished from *caudatus* in having the chestnut restricted to the throat. (For colour plate see JBNHS 48: 1.)

STATUS, DISTRIBUTION AND HABITAT. Known only from the type: Dreyi, Mishmi Hills (NEFA), c. 1600 m, (see map, p. 160). Affects subtropical wet forest (in winter).

GENERAL HABITS. Presumably those of *caudatus*. Shy and skulking.

FOOD. Insects.

VOICE AND CALLS. Unrecorded.

BREEDING. Unrecorded.

MUSEUM DIAGNOSIS. Above, bistre (sooty brown), each feather with a dark area in the centre bordering the shaft approaching clove-brown in tone; tail seal-brown. Wing-feathers chocolate on the outer, seal-brown on the inner webs. Below, throat chestnut, each feather with a narrow sepia-coloured centre. Breast-feathers bistre with a black terminal and a white subterminal bar. Feathers of abdomen more greyish than breast, white subterminal bars enlarged, black terminal bars much

¹ A re-examination of the unique type of *Spelaornis badrigularis* and comparison with freshly collected *Spelaornis caudatus* from Bhutan confirms the separation of *badrigularis* as a species. The differences still appear strongly marked. The white chin, the dark chestnut feathers with darker-streaked centres of the throat and upper breast, and the extensive area all over the lower breast, abdomen, flanks and vent of the subterminal white-tipped bistre feathers, give an entirely different appearance to this bird. The upperparts are on the other hand roughly similar.

An added point of difference which I (SDR) had not noted in my original description is the stouter tarsus of *badrigularis*. The type measures 20 mm in tarsal length but also appears thicker and stronger. Three specimens of *caudatus* measure 17-18 mm, a small difference on paper, but appearing significant when these tiny birds are in the hand.

BABBLERS

163

of moss and ferns. Eggs, normally 4, white, rarely with a faint tinge of cream or pink, marked with spots or small blotches of reddish pink to reddish brown, usually scattered over the whole surface, sometimes forming a zone at the large end. Average size of 50 eggs 18.4 × 19.4 mm (all notes on breeding by Baker).

MUSEUM DIAGNOSIS. See Key to the Species and Field Characters.

Young, like adult but uniform rufous-brown above; the ferruginous feathers of the breast with paler streaks.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♀	49-60	c. 12	19-20	45-48 mm
			(Baker)	

COLOURS OF BARE PARTS. Iris red (adult), brown (young). Bill dark brown to blackish. Legs and feet light brown.

SPELAORNIS CHOCOLATINUS (Godwin-Austen & Walden)

Key to the Subspecies

Sides of neck and body brown, less rufous.....*S. c. chokolatinus*

Sides of neck and body more rufous-brown.....*S. c. oateri*

1203. Streaked Longtailed Wren-Babbler. *Spelaornis chokolatinus*

4 (Mount Japvo, Naga Hills)

Baker, FBI Nos. 463 and 465, Vol. 1: 450 and 453

Plate 75, fig. 7

LOCAL NAME. *Tinglin-nā-gadeba* (Kacha Naga).

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. Male. Above, dark brown with a scaly appearance. Below, chin white, throat white finely speckled, the white extending to centre of belly. Sides of neck and flanks olive-brown washed with ochraceous and spotted with white and dark brown.

Female similar to male but more rufescent above and below.

STATUS, DISTRIBUTION AND HABITAT. Resident, locally common. Assam in north Cachar (Barail Range) east to the Naga Hills and south to Kedimai in Manipur, (see map, p. 160). From 1200 m (winter) to at least 2400 m (summer); vertical movements if any, unknown. Affects deep evergreen forest with undergrowth of bracken, ferns or *Strobilanthus*, on steep hillsides broken with rocks and huge boulders covered with rich vegetation and green moss.

GENERAL HABITS. Resemble those of *Procygna purilla* (1199). Very active and restless, quick on legs but slow and feeble in flight. Not so exclusively a ground bird as *P. albicenter*, being often seen hopping here and there one or two feet above the ground.

FOOD. Ants, small beetles and other insects.

162

TIMALIINAE

reduced. Along the shaft of breast-feathers runs a narrow white stripe margined on the external side of the web with black.

MEASUREMENTS

1 ♀ (type) Wing 48; bill 11; tarsus 20; tail 31 mm.

COLOURS OF BARE PARTS. Iris brown. Bill black. Legs brown.

1202. Longtailed Wren-Babbler. *Spelaornis longicaudatus* (Moore)

Procygna longicaudata Moore, 1854, in Horsfield & Moore, Cat. Birds Mus. E.

I. Co. 1: 398 (Afghanistan ~~error~~ = Khasi Hills, Assam)

Baker, FBI No. 464, Vol. 1: 452

Plate 75, fig. 13

LOCAL NAME. *Tinglin-rui* (Kacha Naga).

SIZE. Sparrow —; length c. 11 cm (4½ in.).

FIELD CHARACTERS. Above, brown with a scaly appearance, paler than in other wren-babblers; a very small pale streak above the eye, and ear-coverts grey-brown. Below, ochraceous-buff with a whitish chin and white centre of belly. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. An endemic species. Scarce resident, more abundant in the Khasi Hills, Assam in the Khasi and Cachar hills, and Manipur, from c. 1000 to 2000 m.¹ Affects deep evergreen forest mainly of oak and rhododendron with ample undergrowth, keeping to ravines or steep hillsides with rock and boulder outcrops covered with moss, ferns and orchids.

GENERAL HABITS. Terrestrial, solitary or in pairs. Creeps and climbs about boulders in typical wren fashion. Very reluctant to fly; when disturbed seeks safety by scurrying away on foot or dodging into crevices and holes between boulders.

FOOD. Insects.

VOICE AND CALLS. On the whole very silent; has a loud, clear whistle much like that of *Procygna* and a soft, chirring alarm-note given for some minutes after being disturbed (Baker). Song unrecorded.

BREEDING. Season, April to June. Nest, domed or egg-shaped, occasionally a very deep cup when shelter is afforded by natural protection. The outer part is made almost entirely of dead leaves, rather loosely put together and mixed with a few roots and scraps of grass; these materials are dark in colour, decayed and almost soaked through. Inside is built a compact structure of rootlets, leaves and grass; finally comes the lining which distinguishes the nest at a glance from all others: a texture of soft fibrous material, skeleton leaves or other vegetable matter about 3 to 6 mm thick, having the aspect of papier-mâché covering the bottom and the greater part of the sides. This layer is apparently placed in position when in the form of pulp which hardens and makes a damp-proof lining. The nest is placed on the ground or among boulders in luxuriant undergrowth

¹ R. L. Fleming reports a specimen collected in eastern Nepal in March, JBNHS 65: 331.

164

TIMALIINAE

VOICE AND CALLS. A loud, melodic, explosive whistle *wheww* (SDR) [needs confirming]; alarm-note, a constantly uttered soft *chir* (Baker). For renderings of song see 1204.

BREEDING. Season, the only nest ever found was in May (Baker). Nest, a deep cup with the back wall much prolonged though not enough to form a roof, measuring about 8 cm across; diameter of cup 5 cm, depth 3 cm. The greater part of material consisted of skeleton leaves bound together with dark, coarse fern roots, a few bents and some fine elastic twigs; the inner part was compactly lined with skeleton leaves alone. (This nest may not be typical; see 1204, Breeding.) It was built under a big fallen log, on a pile of dead leaves, broken twigs and branches. Eggs, 3, white with very pale reddish marks especially near the broad end. Measurements: 17 × 13.2, 17.2 × 13, 17.4 × 13.1 mm (Baker). See also 1204, Breeding.

MUSEUM DIAGNOSIS. See Key to the Species. Differs from *oateri* (1204) in being more greyish brown about the head, the spots and terminal edgings on the feathers of the lower parts being strikingly different, much finer and more delicate in pattern and form.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
5 ♂♂	48-52	13-14	18	40-44 mm
1 ♀	48	13	—	41 mm
Weight 5 ♂♂ 10-14; 1 ♀ 14 g.				(SDR)

COLOURS OF BARE PARTS. Iris light red. Bill dark brown, paler on tip; gape black, mouth bluish fleshy. Legs and feet fleshy.

1204. Chin Hills Longtailed Wren-Babbler. *Spelaornis chokolatinus*

oateri (Rippon)

Uracible oateri Rippon, 1904, Bull. Brit. Orn. Cl. 14: 83 (Mount Victoria)

Baker, FBI No. 469, Vol. 1: 455

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in 1203.

STATUS, DISTRIBUTION AND HABITAT. Resident, locally common. Assam in the Mizo (Lushai) Hills, from 1300 m up (1400 to 2800 m on Mount Victoria, optimum zone 2000-2500 m). (See map, p. 160.) Affects thick low, often thorny bushes and dwarf bamboo, especially at the edge of evergreen forest and in clearings.

Extralimital. The Chin Hills of Burma; the species is found in northeastern Burma and southwestern Szechuan, with an isolated population in north-western Vietnam.

GENERAL HABITS AND FOOD. As in 1203.

VOICE AND CALLS. Song, a loud warbling strophe of mostly three, often two syllables repeated quickly many times: *tiki-tiki* or just *tiki* with accent on the last note. Also a quick and sharp *tiki-tiki-tiki-tiki* (Heinrich).

BABBLERS

163

It has also been described as a rattling song of four or five notes similar to that of *Troglodytes*. While singing, the bird puffs out the head- and breast-feathers and jerks itself up and down in a remarkable way. Other call-notes as in 1203.

BREEDING. Starts, April to June. Nest, domed, oval-shaped, composed of an outer layer of dead leaves, coarse grass etc., and an inner layer of grass stems, fibres and a little moss and a peculiar waterproof lining about 3 mm thick of a papier-mâché-like substance, apparently made of vegetable stuff worked into a pulp and spread over the interior. Size of nest: exterior height c. 15 cm, width 10 to 12 cm; entrance near the top, about 5 by 4 cm; interior dimensions c. 5 cm each way; depth of cup from entrance c. 2.5 cm. Placed on the ground under dense undergrowth or among dead leaves between standing stems. Eggs, normally 3, white with a tinge of pink, speckled with reddish and faint purple. Average size of 20 eggs, 18.1 × 14.6 mm (Baker).

MUSEUM DIAGNOSIS. Much like the nominate race (1203) above, but chin, throat, middle of breast and belly white with black tips; sides of neck and of body brown, less rufous, with dark tips and subterminal white streaks.

MEASUREMENTS

Wing 10 ♂ 47-52; 5 ♀ 47-52 mm (Heinrich).

COLOURS OF BARE PARTS. As in 1203.

1205. Spotted Longtailed Wren-Babbler. *Spelaeornis troglodytrides* *sherriffi* Kinnear

Spelaeornis sherriffi Kinnear, 1934, Bull. Brit. Orn. Cl. 54: 107 (Donga La, between Lingtee and Trashi Yangtse, East Bhutan, 10,500 ft)

Not in Baker, FBI

Plate 75, fig. 10

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. Adult. Above, umber-brown spotted with black and white; tail and wings narrowly barred. A white mark behind the eyes very conspicuous. Below, throat and breast white, this colour extending on to the belly; sides of neck and flanks tawny olive. Sexes alike.

Young, much darker than adult, blackish brown above, back barred as wings and tail, not speckled; throat whitish, breast and belly buff.

STATUS, DISTRIBUTION and HABITAT. Rare resident. Within our limits only recorded from eastern Bhutan (Ludlow) between 3000 and 3300 m in summer. Affects undergrowth and bamboo in wet temperate forest.

Extremities. The species ranges from northeastern Burma through Szechuan to Shensi.

GENERAL HABITS. More arboreal than most wren-babblers; clammers about on bamboo stems and mossy tree-trunks though not to any great height from the ground. Tame and rather less restless in its movements.

FOOD. Insects.

VOICE and CALLS. A low song of four or five notes. Call, a subdued deep. Alarm, a faint chirp (Stanford).

BREEDING. Unknown.

BABBLERS

167

Genus SPHENOCICHLA Godwin-Austen & Walden

Sphenocichla Godwin-Austen & Walden, 1875, Ibis: 250. Type, by monotypy,

Sphenocichla roberti Godwin-Austen & Walden

Stout and rather squat birds of heavy build and large, powerful legs and feet. Bill conical, sharp-pointed, about the length of the head or a little shorter. No ritual bristles. Wing short and rounded. Tail of twelve feathers, greatly graduated. One species.

SPHENOCICHLA HUMERI (Mandelli)

Key to the Subspecies

Feathers of throat and breast black with pale shafts... *S. h. hueri*
Feathers of throat and breast ashy brown with black margins and white submargins... *S. h. roberti*

Heteropogon hueri Mandelli, 1873, Stray Feathers 1: 415 (Sikkim)

Baker, FBI No. 473, Vol. 1: 461

Plate 75, fig. 14

LOCAL NAMES. None recorded.

SIZE. Bulbul —; length c. 18 cm (7 in.).

FIELD CHARACTERS. A stout, heavy-looking bird with powerful legs and feet, and a pointed, conical bill. Above, very dark brown, crown and upper back mottled with golden brown and with fine white shaft-streaks especially conspicuous on forehead; lower back, tail and wings finely barred. A conspicuous pale stripe behind the eye breaking up into spots on the sides of neck. Below, throat and breast dark brown with fine shaft-streaks; centre of belly pale grey; posterior flanks and

x c. 1

lower belly mottled with golden brown. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Very rare resident. Sikkim (not recorded since 1875), NEFA in the Aka Hills, Balipara Frontier Tract (a winter record at 1200 m) and the Mahuni Hills (not recorded since 1879). Probably breeds at high altitudes, moving down in winter. Biotope undescribed (but see 1205).

GENERAL HABITS, FOOD and VOICES. As in 1203.

BREEDING. Unknown.

MUSEUM DIAGNOSIS. See Key to the Subspecies.

MEASUREMENTS

MUSEUM DIAGNOSIS. See Key to the Species; for details of plumage (and coloured plate) Ludlow & Kinnear, Ibis 1937: 252.

MEASUREMENTS

Wing 3 ♂ 47-51; 2 ♀ 47 mm (Kinnear).

COLOURS OF BARE PARTS. Iris red-brown. Bill: upper mandible horny black, lower pale fleshy. Legs and feet horny brown.

1206. Spotted Short-tailed Wren-Babbler. *Spelaeornis formosus* (Walden)

Troglodytes formosus Walden, 1874, Ibis: 91 (Darjeeling)

Baker, FBI No. 462, Vol. 1: 449

Plate 75, fig. 6

LOCAL NAME. Mandi-pho (Lepcha).

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. Above, head, back and wing-coverts olive-brown speckled with white; rump, wings and tail chestnut brown barred with black. Below, cinnamon, densely spotted with white on throat and breast, speckled with black on belly. Sexes alike.

x c. 1

STATUS, DISTRIBUTION and HABITAT. Rare resident, subject to vertical movements. Sikkim, Darjeeling, Bhutan and NEFA east to at least the Dafia Hills, also Assam in the Khasi and Mizo hills, Nagaland, Manipur (Koels collection) and East Pakistan in the northeastern hill tracts. Affects dark rhododendron forest with thick fern ground-cover, mossy rocks and decaying trunks of fallen trees, and brushwood, at high altitude (a March record at 2300 m in Sikkim). Obtained in winter at 1200 m (Dafia Hills and Bhutan) in long grass and scrub.

Extremities. Western Burma (Mount Victoria), southeastern Yunnan and northwestern Fukien. Monotypic.

GENERAL HABITS. Little known. Much as in other wren-babblers.

FOOD. Insects.

VOICE and CALLS. A note resembling that of *P. frontalis* but sharper (Ludlow); a squeaky *seck*... *sick* almost identical with that of *P. alticola* (SA).

BREEDING. Not authentically recorded. Four fully fledged young collected in Khasi Hills on 10 May (Koels). Nests reported to belong to this species were described as deep semi-domed cups of leaves, dead grass, roots, etc., densely lined with feathers and placed on the ground on a bank, half hidden in fallen rubbish or well concealed by undergrowth (Mason in FBI). The 3 or 4 eggs are white with a few reddish brown specks. Size, c. 16.5 × 12.5 mm.

MUSEUM DIAGNOSIS. See Key to the Species.

Young (immature). Similar to adult but much darker, almost blackish brown.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
1 ♂	46	14	18	30 mm
1 ♀	45	14	18	25 mm

COLOURS OF BARE PARTS. Iris brown. Bill, legs and feet horn brown.

TIMALIINAE

163

COLOURS OF BARE PARTS. Iris dark brown. Bill slate, darker on culmen. Legs and feet dark brown.

1208. Cachar Wedgebilled Wren. *Sphenocichla hueri roberti* Godwin-Austen & Walden

Sphenocichla roberti Godwin-Austen & Walden, 1875, Ibis: 251

(Hemes Peak, North Cachar hills)

Baker, FBI No. 474, Vol. 1: 461

LOCAL NAME. *Tingli-mi-gada* (= 'bird which runs up trees' — Kacha Naga).

SIZE. Bulbul —; length c. 17 cm (7 in.).

FIELD CHARACTERS. As in 1207, but throat, breast and upper belly ashy brown edged with black and inside this evenly bordered with white.

STATUS, DISTRIBUTION and HABITAT. Rare resident. Nagaland, Manipur, and Assam in the Cachar Hills and in the Margherita area, from 1500 to 2300 m and probably higher, descending to 900 m in winter. Affects evergreen forest with large trees, and bamboo on the edge of dense jungle.

Extremities. Northern Burma.

GENERAL HABITS. Little known. Goes about in parties of 10 and 15 affecting secondary jungle by preference (Hume). More a tree creeper than a wren in its habits. A very active climber about the rough bark of bigger trees, though not on the higher branches; also hunts in undergrowth as other babblers do. Flies well with a quick flight from tree to tree or bush to bush, but seems to prefer legs to wings as means of progression.

FOOD. Insects, mostly wood-lice and small boring beetles.

VOICE and CALLS. Unrecorded.

BREEDING. Starts, May and June. The only nest described was a pad of moss on top of a mass of fine grasses and a few tendrils with no other lining than the soft moss. It was wedged behind a long hanging slip of bark on a very high tree, about six metres from the ground. It contained four eggs which measured 20.7 × 17 to 22.3 × 17.4 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Subspecies.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	71-74	25	26-27	58-64 mm (Baker)

COLOURS OF BARE PARTS. Iris rich brown or dark crimson. Bill pale bluish slaty, base of maxilla and culmen darker. Legs dark brown, claws and soles pale slaty.

Genus STACHYRIS Hodgson

Stachyris Hodgson, in Elyth, 1844, Jour. Asiat. Soc. Bengal 13: 378. Type, by original designation, *Stachyris nipalensis* Hodgson

Stachyridopsis Sharpe, 1883, Cat. Bds. Brit. Mus. 7: 596-7. Type, by original designation, *Stachyris nipalensis* Elyth

Thirapetia Oates, 1883, Fauna Brit. Ind., Bds. 1: 155. Type, by original designation, *Thirapetia patens* Elyth

Characterized by an operculum covering the nostrils. Plumage variable; bill stout to thin.

1209. Assam Redfronted Babbler. *Stachyris rufifrons ambigua* (Harington)

Stachyridopsis rufifrons ambigua Harington, 1915, JBNHS 23: 631
(Gunjong, north Cachar)
Baker, FBI No. 280, Vol. 1: 270
Plate 74, fig. 1

LOCAL NAME. Deo-fer-ge-joo (Cachar).

SIZE. Sparrow —; length c. 12 cm (4½ in.).

FIELD CHARACTERS. Very similar to *S. ruficeps* (1210). Distinguished from it by white chin, ochraceous throat and whitish belly (v. all pale yellow in *ruficeps*). Flanks and lower belly washed with ochraceous. Black streaks on chin and throat hardly discernible in the field. Rufous of crown not sharply defined from rest of upper plumage which is olive-brown tinged with rufous. A pale grey supercilium. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Resident, locally common. The foothills of Sikkim, Bhutan, NEFA to the head of Assam Valley, sparingly in the plains, Assam, Nagaland, Manipur and East Pakistan in the north-eastern and Chittagong hill tracts; from the edge of the plains up to c. 900 m. Also the northern Eastern Ghats (Sankrametta) between 1000 and 1200 m. Occupies a lower zone than *S. ruficeps*. Affects dense undergrowth, thick forest in ravines, jungle with grass in open forest, light deciduous or semi-evergreen forest, and bamboo or scrub jungle.

EXTRALIMITAL. The species ranges east to N. Vietnam and Laos and south through the Malay peninsula, Sumatra and Borneo.

GENERAL HABITS. In pairs during the breeding season, otherwise in small restless foraging parties often in mixed company with other babblers, creeping through undergrowth and also the crowns of bamboo clumps and medium-sized trees. Often catches insects on the wing.

FOOD. Insects; occasionally berries.

VOICE AND CALLS. Mellow musical iora-like 4-noted whistles, *whi-whi-whi-whi*, and conversational chittering as in 1210 (SA). The song consists of six to seven notes on a monotone with a pause after the first note and the rest uttered rapidly (Smythies).

BREEDING. Season, April to July. Nest, domed or sometimes semi-domed or deep cup-shaped, made chiefly of bamboo leaves, occasionally of grasses

BABBLERS

171

GENERAL HABITS. In pairs in the breeding season, otherwise in small foraging parties often in mixed company of other small babblers etc. keeping to low undergrowth. Actions rather tit-like.

FOOD. Insects; occasionally berries.

VOICE AND CALLS. A low conversational chittering reminiscent of *Dumetia hyperythra* as the birds move about; also a low soft 4-noted whistle indistinguishable from that of 1209 (SA). Song, very similar to that of *S. chrysaea* but a tone lower and without pause between the first and the following notes (Heinrich).

BREEDING. Season, April to July. Nest, either domed or deep cup-shaped, made chiefly of bamboo leaves with grassy fibres and other dead leaves, lined with very fine grass stems. On the whole better made and more compact than that of *S. chrysaea*. Placed in low bushes or bamboo clumps within one metre from the ground, sometimes on the ground. Eggs, normally 4, white, marked with small spots and blotches of brown or reddish brown, generally more numerous at the large end. Average size of 50 eggs 15.8 × 12.6 mm (Baker). Occasionally brood-parasitized by *Cuculus poliocephalus* (Baker, JBNHS 17: 685).

MUSEUM DIAGNOSIS. See Field Characters; for details of plumage Baker, loc. cit. Young, like adult rather less olive above; crown paler; faint rufous edges to wing. Primary and tail characters present; postjuvénal moult complete.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	53-58	15-16	17-20	50-52 mm
1 ♀	54	—	—	—

(SDR, SA, Baker)

Weight 3 ♂♂ 10-12; 1 ♀ 10 g (SDR, SA). 16 ♂♀ (Oct.-Nov.) 8-12 (av. 10.2) g — SA.

COLOURS OF BARE PARTS. Iris red. Bill: upper mandible blackish or brownish, lower basally purple, distally grey, or, pearly horn to pinkish horn. Legs and feet brownish green, brownish yellow, greenish brown or yellowish grey (SDR).

1211. Blackchinned Babbler. *Stachyris pyrrhops* Blyth

Stachyris pyrrhops Blyth, 1844, Jour. Asiat. Soc. Bengal 13: 379 (Nepal)
Stachyris pyrrhops ochreps Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 6
(Kotla, Kangra Dist., Punjab)
Baker, FBI No. 281, Vol. 1: 271
Plate 74, fig. 2

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length 10 cm (4 in.).

FIELD CHARACTERS. Above, olive-brown with a dull tawny olive head; lores black. Below, chin black, sides of head and breast ochraceous, belly buff, flanks tinged with olivaceous. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Common resident. The Himalayas from Murree east to central Nepal. From 750 to 2400 m at all seasons, optimum breeding zone 1500-2000 m; occasionally descends in winter to 300 m. Affects light forest, scrub jungle, bamboo, small nullahs and hedgerows.

170

TIMALIINAE

alone, lined with rootlets. Placed upright between supporting twigs or on a bed of rubbish and leaves inside a clump of bamboo, usually within one metre from the ground, sometimes up to two metres, more rarely on the ground on banks. Deserted clearings are favourite nesting places. Eggs, 3 to 5, normally 4, undistinguishable from those of *S. ruficeps*. Average size of 100 eggs 16.1 × 12.4 mm (Baker). Both sexes take part in incubation. Period undetermined. Occasionally brood-parasitized by *Cuculus sparveroides* and *C. fugax* (Baker, JBNHS 17: 368, 686).

MUSEUM DIAGNOSIS. See Field Characters; for details of plumage Baker, loc. cit. Specimens fox and fade rapidly so that old material in collections is valueless for comparison.

Young, like adult but edges of wings and tail more rusty; black shafts on throat barely visible; rufous cap less pronounced; underparts paler. Primary and tail characters present; postjuvénal moult complete.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♀	50-56	13-15	17-22	43-51 mm (HW, SA)

Weight 2 ♂♂ 10, 10; 1 ♀ 9 g (SA).

COLOURS OF BARE PARTS. Iris brown to red. Bill dark grey or slaty blue. Legs and feet greenish yellow.

1210. Redheaded Babbler. *Stachyris ruficeps ruficeps* Blyth

Stachyris ruficeps Blyth, 1847, Jour. Asiat. Soc. Bengal 16: 452 (Darjeeling)
Stachyris ruficeps ruficeps Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 6
(Kohima, Naga Hills)
Baker, FBI No. 277, Vol. 1: 268
Plate 74, fig. 5

LOCAL NAME. Syak-birang-pho (Lepcha).

SIZE. Sparrow —; length 12 cm (4½ in.).

FIELD CHARACTERS. Above, crown rufous-brown sharply defined from greyish olive back. Lores and orbital area pale yellowish. Below, chin and throat pale yellow finely streaked with black. Rest of underparts pale yellow tinged with olivaceous on flanks and lower belly. Sexes alike. For distinction from *S. rufifrons*, see 1209.

STATUS, DISTRIBUTION AND HABITAT. Common resident. From central Nepal (Sheopuri ridge, Smythies JBNHS 49: 514) east to the Mishmi Hills, the hills of Assam, Nagaland and Manipur; also Orissa (Simlipal Hills, Salim Ali, BNHS coll.). From c. 1000 to 2700 m (in winter to 600 m), optimum zone 1500-2400 m. Occupies a higher zone than *rufifrons* though overlapping at the lower altitudes. Affects thick secondary growth of bushes in clearings, heavy evergreen forest, bamboo jungle, nearly always in dense undergrowth.

EXTRALIMITAL. Northwestern Burma. The species ranges north to Szechuan, east to Anhwei, Formosa, south to Hainan and south-central Vietnam.

¹ Ripley's records from the Mishmi Hills (JBNHS 48: 25) pertain to *S. r. ruficeps*, not *rufifrons*.

172

TIMALIINAE

GENERAL HABITS. In the non-breeding season associates in small flocks of 8 to 10 birds occasionally with the mixed itinerant foraging parties, feeding mostly on the ground turning over fallen leaves in search of insects, or hopping about in the undergrowth, paying special attention to dead leaves. Rarely ascends trees as high as three or four metres. The birds pair off in March.

FOOD. Insects; occasionally berries.

VOICE AND CALLS. A soft chir. Alarm, a slow *pee-re-re*; some song phrases include *phir-dee-dee*, *chur-de-du* (Fleming). Song aptly likened to the ringing of a tiny bell (Proud); reminiscent also of an iora's calls — a soft mellow whistling *wit-wit-wit-wit* etc. repeated quickly 7 or 8 times (SA). Song period in Nepal end February till October (Proud).

BREEDING. Season, April to July. Nest, domed — a ball of grass or dead leaves loosely put together, lined with fibres or pine needles. Usually placed low down in scrub, occasionally as high as 1.5 m. Eggs, 3 or 4, white, lightly speckled and spotted, chiefly at the larger end with pinkish red or brick-red. Unmarked eggs are rare. Average size of 32 eggs 16.5 × 13 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters; for details of plumage Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	52-56	15-16	c. 18	48-52 mm
♀♀	50-54	15-16	—	45-51 mm (BB, Rand & Fleming)

Weight 5 ♂♂ c. 10-11.5; 4 ♀♀ c. 8-11 g (Dieselhorst).

COLOURS OF BARE PARTS. Iris ♂ crimson, ♀ red. Bill dark brown, lower mandible flesh-coloured. Legs, feet and claws pale brownish flesh.

STACHYRIS CHRYSAEA Blyth

Key to the Subspecies

Back yellowish olive, underparts bright chrome-yellow..... <i>S. c. chrysaea</i>
Back greyish olive, underparts dull orange-yellow..... <i>S. c. binghami</i>

1212. Nepal Goldenheaded Babbler. *Stachyris chrysaea chrysaea* Blyth

Stachyris chrysaea Blyth, 1844, Jour. Asiat. Soc. Bengal 13: 379 (Nepal)
Stachyris chrysaea chrysaea Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 5
(Karong, Manipur)
Baker, FBI No. 273, Vol. 1: 265
Plate 74, fig. 3

LOCAL NAMES. Syak-birang-pho (Lepcha); Pre-lin-ne or Pre-ma-ra (Mishmi).

SIZE. Sparrow —; length 10 cm (4 in.).

FIELD CHARACTERS. Above, forehead, crown and nape golden yellow, the last two streaked with black; lores and a short moustachial stripe black. Back and ear-coverts yellowish olive. Below, bright yellow. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Resident, locally common. From west central Nepal (Pokhara, Proud, JBNHS 53: 58, the only post-Hodgsonian record) east through Sikkim, Bhutan, NEFA to the Mishmi Hills, the hills of Assam south to the range of *binghami*, Nagaland and Manipur.

In the Himalayas from 1200 to 2600 m, optimum zone 1500-2000 m; in Assam from 900 to 1800 m, and in Lakhimpur down to 300 m. Affects dense bushes, bamboo and seedling undergrowth and *Rubus* thickets in humid secondary jungle and evergreen forest, deserted cultivation and clearings.

Extralimital. Northern Burma to western Yunnan. The species ranges east to Vietnam and south to the Malay peninsula and western Sumatra.

GENERAL HABITS. An active and restless species found in mixed parties of babblers, flycatchers, and warblers, slipping through bamboo and undergrowth, as well as up in the foliage canopy of trees though seldom ascending very high; clinging to sprigs and peering under leaves in search of insects like a tit. The flocks work feverishly, and sweep on rapidly from tree to tree. Shy but very inquisitive, hopping ceaselessly in tangled undergrowth around 'frozen' observer with the restlessness of a flycatcher, tail cocked and wings drooping at the sides.

FOOD. Insects; occasionally berries.

VOICE AND CALLS. Members of a party keep up a constant, soft, low twittering which rises to shriller and louder notes — *chirik-chirik*, etc. if the birds become agitated or suspicious. The song consists of seven or eight notes on the same tone *pee pi-pi-pi-pi-pi* very like the song of *S. ruficeps* (1210) but with a noticeable pause after the first note; another song consists of three sibilant notes rising in pitch *tzu-tzu-tzu*, somewhat like the song of Franklin's Wren-Warbler (*Smythies*).

BREEDING. *Season*, April to July. *Nest*, normally domed, made of bamboo leaves with an inner cup or lining of rootlets, measuring about 10 to 15 cm in height by 7 to 10 cm in width. Placed in bamboo clumps about 30 to 60 cm from the ground, often buried in fallen leaves, or on the ground, well screened by sheltering bushes and weeds, almost always on a bank. *Eggs*, 4, white, rarely spotted with reddish brown. Average size of 70 eggs 15.4 × 12.2 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Subspecies; for details of plumage, Baker, loc. cit.

MEASUREMENTS	Wing	Bill (from skull)	Tarsus	Tail
♂ ♀	47-56	13-14	17-19	40-50 mm (SDR, SA)

Weight 7 ♂ 6-10; 1 ♀ 7 g (SDR, SA, BB).

COLOURS OF BARE PARTS. Iris light brown. Bill dark slaty horn above, paler below. Legs and feet pale yellowish brown to greenish brown.

1213. Chin Hills Goldenheaded Babbler. *Stachyris chrysaea binghami* Rippon

Stachyris binghami Rippon, 1904, Bull. Brit. Orn. Cl. 14: 84
(Mount Victoria, Chin Hills)

Stachyris chrysaea crocina Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 6
(Sangau, Lushai Hills)
Baker, FBI No. 274, Vol. 1: 266

LOCAL NAMES. None recorded.

Rhopocichla atriceps and *Stachyris nigriceps*

R. a. atriceps (1224). *R. a. bourdilloni* (1225). *R. a. siccalus* (1226).
R. a. nigricans (1227). *S. n. nigriceps* (1214). *S. n. coei* (1215).
S. n. coltarti (1217). *S. n. spadix* (1216).

VOICE AND CALLS. Alarm, an explosive *chhrri* repeated several times; call-note, a repeated, loud, insistent *tuwe-twa* (rising-low) (Lister). Song, a peculiar single note followed by a trill which sounds like a small bell rung faster and faster, then stopping abruptly (Proud). A low, sweet, rather mournful whistle (SA).

BREEDING. *Season*, chiefly April to July. *Nest*, domed, outwardly made of bamboo leaves very loosely put together, interiorly built of rootlets, moss, a few dead leaves and fern fronds, lined with finer moss and fern roots. Nearly always placed on the ground, generally on a bank and well concealed in shrubs, grass or fallen debris; rarely in a bamboo clump or a bush up to 60 cm. *Eggs*, 4, rarely 5 or 3, white. Average size of 50 eggs 18.8 × 14.4 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *coei* in being paler and having the throat feathers edged with white.

MEASUREMENTS	Wing	Bill (from skull)	Tarsus	Tail
♂ ♂	52-62	17-19	21-22	50-56 mm
♀ ♀	56-63	17-18	21-22	47-51 mm

(BB, SDR, SA, Rand & Fleming)

Weight 10 ♂ 14-17; 7 ♀ 10-17 g (GD, BB).

COLOURS OF BARE PARTS. Iris pinkish biscuit colour, orange-brown or reddish brown. Bill: upper mandible horny brown, lower pale flesh, darker in summer.

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in 1212.

STATUS, DISTRIBUTION AND HABITAT. Common resident. Assam in the Mizo Hills south to the hills of East Pakistan, from 1200 m up. Habitat as in 1212.

Extralimital. The Chin Hills and Arakan in Burma.

GENERAL HABITS, FOOD AND VOICE. As in 1212.

BREEDING. As in 1212.

MUSEUM DIAGNOSIS. See Key to the Subspecies.

Stachyris nigriceps Blyth, 1844, Jour. Asiat. Soc. Bengal 13: 378 (Nepal)
Baker, FBI No. 270, Vol. 1: 264
Plate 74, fig. 9

LOCAL NAMES. *Moostay* (Paharia); *Sangriam-pho* (Lepcha).

SIZE. Sparrow —; length c. 12 cm (5 in.).

FIELD CHARACTERS. *Above*, crown blackish striped with white; a black supercilium extending to nape; rest of upperparts olive-brown. *Below*, chin and throat slate-grey bordered by white malar stripes; rest of underparts fulvous tinged with olivaceous on flanks and lower belly. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Common resident. From central Nepal east through Sikkim, Bhutan and NEFA to the Miri Hills where it intergrades with *coei*. From c. 760 to 1800 m, breeding mostly above 1000 m in the western parts of its range, but descending to the edge of the plains farther east. Affects secondary scrub and bamboo jungle in light or dense forest.

GENERAL HABITS. Keeps in parties of 5 to 20, commonly in association with other species of small babblers. Very active, incessantly on the move. When one bird flies to another thicker, the rest promptly follow in twos and threes. Frequents the lower growth. Pairs form in late March.

FOOD. Almost entirely insects; berries and nectar also taken.

Legs and feet olive-yellow (SA). *Or*: Iris dull brownish white or dull whitish yellow. Upper mandible dark brown to black, lower whitish to fleshy white. Legs dull yellow to dull greenish yellow (SDR).

1215. Mishmi Blackthroated Babbler. *Stachyris nigriceps coei* Ripley

Stachyris nigriceps coei Ripley, 1952, Postilla, Yale Peabody Mus., No. 14: 2
(Dreyi, Mishmi Hills)
Not in Baker, FBI

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 12 cm (5 in.).

FIELD CHARACTERS. As in 1214.

STATUS, DISTRIBUTION AND HABITAT. Resident. NEFA in the Mishmi Hills, from the edge of the plains to 1800 m. Affects undergrowth in wet evergreen forest.

GENERAL HABITS, FOOD AND VOICE. As in 1214, q.v.

BREEDING. As in 1214.

MUSEUM DIAGNOSIS. Intermediate between *nigriceps* and *spadix*. Differs from the former in being darker and having an unstreaked throat; from *spadix* in being darker with a more blackish throat and dark seal-brown ear-coverts; from *coltarti* in having dark brown rather than rufous-brown ear-coverts, and by being a purer less rufescent brown below.

MEASUREMENTS. As in 1214.

COLOURS OF BARE PARTS. Iris brown. Upper mandible black, lower greyish horn. Legs dull greenish yellow.

1216. Assam Blackthroated Babbler. *Stachyris nigriceps spadix* Ripley

Stachyris nigriceps spadix Ripley, 1948, Bull. Brit. Orn. Cl. 68: 89
(Laisung, north Cachar)

Stachyris nigriceps rarida Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 5
(Sangau, Lushai Hills)
Baker, FBI No. 271 (part), Vol. 1: 265

LOCAL NAME. *Dao-riaphong* (Cachari).

SIZE. Sparrow —; length c. 12 cm (5 in.).

FIELD CHARACTERS. As in 1214.

STATUS, DISTRIBUTION AND HABITAT. Common resident. Assam in the Garo, Khasi, Cachar and Mizo (Lushai) hills, and East Pakistan in the northeastern hills and the Chittagong region, from the edge of the plains to 1800 m. Affects undergrowth in evergreen forest.

Extralimital. Southern Burma south and east to northern Tenasserim; northwestern Thailand. The species ranges east to Vietnam and south to the Malay peninsula, Sumatra and Borneo.

GENERAL HABITS, FOOD AND VOICE. As in 1214.

BREEDING. *Season*, March to August. *Nest* and *eggs*, as in 1214. Average size of 200 eggs 19.1 × 14.7 mm (Baker). Female does most of the building; both birds incubate; incubation period about twelve days.

BABLERS 177

MUSEUM DIAGNOSIS. Differs from *cori* in being paler and having a more slate-grey throat.

MEASUREMENTS AND COLOURS OF BARE PARTS. As in *nigricaps*.

1217. Nagaland Blackthroated Babbler. *Stachyris nigricaps colarti* Harington

Stachyris nigricaps colarti Harington, 1913, Bull. Brit. Orn. Cl. 33: 61 (Margherita, Assam)

Baker, FBI No. 271 (part), Vol. 1: 265

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 12 cm (5 in.).

FIELD CHARACTERS. As in 1214.

STATUS, DISTRIBUTION AND HABITAT. Common resident. Northeast Assam in the Margherita area, and Nagaland, from the edge of the plains to 1800 m. Affects bamboo and undergrowth in wet evergreen forest and thick scrub jungle.

Extralimital. Northern Burma.

GENERAL HABITS, FOOD AND VOICE. As in 1214.

BREEDING. As in 1214.

MUSEUM DIAGNOSIS. Differs from *spedix* in having the ear-coverts rufous-brown rather than brown; from *cori* by the same character and also by being a more rufescent brown below.

MEASUREMENTS. As in 1214.

Weight 3 ♂♂ 16–17 g (SDR).

COLOURS OF BARE PARTS. As in 1215.

1218. Austen's Spotted Babbler. *Stachyris oglei* (Godwin-Austen)

Actinura oglei Godwin-Austen, 1877, Jour. Asiat. Soc. Bengal 46: 42 (Sadiya, Assam)

Baker, FBI No. 268, Vol. 1: 262

Plate 74, fig. 8

LOCAL NAME. *Chum-pitti* (Trans-Dikku Naga).

SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. Above, crown and nape rich golden brown, back duller. Wings and tail narrowly barred. A conspicuous white supercilium from lores to nape, breaking up into spots on the sides of neck and bordered above by a black line from forehead to nape; ear-coverts black. Below, throat white, breast slate-grey; rest of underparts umber-brown. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Rare resident with a very restricted range. Evidently confined to northeastern Assam in the Patkai Range near Margherita and the hills north of Sadiya. Nests were brought in from an altitude of 1800 m or higher. Appears to inhabit moist dense scrub in rocky ravines.

GENERAL HABITS. Very little known. According to native collectors, keeps much to the heaviest undergrowth, is silent, skulking and does not go about in flocks.

BABLERS 179

STATUS, DISTRIBUTION AND HABITAT. Common resident. Southern Rajasthan (Sambhar and Mount Abu), Saurashtra peninsula, eastern Gujarat,

Dumetia hyperythra

westernmost Satpuras, and the Western Ghats south to Poona (where it intergrades with *albogularis*) and east to about Kannad in Marathwada, c. 20°N., 75°E. Affects well-wooded country and scrub.

GENERAL HABITS, FOOD, VOICE AND CALLS. As in 1221, q.v.

BREEDING. Season, from the latter part of June when the rains have well set in, till September. Nest and eggs, as in 1221.

MUSEUM DIAGNOSIS. Differs from *albogularis* in having the whole crown chestnut and the underparts paler.

MEASUREMENTS AND COLOURS OF BARE PARTS. As in 1221.

1221. Whitethroated Babbler. *Dumetia hyperythra albogularis* (Blyth)

M. (alabaricus) (?) *albogularis* Blyth, 1847, Jour. Asiat. Soc. Bengal 16: 453 (southern India, restricted to Mysore by Baker, 1921, Handlist: 24)

Baker, FBI No. 230, Vol. 1: 229

LOCAL NAMES. *Stah dzwi* (Hindi); *Pandi-jitta* ('pig-bird' — Telugu); *Chima chilappan* (Malayalam).

SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. Above, olive-brown with a reddish brown cap. Below, throat white, rest of underparts ochraceous. Sexes alike.

178 TIMALIINAE

FOOD. Insects.

VOICE AND CALLS. Unrecorded.

BREEDING. Season, April to June. Nest (not seen *in situ* by any ornithologist), a large, globular structure made of bamboo leaves mixed with roots, twigs, dead leaves and a little moss. Said by the native collectors to be placed on the ground, under bushes in rocky ravines. Eggs, about 4, white. Average size of 15 eggs 22.8 × 17.1 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters.

	Wing	Bill (from feathers)	Tarsus	Tail (Baker)
♂ ♀	68–76	c. 17	c. 27	c. 53 mm
		(from skull)		(Baker)
1 ♀	63	20	26	53 mm

LOCAL NAME. *Karamadi laltido* (Gujarati).

SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. As of 1221. See Museum Diagnosis.

180 TIMALIINAE

STATUS, DISTRIBUTION AND HABITAT. Common resident. Southern India south of the Krishna river and Mahabaleswar; intergrades with *hyperythra* in the Nallamalai range, with *abuenis* in the Poona district and with *philippii* in southern Kerala. From near sea level generally up to c. 1200 m (up to 1800 m in the Cardamom Hills). Affects grassland and scrub, bamboo clumps, deciduous scrub jungle and forest; avoids evergreen.

GENERAL HABITS. Keeps in loose flocks of five to twelve birds hopping about restlessly among tall grass, undergrowth or on the ground rummaging quietly among the dead leaves, flicking them aside or peering under them for lurking insects. Great skulkers, scattering and diving into thick cover on the least alarm, the flock soon re-uniting through the agitated cheeps and chittering of the members. Closely resembles *Stachyris* in behaviour, habits and appearance.

FOOD. Mainly insects. Flower-nectar (e.g. *Erythrina*, *Salmaal*) is also taken.

VOICE AND CALLS. Members of a flock maintain contact with one another by means of rather feeble but sharp cheeping notes *sweech-sweech* (reminiscent of a sunbird — *Nectarinia*) varied occasionally by a harsher twittering, especially when alarmed (SA). Also 'a soft *tack-tack* like two pebbles tapped together, and a clear whistling song of seven notes' (Nichols). This song described as 'pleasant, the first half very like a Redwinged Bush Lark's and the latter part resembling the canary-like notes of the sunbird, the two running into each other without a break' (Lowther).

BREEDING. Season, not well defined, mostly during the monsoon (June to October). Nest, a neat ball-shaped structure about 15 cm in diameter, made of coarse grasses and bamboo leaves, lined with finer grasses, with the entrance on the side. One nest was reportedly made of curly paper shavings used in packing bottles. Usually placed in some thorny bush overgrown with monsoon creepers within two metres from the ground, most often near, or on the ground in clumps of grass. Eggs, 3 or 4, white, spotted and blotched with reddish brown. Average size of 50 eggs 17.4 × 14.1 mm (Baker). Brood-parasitized by the Baybanded Cuckoo (582).

MUSEUM DIAGNOSIS. Differs from the nominate subspecies (1222) in having a white throat; from *abuenis* in having the reddish brown restricted to forehead; *philippii* is paler and has a heavier bill. Prenuptial moult takes place in January and February.

Young, has the whole upper plumage a brighter, more rufous brown, without reddish brown on forehead or crown; lower plumage duller, more fulvous brown, with mere traces of white on the chin, throat and central abdomen. Postjuvinal moult complete.

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♂	53–65	14–15	18–20	59–69 mm
♀ ♀	52–58	14–15	18–21	55–69 mm
				(HW, SA, Koelz)

Weight 10 ♂ ♀ 10–15 (av. 12.9) g — SA.

BABLERS 181

COLOURS OF BARE PARTS. Iris creamy white. Bill pale horny brown, paler on lower mandible; mouth pale yellowish flesh to pink, apparently varying with age. Legs and feet yellowish flesh, dusker on anterior tarsus; claws brown.

1222. Rufousbellied Babbler. *Dumetia hyperythra hyperythra* (Franklin)

Timalia hyperythra Franklin, 1831, Proc. Zool. Soc. London: 118
(Ganges near Benares)
Baker, FBI No. 229, Vol. 1: 228
Plate 74, fig. 6

LOCAL NAMES. None recorded.
SIZE. Sparrow —; length c. 13 cm (5 in.).
FIELD CHARACTERS. As in 1221, but underparts entirely clay-coloured; no white.

STATUS, DISTRIBUTION and HABITAT. Common resident, but unevenly distributed. From Simla along the Himalayan foothills through Uttar Pradesh, Nepal terai to Darjeeling duars, West Bengal and East Pakistan west of the Brahmaputra, south to the Krishna river and west approximately to a line Hyderabad-Jalna-Mhow-Jhansi. Intergrades with *albugularis* in the Nallamalai range and with *abensis* in the Jalna area. In the plains and hills up to c. 900 m. Affects tall grass and thorn scrub jungle.

GENERAL HABITS, FOOD and VOICE. As in 1221.

BREEDING. Season, March to mid September (monsoon). Nest, of two types, either an oval ball of dead bamboo leaves lying on its side, with the entrance at the end or, more commonly, a ball of coarse grass with the entrance about half-way up the side, without lining or with a slight one of fine fern stems or grasses. Usually placed near the ground among grass and weeds surrounding a small bush, exceptionally in a bush up to about 1.5 m. May be situated on the outskirts of jungle or a little way inside, but most often alongside some path. Eggs, usually 4, sometimes 3, white with reddish brown spots and blotches. Average size of 50 eggs 17.3 x 13.8 mm (Baker).

MUSEUM DIAGNOSIS. Distinguished from other subspecies by its uniformly clay-coloured underparts (no white on throat or abdomen). Postnuptial moult complete in October and November. A partial prenuptial moult in April and May, confined to head, neck and breast.

Young, differs from adult in lacking the reddish brown tinge of the forehead. Colour of underparts duller and paler. May also be recognized by the broad, soft round-tipped first primary and soft narrow tail-feathers. Postjuvinal moult complete and remarkable for the sudden casting of rectrices.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	53-58	13-14	19-21	57-64 mm
♀♀	52-55	13-14	19-20	58-63 mm (HW, SA)

COLOURS OF BARE PARTS. Iris hazel brown or yellowish red. Bill pale brown; mouth pale fleshy pink. Legs and feet light brown or pale yellowish.

BABLERS 183

1224. Blackheaded Babbler. *Rhopocichla atriceps atriceps* (Jerdon)

Brachypteryx atriceps Jerdon, 1839, Madras Jour. Lit. Sci. 10: 250
(Trichoor = Wynad vide Whistler, 1935, JBNHS 38: 82)
Baker, FBI No. 294, Vol. 1: 281
Plate 74, fig. 10

LOCAL NAME. *Poti chilappan* (Malayalam).

SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. Above, head blackish brown, looking black at a distance, sharply defined from the rest of upper plumage which is olive-brown (bistre). Eyes pale yellow. Below, whitish, lower belly olive-brown. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Common resident. The Western Ghats from Belgaum south to the Palghat Gap, and east to Shimoga and the Biligitirangan Hills (Mysore). From the lowlands to 1800 m, optimum elevation 600 to 1200 m (see map, p. 175). Essentially a bird of evergreen biotope. Affects sholas, thickets near streams, dense and marshy jungle, reed-beds, bamboo jungle, cardamom cultivation; particularly fond of cane brakes in dank ravines.

GENERAL HABITS. Moves about the undergrowth, much in the manner of *Dumetia*, in parties of up to a dozen birds or more, often with other babblers. Seldom ascends more than a metre or two above the ground, but when having ventured too far up, has a habit of dropping perpendicularly like a falling leaf into the thickets below on the slightest alarm.

FOOD. Insects.

VOICE and CALLS. Utters sundry squeaks and a harsh, rather subdued *chur-r chur-r*, like an *iora*'s, when a flock is working through undergrowth. Alarm, a rattling *chur-r*. Song, if any, not recorded.

BREEDING. Season, ill-defined, practically the whole year, but there appear to be two main periods, before and after the monsoon (Betts); main season seems to be March to July. Nest, a rough ball of dead bamboo or grass blades lined with black rootlets and grass, well hidden in thick shrubs, usually within one metre from the ground. This species builds 'cock nests', very loosely and untidily made balls of bamboo leaves, unlined and usually in full view; they are not used for breeding though the birds, at times up to four individuals, roost in them. Wherever the species occurs, one finds many of these nests at all times of the year, often two or three, sometimes more, close together, thus leading some observers to believe that the species may be 'semi-colonial' in its breeding habits. Eggs, normally 2, white, speckled or spotted with brownish red, slightly more so at the larger end. Average size of 24 eggs 19.3 x 13.8 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *bourdilloni* in having the crown blackish brown instead of sooty brown.

MEASUREMENTS and COLOURS OF BARE PARTS. As in *bourdilloni*.

1225. Kerala Blackheaded Babbler. *Rhopocichla atriceps bourdilloni* (Hume)

Alcippe bourdilloni Hume, 1876, Stray Feathers 4: 485 (Mynall, Travancore)
Baker, FBI No. 295, Vol. 1: 282

LOCAL NAME. *Poti chilappan* (Malayalam).

SIZE. Sparrow —; length c. 13 cm (5 in.).

1223. Ceylon Whitethroated Babbler. *Dumetia hyperythra phillypsii* Whistler

Dumetia hyperythra phillypsii Whistler, 1941, Ibis: 319
(Kumbalgamuwa, Ceylon, 3000 ft)
Not in Baker, FBI

LOCAL NAMES. *Balechia*, *Parandel-kurullā* (Sinhala).

SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. As in 1221. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Resident, well distributed and moderately plentiful. Ceylon in the low country and hills up to 1500 m or higher in some districts. Affects scrub and high grasslands in both the Wet and Dry zones.

GENERAL HABITS, FOOD and VOICE. As in 1221.

BREEDING. Season, ill-defined; in the hills, mostly March to May and again in August and September, but nests have been found in every month except November and December. In the low-country Wet zone, chiefly January and February and also in September. In the Dry zone, in the south as well as in the north, the season starts with the November rains and may continue well into June, though the majority of nests are found during December, January and February. Appears to have two broods. Nest, as in 1221. Eggs, generally 3, occasionally 2, rarely 4, white, spotted and blotched with reddish brown, c. 18 x 14 mm.

MUSEUM DIAGNOSIS. Differs from *albugularis* (1221) in being paler rufous below, with the white of the central abdomen more extensive. Bill larger and heavier.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	54-59	14-15	19-20	54-63 mm
♀♀	54-59	c. 14	19-20	55-61 mm (HW)

Weight 1 ♂ 14 g (SDR).

COLOURS OF BARE PARTS. As in 1222.

GENUS RHOPOCICHLA Oates

Rhopocichla Oates, 1889, Fauna Brit. India, Bds. 1: 159. Type, by original designation, *Brachypteryx atriceps* Jerdon

Differs from *Alcippe* in having the nostrils roundish, exposed, and pierced in the anterior part of the membrane, and the tail shorter than the wing. Eggs of the two genera also different.

RHOPOCICHLA ATRICEPS (Jerdon)

Key to the Subspecies

184 TIMALIINAE

FIELD CHARACTERS. As in 1224. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Common resident. The hills of Kerala and western Tamil Nadu south of the Palghat Gap; from the lowlands to c. 1800 m, (see map, p. 175). Habitat as in 1224.

GENERAL HABITS, FOOD and VOICE. As in 1224, q.v.

BREEDING. As in 1224. Average size of 24 eggs 19.1 x 14.1 mm (Baker).

MUSEUM DIAGNOSIS. Intermediate between *atriceps* and *nigrifrons*. Differs from *atriceps* in having the crown, nape, lores and cheeks sooty brown instead of very dark blackish brown, and the underparts from lower breast to under tail-coverts ferruginous. Adult and juvenal plumages agree in being brown-headed, but there is a certain amount of individual variation.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	55-61	14-16	—	46-52 mm
♀♀	54-58	14-16	21-22	43-48 mm (SA, HW, Koels)

COLOURS OF BARE PARTS. Iris lemon-yellow or pale yellow. Bill: upper mandible dark horny brown; commissure and lower mandible pale greyish flesh; adult mouth pale pinkish flesh, young mouth and gape yellow. Legs and feet pinkish grey; claws dusky.

1226. Ceylon Dry Zone Blackheaded Babbler. *Rhopocichla atriceps siccatus* Whistler

Rhopocichla atriceps siccatus Whistler, 1941, Bull. Brit. Orn. Cl. 62: 37
(Kalawewa, N.C.P., Ceylon)
Baker, FBI No. 296 (part), Vol. 1: 282
Plate 74, fig. 11

LOCAL NAMES. *Parandel-kurullā*, *Battichecha* (Sinhala).

SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. As in 1224, but blackish restricted to forehead and ear-coverts.

STATUS, DISTRIBUTION and HABITAT. Common resident. Ceylon in the low-country Dry zone and Hill zone up to over 2100 m, (see map, p. 175). Affects undergrowth in forest, scrub and bamboo.

GENERAL HABITS, FOOD and VOICE. As in 1224, q.v.

BREEDING. Season, breeds the year round but chiefly from February to the end of May and during October and November. Nest and eggs, as in 1224.

MUSEUM DIAGNOSIS. Similar to *nigrifrons* (1227) but fulvous-brown of upperparts, wings and tail olivaceous-fulvous instead of a more saturated rusty fulvous; brown of lower flanks, vent and under tail-coverts olivaceous-brown v. earth-brown.

Young. Similar to adult but black of sides of head less sharply defined; edges of wings, tail and wing-coverts more rusty.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	55-60	14-16	21-23	43-50 mm
♀♀	54-60	14-15	21-23	42-48 mm (HW, SDR)

Weight 1 ♀ 16 g (SDR).

BABBLERS

185

COLOURS OF BARE PARTS. Iris yellow or yellowish. Upper mandible brownish horn, lower whitish horn. Legs pearly pink or flesh-coloured.

SIZE. Sparrow —; length c. 11 cm (4 in.).

BABBLERS

187

FOOD. Insects.

VOICE and CALLS. A rich, mellow, rather metallic *kew-kew-kew-kew-kew* repeated monotonously for minutes, with short breaks between the runs — rather like one of the Tailor Bird's calls but even more surprisingly loud for the size of the bird; occasionally varied by a harsh *chichoo* or *chrr-chichoo* (SA). Birds of a feeding party keep up a soft, conversational *pick pick* etc. Alarm, a sharp *chr-r-r*. Apparently also has a song, but this has not been intelligibly described.

BREEDING. Season, April to July, chiefly May and June. Nest, globular, varying in size from 10 to 20 cm in diameter, made of bamboo leaves, broad grass blades or palm strands, lined with fine grass and fine fibrous rootlets. Placed fairly low down in bushes or bamboo clumps, looking very much like a wind-blown cluster of bamboo leaves. Eggs, 3 or 4, occasionally 5, white, marked with very small blotches and specks of reddish brown, generally forming a ring at the large end. Average size of 120 eggs 16.6 × 12.6 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

Baker, FBI No. 227, Vol. 1: 226

Plate 79, fig. 1

LOCAL NAMES. *Vengrazi* (Mikir); *Deo-maogasha gashim* (Cachari); *Ingto* (Kacha Naga).

SIZE. Sparrow +; length c. 17 cm (6½ in.).

FIELD CHARACTERS. Above, forehead white continued as a streak over the eye; crown chestnut; lores and stout bill black; ear-coverts white; sides of neck slate grey. Back olive-brown, slightly streaked on upper back; tail

186

TIMALIINAE

FIELD CHARACTERS.

Above, greyish olive with tawny olive cap and wings. Lores and supercilium pale yellow. Below, chin, throat and breast pale yellow with dark streaks. Belly pale yellow; sides of body olive-buff. Sexes alike.

× c. 1

STATUS, DISTRIBUTION and HABITAT. Common resident. From western Nepal in the bhabar, duns and terai east through Darjeeling and Sikkim duars and Bhutan foothills; the plains and base of hills in Assam, Nagaland, Manipur, East Pakistan, West Bengal, southeast Bihar (Chota Nagpur), Orissa, southeast Madhya Pradesh (Bastar district),

Macronous gularis

Distributional range of *M. g. rubricapilla* (1228).

northeast Andhra Pradesh (Vishakhapatnam Ghats) and south Mysore (Mysore District); usually below 600 m (up to 900 m in the Peninsula). Affects both light and dense forest among bushes and undergrowth, bamboo jungle, long grass and brushwood.

Extralimital. Numerous subspecies throughout the Indochinese countries, Malaysia, Sumatra, Java, Borneo, Palawan, and neighbouring islands.

GENERAL HABITS. A low-elevation babbler; one of the noisiest of the tribe, thus unlikely to be overlooked wherever occurring. Keeps in parties up to a dozen or more — singly or pairs during breeding season — often in mixed company. Hunts in the foliage canopy or up amongst bamboos, the flocks quickly moving on, or 'flowing' from tree to tree. Actions and behaviour rather tit-like — similar to *Alcippe*, *Minla* and other small babblers: clinging to leaves upside down and sideways and scanning the undersurface for insects. Occasionally feeds on the ground.

188

TIMALIINAE

brown, narrowly barred, graduated. Below, chin and throat white, the latter with fine black streaks; belly buff, flanks olive-brown. Sexes alike.

× c. 1

STATUS, DISTRIBUTION and HABITAT. Common resident. From the western Nepal terai east to Gorakhpur (east U.P.), the plains of Darjeeling and Jalpaiguri districts (duars), the foothills of Sikkim and Bhutan, the flood plains of the Brahmaputra, West Bengal (Calcutta), East Pakistan, Assam, Nagaland and Manipur. From the lowlands to about

900 m, in the Khasi Hills on the grass-covered plateaux up to c. 1200 m. Affects low-lying swampy areas — tall grass, reed-beds, brushwood and scrub jungle, often along streams and roads.

Extralimital. Northwestern Burma and northern Arakan. The species extends north and east to Kweichow, Kwangsi and Vietnam; nominate race in Java.

GENERAL HABITS. Keeps in pairs during the breeding season, otherwise in small parties of up to 6 or 8 birds. Hunts in the lower cover working from stem to stem, picking insects off the twigs and leaves, threading its way through the tangles of tall grass and bushes, seldom exposing itself to view.

FOOD. Insects.

VOICE and CALLS. Ordinary call-note, a quiet *tit, tit* (Fleming). Alarm-notes harsh and rasping, very similar to the *korchuck* of the Great Reed Warbler (Bates); also a (conversational?) rolling *prrew* (SA). Song, a curious combination of a flute-like trill and a whistle, of about half a dozen notes, descending in pitch, distinctive and unlike any other bird-call. Another call commonly uttered as the bird climbs about in cover resembles *chee-aye*, *chit*, *chit*, *chit*, *chit*, or sometimes *scree* . . . *chit*, *chit*, *chit*; also one consisting of five or six notes harsh and rising in pitch (Smythies).

BREEDING. Season, March to October. Nest, a roughly made ball of coarse grass or strips of bamboo leaves with occasionally a few leaves or rootlets, and scantily lined with finer grass; the whole nest looks like an accumulation of rubbish. The entrance is large in proportion to the size of the nest (c. 5 cm); one nest is described (Roseveare) as cup-shaped. Placed low down in a bush or on the ground under the shelter of a bush or tussock of grass. Eggs, 3 to 5, white, marked with small blotches of dark umber-brown and a few secondary ones of dark inky grey, more numerous at the large end. Average size of 50 eggs 19 × 14.5 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters. Colour of cap varies from chestnut to almost brick-red or maroon.

Baker, FBI No. 234 (part), Vol. 1: 233

LOCAL NAMES. *Bārā-pōdnā*, *Bārā-piddā*, *Gōtah* (Hindi).

SIZE. Bulbul —; length c. 18 cm (7 in.).

FIELD CHARACTERS. As in 1231.

STATUS, DISTRIBUTION AND HABITAT. Resident, locally common; absent from pure desert. West Pakistan and northwest India from Kohat and the Indus Valley, east to northern and eastern Uttar Pradesh, northwestern Madhya Pradesh and extreme northeastern Maharashtra. Intergrades with *sinense* in northern U.P. (Dehra Dun); eastern U.P. (Gorakhpur), western M.P. (Sagar, Sehore, Indore) and Khandesh (Nasik, Igatpur). In the plains and at the base of hills up to 1200 m. Affects scrub, thorn jungle, tamarisks, brushwood by streams, scrub-covered eroded ravines, edges of cultivation, reed-beds, bamboo, cane fields and tall coarse grass.

GENERAL HABITS, FOOD AND VOICE. As in 1231, q.v.

BREEDING. Season, June (rarely April) to September (monsoon). Nest and eggs, as in 1231. Average size of 46 eggs 19.1 × 14.5 mm (Baker). MUSEUM DIAGNOSIS. See Key to the Subspecies. Postnuptial moult takes place in October-November.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	61-71	14-15	22-27	80-104 mm
♀♀	61-67	13-16	25-27	84-94 mm (HW, SA)

BABLERS 191

and Jalpaiguri districts, Bhutan foothills and Brahmaputra valley. Usually under 1000 m in the hills. Affects scrub, bush-clad grassy hillsides, secondary growth, tall grass and bushes, sugarcane fields, hedges and bamboo.

Extralimital. Extends east to Vietnam and through south China to Kwangtung.

GENERAL HABITS. After the breeding season keeps in small parties of five to fifteen individuals often in association with the various species of *Prinia* (wren-warblers) which share its habitat, working through thick cover, clinging to twigs or reed-stems sideways or upside down in the manner of tits. Very elusive. Clambers up to exposed tops of reeds now and again for a few seconds to utter its cheeping notes, and dives into the thicket again to resume hunting. Flight feeble, jerky and undulating.

FOOD. Caterpillars, grasshoppers and other insects and spiders; berries (*lantana*, *Salvadora persica*, etc.); also nectar (*Erythrina*, *Salmalia*, etc.).

VOICE AND CALLS. Normal call-note a loud, clear, somewhat plaintive *cheep-cheep-cheep*. Alarm, *churr*. Song, in breeding season a sweet, powerful whistling phrase resembling *twee-twee-la-whit-chu* with accent on the penultimate *whit*, and also a loud *cheep-cheep-cheep cheep-cheep*, about two notes per second, alternating with a low *kru-kru-kru* (Smythies). The song is delivered from the top of a bush or the extremity of some tall grass-stem. Males continue to sing even in heavy postnuptial moult.

BREEDING. Season, from June (occasionally April and May) to November, chiefly July and August (monsoon). Nest, a beautiful cone-shaped, deep cup of coarse grasses and blades lined with finer material, sparsely to copiously cemented on the outside with cobwebs. Hung hammockwise between upright stems of grasses or monsoon plants, or wedged into some crotch of a bush 50 to 150 cm from the ground. The supporting stems are incorporated into the wall of the nest which is sometimes carefully concealed, at others very conspicuous. Eggs, 3 to 5, usually 4, pinkish white, thickly marked all over with chestnut-red; for descriptive details, see Baker, *Nidification*, Vol. 1: 197. Average size of 100 eggs 17.9 × 14.9 mm (Baker). Both sexes incubate and feed the young, which leave the nest 12 or 13 days after hatching. Period of incubation undetermined. When approached, the parents slip off the nest and skulk away through cover before taking flight. A bird near the nest has been described to 'feign in a most realistic manner to be wounded, swaying with wings and tail outspread on a twig, as if about to topple over and fall at any moment' (HW).

MUSEUM DIAGNOSIS. See Key to the Subspecies.

Young, very similar to adult but wings are a paler chestnut. Postjuvinal moult complete.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	62-70	14-15	22-27	73-102 mm
♀♀	62-70	13-16	25-27	78-100 mm (HW, SA)

Weight 15 ♂♂ ♀♀ 15-21 (av. 18.3) g — SA.

COLOURS OF BARE PARTS. Iris yellowish to orange-yellow; eye-rim orange. Bill black; mouth apparently differs seasonally, black in the breeding season, otherwise orange-brown.

Baker, FBI No. 236, Vol. 1: 235

LOCAL NAME. *Hambu-kurullā* (Sinhala).

SIZE. Bulbul —; length c. 18 cm (7 in.).

FIELD CHARACTERS. As in 1231.

STATUS, DISTRIBUTION AND HABITAT. Resident; widely distributed but nowhere common. Ceylon, in all zones up to nearly 1800 m. Affects scrub, high grass, 'patanas', low grassy jungle, swamps and fernlands.

GENERAL HABITS. As in 1231, q.v.

FOOD. Mainly insects; also berries (*Lantana* etc.) and flower-nectar.

VOICE AND CALLS. Song of male, a briskly whistled phrase rendered as *cutykra-weeko wiwiwiwiwi*; a loud call *preepreep lowhikihiki* (Henry). Other notes as in 1231.

BREEDING. Season, ill-defined: November to May, chiefly February to May; nests also recorded in July. Nest, as in 1231. Eggs, usually 3, sometimes 4, similar to those of *sinense*. Average size of 16 eggs 17 × 13.8 mm (Baker).

MUSEUM DIAGNOSIS. Bill stouter than in the continental races; nostrils black. Upperparts slightly more saturated, with little difference between crown and mantle.

MEASUREMENTS

BABBLERS

193

Distinguished from the Yellow-eyed Babbler by the following: eye brown, bill yellowish brown; no white supercilium; forehead black with ashy margins. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Resident, very local; range disjunct from that of *griseigularis*. West Pakistan in the plains of the Indus, near

Chrysomma altirostre

Distributional ranges

■ *scindicum* (1233). ▨ *griseigularis* (1234). ▩ *altirostre* (RE).

Mianwali, Muzaffargarh, Jampur and Sukkur. Appears to be confined to the 'khan' grass jungle (*Saccharum arundinaceum*).

GENERAL HABITS. Found in parties of six to twelve or more in the non-breeding season. 'To suit it there must be a regular "sea" of khan, preferably not less than six feet (180 cm) high. If the grass is eaten down by cattle or grows in separate clumps one is not likely to come across it' (H. W. Waite).

BREEDING. Only a single nest (with 2 eggs) known from Sukkur dist., Sind — *vide* Holmes & Wright (JBNHS 66: 20). No details. See 1234.

MUSEUM DIAGNOSIS. Differs from *griseigularis* in having a white chin and throat (v. grey), and the remainder of lower parts ochraceous.

MEASUREMENTS. (Type, probably an immature)

	Wing	Bill	Tarsus
♂	65	13	24 mm (HW)

COLOURS OF BARE PARTS. Unrecorded.

194

TIMALIINAE

1234. Hume's Babbler. *Chrysomma altirostre griseigularis* (Hume)

Pyctorhis griseigularis Hume, 1877, Stray Feathers 5: 116 (Assam)
Baker, FBI No. 238, Vol. 1: 236

LOCAL NAME. *Tiri-sorāi* (Assam).

SIZE. Bulbul —; length c. 17 cm (6½ in.).

FIELD CHARACTERS. Above, dark ferruginous brown, paler on rump; a hoary grey supercilium. Below, chin and throat ashy grey, remainder brownish buff. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Resident, locally common. From the Bhutan and north Bengal duars east in the plains of the Brahmaputra to the Naga Hills, the plains of Cachar and East Pakistan in the Surma Valley, the Haor Basin and the Chittagong region. Affects the great expanses of ekra or elephant grass, reeds and vegetation along rivers.

Extralimital. Northeastern Burma (Kachin State). The race of the Irrawaddy plains, south-central Burma, may be extinct (Deignan in Peters's Check-list).

GENERAL HABITS. Keeps in pairs or small parties according to the season, skulking in long grass or reeds, constantly flitting from one reed to another.

FOOD. Grasshoppers and other insects; also small seeds.

VOICE and CALLS. 'A sweet little song of half a dozen notes uttered from the top of a tall reed' (Baker). Call described by Stevens as resembling the syllables *cheu, chi, chi* repeated several times, and to be the reverse of the *chi-cheu* call of Marsh Spotted Babbler (1160) inhabiting the same facies.

BREEDING. Season, mainly June and July (monsoon). Nest, a neat, deep cup of tightly drawn grass, plastered with cobwebs and lined with fine fibres. Most nests are built on a single stout stem at the junction of leaf-blades or sometimes embracing several thinner stems. Eggs, average size of fourteen 18.1 × 14.6 mm. 'All my nests have contained two or three eggs only, but one would imagine four or five to be the full clutch' (Baker). They are of the same types as those of the Yellow-eyed Babbler, pale or bright pink with blotches or smears of reddish brown or light red; their similarity to those of the genus *Alcippe* is striking.

MUSEUM DIAGNOSIS. See Field Characters and Key to the Subspecies.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
o? (type)	65	13	24	82 mm (HW)
1 ♂	64	13	25	91 mm (Desfayes)

COLOURS OF BARE PARTS. Iris brown or golden brown; eye-rim yellowish green. Bill pale horny. Legs pale fleshy or orange-brown; feet darker.

¹ The low-lying country northeast of the central region of East Pakistan dotted with perennially flooded depressions known as *haors*, adjacent to the Surma Valley.

BABBLERS

195

Genus PANURUS Koch

Panurus Koch, 1816, Syst. baier. Zool.: 201. Type, by monotypy, *Parus biarmicus* Linnaeus

Bill short, culmen rounded with uncinat tip. Nostrils mostly covered by bristly plumules. Rictal bristles soft and short. Tail long and strongly graduated, the outermost rectrices scarcely half as long as median pair. Under tail-coverts very long, equal to outermost rectrices.

1235. Bearded Tit-Babbler or Reedling. *Panurus biarmicus russicus* (Brehm)

Mystecinus Russicus Brehm, 1831, Handb. Naturg. Vög. Deutschland: 472 (Russia)
Not in Baker, FBI
Plate 96, fig. 15

LOCAL NAMES. None recorded.

SIZE. Sparrow, with long tail; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male (adult). Distinguished at once by the striking head pattern. Above, head lavender grey with broad, tapering black moustachial stripe. Bill yellow. Back, rump and tail mostly cinnamon-buff. Closed wings banded lengthwise with whitish (outer border), rufous, blackish and pale buff (scapulars and inner border). Below, chin and throat white, breast and belly tinged with pink; flanks tawny; under tail-coverts black. Tail long and graduated, the shorter rectrices tipped or edged with white.

Female (adult). Duller; head concolorous with back, moustachial stripe lacking; under tail-coverts buff, not black.

STATUS, DISTRIBUTION and HABITAT. Accidental winter visitor. One record: a flock of eight to twelve birds near Attock, West Pakistan (Whistler, JBNHS 32: 217). Affects reed-beds; the flock observed near Attock was in dense *sarpat* grass (*Saccharum* sp.) and tamarisk scrub.

Extralimital. Middle Eurasia from western Europe to Manchuria and Japan. The nominate race is restricted to western Europe.

GENERAL HABITS. Gregarious outside the breeding season, in flocks up to forty or fifty. Moves up and down reeds with jerky action assuming a variety of acrobatic postures, or creeps among vegetation at their base.

FOOD. Insects. In winter chiefly seeds of reeds.

VOICE and CALLS. A distinctive, ringing, vibrant 'ping ping' and more distinctive 'tic'. Parties keep up a twitter mingled with a more plaintive *tee*. Notes of alarm or anxiety described as a scolding, guttural *pu-kut*, a plaintive *ee-er, ee-er*, and churring *chirr-ir-irrrrr* (Witherby, 1938, 1: 275).

BREEDING. Not recorded in our limits, *Seeser*, elsewhere, April to July. Nest, built low down among reeds, made of reed-blades lined with the flowering tops of reeds.

MUSEUM DIAGNOSIS. See Field Characters. For details of plumages and structure (also bionomics) of nominate race, see Witherby, 1938, 1: 274-7.

♀ ♀	53-62	c. 10	c. 21	83-92 mm

(Wing and tail by Dementiev)

COLOURS OF BARE PARTS (of nominate race). Iris pale buff. Bill, ♂ deep straw-colour; ♀, upper mandible and base and cutting edges of lower mandible greenish horn; rest of lower mandible yellow. Legs and feet black (Witherby).

Genus CONOSTOMA Hodgson

Conostoma Hodgson, 1841, Jour. Asiat. Soc. Bengal 10: 856-7. Type, by original designation, *Conostoma aemodius* Hodgson

Size large. Bill longer, less deep than in *Paradoxornis*, cutting edges gently curved, not sinuous. Nostrils entirely covered by stiff feathers. Tail longer than wing, not strongly graduated. Legs, feet and hindclaw very strong.

1236. Great Parrotbill. *Conostoma aemodius* Hodgson

Conostoma aemodius Hodgson, 1841, Jour. Asiat. Soc. Bengal 10: 857 (Nepal)
Baker, FBI No. 89, Vol. 1: 104
Plate 79, fig. 15

LOCAL NAMES. *Tūli* (Paharia); *Lho-ranio-pho* (Lepcha).

SIZE. Myna; length 28 cm (11 in.).

FIELD CHARACTERS. A large grey-brown bird resembling a laughing thrush with an upright carriage and a stout, orange-yellow bill. A d u l t.

Above, forehead whitish, lores and supercilium brown. Back olive-brown. Below, entirely mouse-grey. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Resident, sparingly distributed. The Himalayas from central Nepal through Sikkim, Bhutan, and presumably NEFA; from 2700 to 3600 m at all seasons, perhaps down to 2100 m in winter. There are no records of it descending to 4000 ft (c. 1200 m) as stated in the FBI. Affects ringal bamboo and rhododendron bushes.

Extralimital. Extends to southeastern Tibet, northern Burma, north-western Yunnan and southwestern Szechuan.

GENERAL HABITS. In pairs or small parties, often associated with various species of laughing thrushes. Keeps very much to bamboo jungle, hopping about with a rather upright carriage. Resembles somewhat the laughing thrushes in habits, but instead of hopping up the branches, usually moves about two metres or so off the ground and parallel with the forest floor. Also feeds a good deal on the ground, even in snow, venturing a little way into the open for the purpose. Though large and clumsy, it is skillful at keeping out of sight but at the same time intensely curious, readily allowing itself to be called up.

FOOD. Green bamboo shoots, crab-apple seeds, wild raspberries and insects.

VOICE and CALLS. Very noisy with much churring and chattering like a *Turdoides*; also a characteristic note, very harsh *kratchah*, *kratch kratchah* (Proud). A fourfold grating croak and a clear musical *wheou wheou* (Stanford).

BREEDING. Little known. *Season*, May to July. *Nest*, a very regular hemisphere, both inside and outside, compactly built of dry coarse grass and strips of bamboo leaves and thickly lined with very fine green grass-stems. Exterior diameter c. 15 cm, height c. 8 cm, diameter of cup c. 11 cm, depth c. 5 cm. Placed in clumps of bamboo. *Eggs*, the two nests known contained 2 and 3 eggs, dull white, sparsely blotched, streaked and smudged with pale yellowish brown, with pale secondary inky purple spots and smudges about the large end, or white with a few specks and tiny blotches of reddish, fairly numerous at the larger end. Size of two eggs 27·8 × 20·4 and 28·1 × 20·8 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters; for details of plumage Baker, loc. cit. Young (immature). Like adult, but upperparts and edges to wing more rufescent. Tail-feathers narrower and more pointed.

SIZE. Sparrow —; length c. 12 cm (4½ in.).
FIELD CHARACTERS. A small bird recognized by its general fulvous colour and very short globular bill; tail comparatively longer than in others of the genus. *Above*, forehead and crown ochraceous with a wide olive supercilium extending to nape and a smaller ochraceous eye-stripe below; back olive; a rufous patch along wing; tail brown, rufous at base. *Below*, throat and breast ochraceous; belly pale grey, looking practically white in the field. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Resident, sparingly distributed. From east Nepal through Sikkim, Darjeeling and Bhutan; from 2700 to 3400 m at all seasons. Keeps almost exclusively to dense bamboo (maling, *Arundinaria racemosa* and prong, *A. aristata*).

GENERAL HABITS. In large parties of 20 to 30 birds, quite fearless, spending most of their time clambering up and down the bamboo stems in feverish haste to scrutinize them from top to bottom.

FOOD. Mostly vegetable: bamboo and birch buds, tiny seeds; also insects.

VOICE and CALLS. A continual twittering and a faint, mouse-like *cheep* uttered as they flit from stem to stem.

BREEDING. Unknown. *Season*, probably June-July.

MUSEUM DIAGNOSIS. See 1239.

1237. Brown Parrotbill. *Paradoxornis unicolor* (Hodgson)
H.(eteromorpho) unicolor Hodgson, 1843, Jour. Asiat. Soc. Bengal 12: 483
(the Cachar, Nepal)
Baker, FBI No. 92, Vol. 1: 108
Plate 79, fig. 13

LOCAL NAME. *Lho-ranpio-pho* (Lepcha).
SIZE. Bulbul; length c. 21 cm (8 in.).

FIELD CHARACTERS. A dull olive-brown babbler-like bird with dark head, conspicuous black eyebrow and very short thick yellow bill. *Above*, head greyish brown with a hoary aspect especially on the sides; a pale ring round the eye; a dark eye-stripe; rest of upperparts olive-brown. *Below*, throat and breast greyish brown; rest of underparts olive-brown. Sexes alike.
STATUS, DISTRIBUTION and HABITAT. Uncommon resident. From east Nepal to Sikkim, Darjeeling, Bhutan, NEFA (Tawang and presumably through the Agency); from c. 2700 to 3400 m at all seasons, but descending to 2000 m in winter. Keeps almost exclusively to dense maling bamboo (*Arundinaria* sp.) and dwarf rhododendron growth.

Extralimital. Southeast Tibet, northeastern Burma, northwestern Yunnan and southwestern Szechuan.

GENERAL HABITS. In small noisy parties of half a dozen or so, sometimes in company with *Conostoma*, skulking, and reluctant to fly long distance. Sits very upright and keeps edging up to the top of bamboo stems, occasionally clinging upside down and pecking about on mossy branches. Flight slow, weak, fluttering and babbler-like.

FOOD. Bamboo and bracken buds, moss or other vegetable matter, and insects — beetles etc.

VOICE and CALLS. When alarmed, flutters into the densest cover uttering chirrups and a sort of bleating sound (Meinertzhagen). Other notes, a faint *churr*, *churr* (Stanford).

BREEDING. Unknown. *Season*, appears to be late since birds collected in May were not breeding and a male collected in late June had gonads enlarged.

♀♀	55-56	c. 7	c. 18	c. 60 mm	c. 60 mm (Stevens, Desfaves)

COLOURS OF BARE PARTS. Iris red-brown. Bill horny pink, culmen with a broad band dark horny. Tarsus brownish plumbeous (Stevens).

1239. Tibetan Fulvousfronted Parrotbill. *Paradoxornis fulvifrons chayulensis* (Kinnear)
Suthora fulvifrons chayulensis Kinnear, 1940, Bull. Brit. Orn. Cl. 60: 56
(Lung, Chayul Valley, SE. Tibet)
Not in Baker, FBI

LOCAL NAMES. None recorded.
SIZE. Sparrow —; length c. 12 cm (4½ in.).
FIELD CHARACTERS. As in 1238.
STATUS, DISTRIBUTION and HABITAT. Resident. Southeast Tibet south of the main range in the hills adjacent to northeastern Bhutan, and the northern Dafia-Miri hill tracts of NEFA (and presumably through the Agency). Affects dense bamboo.
Extralimital. The species extends to northwestern Yunnan, western Szechuan and southern Shensi.
GENERAL HABITS, FOOD and VOICE. As in 1238.
BREEDING. Undescribed. *Season*, June-July (nestling taken in early July by Ludlow).

MUSEUM DIAGNOSIS. Differs from the nominate race in having the upperparts paler, especially on rump. *Below*, the fulvous does not usually extend below the breast and is paler. Abdomen and thighs greyer.
MEASUREMENTS. Wing 8 ♂♂ 54-59; 4 ♀♀ 53-57 mm (Ludlow).
COLOURS OF BARE PARTS. As in 1238.

Suthora daflensis Godwin-Austen, 1876, Ann. Mag. Nat. Hist. 17: 32
(Toroputu Peak, Daffa Hills)
Baker, FBI No. 94, Vol. 1: 109

LOCAL NAME. *Dao mougasha kashiba* (Cachari).

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in *nipalensis* (1240) but crown bright ochraceous, conspicuous in the field.

STATUS, DISTRIBUTION and HABITAT. Resident. From east Bhutan through NEFA to the Mishmi Hills, Nagaland and Manipur; from c. 1500 to at least 2600 m, and the hills of Assam from 600 to 1200 m. Affects bamboo jungle and dense evergreen forest with tangled undergrowth in very broken country, steep hillsides with rocky ravines.

Extralimital. Northeastern Burma and northwestern Yunnan. The species extends north to Szechuan, east to Fukien and Formosa and south to southeastern Burma, northern Thailand and Laos.

GENERAL HABITS, FOOD and VOICE. As in 1241.

BREEDING. Season, May and June. Nest, a tiny, neat and compact cup of bamboo leaves and fine grasses, coated on the outside with cobwebs, lined with finer grasses and root hairs. Fixed in a cluster of twigs springing from a bamboo node or in a thick bush, less than two feet (60 cm) from the ground. Eggs, 2 to 4, generally 3, pale blue, very like those of *Zosterops* but darker and less glossy. Average size of 20 eggs 13.7 × 11.9 mm (Baker).

202

1240. Ashy-eared Parrotbill. *Paradoxornis nipalensis nipalensis* (Hodgson)

Suthora Nipalensis Hodgson, 1837, Ind. Rev. 2 (1): 32 (Nepal; restricted to Kathmandu Valley by Ripley, Synopsis: 370)
Baker, FBI No. 93, Vol. 1: 109

LOCAL NAME. *Suthora* (Nepal).

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. A tiny orange-brown bird with conspicuous black supercilium, white moustache and black throat. Above, crown grey, back tawny olive, brighter on rump; a broad white moustache. Wings blackish with rufous and white edges. Below, chin and throat black. Sides of neck grey, breast pale grey, belly whitish washed with tawny. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Resident. Central Nepal; eastern and western limits to be determined. From 2000 to 2900 m. Affects ringal bamboo and undergrowth in oak forest.

GENERAL HABITS, FOOD and VOICE. As in 1241.

BREEDING. Unknown.

MUSEUM DIAGNOSIS. Differs from *humii* in having a grey crown and slaty ear-coverts.

MEASUREMENTS

Suthora humii Sharpe, 1883, Cat. Bds. Brit. Mus. 7: 487 (Darjeeling)¹
Baker, FBI No. 95, Vol. 1: 110
Plate 96, fig. 22

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in *nipalensis* (1240) but crown and ear-coverts ochraceous, not grey.

STATUS, DISTRIBUTION and HABITAT. Uncommon resident. From east Nepal, Sikkim, Darjeeling to east Bhutan (where it intergrades with *poliotis*); from 1200 to 3300 m at all seasons, mostly in a lower zone than *P. fulvifrons*; more addicted to a varied tree-and-scrub growth than the latter and therefore more widely distributed. Affects mixed deciduous and bamboo jungle, rhododendron and bamboo undergrowth in oak forest, generally in very broken country and steep hillsides.

GENERAL HABITS. A gregarious and confiding bird reminiscent of the Redheaded Tit, found in parties of 3 to 30 or more, often in association with other babblers and tits, hunting with feverish activity among bamboo clumps and low bushes, clinging to sprigs and leaves in acrobatic positions. When a bird suddenly decides to fly off to the next tree, the entire party

Chleuasiscus ruficeps Blyth, 1845, Jour. Asiat. Soc. Bengal 14: 578 (Darjeeling)
Baker, FBI No. 101, Vol. 1: 114
Plate 96, fig. 20

LOCAL NAME. *Chongto-phep-pho* (Lepcha).
SIZE. Sparrow; length c. 15 cm (6 in.).
FIELD CHARACTERS. As in 1246 but lacks the black supercilary stripe. Easily confused with *P. ruficeps* from which it differs in its smaller size, smaller and blunter bill, and more graduated tail; ear-coverts are much lighter in colour, ochraceous rather than dark ferruginous.
STATUS, DISTRIBUTION and HABITAT. Very rare. Obtained only from Sikkim and Darjeeling at c. 2100 m. Not recorded since the last century. Habitat not described; probably as in 1246.
GENERAL HABITS, FOOD and VOICE. Unrecorded.
BREEDING. Unknown.
MUSEUM DIAGNOSIS. See Field Characters. Differs from the nominate race (1246) in being less richly coloured and lacking the short black supercilium.

COLOURS OF BARE PARTS. Iris red-brown. Bill pale grey, tipped white. Legs pale blue-grey; claws whitish grey; soles pale green (Stanford). Iris reddish brown. Bill pinkish flesh. Legs and feet plumbeous (SDR).

PARADOXORNIS RUFICEPS Blyth
Key to the Subspecies
Underparts whitish, buff restricted to flanks.....*P. r. ruficeps*
Entire underparts buff.....*P. r. bakeri*

1247. Greater Redheaded Parrotbill. *Paradoxornis ruficeps ruficeps* Blyth
Paradoxornis ruficeps Blyth, 1842, Jour. Asiat. Soc. Bengal 11: 177 (Bootaan)
Baker, FBI No. 104, Vol. 1: 116
Plate 96, fig. 19

LOCAL NAME. *Chongto-phep-pho* (Lepcha).
SIZE. Bulbul—; length c. 18 cm (7 in.).
FIELD CHARACTERS. Above, head deep ferruginous; rest of upperparts olive-brown. Below, whitish tinged with buff on sides of belly. Distinguished from Lesser Redheaded Parrotbill (1245) by its larger size, less blunt bill, less graduated tail and deep ferruginous sides of head. Sexes alike.
STATUS, DISTRIBUTION and HABITAT. Resident, locally distributed. Darjeeling, Sikkim, Bhutan and NEFA to the Dibang river; from plains level to 1400 m at all seasons. Affects bamboo, scrub growth, dense thickets of reeds and mixed grasses along the banks of rivers.
GENERAL HABITS, FOOD and VOICE. As in 1248.
BREEDING. Season, April to July. Nest, a neat and compact cup of grass strips and a very few cobwebs, lined with fine fibrous threads of bamboo stems. The material used is particularly clean and new-looking. The neatness and yellowness of the nest is a conspicuous feature. Placed and fastened in the spray of a bamboo, in saplings or in reeds between one and two metres from the ground. Eggs, 2 or 3, of two types: (a) white to dull creamy marked with light to dark brown with secondary markings of lavender, or (b) blue-grey marked with dark brown and reddish brown; in both types the markings consist of smudges and ill-defined blotches, more numerous at the large end. Average size of 12 eggs 22.6 × 16.7 mm (Baker).
MUSEUM DIAGNOSIS. Differs from *bakeri* (1248) in being smaller and in having the ferruginous of the head darker, the rest of upperparts tinged with rusty, and the buff of the underparts restricted to the flanks.
Young, like adult but paler on head and cheeks; wings, tail and back washed with rusty brown; first primary more rounded and tail-feathers narrower.
MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♀	84-90	15-16	28-29	75-85 mm (Baker, MD, SA)

Weight 1 ♂ 30; 1 ♀ 34 g (SA).
COLOURS OF BARE PARTS. Iris deep red-brown; orbital skin slate-blue. Bill: upper mandible horny brown, lower fleshy brown; mouth slate-blue. Legs dark plumbeous blue; claws horn-brown.

206

TIMALIINAE

1246. Blackbrowed Parrotbill. *Paradoxornis atrosuperciliaris atrosuperciliaris* (Godwin-Austen)
Chleuasiscus ruficeps var. *atrosuperciliaris* Godwin-Austen, 1877, Proc. Asiat. Soc. Bengal 46: 147 (Sadiya, Assam)
Suthora ruficeps rufina Koelz, 1952, Jour. Zool. Soc. India 4: 37 (Laikul, N. Cachar)
Baker, FBI No. 102, Vol. 1: 114
Plate 96, fig. 21

LOCAL NAME. *Dao mougasha* (Cachari).
SIZE. Sparrow; length c. 15 cm (6 in.).
FIELD CHARACTERS. Above, crown, nape and sides of neck ferruginous, ear-coverts ochraceous; a pale area around the eye and a short black supercilium. Back rufous olive-brown; wings rufous and brown, inner edges buff; tail brown, graduated. Below, entirely creamy buff. Sexes alike.
The short black supercilium distinguishes it from the larger *P. ruficeps*.
STATUS, DISTRIBUTION and HABITAT. Uncommon resident. East Pakistan in the northeast highlands, Assam in the Khasi and Cachar hills, the Patkai Range, and NEFA in the Mishmi Hills and Abor-Miri Hills (?); from c. 600 to 1500 m, reaching the foothills in winter. Affects reed-bamboo and high grass and scrub jungle.
Extralimital. Northern Burma and western Yunnan to western Laos.
GENERAL HABITS. Goes about in parties of six to twelve or more, almost invariably in company with *Gampsorhynchus rufulus* (1347), often with *P. ruficeps* and *P. flavirostris*. A great skulker never taking flight unless forced, working through cover; every now and then an individual will climb to a tall grass stem, chirp loudly and immediately descend again. Often feeds upside-down like a tit. Flight fluttering, similar to that of *Gampsorhynchus*.
FOOD. Vegetable matter and insects. The stomach of one individual contained small seeds, small beetles, a spider's nest and a pupa (Stanford).
VOICE and CALLS. A distinctive and curious wheezy call-note, like the twang of a guitar, and a loud chittering alarm-note (Smythies); also a mewling note [same as above?] (Stanford).
BREEDING. Season, April to July. Nest, a deep cup of fine shreds of grass and whitish grass-bark, broad pieces of bamboo leaves, lined with some grass stems and a few scraps of tree bark. The colour of the exterior is yellowish white, that of the interior darker and browner. Placed in a cluster of twigs growing from a bamboo node or attached to some coarse reeds within a couple of metres from the ground. Eggs, apparently 3, pale blue. Size, (one) 19.5 × 15.2 mm (Baker).
MUSEUM DIAGNOSIS. Differs from *oatesi* in being darker and more richly coloured and having a black supercilium. Distinguished from *P. ruficeps* by smaller size, blunter bill and the presence of a supercilium.
MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

1248. Assam Redheaded Parrotbill. *Paradoxornis ruficeps bakeri* (Hartert)
Scaevola ruficeps bakeri Hartert, 1900, Novit. Zool. 7: 548 (Hungnam, N. Cachar)
Prithiparus ruficeps prithiparus Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 2 (Sangau, Lushai Hills)
Prithiparus ruficeps rufinotus Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 2 (Cherrapunji, Khasia Hills)
Baker, FBI No. 105, Vol. 1: 117

LOCAL NAMES. *Dao mougasha gejae* (Cachari); *Indo-rui ingaoria* (Naga); *Wahleira* (Mikir).
SIZE. Bulbul—; length c. 18 cm (7 in.).
FIELD CHARACTERS. As in 1247, but entire underparts buff.
STATUS, DISTRIBUTION and HABITAT. Resident; locally common. NEFA in the Mishmi Hills east and south of the Dibang river, the Patkai Range, Nagaland, Manipur and the adjacent hills of Burma, the hills of Assam south to the Mizo (Lushai) Hills, and the hills of East Pakistan south to Sylhet and the Chittagong region. From the foothills to at least 1800 m, more usually above 600 m. Affects wet forest, bamboo and scrub jungle and, in the foothills, reed-beds and elephant grass.
Extralimital. Northern and eastern Burma. Another subspecies in northern Vietnam.
GENERAL HABITS. Keeps in pairs or small parties, often consorting with other babblers. Actions very tit-like but slower. Spends much of its time clambering about the smaller twigs and branches, sometimes hanging head downwards and in this fashion proceeding along the lower side of some thin branch. In reeds and long grass, moves about like babblers, taking short flights from stem to stem, alighting on the ground, then climbing again to the summit of a reed before once more taking flight. A skulker like other members of the genus; when disturbed makes its way through cover without showing itself and disappears. Flight level but weak, never long-sustained — a few wing-flaps followed by a short glide; in flying the wings make a soft whirl peculiar to the species.
FOOD. Insects and seeds.
VOICE and CALLS. A very characteristic squirrel-like chitter interrupted with a series of rather slowly pronounced double notes *tee-ur* (SDR). When feeding, utters a constant *chir-chirup* and when separated from one another, its call is the typical bleat of the family. 'So curiously like it to the plaintive bleat of a small kid in distress that I have more than once been deceived by it' (Baker). A peculiar snapping of the bill may be heard as a party moves about.
BREEDING. Season, April to July. Nest and eggs, as in 1247. Average size of 47 eggs 21.5 × 16.7 mm (Baker).
MUSEUM DIAGNOSIS. Differs from *ruficeps* in having the entire underparts buff; there is a considerable variation in the shade of colour of the head and of the upperparts.

1249. Greyheaded Parrotbill. *Paradoxornis gularis gularis* Gray

Paradoxornis gularis Gray, 1845, Gen. Bds. 2: 389 (Bhutan, ex Horsfield MS.)
Baker, FBI No. 106, Vol. 1: 118

Plate 96, fig. 16

LOCAL NAME. *Chongto phep-pho* (Lepcha).

SIZE. Bulbul —; length c. 16 cm (6 in.).

FIELD CHARACTERS. *Above*, head dark grey with black forehead continued behind in a black supercilium extending to the nape. Lores and eye-ring white. Bill yellow. Rest of upperparts rufous-brown, wings and tail darker. *Below*, white, with a black bib. Sexes alike. The conspicuous head pattern renders this species unmistakable.

STATUS, DISTRIBUTION and HABITAT. Resident; scarce and local. Darjeeling, Sikkim and through Bhutan and NEFA east to Sadiya; from c. 900 to 1500 m (once 2400 m), reaching the duars and plains in winter. Affects bamboo, bushes and low trees.

GENERAL HABITS, FOOD and VOICE. As in 1250, q.v.

BREEDING. *Season*, April to June. The only nest recorded was said to have been placed in the fork of a tree, 9 metres from the ground. *Nest* and *eggs*, as in 1250.

MUSEUM DIAGNOSIS. Differs from *transfluvialis* (1250) in having the underparts suffused with fulvous.

Young. Similar to adult but upperparts brighter rust colour; crown not so pure grey; black chin-patch less defined. First primary rounded; tail-feathers narrower.

MEASUREMENTS	Wing	Bill (from skull)	Tarsus	Tail

Weight 1 ♂ 29; 1 ♀ 29 g (SA).

COLOURS OF BARE PARTS. Iris red-brown. Bill chrome-yellow. Legs and feet greenish horn (HW). Bill orange-yellow. Legs slaty green (Stanford).

1250. Assam Greyheaded Parrotbill. *Paradoxornis gularis transfluvialis* (Hartert)

Scotorynchus gularis transfluvialis Hartert, 1900, Novit. Zool. 7: 584
(Guilang, N. Cachar)

Prittiparus gularis schoeniparus Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 2
(Karong, Manipur)

Baker, FBI No. 107, Vol. 1: 118

LOCAL NAMES. *Deo mougasha gophu* (Cachari); *Indo-ruí gahabele* (Kacha Naga).

BABBLERS

211

olive-brown; wings and tail brown; ear-coverts black, cheeks white; a very deep, parrot-like yellow bill. *Below*, chin black; upper throat barred white and brown; throat deep brown; rest of underparts fulvous. Sexes alike.

x c. 1

The black ear-coverts distinguish this species from all parrotbills except *P. guttaticollis* which has whitish underparts and almost no black on throat.

STATUS, DISTRIBUTION and HABITAT. Resident; scarce in the hills, locally common in the plains. From east

Nepal (two specimens in the British Museum, including type) east along the foothills through Darjeeling, Sikkim, Bhutan and NEFA to the Mishmi Hills, the plains of the upper Assam Valley and surrounding hills, Nagaland, Assam and East Pakistan in Sylhet and the Chittagong region. In the terai, duars and base of hills (once at 1900 m, Sikkim), up to 1500 in the Assam hills and to 2400 m in the Naga hills; also in the lowlands of the Assam Valley. In the latter region, affects dense thickets of reeds, elephant-grass, wild cardamom, and mixed grasses along the banks of rivers; in the hills, mixed grass and bamboo but keeps mostly to the valleys where there is plenty of ekra or elephant-grass.

GENERAL HABITS. In the non-breeding season, keeps in small parties of up to a dozen birds, more often only seven or eight. Very shy and reluctant to take flight but greatly adept at concealing itself. When undisturbed, often mounds to the tops of reeds, now and then taking short flights into the air much in the manner of some *Prinias*, uttering a loud chirrup as it rises (display?). Keeps low down when under observation. The noise made by their mandibles as they nibble at the reeds is distinctly audible though the birds may not be visible.

FOOD. Chiefly vegetable matter (bamboo shoots, seeds); also insects and their larvae found in the crevices of reeds, especially during the breeding season.

VOICE and CALLS. A striking whistle rendered as *phew, phew, phew*, *phuit* commencing in a low tone and rapidly ascending in scale and volume (Stevens). Other notes: a bleating or mewling cry (Baker), and a mellow warble of three notes (Cripps).

BREEDING. *Season*, April to July. *Nest*, a very neat and compact, deep cup, made with fine strips of bark or coarse grasses and bamboo, mixed with fine strips of bamboo or grass blades, bound with cobwebs, lined with grass, bark and fine grass stems, occasionally with hair. The clear, yellow colour of the nest is remarkably bright but blends perfectly with the surroundings. Usually affixed to three or four reed-stems or in a cluster of twigs jutting out from a bamboo node, at a height of one to one and a half metres above the ground, exceptionally in saplings. This species seems to have a predilection for wet places and even in the hills selects a wet patch where there is some grass, cane or reeds. *Eggs*, 2 or 3, occasionally

210

TIMALIINAE

SIZE. Bulbul —; length c. 16 cm (6 in.).

FIELD CHARACTERS. As in 1249, but underparts suffused with fulvous.

STATUS, DISTRIBUTION and HABITAT. Common resident. The hills of Assam, East Pakistan in the Chittagong region, Manipur and Nagaland, north in the Patkai Hills to the range of *gularis*; from 600 to 2100 m. Affects bamboo jungle and various types of forest.

Extralimital. Burma and northwestern Thailand; the species extends to central Vietnam, Hainan, Fukien and Anhwei.

GENERAL HABITS. Keeps in small parties of six to eight birds in trees as well as bushes, low tree jungle or undergrowth in lofty forest; less restricted to bamboo than other parrotbills, less of a skulker, and apparently does not associate with them or other babblers. 'Their way of picking up a bud, carrying it to a convenient twig and holding under their feet while picking it to pieces is very tit-like' (La Touche).

FOOD. Vegetable matter, grubs and insects (La Touche).

VOICE and CALLS. A loud call of four notes on the same tone when one bird of a pair is calling to the other; alarm, a harsh chattering note (Smythies).

BREEDING. *Season*, April to July. *Nest*, a very neat, compact cup of grass well bound with cobweb, lined with fine grass stems and shreds of grass bark. Placed in saplings, usually between two and three metres above the ground. *Eggs*, 2 or 3, rarely 4, variable in colour and markings but similar to those of *P. ruficeps* (1247). Average size of 71 eggs 21.1 × 15.9 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♀	85-90	12-13	c. 25	c. 78 mm
		(Depth at base 9-10)		(Baker)

COLOURS OF BARE PARTS. Iris deep red-brown. Bill chrome-yellow to almost orange horny yellow. Legs and feet slaty brown, occasionally with a bluish tinge.

1251. Gould's or Blackthroated Parrotbill. *Paradoxornis flavirostris* Gould¹

Paradoxornis flavirostris Gould, 1836, Proc. Zool. Soc. London: 17 (Nepal)
Baker, FBI No. 90, Vol. 1: 105

Plate 96, fig. 17

LOCAL NAMES. *But-but sorü* (plains Miris); *Deo mougasha gadeba* (Cachari).

SIZE. Bulbul; length c. 19 cm (7½ in.).

FIELD CHARACTERS. *Above*, crown and nape rufous-chestnut; back

¹ *Paradoxornis flavirostris* and *P. guttaticollis* should be listed as a superspecies, most closely related to each other; the differences in calls, size, hind toe and bill size (the latter not apparent in measurements) and lack of intergradation in their area of overlap with strict ecological and altitudinal replacement, incline us to think that they are species, perhaps a double invasion of Assam of similar ancestral stock after long isolation.

212

TIMALIINAE

4, white, sparsely speckled at the larger end with pale reddish. Average size of 50 eggs 21.9 × 16.2 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *P. guttaticollis* as follows: upperparts including crown darker; chin barred black and white; throat dark brown; rest of underparts fulvous. It is also a little larger and somewhat stouter.

MEASUREMENTS	Wing	Bill (from feathers)	Tarsus	Tail
♂♀	85-90	c. 12	c. 30	100-110 mm
				(Baker)

Bill from skull, 19 mm; greatest depth of upper mandible c. 10 mm. Length of hind toe including claw c. 20 mm.

COLOURS OF BARE PARTS. Iris deep red or red-brown. Bill wax-yellow to bright yellow. Legs clear slate to plumbeous grey.

1252. Whitethroated Parrotbill. *Paradoxornis guttaticollis* David

Paradoxornis guttaticollis David, 1871, Nouv. Arch. Mus. Paris 7: 14
(Moupin, east Chwanben, China)

Paradoxornis austeni Gould, 1874, Bds. Asia 3, pt. 26, pl. 73
(near Kuchai, Naga Hills and Shillong, Assam)

Baker, FBI No. 91, Vol. 1: 106

Plate 96, fig. 18

LOCAL NAME. *Deo mougasha gadeba* (Cachari).

SIZE. Bulbul; length c. 19 cm (7½ in.).

FIELD CHARACTERS. *Above*, crown and nape rufous-cinnamon; rest of upperparts olive-brown; cheeks white; ear-coverts black. *Below*, pale creamy buff lightly speckled with black on throat. Sexes alike.

Distinguished at once from *P. flavirostris* in lacking the dark brown throat, and from other parrotbills by its black ear-coverts.

STATUS, DISTRIBUTION and HABITAT. Resident; locally common. East Pakistan in Sylhet and the Chittagong Hill Tracts, the hills of Assam north to Nagaland and the Patkai Range; from c. 900 to over 2100 m, mostly 1500 to 1800 m. Replaces *P. flavirostris* at higher elevations. Affects scrub and grass on abandoned cultivation, bushes, and bamboo jungle but is less restricted to the latter than Blackthroated Parrotbill (1251).

Extralimital. Extends east to northern Vietnam, Kwangtung and Fukien.

GENERAL HABITS. A noisy, pugnacious bird found in small parties, sometimes in association with other babblers, e.g. *Garrulax ruficollis*. Carriage upright as in others of the genus.

FOOD. Insects and seeds (including cultivated millet).

VOICE and CALLS. A series of 6 or 7 harsh, peculiar notes on the same tone, lasting about two seconds; alarm, a variety of chattering and strident notes (Smythies). Also a bleating call (Baker).

BREEDING. *Season*, April to June. *Nest*, similar to that of *P. flavirostris*, made with the same yellow material and lined with yellowish, rarely dark-coloured strips of grass. As a rule placed between 90 and 180 cm above the ground in bamboo clumps, or occasionally in a shrub or stout weed. Little attempt is made at concealment and attention is drawn to it by the

BABLERS

213

fussy and noisy behaviour of the owners. Eggs, 2 or 3, variable but indistinguishable from those of *P. flavirostris*. One variety is described as pale green-grey with numerous but faint blotches and smudges of sepia and brown, and underlying spots of lavender and a few scrawly lines of dark brown. Average size of 34 eggs 22.2 × 16.4 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *P. flavirostris* in having the underparts pale cream-buff, not fulvous, lightly speckled with black on throat; upperparts paler, less rufous; bill smaller and legs weaker.

Young. Similar to adult but crown paler; upperparts and edges of wings and tail tinged with pale rust. First primary (as.) more rounded with broader outer web; rectrices narrower and more pointed.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	80-85	8-9	c. 26	c. 100 mm (Baker)

Bill from skull 17 mm; greatest depth of upper mandible 10 mm. Length of hind toe including claw 17 mm.

Weight 1 ♀ 26 g (SDR).

COLOURS OF BARE PARTS. Iris brown to red-brown. Bill wax-yellow. Legs and feet slaty grey (Baker). Iris brown. Bill yellow. Feet bluish grey (SDR).

Genus TURDOIDES Cretzschmar

Turdoides Cretzschmar, 1826, in Rüppell's Atlas zu der Reise in n. Afrika, (Vög.): 7, pl. 4. Type, by monotypy, *Turdoides leucocephala* Cretzschmar

Argus Lesson, 1831, Traité d'Orn.: 402. Type, by subsequent designation (Gray, 1855), *Malurus squamiceps* Cretzschmar

Acanthoptila Blyth, 1855, Jour. Asiat. Soc. Bengal 24: 478. Type, by original designation, *Timalia nipalensis* Hodgson

Differs from *Garrulus* in having the covering membrane of the nostrils more or less covered by plumes. Rictal bristles short and stout; feathers of the forehead short, firm and close. Legs very strong.

LOCAL NAMES. Heddo, Lailo (Sind); Chiltchil, Sor, Genga, Chhōta gengā, Dumri (Hindi); Shirdādi (Gujarati); Chinna rida (Telugu); Huni (Tamil); Chilappan (Malayalam).

SIZE. Bulbul +; length c. 23 cm (9 in.).

FIELD CHARACTERS. A slim earthy brown babbler with a long, graduated, loosely attached tail. Above, head and back drab brown heavily streaked with dark brown. Tail narrowly cross-banded. Below, throat white; rest of underparts creamy buff or pinkish-buff lightly streaked with dark on sides of breast. Legs yellow. Sexes alike. For distinction from other members of the genus see Key to the Species.

STATUS, DISTRIBUTION and HABITAT. Resident; generally common and widely distributed, more locally so, south of the Godavari river. West Pakistan (except for the range of *huttoni*) and India from the N.W.F.P. along the foothills to Dehra Dun and the plains east to eastern Bihar (possibly northwestern East Pakistan) and eastern Madhya Pradesh (not recorded in Orissa), and the whole Peninsula south to Cape Comorin and Rameswaram Island; also the Laccadive Islands. In semi-desert and the dry plains and stony lower hills normally up to 900 m in the Peninsula; sometimes up to 2100 m in the Himalayas (Dharmasala). Affects xerophytic thorn scrub jungle, sandy flood plains dotted with clumps of tamarisk, sarpat grass (*Saccharum*), and ber bushes (*Zizyphus*), etc. Occasionally enters cultivation, gardens and compounds especially in the north.

GENERAL HABITS. Keeps in flocks of six to twenty individuals, sometimes even in the breeding season, spending its time on the ground, hopping about rapidly with a bouncing gait, more commonly scuttling like a rat under the sparse vegetation and hedges, uttering pleasant whistling trills. Switches tail before commencing to run, sometimes cocking it up to look like an oversize *Prinia*. When alarmed, e.g. at the appearance of a cat or mongoose, the birds nervously twitch their wings and hop from bush to bush, peering down at the intruder, loosely jerking their tails, the whole sisterhood combining to hurl invectives at it in disorderly chorus. Loath to take flight; when leaving one patch of cover for another, fly off singly, one after another with a weak flight—a few rapid flaps followed by a glide on outspread wings and tail, close to the ground. Roosts at night

Cf. Vaurie, C., 1953, Amer. Mus. Novit., No. 1642: 5-8

Baker, FBI No. 193, Vol. 1: 199

LOCAL NAMES. Pinkulag (Baluchi); Suru, Dām dārāz (Persian).

SIZE. Bulbul +; length c. 23 cm (9 in.).

FIELD CHARACTERS. As in 1254.

STATUS, DISTRIBUTION and HABITAT. Common resident. West Pakistan

Turdoides caudatus

in Baluchistan roughly west of a line from Kalat to the Basul river on the Makran coast. Affects scrub in the plains and lower hills up to 1200 m. *Extralimital.* Southeastern Afghanistan and eastern Iran. The species extends west to southwestern Iran and southeastern Iraq.

GENERAL HABITS, FOOD and VOICE. As in 1254, q.v.

BREEDING. Season, April and May. Nest and eggs, as in 1254.

MUSEUM DIAGNOSIS. Similar to *caudatus* but paler and greyer, the central marks on the feathers less defined and not so dark.

216

TIMALIINAE

in a tightly packed row along a favourite branch, all heads facing the same way, preceded by much characteristic community trilling.

FOOD. Mainly insects—ants, caterpillars, beetles, grasshoppers, etc. Flying termites frequently captured in mid-air, like bulbul, by springing a metre or so vertically from a bush-top; also spiders, grains and berries especially *Lantana*. In season, feeds largely on the nectar of *Capparis aphylla* flowers; the birds get their forehead thickly coated with pollen and thus act as important fertilization agents.

VOICE and CALLS. A number of pleasant musical whistles which-which-which-ri-ri-ri-ri constantly uttered as the flock moves about. Squeaky alarm-notes when suddenly come upon, very like those of a covey of bush quails (*Perdix*) when flushed and scattering.

BREEDING. Season, varying locally to cover almost the whole year; mostly March to July, extending into October. Double-brooded. Nest, a neat compact cup of grass and rootlets, practically always lined with the same but finer material. It is typical, and once seen cannot be mistaken for any other, the most noticeable points being symmetry of form, cleanliness and the great thickness of the walls. Almost invariably placed low down in thorny bushes (e.g. *Zizyphus*, *Prosopis*, *Lantana*), generally between 60 and 120 cm from the ground, sometimes lower or up to 180 cm. A favourite situation is in hedges of prickly pear (*Opuntia*). Fronds of low date palms also availed of. Eggs, commonly 4, often 3, exceptionally 5, turquoise blue. Average size of 180 eggs 21.2 × 16.1 mm (Baker). Incubation takes 13 to 15 days. Both sexes share in construction, incubation, and nest-feeding. Frequently brood-parasitized by the Pied Crested Cuckoo (*Clamator jacobinus*) and Hawk-Cuckoo (*Cuculus varius*).

MUSEUM DIAGNOSIS. See Key to the Subspecies.

Young. Like adult but dark markings on head and nape rounder, occupying most of the feathers; tips and pale outer webs of wing-feathers paler. Postjuvinal moult complete.

Moult of adult are irregular and practically every stage of moult may be seen in different individuals at any time of the year.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♂	76-85	20-23 (once 25)	26-29	113-130 mm
♀ ♀	72-82	20-22	27-29	(1) 101 mm (HW, SA, Waite)

Weight 2 ♂♂ 40, 40 g (Roonwal). 10 ♂♀ 30-40 (av. 36) g—SA.

COLOURS OF BARE PARTS. Iris brown, yellow or orange-yellow. Bill fleshy brown or brown, base of lower mandible yellow; mouth pale flesh. Legs and feet yellow; claws horny brown. Gape and mouth of young bright yellow.

T. longirostris (1257).*T. malcolmi* (1258).

and Assam duars, east Lakhimpur district near Sadiya, Assam in the Khasi Hills and Cachar, and Manipur (common round Logtak Lake). In the lowlands in long grass, usually near water, ditches or lakes; on the grassy plateaux of the Khasi Hills between 900 and 1200 m.

218

TIMALIINAE

1256. Striated Babbler. *Turdoides earlei earlei* (Blyth)

Malacocercus Earlei Blyth, 1844, Jour. Asiat. Soc. Bengal 13: 369 (vicinity of Calcutta)
Baker, FBI No. 191 (part), Vol. 1: 197
Plate 79, fig. 5

LOCAL NAMES. *Bādā-phinga* or *ganga*, *Chilchil* (Hindi); *Dorā chhāstāri* (Bengali).

SIZE. Bulbul; length c. 21 cm (8 in.).

FIELD CHARACTERS. An earth-brown bird with a long graduated tail and streaked head and back. Above, head and back drab brown streaked with dark brown; tail finely cross-barred. Below, fulvous with dark shaft-streaks on throat and breast. Sexes alike.

Distinguished from *T. caudatus* by its fulvous (not white) throat; habitat (q.v.) different.

STATUS, DISTRIBUTION and HABITAT.

Resident; common in suitable biotope.

The plains of the Ganges and of the Brahmaputra river systems, from Punjab (east of the range of *sonivius*) through Uttar Pradesh, Nepal terai, Bihar (?), West Bengal, East Pakistan and Assam east to Sadiya; also Orissa in the Mahanadi river delta, and Manipur. Affects tall grass, elephant-grass, rushes and reed-beds in swampy areas, mainly along the course of the great rivers; also observed in dry grass and acacia scrub (winter only?). Replaces *T. caudatus* in moist terrain.

Extralimital. The plains of Burma.

GENERAL HABITS. Very gregarious and noisy, being found in flocks of 7-10 or more even in the breeding season. Clambers about reeds and grass in search of food and does not descend as much to the ground as other babblers. When one bird flies the rest follow one after the other, sailing with a weak flight, head poked out, then pitching into the grass.

FOOD. Insects and snails; also some vegetable matter.

VOICE and CALLS. A loud trisyllabic whistle *keep quiet* (Roseveare) and a rather slow *cheer cheer cheer* (Donahue).

BREEDING. Season, overall March to October or later, but with two main periods: March to May and August to October. Double-brooded. Nest, a neat, compact and rather massive, cup-shaped structure, made of grass, reed-leaves and rootlets, lined with the same but finer material and firmly bound to some close-growing reed-stems or placed in some little bush surrounded by high grass. Nearly all nests are found in the vicinity of water. Eggs, 3 or 4, pale blue. Average size of 60 eggs 22.8 × 17.6 mm (Baker). Brood-parasitized by Pied Crested Cuckoo (*Clamator jacobinus*).

MUSEUM DIAGNOSIS. Differs from *sonivius* in having a darker throat. Specimens from Assam are somewhat richer in colour.

Young. As adult but paler. Primary and tail characters present; postjuvinal moult complete.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	85-93	c. 20	c. 32	120-130 mm (Baker)

220

TIMALIINAE

Extralimital. Northern Arakan.

GENERAL HABITS. Gregarious and noisy like others of the genus; also singly (when quiet), and in pairs. An inveterate skulker. Keeps closely to the grass and rarely shows itself; threads its way through the densest growth with ease. Feeds both on the ground and above in grass and reeds.

FOOD. Mostly insects.

VOICE and CALLS. A variety of notes, some pleasant, some discordant.

BREEDING. Season, May and June. Nest, a neat cup of leaves, grass-blades, stems and a few twigs, bound together with fibres and rootlets and lined with fine grass-stems and rootlets; placed in small, scrubby bushes growing in a sea of grass. Eggs, 3 to 5, pale blue, similar to those of *T. caudatus*. Average size of 20 eggs 21.5 × 16.7 mm (Baker). The birds sit close; when leaving the nest they slink quietly into the grass and are not as noisy and demonstrative as most members of the genus. Not gregarious in the breeding season.

MUSEUM DIAGNOSIS. See Key to the Species and Field Characters.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	75-79	c. 18-19	c. 30	115-120 mm (Baker)

Weight 1 ♀ 35 g (SDR).

COLOURS OF BARE PARTS. Iris white or bluish white. Bill black. Legs and feet dark brown.

1258. Large Grey Babbler. *Turdoides malcolmi* (Sykes)

Timelia malcolmi Sykes, 1832, Proc. Zool. Soc. London: 88 (Dukhun = Poona)
Baker, FBI No. 195, Vol. 1: 200
Plate 79, fig. 8

LOCAL NAMES. *Ghagāi*, *Gāgāi*, *Sāthāi* (Hindi); *Gongye* (Kannada); *Kākāiti* or *Khāits* (Marathi); *Bhāizā* (U.P., Lucknow); *Lālāis* (Gujarati); *Verrā-chāda*, *Gemo-sida* (Telugu).

SIZE. Myna; length c. 28 cm (11 in.).

FIELD CHARACTERS. Above, greyish brown mottled with dark brown on back. Forehead with pale ashy (whitish) shaft-streaks. Tail faintly cross-barred. Below, creamy buff with a pinkish tinge on throat and breast. Sexes alike.

The light ashy forehead, bright yellow eyes, and whitish outer feathers of the long graduated tail (spread out in flight) are diagnostic.

STATUS, DISTRIBUTION and HABITAT. Resident; common but locally distributed; most common on the Deccan tableland. May have spread recently with increase in cultivation. From Punjab (Ferozepore and Ludhiana) east along the edge of the plains to eastern Uttar Pradesh (Gorakhpur and Ghazipur), south through Rajasthan (east of the Thar Desert) to Kutch and Saurashtra, and through the Peninsular south to Tamil Nadu (Nilgiris and Palni), and east to a line Ghazipur-Ambikapur (east M.P.)-Nellore. Its occurrence in Sind (Schwan *vide Itis* 1922: 541) and in Kerala needs confirmation. Ascends the hills to c. 1200 m in the

BABLERS 221

Peninsula. Affects dry, open, sparsely scrubbed country, babool and dhāk (*Butea*) jungle, cultivation, city gardens and village environs (though not everywhere). Usually found in less dry facies than that of *T. caudatus* and not so wooded as that of *T. striatus*, but locally side by side with either. (See map, p. 219.)

GENERAL HABITS. Very gregarious; keeps in parties usually of five to twelve birds even during the breeding season, though nesting birds separate into pairs; flocks of twenty are common and sometimes as many as forty keep together. Frequently seen in association with Common and Jungle Babblers in appropriate facies. Feeds on the ground and in low vegetation. Active on legs, feeble on wings. Very excitable; if one member is set upon by a hawk or other enemy, the rest of the flock combines in its defence with much noise and bluster and may succeed in driving off the marauder. In scrub jungle it is the first bird to give warning of an intruder's approach, thus causing annoyance to observers by alerting other species.

FOOD. Mostly insects; also grain, seeds and berries. Sometimes ripening jowari on cob in standing fields.

VOICE AND CALLS. Unmistakable for that of the Jungle Babbler, being flatter and less squeaky. Common call, a monotonous, plaintive, drawling *kay-kay-kay-kay* etc., kept up in chorus for minutes at a stretch. A short alarm-note, and noisy chattering on spying an enemy.

BREEDING. Season, ill-defined; nests are found in every month, but most birds breed during the hot months and the monsoon, from March to September, with possibly two peak periods: March-April and June-July with some regional variation. Nest, an untidy cup of grass, small twigs and roots, either without lining or with a slight one of fine rootlets and grass-bents. Generally placed low down in scrub, but quite often in small trees up to five, rarely nine metres. Eggs, 4, often 3, glossy blue. Average size of 36 eggs 24.2 × 19.5 mm (Baker). Commonly brood-parasitized by Pied Crested Cuckoo (*Clamator jacobinus*), two fledglings of the latter along with one or two (or none) of the babbler frequently observed with a flock. Communal nesting common (or usual?). Pairs continue to remain with the flock throughout, merely detaching themselves from time to time to attend to their domestic chores. More than one pair often seen working on the same nest and sharing in incubation and feeding the nestlings. The 'sisterhood' takes corporate action in the care of the nest and the fledglings after they leave it, even though these be only impostor cuckoos. (For an interesting note on communal nesting see Malcolm Macdonald, JBNHS 56: 132, and editorial comment.)

MUSEUM DIAGNOSIS. See Key to the Species.
Young. Like adult but no spots on mantle and more buffish, less grey on upper coverts. Primary characters present; postjuvénal moult complete.

MEASUREMENTS	Wing	Bill (from skull)	Tarsus	Tail

plains and foothills to c. 1000 m. Affects dense scrub undergrowth, particularly where intermixed with tall coarse grass and bamboo brakes, edges of forest and abandoned coffee clearings.

GENERAL HABITS, FOOD AND VOICE. As in 1260, q.v.
BREEDING. As in 1260.

MUSEUM DIAGNOSIS. Like *hyperythrus*, but less richly coloured.
MEASUREMENTS AND COLOURS OF BARE PARTS. As in 1260.

1260. Kerala Rufous Babbler. *Turdoides subrufus hyperythrus* (Sharpe)

Argya hyperythra Sharpe, 1883, Cat. Bds. Brit. Mus. 7: 390 (Madras, restricted to Palghat by Ripley, 1953, Postilla No. 17: 4)
Baker, FBI No. 196 (part), Vol. 1: 201

LOCAL NAME. *Chenchilappan* (Malayalam).
SIZE. Myna —; length c. 25 cm (10 in.).
FIELD CHARACTERS. Above, forehead deep grey; rest of upperparts olive-brown tinged with rufous. Tail slightly cross-barred. Below, bright ferruginous. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Resident; fairly common. Kerala and western Tamil Nadu; plains and foothills to c. 1000 m. Affects secondary jungle and dense scrub undergrowth in evergreen or moist-deciduous biotope — especially where intermixed with tall coarse grass and bamboo brakes as on the edge of forest clearings for cultivation and plantations. Though habitat sometimes overlaps that of the Jungle Babbler locally, the two species do not intermingle.

GENERAL HABITS. Usually keeps in parties of six to eight individuals rummaging among fallen leaves, flicking them aside or turning them over in search of insects. A great skulker, more often heard than seen, creeping in and out of bamboo stems with the agility of a rat. Especially wary when venturing up into the branches of trees for flower-nectar, and will dive headlong into the undergrowth on the slightest suspicion.

FOOD. Mainly insects, but also berries, particularly of *Lantana*, and nectar of *Erythrina*, *Salmdia* and other flowers.

VOICE AND CALLS. A continual shrill but not unpleasant whistling *tree-tree-tree*, rather of the quality of the chirping of a large cricket, sometimes without a break for ten seconds or more, preceded and punctuated now and then by one or two typical harsh babbler squeaks (SA). Same squeaks on alarm.

BREEDING. Season, not well-defined: overall February to November, mostly February to May. Nest, a deep, massive cup of leaves, grass blades, and creeper stems carelessly and roughly wound about the exterior, lined more neatly with fine rootlets. Placed in a fork in bushes or small trees. Eggs, normally 4, dark blue. Average size of 17 eggs 25 × 18.1 mm (Baker).

MUSEUM DIAGNOSIS. More richly coloured than *subrufus*.
Young. Like adult but upperparts deeper, richer brown. Postjuvénal moult complete.

222 TIMALIINAE

COLOURS OF BARE PARTS. Iris bright lemon-yellow. Bill horny brown, darker at gape and paler at base of lower mandible; mouth blackish brown (bright lemon-yellow in juvenile). Legs and feet brownish grey; claws dusky.

up to 1200 m, locally up to 1800 m. Affects cultivation, gardens, mango groves, sheesham plantations with tall coarse grass (where it is found side by side with *T. earlei*), tamarisk jungle, and scrubby hillsides.

GENERAL HABITS, FOOD and VOICE. As in 1262, q.v.

BREEDING. Season, ill-defined, mostly March to September. Nest and eggs, as in 1262. Average size of 21 eggs 24.1 × 17.9 mm (Osmaston); of 30 eggs 25 × 19.4 mm (Baker).

MUSEUM DIAGNOSIS. Differs from nominate *striatus* (1265) in being more ashy above; belly paler, cream-buff. Differs from *orientalis* in having the breast mottled as the throat, not heavily streaked; *somervillei* is much browner, has a rufous-brown tail, blacker wing-quills, darker throat and ochraceous-buff belly.

Young, like adult but paler. Primary and tail characters present; postjuvenile moult complete.

MEASUREMENTS

♀♀	99-110	23-25	35	104-110 mm (HW)

Weight 2 ♂♂ 66, 77; 3 ♀♀ 68-77; 1 ♂ 59 g (BB, Paynter).

BABBLERS

227

Very fond of nectar of *Salmaia*, *Butea*, *Erythrina* and other blossoms which it doubtless helps to cross-pollinate.

VOICE and CALLS. A harsh conversational *ki-ki-ki* uttered as the birds move about which frequently breaks out into a loud, discordant chorus of squeaking and chattering under any sort of excitement.

BREEDING. Season, ill defined; mainly March to October with a peak period from June to August, after the onset of the rains; nests may be found every month. For details of gonadal cycles, weights and sexual maturity see M. I. Andrews & R. M. Naik, 1966, *Pavo* 4: 48-57. Nest, a loosely put together cup of twigs, roots, grass and various other material, scantily lined with rootlets and fine grass. Placed in bushes and trees from one to nine metres above the ground, usually between two and four metres, often in gardens, orchards, hedges or euphorbia thickets. Eggs, normally 4, frequently 5 or 6, once 7; the larger clutches may be the product of more than one hen. Colour, deep turquoise blue. Average size of 100 eggs (including those of nominate *striatus*) 25.2 × 19.6 mm (Baker). Both sexes share in building, incubation and tending the young. Breeding not synchronized or 'colonial'. More than one concurrent nest per sisterhood unrecorded. Apparently pairs breed consecutively rather than concurrently. Breeding birds continue to remain with the flock during this period, only detaching themselves from time to time to attend to their domestic chores. More than two birds have been frequently observed building a single nest and feeding nestlings communally. Commonly brood-parasitized by *Clamator jacobinus* and *Cuculus serripes*. The impostor hawk-cuckoo continues to be tended by its foster-parents and is accepted by the unsuspecting sisterhood even when it has grown considerably larger than themselves. However, the moment the youngster moves from one tree to another in order to keep up with the flock, its hawk-like flight and appearance immediately arouse their suspicion. The members give the 'Ware-hawk' alarm-call and make as if to scatter with every sign of nervousness, notwithstanding that as soon as it has settled some of them (even besides the foster parents?) will resume feeding the importunate fledgling as before!

MUSEUM DIAGNOSIS. Differs from *striatus* and *striatus* by the darker throat and more heavily streaked breast. Differs from *somervillei* in having the base of the tail ashy brown, not rufous- or warm brown. Very similar to *malabaricus* but greyer, less brown, especially on tail. *T. s. erissae* is more rufescent brown on back, has a more rufous-brown tail and the breast and belly fulvous without the heavy streaking.

Young, a pale edition of the adult. Primary and tail characters present, and postjuvenile moult complete.

For details of moults, age determination and pterylosis, see R. M. Naik & M. I. Andrews, 1966, *Pavo* 4: 22-47.

TIMALIINAE

COLOURS OF BARE PARTS. Iris white to pale straw. Bill yellow (breeding), horn-brown (winter). Legs and feet dull yellow.

1262. Peninsular Jungle Babbler. *Turdoides striatus orientalis* (Jerdon)

Melocircus orientalis Jerdon, 1847, Ill. Ind. Orn. text to pl. 19 ('jungles of the Carnatic, and ... Eastern Ghats,' restricted to Horsleykonda, west of Nellore, by Ripley, 1958, Postilla No. 35: 9)
Baker, FBI No. 183 (part), Vol. 1: 191

LOCAL NAMES. *Vānā lalidā* (Gujarati); *Sāthhāi*, *Pengga myna*, *Jāngli-khyr*, *Ghōngghāi*, *Gayange* (Hindi); *Peddā-rīdā*, *Admī-rīdā* (Telugu).

SIZE. Myna; length c. 25 cm (10 in.).

FIELD CHARACTERS. A familiar earthy brown bird of tousy untidy appearance with creamy white eyes, yellowish bill and legs, and longish tail which appears to be loosely stuck into the body. Above, drab grey-brown, a little greyer on head and nape. Rump and tail-coverts buff; tail rufous-brown. Below, throat drab-grey; breast streaked with pale brown; belly creamy buff. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Resident. One of the commonest birds of the Peninsula. Gujarat and the western half of Madhya Pradesh south through the Peninsula to the Nilgiris and Palnis (except for the ranges of *somervillei*, *malabaricus* and *erissae* q.v.). Intergrades with *sindicus* in the Little Rann of Kutch, and with *striatus* in southwestern Uttar Pradesh along the Yamuna river. In the plains and hills up to 1500 m. Affects deciduous forest, bamboo and cultivation.

GENERAL HABITS. Very gregarious; seen the year round in parties of six to twelve, well deserving its Hindi name of *Sāthhāi* (= 'seven brothers', or 'Seven Sisters' as transmuted into English!). Large flocks break up into smaller groups during the breeding season. Jungle Babblers often form the nucleus of the mixed itinerant hunting parties. They spend much of their time hopping about on the ground, vigorously turning over or flicking aside dead leaves in search of food, taking to trees and bushes at the slightest disturbance. Each flock keeps to a more or less restricted territory. All the members of a 'sisterhood' roost together sitting side by side with their bodies touching each other. Individuals may frequently be seen shuffling themselves among the dripping foliage of a bushy tree after a shower. When curious or agitated, has a habit of fluffing out its plumage, especially that of the back which assumes an arched appearance, drooping the wings, spreading and depressing the tail, and pivoting uneasily from side to side, peering at and chivvying the intruder all the while. Very plucky in united defence of individuals from attacks by predators, and a flock may successfully rescue a 'sister' from the talons of a hawk simply by blustering noisy demonstrations against the aggressor.

FOOD. Mainly insects: grasshoppers, ants, beetles, cockroaches, caterpillars, etc., and spiders. For insects (mostly injurious) identified among stomach contents in an intensively cultivated area in Bihar, see Mason & Lefroy, 1912: 51-4. Four out of the 36 birds examined had taken frogs! Also eats grains, seeds, banyan figs, *Lantana*, *Zizyphus* and other berries.

228

TIMALIINAE

COLOURS OF BARE PARTS. Adult. Iris creamy white. Bill pale yellow, pale horny at tip; mouth and commissure near gape bright yellow. Legs, feet and soles pale yellow; claws fleshy horny. Fledgling. Iris greyish brown. Bill: upper mandible brownish flesh, lower yellow; gape creamy yellow. Legs, feet and claws pale flesh-colour.

1263. Bombay Jungle Babbler. *Turdoides striatus somervillei* (Sykes)

Timalia Somervillei Sykes, 1832, Proc. Zool. Soc. London: 88
('Ghats' = Bombay Ghats)
Baker, FBI No. 183, Vol. 1: 194

LOCAL NAMES. *Sāthhāi* (Hindi); *Khāts* (Marathi).

SIZE. Myna; length c. 25 cm (10 in.).

FIELD CHARACTERS. As in 1262, but with blacker wing-quills and markedly red tail-coverts and tail. Breast more heavily streaked.

STATUS, DISTRIBUTION and HABITAT. Common resident. Southeastern Gujarat and coastal Maharashtra, from the Tapti river south along the western flank of the Ghats to Goa (where it intergrades with *malabaricus*); from the coast to the tops of the hills. Intergrades in the north and east with *orientalis*. Affects gardens, scrub and patches of moist-deciduous forest.

GENERAL HABITS, FOOD and VOICE. As in 1262, q.v.

BREEDING. As in 1262.

MUSEUM DIAGNOSIS. Differs from *orientalis* (1262) and *striatus* (1265) in having the upperparts more rusty brown; striations on mantle less marked; rump and upper tail-coverts rufous or ferruginous; flight-feathers blacker. Breast with pale centres to feathers more pronounced; under tail-coverts and tail ferruginous, the last obsoletely cross-banded or not at all.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

231

1266. **Ceylon Rufous Babbler.** *Turdoides rufescens* (Blyth)¹
M. (alacocercus) rufescens Blyth, 1847, Jour. Asiat. Soc. Bengal 16: 453 (Ceylon)
Baker, FBI No. 189, Vol. 1: 195
Plate 79, fig. 11

LOCAL NAMES. *Ratu-demalichchā* (Sinhala); *Vēlaikkāra-kūrūi* (Tamil).

SIZE. Myna; length c. 25 cm (10 in.).
FIELD CHARACTERS. Superficially like Jungle Babbler but entirely rufous-brown with cinnamon throat and breast and somewhat greyer head and darker ear-coverts. Bill and legs bright yellow. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Resident; moderately plentiful. Endemic to Ceylon in the Wet zone and neighbouring hills to over 2100 m. Affects deep primeval forest, thickets and bamboo scrub in well-wooded areas. (See map, p. 222.)

GENERAL HABITS. Unlike the Jungle Babbler, it is a forest-loving species found only in the dampest forest tracts and seldom away from deep jungle. Very sociable and noisy; keeps in parties of six to twelve or more, actively working about the lower limbs of trees, and threading its way through the branches of low jungle, thus resembling more a laughing thrush than a babbler. It has the quick movements of the former, jerking up its wings and tail, restlessly jumping to and fro on its perch. Its flight is weak and consists of little more than fluttering from tree to tree, with an occasional glide across a ravine. Appears not to mix with other species but has, in common with *T. affinis* and *Gerrulax cinereifrons*, a curious association with small squirrels of the *Fimambulus* group. 'Whenever a flock of these birds is on the feed, a squirrel is almost sure to be found in their near neighbourhood' (Henry).

FOOD. Chiefly insects.
VOICE AND CALLS. A continual chattering, squeaking and chirping (Henry). According to Legge, its notes resemble those of *Gerrulax* more than *Turdoides*, and it seems not to indulge in long periods of silence as does the latter, but a continual low babble from the flock usually betrays its whereabouts in the jungle.

BREEDING. Season, March to May. Unlike *affinis* and *striatus*, this species is such an adept at concealing its nest that little is known of its nesting habits. Nest, said to be similar to that of *affinis*, a cup of grass and small twigs, placed among creepers surrounding the trunk of a tree or in a low fork of a tree. Eggs, 2 or 3, very similar to those of *affinis* according to Legge. Measurements of 4 eggs: length 23.3 to 24.2 mm; width 17.8 to 18.1 mm (Baker).

MUSEUM DIAGNOSIS. Rectrices, secondaries and outer web of secondaries very faintly cross-banded.

Wing formula:			
	<i>T. rufescens</i>	Primaries (aa.)	<i>T. striatus</i> sp.
1st	c. 24 mm > primary-coverts		c. 36 mm > primary-coverts
2nd	c. 18 mm > 1st		c. 23 mm > 1st
3rd	c. 17 mm > 2nd		c. 10 mm > 2nd
4th	c. 6 mm > 3rd		c. 4 mm > 3rd
5th	c. 3 mm > 4th		
	5th longest (= 6th)		4th longest (= 5th)

¹ In view of the differences in ecological choice, wing formula, possibly also in voice and behaviour, as well as the lack of any intergradation, *T. rufescens* is better retained as a full species, not a subspecies of *T. striatus*.

Baker, FBI No. 183 (part), Vol. 1: 191
Plate 79, fig. 7

LOCAL NAMES. *Sāthhāi*, *Pengya myna* (Hindi); *Kāth-bāichā* (Bihar); *Chātākā* (Bengali).

SIZE. Myna; length c. 25 cm (10 in.).
FIELD CHARACTERS. As in 1262, but tail dark grey-brown, noticeably barred.

STATUS, DISTRIBUTION AND HABITAT. Resident; locally common. Northern India east of the Yamuna river in the Gangetic plain north to Dehra Dun, Nepal terai and duns, Sikkim and Bhutan foothills, West Bengal, Assam Valley as far as Dibrugarh, and East Pakistan east to Comilla; plains and foothills, locally up to c. 1600 m. Affects gardens, orchards, hedges in cultivation, bushes on waste ground, and secondary scrub forest.

GENERAL HABITS, FOOD AND VOICE. As in 1262, q.v.
BREEDING. As in 1262.

MUSEUM DIAGNOSIS. Description: *Above*, pale brown including coverts, and tertials; greyish on head and rump, slightly fulvous on upper tail-coverts, the back with dark brown streaks and whitish shaft-strips. Tail brown, paler at base, darker at tip and cross-rayed. Wings dark brown, ashy on outer edges. Lores whitish with a narrow dark line above. *Below*, chin and throat grey with faint darker bars; breast fulvous ashy with paler centres and shafts to the feathers. Belly, vent, and under tail-coverts fulvous, tinged brown at sides and with faint white shafts.

Differs from *sindianus* in being browner, less ashy; underparts more fulvous buff; grey of throat not extending so far down on breast; *orientalis* has a more heavily streaked breast; *orissae* is more rufescent brown above, has a fulvous belly, unstreaked breast and rufous-brown tail.

YOUNG, a pale edition of the adult. Upperparts and head pale brown, not grey. Underparts rufescent, brownish on breast. Edges of primaries ochraceous.

♂♂	104-113	22-24	33-34
♀♀	97-106	22-24	32-35
			(HW, SDR)

COLOURS OF BARE PARTS. Iris white or yellowish white; orbital skin pale greenish yellow. Bill orange-yellow, deepest on basal half. Legs and feet chrome-yellow.

TURDOIDES AFFINIS (Jerdon)
Key to the Subspecies
Crown cream-coloured contrasting with back..... *T. a. affinis*
Crown greyish, concolorous with back..... *T. a. taprobanus*

1267. **Whiteheaded Babbler.** *Turdoides affinis affinis* (Jerdon)
Malacocircus affinis Jerdon, 1847, Ill. Ind. Orn., text to pl. 19
(Travancore, [Kerala])
Turdoides poliopterus Oberholser, 1920, Proc. Biol. Soc. Washington 33: 84, new name for *Turdus griseus* Gmelin (Coromandel Coast, India), *not* *Turdus griseus* (Boddaert)
Baker, FBI No. 186, Vol. 1: 193
Plate 79, fig. 9

LOCAL NAMES. *Kariyilakkili* (Malayalam); *Chinda sida* (Telugu); *Tharittu-kūrūi*, *Pandri-kūrūi* (Tamil).

SIZE. Bulbul +; length c. 23 cm (9 in.).
FIELD CHARACTERS. *Above*, crown cream colour; ear-coverts greyish brown. Upper back and rump drab brown; dorsal feathers dark brown fringed with grey, giving the middle back a somewhat scaly appearance. Wings dark brown, drab brown when folded. Tail cross-banded in the middle, basal half grey-brown, distal half dark brown. *Below*, throat and breast dark brown, each feather edged with grey. Belly and under tail-coverts ochraceous buff, flanks greyish. Bill and feet pale yellow. Sexes alike.

The dingy cream-coloured crown contrasting with the dark ear-coverts, as well as its sharper, more musical call-notes distinguish this species.

STATUS, DISTRIBUTION AND HABITAT. Resident; locally common. Andhra Pradesh from the Godavari and Penganga rivers, and western Mysore from the Belgaum area, south through Tamil Nadu and Kerala to Kanyakumari (Cape Comorin) and Rameswaram Island. Birds from the latter place are intermediate between peninsular and Ceylon races. Absent or scarce in Mysore east of the Western Ghats. In the low country and foothills up to c. 300 m, exceptionally 1000 m. Affects dense secondary jungle, dry scrub, particularly *Lantana*, often in the vicinity of cultivation, precincts of villages and homesteads; also orchards and urban gardens and compounds; the common babbler of Hyderabad City and Madras. Prefers drier and more open low scrub country than the Jungle Babbler, but both are frequently found side by side and sometimes in association where their respective preferences overlap. (See map, p. 217.)

GENERAL HABITS. Similar to those of the Jungle Babbler with which it often associates. Most of its food is taken on the ground. Has a habit of

BABBLERS

233

holding down underfoot morsels too large to swallow, while it tears off pieces. Flight weak; if any distance is to be covered, prefers to hop to the top of a tree and take off from there, proceeding in a series of rapid flutterings alternating with sailings, the birds usually following each other one at a time.

FOOD. Insects and vegetable matter — wild figs, berries of *Lantana* and *Zizyphus*, paddy grains, nectar of *Erythrina*, *Butea* and other large flowers, kitchen scraps around human habitations etc. Also recorded are whip-scorpions and (once) a lizard (*Celotes versicolor*).

VOICE AND CALLS. Sharper and more musical than those of the Jungle Babbler, very distinct. A musical trill *tr-r-r-r-r* uttered by one or more members of a flock from the ground or some low perch while the rest hop about for food. The tail of the calling bird is spread out and hangs loose while it nervously twitches or flicks its wings and pivots from side to side (SA). Also some noisy conversational squeaks.

BREEDING. *Season*, ill-defined. Overall January to November, mainly March to June with a second peak period in October-November. *Nest*, much as that of the Jungle Babbler, an open bowl of twigs and rootlets, coarse grass, some green weeds and leaves or other material (old newspaper recorded), lined with fern stems or rootlets. Diameter about 8 cm at the rim, depth of cup about 5 cm. Built in similar sites but rather lower down, usually between one and two metres from the ground, less often up to six metres or higher. Bushy mango grafts are much favoured. *Eggs*, 3 or 4, turquoise blue. Average size of 60 eggs 24×18.8 mm (Baker). Frequently brood-parasitized by *Clamator jacobinus*. Incubation period, 14 to 17 days. Both sexes build the nest and feed the young. When the young leave the nest, they accompany their parents and join the sisterhoods; they are then fed by the other members of the party, as well as by their own parents. Communal or cooperative nest-building and feeding of young as described in JBNHS 61: 181-3 (P. J. Sanjeeva Raj) is probably normal in the *Turdoides* group of babblers.

MUSEUM DIAGNOSIS. Differs from *taprobatus* in being browner and less washed with grey and having the crown and nape creamy, contrasting with dark ear-coverts. Differs from the Jungle Babbler, among other characters, by the colouring and squamation of throat and breast.

Young, resembles adult but streaking on mantle, and squamation on throat and breast very indistinct, pale and almost unicolorous. Primary and tail characters present. Postjuvinal moult complete.

Complete postnuptial moult takes place from June to November, but odd body-feathers are being moulted practically throughout the year.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	94-109	20-22	32-35	95-107 mm
♀♀	99-110	19-23	31-35	95-109 mm (HW, SA)

COLOURS OF BARE PARTS. Adult. Iris from creamy or greyish white to pale blue. Bill, legs, feet and claws pale yellow. Mouth pale pinkish yellow. Young. Iris greenish grey. Bill pale flesh; mouth bright orange-yellow.

BABBLERS

235

STATUS, DISTRIBUTION AND HABITAT. Resident, very local but not uncommon; some downward movement in winter. Not recorded in more than a hundred years since Hodgson's days, it was believed to be extinct until its rediscovery in 1948 (Proud, JBNHS 48: 699, Ripley, JBNHS 49: 393). It has since proved to be fairly common in some areas, even within easy reach from Kathmandu (Fleming, JBNHS 51: 941; Proud, JBNHS 56: 330; Rand & Fleming, *Fulldiana* 4: 126; Fleming & Traylor, *Fulldiana* 35: 477 and 35: 532). From the Nepal-Kumaon border east to central Nepal (Kathmandu Valley); from 1500 to 2000 m in summer (Proud, loc. cit.); recorded in winter from 900 to 1600 m. Affects dense secondary scrub on hillsides.

GENERAL HABITS. In pairs during the breeding season, in small groups of three to ten birds during the winter. Feeds almost entirely on the ground, searching for food among low bushes, turning over dead leaves, occasionally venturing into the open. Disappears at the slightest disturbance, only to come creeping out a minute or two later. Pairs form in March.

Pre-breeding activities. The male sits on some prominent bush, usually in full view but not quite on top, whence it sings from morning till night. Particularly noisy after rain and in the middle of the day. As soon as a bird starts to call, it is answered by another and another, usually some 200 metres apart. During March and April the singing male is usually accompanied by a female, low in the scrub. She spends a good deal of time preening herself, uttering low churring calls. The male may occasionally pick up a leaf and offer it to the female. While moving through the bushes, she frequently picks up dead pine needles and leaves, carries them for a short distance before dropping them; the male occasionally does the same. At times both birds fly, just skimming the bushes, sometimes for a considerable distance, but in an awkward, top-heavy manner. Pairs may occasionally preen each other, uttering low churring notes and raising the feathers of the head into a crest. The female may be seen begging food like a young bird, with drooping wings and tail (Proud).

FOOD. Chiefly insects.

VOICE AND CALLS. Usual call, a clear *el-el-el-el* uttered as it hops about on the ground. Alarm, a low *churr*. Female, in addition to churring notes, has a loud *trick-trick-trick-trick*. A pair will sometimes burst out in a wild crescendo of screaming calls, when they sound very like the Jungle Babbler. Song: The male has a great variety of notes, but the tone, a peculiar harsh yet ringing whistle, is always the same. It is unlike that of a typical *Turdoides*, nor does it have the beautiful pure whistle of so many *Certhia* species. A phrase most often heard starts with a few fine whistles, then continues up the scale: *ter-ter-ter-ter-ter-ter*. It has also, in the breeding season only, a very distinctive and peculiar phrase down the scale: *tee-tee-tee-tee-tee-tee*, sometimes preceded by a running trill. There are many other variations. The song can be heard most of the year but is more frequent from March to September (Proud). Other renditions of song:

there, chir, chir, wee wee
right here, right here, right here
ter-ter, ter-ter, ter-ter, ter-ter
fwink, chip, chip

234

TIMALIINAE

1268. **Ceylon Whiteheaded Babbler.** *Turdoides affinis taprobatus* Ripley *Meleocircus striatus* Swainson, 1833, Zool. Ill., ser. 2, 3, pl. 127 and text (Ceylon), *nee Cosyphus striatus* Dumont, 1823 = *Turdoides striatus* (Dumont) *Turdoides affinis taprobatus* Ripley, 1958, Postilla, Yale Peabody Mus., No. 35: 10 (Alawna, Ceylon)

Baker, FBI No. 187, Vol. 1: 194

LOCAL NAMES. *Demalishchā* (Sinhala); *Vilaikāra-kūrūri*, *Keleni-kūrūri*, *Pelung-kūrūri* (Tamil).

SIZE. Bulbul +; length c. 23 cm (9 in.).

FIELD CHARACTERS. As in 1267, but crown concolorous with back. 'Its pale orbital region and bluish white eye give it a curiously anaemic look' (Henry).

STATUS, DISTRIBUTION AND HABITAT. Common resident. Ceylon, all zones, in the lowlands and lower hills to c. 1500 m. Affects semi-open country, scrub jungle and gardens. Avoids heavy forest.

GENERAL HABITS, FOOD AND VOICE. As in 1267, q.v.

BREEDING. *Season*, throughout the year but chiefly March to May and again September to October in the hills and in the Wet zone, and mainly November to March in the low-country Dry zone. Nesting, as in 1267. *Eggs*, in the hills 3 to 5, generally 4; in the lowlands usually 3, rarely 4, similar to those of *affinis*. Average size of 50 eggs 23.8×18.4 mm (Baker). Frequently brood-parasitized by *Clamator jacobinus*.

MUSEUM DIAGNOSIS. Differs from *affinis* (1267) in having a much greyer wash on head and body, with reduced or absent subterminal blackish spots, and lacks the cream-coloured crown.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	102-110	21-22	31-32	101-102 mm
♀♀	101-107	21-22	31-34	92-103 mm (HW, SDR)

COLOURS OF BARE PARTS. Iris creamy white. Bill, legs, feet and claws pale lemon. Mouth pale yellow.

1269. **Spiny Babbler.** *Turdoides nipelensis* (Hodgson)

Timalia nipelensis Hodgson, 1836, Asiat. Res. 19: 182 (Nepal)

Baker, FBI No. 193, Vol. 1: 204

Plate 79, fig. 6

LOCAL NAMES. None recorded.

SIZE. Bulbul +; length c. 25 cm (10 in.).

FIELD CHARACTERS. *Above*, dark olive-brown with whitish ear-coverts, eye-ring and short supercilium. *Eye* white. Tail faintly cross-banded. *Below*, breast creamy buff finely streaked with black. Throat white or streaked like breast. Belly whitish. Flanks and under tail-coverts tawny olive. Tail strongly graduated. Sexes alike.

The streaked breast and usually whitish ear-coverts distinguish this babbler.

x c. 1

236

TIMALIINAE

poakil, poakil, poakil, chup, chup, etc. (Fleming).

Bursts of song often culminate in three or four clear and loud *ter-ter-ter-ter*, a characteristic feature.

BREEDING. *Season*, April, May and June (?), between c. 1500 and 1800 m. *Nest*, a deep grass cup placed in a small bush or built into a sturdy grass clump, not specially well concealed [A very loose shallow grass cup in the fork of a tree — Hodgson]. *Eggs*, 3 or 4, pale blue measuring about 28×16.5 mm. Both parents feed the young. Share of the sexes in incubation, and period, unknown (R. L. Fleming, Jr. in *epist.*).

MUSEUM DIAGNOSIS. The shiny black, rigid and pointed shafts of the feathers on head, nape, sides of neck and breast are characteristic. Shafts of chin and throat feathers have the same character but may be white or, in part or all, black. In a few specimens the throat is mostly brown with only a little white mottling.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
5 ♂♂	79-86	21-25	30-32	104-117 mm
7 ♀♀	81-87	20-26	30-33	107-117 mm (Rand & Fleming)

Weight 2 ♂♂ 58, 64 g (Dieselhorst, Paynter).

COLOURS OF BARE PARTS. Iris white. Bill: upper mandible brownish black, lower light grey on the basal half. Legs and feet light brownish grey.

Genus BABAX David

Babax David, 1875, Jour. troisième Voy. Expl. Chine 1: 181. Type, by original designation, *Pterorhinus lanceolatus* Verreaux

Close to *Turdoides*. Wing short and rounded; tail long, much graduated. Bill rather slender, slightly curved; rictal bristles long and strong; nostrils oval, exposed, overhung by numerous hairs.

Key to the Species

Wing under 115 mm; upper plumage rich brown....*B. lanceolatus*
Wing over 120 mm; upper plumage grey.....*B. woodi*

1270. **Chinese Babax.** *Babax lanceolatus woodi* Finn

Babax woodi Finn, 1902, Jour. Asiat. Soc. Bengal 71: 125

(Kamperlet, Mount Victoria, Chin Hills)

(Mount Victoria, Chin Hills)

Babax lanceolatus erileta Koeh, 1954, Contrib. Inst. Regional Exploration, No. 1: 3 (Blue Mountain, Lushai Hills)

Baker, FBI No. 180, Vol. 1: 187

Plate 76, fig. 12

LOCAL NAMES. None recorded.

SIZE. Myza +; length c. 28 cm (11 in.).

FIELD CHARACTERS. An unmistakable babbler. *Above*, head and back boldly striped chestnut-brown and grey; a black moustachial stripe. Rump and tail dark brown. *Below*, cream colour, streaked with chestnut-brown, more heavily so on belly and flanks. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Rare resident. The Mizo (Lushai) Hills, from c. 1500 m up (found breeding at 1800 m in the Chin Hills, but on Mount Victoria restricted to a higher zone, 2600-3000 m). Affects thin, scattered forest and the more open hillsides covered with bracken, brambles and reedy grass.

Extralimital. The Chin Hills of Burma. The species extends north to Shensi and east to Fukien.

GENERAL HABITS. A shy species found in pairs or small parties. Hops with great agility through dense bushes as well as on the ground. In this respect it behaves like a laughing thrush though it is less confined to the ground; on the contrary, it freely ascends trees and may often be seen in the highest crowns of deciduous trees, especially in the mornings and evenings (Heinrich).

FOOD. Unrecorded. Presumably insects.

VOICE and CALLS. A full, far-sounding double whistle of wailing quality *ou-phée ou-phée* repeated six or eight times at short intervals; the second, emphasized note lies about two tones higher than the first (Heinrich). Also keeps up a continual flow of soft musical notes, varied occasionally by a harsher outburst, rendered as *auā quā qua quo, qui wa wa wa*, and *zerr-zerr-zerr-zerr* (Schäfer). A harsh noise like a creaking gate-hinge (H. C. Smith).

BREEDING. Season, April to June. Nest, cup-shaped, made of dead leaves, grass, bits of bracken, etc., lined with rootlets. Placed in low bushes within a metre from the ground. Eggs, 2 to 4, generally 3, spotless, deep blue approaching those of *Garrulax squamatus*. Average size of 15 eggs 27.3 × 20.3 mm.

MUSEUM DIAGNOSIS. See Key to the Species.

Young, like adult, but pale markings on upperparts and wing-coverts largely absent, except on hindneck. Streaks on flanks much less defined, but lower throat more streaked than in adult. Primary and tail characters present, i.e. first primary rounder at tip; outer rectrices narrower and more pointed. Postjuvénal moult complete.

MEASUREMENTS			
	Wing	Bill (from feathers)	Tarsus
♂ ♀	c. 100	c. 25	c. 35
			c. 140 mm (Baker)

Wing 7 ♂♂ 98-103; 9 ♀♀ 98-102 mm (Heinrich).

COLOURS OF BARE PARTS. Iris white to bright orange. Bill horn or black. Legs and feet horny grey.

1271. Giant Babax. *Babax waddelli waddelli* Dresser

Babax waddelli Dresser, 1905, Proc. Zool. Soc. London: 54
(Tsangpo Valley, Tibet = Chaksam)

Witherby, H. F., F. C. R. & Jourdain, N. F. Ticehurst, and B. W. Tucker (1938-41): *The Handbook of British Birds*. 5 vols., H. F. & G. Witherby, London.

FIELD CHARACTERS. Very similar to *B. lanceolatus* (1270) but larger; bill longer and more curved. Plumage greyer above; tail blackish instead of brown. Above, ashy grey with broad stripes of blackish brown. Black moustachial stripe less prominent than in *lanceolatus*. Below, ashy grey with narrower streaks of chestnut. Belly and under tail-coverts ashy. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Common resident. Extreme north-eastern Sikkim (and possibly northern NEFA) in Tibetan facies, north of the main range; from 2800 to 4500 m. Affects arid scrub, especially thickets of *Hippophae rhamnoides*.

Extralimital. Southeast Tibet from Gyantse to the Tsangpo bend.

GENERAL HABITS. Keeps in parties of five or six in the non-breeding season, mainly to the ground, hopping about and turning over dead leaves and skulking in dense bushes. Very difficult to see even in leafless bushes in winter.

FOOD. Mostly insects; also berries (*Hippophae*).

VOICE and CALLS. 'Its spring call is a rapid series of quavering whistling notes, whilst in early mornings it has a pleasant thrush-like song' (Ludlow). Also a harsh grating call.

BREEDING. Season, April to June. Nest, a large ragged structure of twigs, fibres, dried grass and bits of wool, generally placed in a thorn bush about two metres from the ground. Eggs, usually 3, deep turquoise blue. Average size of 24 eggs 33.1 × 21.6 mm (Baker), and of 9 eggs 34 × 22.2 mm (Ludlow). Both sexes incubate.

MUSEUM DIAGNOSIS. See Key to the Species.

	Wing	Bill (from skull)	Tail
8 ♂ ♀	130-138 (av. 134)	34-40 (av. 36)	150-155 mm

1272. Ashyheaded Laughing Thrush. *Garrulax cinereifrons* Blyth¹

Garrulax cinereifrons Blyth, 1851, *Jour. Asiat. Soc. Bengal* 20: 176 (Ceylon)

Baker, *FBI No. 190*, Vol. 1: 196
Plate 79, fig. 14

LOCAL NAMES. *Ala-damalichā* (Sinhala); *Velaikkāra-kūri* (Tamil).

SIZE. Myna; length c. 23 cm (9 in.).

FIELD CHARACTERS. *Above*, forehead, crown and ear-coverts grey; rest of upperparts dark reddish brown. *Below*, chin and throat whitish (ochraceous buff); rest of underparts rufous-brown (clay-colour). Sexes alike.

Distinguished from the Rufous Babbler (1266) mainly by its black bill, dark grey legs and grey head. It is also somewhat less unkempt-looking.

STATUS, DISTRIBUTION and HABITAT. Resident in Ceylon; moderately plentiful in the low-country Wet zone and Hill zone to c. 1500 m. Affects dense, humid forest.

GENERAL HABITS. Lives in flocks of ten to twenty individuals working steadily through the damp undergrowth, fluttering from tree to tree and exploring the mossy recesses of fallen trunks. Keeps up a constant flow of squeaks and chattering which can be mistaken for those of the Rufous Babbler which inhabits the same jungles. Such flocks are often accompanied by one or two jungle squirrels.

FOOD. Chiefly insects.

VOICE and CALLS. Breaks out constantly into a harsh chattering which is taken up in turn by all the members of the troop; this chattering is usually finished up with a hurried sort of scream (Legge). Also a flow of squeaks and chatterings while working through the undergrowth.

BREEDING. Unknown. *Season*, appears to be between March and July (full-fledged nestlings seen in April and August). *Nest*, described by native woodmen as a large cup placed in bushes. *Eggs*, said to be dark blue, 3 or 4 to the clutch.

MUSEUM DIAGNOSES. See Field Characters. Young as adult, but first primary soft and blunt and rectrices narrower and pointed.

¹ As already pointed out by Ripley (*Spolia Zeylanica* 24: 223, 1946), this species is most closely related to *Garrulax leucotis*.

MEASUREMENTS

		Wing	Bill (from feathers)	Tail
4	♂♂	114-118	22-24	100-104 mm
2	♀♀	110, 116	22, 23	95, 105 mm (SDR)

Bill from skull 27 mm. Tarsus 36 mm (MD).

Weight 1 ♂ 70 g (SDR).

COLOURS OF BARE PARTS. Iris pale yellowish white or whitish. Bill black, base of lower mandible greyish or greyish white. Legs bluish brown or bluish grey-brown.

GARRULAX ALBOGULARIS (Gould)

Key to the Subspecies

Belly more richly coloured, ferruginous..... <i>G. a. albogularis</i>
Belly paler, ochraceous..... <i>G. a. whistleri</i>

1273. Western Whitethroated Laughing Thrush. *Garrulax albogularis whistleri* Baker

Garrulax albogularis whistleri Baker, 1921, *Bull. Brit. Orn. Cl.* 42: 29 (Simla)
Baker, *FBI No. 138*, Vol. 1: 154

LOCAL NAMES. None recorded.

SIZE. Myna +; length c. 28 cm (11 in.).

FIELD CHARACTERS. *Above*, olive-brown with tawny forehead, black lores and eye-rim. Outer edge of wing grey. Tail olive-brown, graduated, the rectrices broadly tipped with white (except the central pair) showing up as a prominent white terminal band, especially when spread in flight and while alighting. *Below*, throat conspicuously white bordered on breast by an olive-brown band. Belly and under tail-coverts ochraceous. Terminal half of tail white. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Resident, common but rather locally distributed especially in the western part of its range; subject to some vertical movements. The western Himalayan outer ranges from the Indus river east to Kumaon. From 1800 to 2900 m in summer (up to tree-line in Garhwal), and from 1200 to at least 2400 m in winter, rarely or occasionally descending to 450 m in the cold weather. Affects dense forest of oak, fir, decidar; also scrub and light jungle, sometimes coming into gardens.

GENERAL HABITS. Gregarious even in the breeding season; keeps in flocks of six to twelve birds and in winter up to thirty or more, commonly in association with other laughing thrushes, tree pies, jays and Blue Magpies. Feeds a good deal on the ground but on the whole keeps more to the trees than *G. leucolephus*, searching the crevices of bark, tearing off lumps of moss, and slipping away through the branches with rapidity. Sometimes ventures into harvested fields, hopping on the ground like a Jungle Babbler, digging with its bill for food. Less wary of man than other laughing thrushes.

FOOD. Chiefly insects; also berries and seeds.

BABLERS

5

VOICE and CALLS. While feeding keeps up a soft, low *teh, teh*, rather like a common note of the Black Bulbul and very reminiscent of a flock of tits though louder (HW). When alarmed, bursts into an extraordinary series of sibilant squeals and hisses which develop into choruses of shrill squeaky 'laughter' when birds really excited. For renditions see 1274.

BREEDING. *Season*, March to July. *Nest*, a cup of coarse grass, bamboo leaves, roots, moss, lichen or other material, usually thickly lined with rootlets. Placed in a bush, at the top of a sapling or near the extremity of a horizontal branch, between one and four metres from the ground, sometimes up to six metres. *Eggs*, normally 3, exceptionally 4, longish ovals, glossy intense blue, deeper than those of most Indian laughing thrushes. Average size of 60 eggs 29 × 21.1 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *albogularis* (1274) in having the upperparts paler (more greyish), the ochraceous of underparts duller, and in being slightly larger.

Young like adult but upperparts tinged rufescent; flanks paler; olive-brown pectoral band less distinct.

MEASUREMENTS

	Wing, ♂ ♀ 132 (worn) to 144 mm (Baker).		Tarsus	Tail
	Wing	Bill (from skull)		
1 ♀	137	23	43	149 mm (MD)

COLOURS OF BARE PARTS. As in 1274.

1274. Eastern Whitethroated Laughing Thrush. *Garrulax albogularis albogularis* (Gould)

Ianthocincla albogularis Gould, 1836 (8 April), Proc. Zool. Soc. London: 187 (Nepal)
Baker, FBI No. 137, Vol. 1: 153
Plate 77, fig. 15

LOCAL NAME. *Karriam-pho* (Lepcha).

FIELD CHARACTERS. As in 1273, q.v.

STATUS, DISTRIBUTION and HABITAT. Common resident subject to some vertical movements. The Himalayas from western Nepal east through Sikkim, Bhutan and NEFA at least to Shergaon c. 27°N, 92°15'E. (Whistler, *Ibis* 1941: 172); eastern limit unknown. Also Assam in North Cachar ['Very rare everywhere'; recorded twice in the Barail range; nest found (Baker, JBNHS 8: 174 and FBI 1: 153)]. From 1800 to 3300 m, descending to 900 m in winter. Affects dense forest but does not shun thin and open scrubby hillsides, apparently frequenting the latter in winter.

Extralimital. The species extends to southwestern Szechuan, Yunnan and northwestern Vietnam; also Formosa. Introduced on Kauai (Hawaii).

GENERAL HABITS and FOOD. As in 1273. In winter large loose flocks of between fifty and a hundred not uncommon. Fond of rummaging on the ground amongst bonfire and kitchen ashes on the site of pilgrim and muleteer bivouacs.

BABLERS

7

with undergrowth of rattan brakes etc. Geographical and vertical distribution of this species coincides with that of *G. pectoralis*.

Extralimital. Burma. The species extends east to Vietnam, Hainan and Anhwei.

GENERAL HABITS. Highly gregarious. Keeps in flocks outside the breeding season, often in company with its larger 'double' *G. pectoralis* or other laughing thrushes. Feeds on the ground, turning over dead leaves with much rustling and scratching. Behaves exactly as *G. pectoralis* (1278) with which it shares the same ecological niche. Flocks break up at the end of March.

FOOD. Insects, snails, small lizards, etc.; also berries, seeds and other vegetable matter.

VOICE and CALLS. Usually silent and secretive if people are about, but once they fancy the danger has passed, utter a noisy chorus of hollow-sounding musical whistles (SA). Voice indistinguishable from that of *G. pectoralis* (1278) q.v.

BREEDING. *Season*, March to July, chiefly April and May. *Nest and eggs* (4 or 5) very similar to those of *G. pectoralis*; nest placed in identical situations. Average size of 100 eggs 28.4 × 21.3 mm (Baker). Commonly brood-parasitized by the cuckoos *Clamator jacobinus*, *C. coromandus* and presumably also *Cuculus sparveroides*.

MUSEUM DIAGNOSIS. *G. m. badius* (1276) is darker, more saturated with rufous. For distinguishing from *G. pectoralis*, see Field Characters.

Young very similar to adult but paler. Necklace dusky, underparts less fulvous. Distinguished from the young of *pectoralis* by the olive-brown primary-coverts (v. black). Postjuvencal moult complete.

MEASUREMENTS

	Wing		Tarsus	Tail
	Wing	Bill (from skull)		
♂ ♂	119-132	29-30	41-44	121-132 mm
♀ ♀	116-126	—	—	— mm

(SA, Rand & Fleming, Heinrich)

Weight 5 ♂ ♀ 77-91 g (SA).

COLOURS OF BARE PARTS. Iris yellow, orange-yellow or reddish yellow. Bill dark horn, tip paler. Legs and feet yellowish brown or brownish flesh.

1276. Mishmi Necklaced Laughing Thrush. *Garrulax monileger badius* Ripley

Garrulax monileger (sic) *badius* Ripley, 1948, Proc. Biol. Soc. Washington 61: 102 (Tezu, Mishmi Hills, NE. Assam)
Baker, FBI No. 134 (part), Vol. 1: 151

LOCAL NAMES. None recorded.

SIZE. Myna +; length 27 cm (11 in.).

FIELD CHARACTERS. As in 1275, q.v.

STATUS, DISTRIBUTION and HABITAT. Common resident. NEFA from the Mishmi Hills to the Patkai Range; from the edge of the plains to c. 900 m. Affects tropical evergreen forest.

GENERAL HABITS, FOOD and VOICE. As in 1275.

BREEDING. As in 1275.

6

TIMALIINAE

VOICE and CALLS. As in 1273; very noisy. A continual musical chattering *chip chip chip chip*; alarm *quwik, tsueeeee* (Fleming). Voice more subdued and less harsh than that of *G. leucolophus*, but shriller.

BREEDING. As in 1273.

MUSEUM DIAGNOSIS. Differs from *whistleri* (1273) in being more richly coloured, especially on underparts.

MEASUREMENTS

	Wing		Tarsus	Tail
	Wing	Bill (from skull)		
♂ ♂	123-136	25-30	45-48	125-141 mm
♀ ♀	122-135	24-30	45-48	125-137 mm

(BB, Fleming, SA)

Weight 17 ♂ ♂ 97-114; 7 ♀ ♀ 78-105 g (GD, SA).

COLOURS OF BARE PARTS. Iris dull white to bluish white. Bill horny black; mouth yellow. Legs and feet plumbeous; claws grey; soles yellowish white.

GARRULAX MONILEGER (Hodgson)

Key to the Subspecies

Paler, less richly coloured.....*G. m. monileger*
Darker, more saturated with rufous.....*G. m. badius*

1275. Necklaced Laughing Thrush. *Garrulax monileger monileger* (Hodgson)

Cinclosoma monilegera Hodgson, 1836, Asiat. Res. 19: 147 (Nepal)
Baker, FBI No. 134 (part), Vol. 1: 151
Plate 76, fig. 11

LOCAL NAMES. As for 1278; *Chhōta pengā* (Bengal).

SIZE. Myna +; length c. 27 cm (11 in.).

FIELD CHARACTERS. At first sight confusingly like *G. pectoralis* (1278) from which it may be distinguished by the following: Lack of check-stripe between throat and ear-coverts. Necklace much narrower on the breast, nearly covered by the rufous of the lower throat; chin and throat white (*G. pectoralis* has a buff throat bordered with white along the broad black necklace). White of belly extends up to the nuchal collar along and below the necklace. Shoulders (primary-coverts) olive-brown, concolorous with upperparts and rest of wing (*contra* blackish brown in *pectoralis*). It is also smaller in size with less strong bill, legs and feet, the latter paler coloured (yellowish brown as against slate-grey); the bill is entirely dark while in *pectoralis* it is paler at the base of the lower mandible.

STATUS, DISTRIBUTION and HABITAT. Resident, fairly common except in the western part of its range. From west-central Nepal east through Sikkim, Darjeeling, Jalpaiguri district, Bhutan, NEFA to the range of *G. m. badius*, the hills of Assam (except the Patkai Range), Nagaland, Manipur and East Pakistan in the northeastern hills and the Chittagong region; from the edge of the plains to c. 1000 m, locally up to 1400 m. Affects thick evergreen and moist-deciduous forest and secondary jungle

8

TIMALIINAE

MUSEUM DIAGNOSIS. Differs from *G. m. monileger* (1275) in being darker, more saturated with rich rufous, particularly on the nuchal collar and on the underparts.

MEASUREMENTS

3 ♂ ♂ Wing 120-124 mm (SDR).

COLOURS OF BARE PARTS. Iris whitish orange to orange-yellow. Bill black, tip light grey. Legs light grey.

GARRULAX PECTORALIS (Gould)

Key to the Subspecies

Paler, less richly coloured.....*G. p. pectoralis*
Darker, more richly coloured.....*G. p. melanotis*

1277. Nepal Blackgorgeted Laughing Thrush. *Garrulax pectoralis pectoralis* (Gould)

Ianthocincla pectoralis Gould, 1836 (8 April), Proc. Zool. Soc. London: 186 (Nepal)
Baker, FBI No. 132 (part), Vol. 1: 150
Plate 76, fig. 13

LOCAL NAMES. None recorded.

SIZE. Myna +; length c. 29 cm (12 in.).

FIELD CHARACTERS. As in 1278, q.v.

STATUS, DISTRIBUTION and HABITAT. Common resident. Central Nepal to eastern Nepal, from the edge of the terai up to 1650 m. Affects secondary growth, cut-over scrub and forests of sal, pine, etc. with dense undergrowth.

GENERAL HABITS, FOOD and VOICE. As in 1278.

BREEDING. As in 1278.

MUSEUM DIAGNOSIS. *Paler and less richly coloured than melanotis* (1278). This species has a fine fleshy yellow eye-rim which is absent in *G. monileger*.

MEASUREMENTS

Wing, 4 ♂ ♂ 144-149; 4 ♀ ♀ 139-143 mm (Rand & Fleming).

COLOURS OF BARE PARTS. As in 1278.

1278. Assam Blackgorgeted Laughing Thrush. *Garrulax pectoralis melanotis* Blyth

Garrulax melanotis Blyth, 1843, Jour. Asiat. Soc. Bengal 12: 949 (Arracan)
Garrulax McClellandi Blyth, 1843, Jour. Asiat. Soc. Bengal 12: 949 (Assam)
Garrulax wroghii Bonaparte, 1850, Consp. Gen. Av. 1: 371 (Assam)
Garrulax waddellii Ogilvie-Grant, 1894, Bull. Brit. Orn. Cl. 3: xxix (Rungeet (Rangit) River, Sikkim)
Baker, FBI No. 132 (part), Vol. 1: 150

LOCAL NAMES. *Ol-phs* (Lepcha); *Piang-kam* (Bhutia); *Pereri* or *Purishi* (Dalla); *Bdāi pengā* (Bengali).

¹ The Burmese race *melanotis*, illustrated, differs only in having the broad tips to the tail buff instead of white; the pectoral gorget is often incomplete.

BABLERS

9

SIZE. Myna +; length c. 29 cm (12 in.).

FIELD CHARACTERS. Above, olive-brown with a rufous nuchal collar and white supercilium extending to the collar. Shoulder (primary-coverts) blackish brown; outer edge of wing whitish. Tail graduated, the rectrices, except central pair, black, broadly tipped with white, showing in flight as a broad terminal band. Ear-coverts varying from striped black and white to entirely white or black, bordered above and behind by black, and below by a black chin stripe. Below, throat mostly buff bordered by white along the broad necklace. Centre of belly white, flanks ochraceous. Sexes alike.

Confusingly similar to Necklaced Laughing Thrush (*G. monileger*); for distinguishing from it see 1275 Field Characters.

STATUS, DISTRIBUTION and HABITAT. Common resident. From Darjeeling, Sikkim, and Jalpaiguri district east through Bhutan and NEFA to the Mishmi Hills; the hills of Assam, Nagaland and Manipur, and East Pakistan in the northeastern hills and the Chittagong region; from the edge of the plains to c. 1200 m, locally up to 1700 m. Affects dense forest, secondary growth and bamboo jungle, often bordering cultivation.

Extralimital. Burma to Arakan and western Yunnan. The species ranges east to Vietnam, Hainan and Anhwei.

GENERAL HABITS. Highly gregarious; goes about in troops of 10 to 25, often in association with *G. monileger* and other laughing thrushes. To cross an open space, the members of a flock glide one after another (never all together unless scared), in a continuous flowing motion. Flight rather clumsy and jay-like, yet stronger than of most laughing thrushes. Feeds much on the forest floor, proceeding by long hops. On alarm, flies up into bushes and mounts into trees, hopping rapidly from branch to branch, then gliding off as described. Its ability to disappear into cover when in danger is remarkable. The birds often display, in spring and at other times as well, hopping about on the ground, flirting and spreading their wings, bowing and performing like circus contortionists, all the while uttering loud calls (Baker).

FOOD. Mostly insects.

VOICE and CALLS. Very noisy. Keeps up an incessant querulous conversational squeaking, a nasal *week, week, week* (SA); also described as a strange, very human piping to which are usually added several short high whistles. The several individuals simultaneously and confusedly uttering these strange calls sound like an orchestra of mournful piping (Heinrich). According to the same observer, its voice is undistinguishable from that of *G. monileger*. Also has some harsh, grating calls.

BREEDING. Season, March to August, mainly April to June. Nest, a broad, rather shallow but bulky saucer, untidily and rather loosely put together; made mostly of bamboo leaves, with other dead leaves, roots, scraps of moss, bracken, etc., bound by weed stems and tendrils, lined with rootlets and fine grass stems. Placed in bushes or small trees, from near the ground to about six metres up. Eggs, 3 to 5 (rarely up to 7), most often 4, deep blue. Average size of 100 eggs 31.4 × 22.7 mm (Baker). The incubating bird sits close but is adept in slipping off without giving a clear view and hiding in the undergrowth with no sign of its presence. Commonly brood-parasitized by *Clamator coromandus* and *Cuculus sparrerioides*.

BABLERS

11

STATUS, DISTRIBUTION and HABITAT. Resident, locally common, subject to vertical movements. The western Himalayas from Kulu and Mandi to

Garrulax striatus

Distributional ranges

- *striatus* (1279).
- ▨ *ribex* (1280).
- ▤ *sikkimensis* (1281).
- ▧ *cranbrookii* (1282).

Garhwal; from 1200 to 2700 m, mostly between 2000 and 2700 m in summer. Affects dense forest and better-wooded nullahs and ravines; local in its choice of habitat.

GENERAL HABITS. More arboreal than most laughing thrushes, feeding in the canopy of tall trees as well as in undergrowth and lower branches. Keeps in pairs in the breeding season, otherwise in small noisy parties of five to eight birds—sometimes singly—frequently in association with other laughing thrushes and trees pies; rather parochial, frequenting the same patch of forest day after day. Often found at fruiting trees in company with bulbuls, barbets and fruit pigeons.

FOOD. Insects, berries and seeds.

VOICE and CALLS. A variety of loud, discordant cackling notes resembling those of a domestic fowl that has laid an egg, and sometimes a harsh unmusical chorus of chattering laughter. A lively, rich whistling call rendered as *eh-se-aw-oh-white oh-white* (Frome), which usually betrays the presence of the birds a long way off. A frequent call-note is a double whistle *wh-eh*, easily imitated (Stanford). Alarm, a harsh *cick-cick-cick-cick*. Other calls, doubtless variants of above, under 1281.

BREEDING. Season, April to July, mostly May and June. Nest, a broad, shallow cup strongly made of coarse grass, twigs, rootlets, dead leaves, moss or green ferns, and lined with rootlets. Placed in a sapling or among

10

TIMALIINAE

MUSEUM DIAGNOSIS. Differs from *G. p. pectoralis* (1277) in being darker and more richly coloured.

Young, as adult but paler. Primary-coverts black with pale tips. Postjuvenile moult complete.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	130-152	32-36	46-48	122-144 mm
♀♀	130-148	c. 35	46-49	118-135 mm

(SA, HW, SDR, Heinrich)

Weight 1 ♂ 156; 2 ♀♀ 135, 135 g (SDR, SA).

COLOURS OF BARE PARTS. Iris reddish- or orange-brown; fleshy circumorbital ring chrome yellow. Bill: upper mandible blackish brown, lower mandible basally grey, distally brown; extreme bill-tip whitish. Legs and feet slate-grey; claws horny white.

13

FIELD CHARACTERS. As in 1279; see Museum Diagnosis.
STATUS, DISTRIBUTION and HABITAT. Common resident, subject to some vertical movements. Eastern Nepal from the Arun Kosi river to eastern Bhutan. Breeds between 1500 and 2700 m, optimum zone 1800-2400 m; in winter descends to c. 750 m in Sikkim, and to the foothills of Bhutan. Recorded also as high as 2700 m in winter. Affects dense rain-forest with heavy undergrowth; also secondary and scrub jungle.
GENERAL HABITS and FOOD. As in 1279.
VOICE and CALLS. As in 1279. Flocks keep up a sharp conversational squealing, reminiscent of the Pariah Kite's (*Milvus migrans*). Song, recorded in Sikkim and Bhutan — doubtless variants of those under 1279 — a loud rich musical whistle uttered with shaggy crest erected *O-willyou-willyou-wit* sometimes ending with *wit-witoo*. Two common variants of this are *whewyou-you-witoo* and *white to greet you* (accent on *greet*). These phrases repeated unvaryingly every 3 to 5 seconds for many minutes from the same stance. Another call is Father reminiscent of the 'brain fever' call of hawk-cuckoo, *tiwo-wo* (first *wo* loudest) repeated singly at intervals, not in runs or crescendo.
BREEDING. As in 1279. Eggs said to be more pointed than those of the western races. Average size of 16 eggs 33.1 × 22.7 mm (Baker).
MUSEUM DIAGNOSIS. Differs from *vibex* in being darker, more red-brown.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♀ ¹	126-152 (mostly 130-142)	23-30	39-47	121-137 mm

(SA, SDR, GBT, Stresemann)

Weight 1 ♂ 92; 3 ♀ 99-106 g (SA).

COLOURS OF BARE PARTS. Iris reddish brown (the iris of one specimen examined immediately after death was pinkish biscuit colour; two hours later brownish scarlet. SA). Bill blackish brown. Legs and feet plumbeous; claws horny brown.

1282. Assam Striated Laughing Thrush. *Garrulax striatus cranbrookii* (Kinnear)

Grammatoptila striata cranbrookii Kinnear, 1932, Bull.

Brit. Orn. Cl. 53: 79 (Adung Valley, Burma)

Garrulax striatus brahmputra Hachisuka, 1953, Auk 70: 92.

New name for *Grammatoptila austeni* Oates, preoccupied.

Grammatoptila austeni Oates, 1889, Fauna Brit. India, Birds 1: 104 (Dafila and Naga Hills, Assam). Not *Trochalepteron Austeni* Godwin-Austen, 1870

= *Garrulax austeni austeni* (Godwin-Austen)

Baker, FBI No. 178, Vol. 1: 185

LOCAL NAME. *Daopa* (Cachari).

SIZE. Myna +; length c. 28 cm (11 in.).

FIELD CHARACTERS. As in 1279 but with a broad black stripe on side of crest from eye to nape, and no shaft-streaks on crown.

¹ A remarkable disproportion in the sexes has been noted. Of 14 specimens collected in Sikkim and Bhutan between January and April in different years, 13 birds in a row proved to be female, only the last being a male! It is difficult to accept this as mere coincidence (SA).

BABLERS

15

STATUS, DISTRIBUTION and HABITAT. Common resident. The Himalayas from Chamba east through Nepal, Sikkim, N. Bengal (Jalpaiguri district), Bhutan and NEFA to the Mishmi Hills; from the duars and foothills to 1700 m, locally (Sikkim) up to 2100 m, extending to adjacent plains in the eastern half of its range (east of Nepal). Optimum breeding zone 600 to 1500 m. Observed at 1700 m in winter; there may be some downward movement in the cold season. Affects forest with dense undergrowth and secondary scrub and bamboo jungle — especially broken foothills country with wooded ravines and bordering terraced cultivation.

× c. 1

GENERAL HABITS. A very noisy species, gregarious at all seasons, keeping in flocks of six to twelve, sometimes up to forty individuals; often accompanied by other laughing thrushes, tree pies, Green Magpies and occasionally Red Junglefowl. Feeds mostly on the ground, turning over and flicking aside dead leaves, uttering soft single contact chuckles continuously. Shy as a rule but may also be very inquisitive. Very boisterous when disturbed, exploding into choruses of loud cackling 'laughter'. The flocks move about in scattered follow-my-leader style from tree to tree, three or four birds sometimes perching huddled up affectionately on a twig for a brief moment. On the ground they progress in long bouncing or volplaning hops. Like its white-throated congener (1274) often seen rummaging for scraps among wood ashes on the site of pilgrims' or muleteers' bivouacs.

FOOD. Chiefly insects, berries and seeds; also small reptiles and flower-nectar. Larger items held under foot and torn with bill or hacked by vigorous hammer blows of the bill.

VOICE and CALLS. One of the noisiest birds, always calling one another with a variety of notes, bursting out every now and again into a cacophony of cackling choruses 'in which each member tries to outshout the rest' (Baker). One bird leads with a loud, pleasant *pick* or *pick-wo* and the whole flock chimes in with a tumult of discordant cackling; throughout the performance the leader beats time with his *pick-wo* refrain at regular intervals, bill raised skyward and his half-drooped wings fluttering — as if conducting an orchestra! (SA). On the ground these outbursts are often accompanied by dancing, posturing and flapping of wings by the entire company. In the distance the clamour sounds not unlike the yelping of a pack of hounds in full cry. It has also been aptly rendered by one observer (Zafar Futehally) as *Ré-ré-ré, mǎrgio, mǎrgio, mǎrgio*, etc. (= 'I am dead' or 'Help! murder!' in Gujarati).

BREEDING. Season, end of March to September. Mostly April to June. Nest, a large but shallow cup roughly made of grass, bamboo leaves, roots,

14

TIMALIINAE

STATUS, DISTRIBUTION and HABITAT. Common resident. From eastern Bhutan through NEFA to the Mishmi Hills, and Assam in the Khasi and Cachar hills, Nagaland and Manipur (?); from c. 1400 to at least 2400 m, reaching the foothills in winter (600 m in NEFA). Affects deep forest of great trees with plenty of undergrowth.

Extralimital. The Chin Hills of Burma.

GENERAL HABITS, FOOD and VOICE. As in 1279, q.v.

BREEDING. Season, April to August, chiefly May and June. Nest as in 1279. Eggs, 2 or 3, pale blue. Average size of 34 eggs 31.5 × 23.5 mm (Baker). Both sexes share, at least, incubation.

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS

	Wing	Bill (from skull)	Tail
♂ ♂	134-149	29-31	120-129 mm
♀ ♀	133-143	c. 31	127-130 mm

(Kinnear, SDR, HW)

COLOURS OF BARE PARTS. Iris reddish brown. Bill blackish brown. Legs and feet greyish brown; soles yellowish.

SIZE. Myna +; length c. 28 cm (11 in.).

FIELD CHARACTERS. An unmistakable large olive-brown laughing thrush with a white crested head, throat and breast and prominent black eye-mask.

Above, crown and crest white becoming slightly ashy on nape. A broad eye-stripe from lores to ear-coverts jet black. A rufous collar blending into the olive-brown back. Tail blackish. Below, throat, sides of neck and breast white bordered by a rufous band joining the nuchal collar. Belly olive-brown. Sexes alike.

... from the nominate (1283) chiefly in having

TIMALIINAE

16

moss or other material, loosely bound with creepers and tendrils, and lined with rootlets. Generally placed in shrubs within reach of the hand among low, dense jungle, sometimes as high as six metres. Eggs, 3 to 6, normally 4, white with innumerable tiny pits over the whole surface. Average size of 30 eggs 29.2 × 23.5 mm (Baker). Both sexes incubate; incubation period about 14 days. Frequently brood-parasitized by the cuckoos *Glaucator jacobinus* and *G. coromandus*.

MUSEUM DIAGNOSIS. Differs from *patkaicus* in being paler; nuchal collar and pectoral belt rufous.

Young, like adult but crest shorter; nuchal feathers ashy brown. More ferruginous on upperparts; coverts and outer edges of wing more rusty; underparts suffused with dull vinaceous brown. Postjuvénal moult complete.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♂	124-136	28-30	46-48	125-131 mm

LOCAL NAMES. *Naga-dhaopuleka* (Assam); *Dao-flantu* (Cachari); *Ngo* (Naga).

SIZE. Myna +; length c. 28 cm (11 in.).

FIELD CHARACTERS. As in 1283; see Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Common resident. The hills of Assam, Nagaland and Manipur, and East Pakistan in the northeastern hills and the Chittagong region; from the base of the hills to c. 1800 m, most common between 400 and 800 m. Affects deep forest, dense secondary growth on abandoned cultivation and, less often, bamboo-jungle.

Extralimital. Northern and western Burma. Other races in Thailand, the Indochinese countries and western Sumatra.

GENERAL HABITS, FOOD and VOICE. As in 1283.

BREEDING. As in 1283.

MUSEUM DIAGNOSIS. Differs from the nominate race (1283) in being darker, especially on belly; nuchal collar and pectoral belt chestnut.

MEASUREMENTS and COLOURS OF BARE PARTS. As in 1283.

Weight ♂ ♀ 104-130 g (SDR).

BABBLERS

17

1285. Chestnutbacked Laughing Thrush. *Garrulax chinensis nuchalis*.
Godwin-Austen

Garrulax nuchalis Godwin-Austen, 1876, Ann. Mag. Nat. Hist. 18: 411
(Khasi-Naga Hills, North Bengal)
Baker, FBI No. 121, Vol. 1: 140
Plate 77, fig. 10

LOCAL NAME. Pak-chi-loka (Trans-Dikku Naga).

SIZE. Myna; length c. 23 cm (9 in.).

FIELD CHARACTERS. Above, forehead, lores, eye-rim and a short stripe behind eye black. Ear-coverts and sides of neck white. Crown slaty with a few small white feathers in front. A broad rufous-chestnut nuchal collar. Rest of upperparts olive-brown, the outer edge of wing light grey and the tip of tail black. Below, chin and throat black. Breast pale grey. Belly olive-brown. Sexes alike.

The large white cheek-patch in combination with the black throat and rufous collar identifies this species.

STATUS, DISTRIBUTION and HABITAT. Resident, locally common. From the Mishmi Hills south through East Lakhimpur, the Patkai Range, Nagaland, east Manipur; from the base of the hills to c. 900 m. Affects thick scrub jungle on broken ground, and rocky scrub-clad ravines; also high grass.

Extralimital. Extends to northern Burma. The species ranges east to Vietnam, Hainan and Kwangtung.

GENERAL HABITS. Keeps in small parties sometimes in company with other laughing thrushes, feeding on the ground in thick scrub, each bird every now and then clambering up to the top of a bush and uttering loud calls and soon joined in chorus by the others.

FOOD. Insects (ants etc.) recorded. Presumably also berries and seeds.

VOICE and CALLS. An unmistakable *churr* when alarmed; a rich, loud whistling song of four or five notes which at once attracts attention (Smythies). Call-note, a soft *chip* (Stanford).

BREEDING. Season, March to July, mostly May and June. Nest, a neat and compact cup of bracken with an inner layer of dead leaves and broad grass-blades, lined with moss, rootlets and fibres. Placed in dense-foliaged bushes within a metre or so from the ground. Eggs, 3 sometimes 2, very pale blue (an abnormal clutch of white eggs has been taken). Average size of 40 eggs 28.5 × 20.7 mm (Baker). Both birds incubate. Sits very close, but slips away quietly into the low jungle when approached, uttering a low chuckle as it disappears.

MUSEUM DIAGNOSIS. *G. propinqua* of southern Burma (Vol. 6, plate 72) lacks the rufous collar.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♀	106-117	26-27	c. 40	106-115 mm (HW, Baker)

COLOURS OF BARE PARTS. Iris blood-red to brick red; orbital skin grey. Bill black. Legs and feet pale fleshy or fleshy grey.

GARRULAX DELESSERTI (Jerdon)

Key to the Subspecies

All rectrices blackish brown.....*G. d. delesserti*
Four outer rectrices rufous.....*G. d. gularis*

1287. Wynaad Laughing Thrush. *Garrulax delesserti delesserti* (Jerdon)

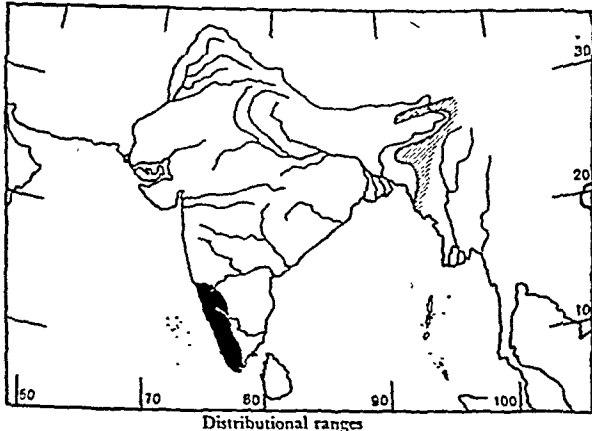

Crateropus delesserti Jerdon, 1839 (Oct.), Madras Jour.
Lit. Sci. 10: 256 (Wynaad, S. India)
Baker, FBI No. 131, Vol. 1: 149
Plate 77, fig. 6

LOCAL NAMES. *Pattengen kili* (Malayalam); *Pūn kūrti* (Tamil).

SIZE. Myna; length c. 23 cm (9 in.).

FIELD CHARACTERS. An uncrested laughing thrush, chiefly chestnut-brown above, ashy and chestnut below. Crown and nape brownish slate. Lores, eye-rim and ear-coverts black. Bill mostly yellow. Back chestnut-brown. Tail blackish brown. Below, throat white; breast ashy grey. Lower belly and under tail-coverts rufous. Legs dusky yellow. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Resident, locally common. Range disjunct from that of the subspecies *gularis* of northeastern India: the hills of southwest India from Goa and Belgaum south through western Mysore,

Garrulax delesserti

Distribution ranges

■ *delesserti* (1287)

▨ *gularis* (1288).

Kerala and western Tamil Nadu; from the base of the hills to the highest elevations. Affects humid rain forest with dense undergrowth of *Strobilanthes*, thorny cane-brakes and cardamom sholas.

18

TIMALIINAE

1286. Yellowthroated Laughing Thrush. *Garrulax galbanus galbanus* Godwin-Austen

Garrulax galbanus Godwin-Austen, 1874, Proc. Zool. Soc.
London: 44, pl. 10 (Manipur Valley, NE. Bengal)
Garrulax galbanus galbanus Koels, 1954, Contrib. Inst.
Regional Exploration, No. 1: 2 (Blue Mountain, Lushai Hills)
Baker, FBI No. 127, Vol. 1: 107
Plate 77, fig. 5

LOCAL NAMES. None recorded.

SIZE. Myna; length c. 23 cm (9 in.).

FIELD CHARACTERS. A striking-looking laughing thrush with a black face and chin and yellow underparts. Above, crown and nape ashy-brown with a thin whitish supercilium; rest of head black. Remainder of upperparts ochraceous brown. Outer rectrices with broad white tips preceded by black. Below, chin black. Rest of underparts pale yellow, washed with olive on flanks. Under tail-coverts white. Sexes alike.

In flight, the white of the rectrices and the under tail-coverts make it very conspicuous.

STATUS, DISTRIBUTION and HABITAT. Resident, locally common. Nagaland, Manipur, Assam in the Cachar and Mizo (Lushai) hills, and East Pakistan in the Chittagong region; from c. 800 to 1800 m. Affects open jungle, tall grass intermixed with trees and shrubs and outskirts of dense evergreen forest.

Extralimital. The Chin Hills of Burma. Another race in northeastern Kiangsi.

GENERAL HABITS. Keeps in pairs or small parties of up to six individuals, sometimes in larger flocks ('50-80' — Hume), often in association with *G. ruficollis*. Feeds on the ground; always on the move in follow-my-leader, style through the long grass; when flushed flies up into trees and threads its way through the branches.

FOOD. Chiefly insects; also small seeds.

VOICE and CALLS. A feeble chirping call frequently uttered.

BREEDING. Season, April to June. Nest, a cup roughly made of grass stems, bamboo leaves, creepers and fine twigs, lined with yellow grass-seed stems or rootlets; the yellow lining seems to be a distinguishing feature. Placed in the fork of a bush between 30 cm and 3 m above the ground. Eggs, normally 3, sometimes 2, exceptionally 4, white or 'occasionally very pale blue'. Average size of 80 eggs 25.8 × 18.6 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	92-96	20-22	c. 35	c. 105-110 mm (Baker)

Weight 2 ♂ 56, 57; 1 ♀ 55 g (SDR).

COLOURS OF BARE PARTS. Iris pinkish brown to reddish brown; orbital skin blue. Bill black. Legs and feet blackish grey.

20

TIMALIINAE

GENERAL HABITS. Very gregarious. Keeps in flocks of six to fifteen and sometimes up to forty or fifty individuals. Feeds mostly on the ground, rummaging among the mulch, turning over or flicking aside dead leaves, and occasionally ascending small trees. A half-dozen birds may often be seen huddled affectionately on the same branch, preening each other. A great skulker; scuttles into cover on the least disturbance, the birds hopping swiftly from bush to bush, uttering a chorus of squeaky shrieks as they disappear.

FOOD. Mostly insects; also berries and seeds.

VOICE and CALLS. Characteristic shrill chattering and cackling of the genus, starting with one individual, followed one after another by the rest of the flock till it finally ends up in a chorus of loud, discordant 'laughter' (SA). Also an occasional low harsh churring and a call-note similar to the chirp of a fledgling thrush. Voice very similar to that of *Turdoides subrufus*, 1260 (La Personne).

BREEDING. Season, ill-defined; mostly during the monsoon: April to August in Kerala, July to September in Kanara. There is also evidence of breeding in December, February and March. Nest, a bulky, untidy semi-domed cup of twigs, creepers and roots, lined with rootlets. Placed in bushes, saplings or *Strobilanthes* plants, within a couple of metres from the ground. Eggs, 3 or sometimes 4, rarely more, white. Average size of 50 eggs 27.5 × 21.3 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *gularis* in having the crown and nape darker, the feathers of the forehead tipped with black. Back a darker chestnut-brown; tail darker with the under surface blackish brown, not rufous. Underparts white, not yellow; less grey on breast.

Juvenile and first-winter birds similar to adult but slightly duller above; coverts and edges of wings not so deep chestnut; showing the normal differences of the subfamily Timaliinae, namely the possession of a soft blunt first primary and narrow, pointed rectrices. Postjuvenile moult complete.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♂	100-113	30-31	c. 39	97-107 mm
♀ ♀	108-113	c. 31	—	101-106 mm (SA)

COLOURS OF BARE PARTS. Adult: Iris scarlet or 'maroon-brown'. Gape and upper mandible dark horny brown, lower mandible pale yellowish flesh; palate yellow, gullet pink. Legs, feet and claws pinkish flesh with grey tinge. Juvenile and immature: Iris pale pinkish buff. Eye-rim bright yellow, orbital skin paler yellow. Bill: upper mandible horny brown except tip, nostrils, lores and a spot on culmen near forehead, which are yellow; gape and lower mandible bright yellow. Legs and feet dusky yellow, claws paler.

One specimen (age?): Iris brownish orange. A bare post-orbital patch bluish slate. Bill: upper mandible horny brown, lower pale yellow or cream. Legs and feet dirty brownish grey; claws creamy white.

BABLERS

21

1288. Yellowbreasted Laughing Thrush. *Garrulax delesserti gularis* (McClelland)

Ianthocincla gularis McClelland, 1839 (1840),
(Oct. 22, 1839 = March 1840), Proc. Zool. Soc. London : 159 (Assam)
Garrulax gularis greater Koelz, 1954, Contrib. Inst.
Regional Exploration, No. 1: 2 (Sangau, Lunhai Hills)
Baker, FBI No. 136, Vol. 1: 152
Plate 77, fig. 7

LOCAL NAMES. None recorded.
SIZE. Myna; length c. 23 cm (9 in.).
FIELD CHARACTERS. As in 1287 but white of underparts replaced by yellow, the four outer rectrices rufous and the bill entirely black. Seen from below, the tail is rufous, not blackish. Sexes alike.
STATUS, DISTRIBUTION AND HABITAT. Resident, locally common. The Himalayan foothills of eastern Bhutan and NEFA (mostly confined to the base of the hills), the hills of Assam, Nagaland and Manipur, and East Pakistan in the northeastern hills and the Chittagong region; from c. 1000 to 1800 m. Affects thick evergreen undergrowth, dense secondary growth, less often bamboo and scrub jungle.

Extralimital. Northern Burma and northern Laos. Range widely disjunct from that of the nominate race (southwest India).

GENERAL HABITS AND FOOD. As in 1287, q.v.
VOICE AND CALLS. A loud, rather sweet whistle in addition to the usual cackling notes of its kind (Baker).

BREEDING. Season, April to July, mostly May. Nest as in 1287. Eggs, generally 3, sometimes 2, white or pale blue. Average size of 100 eggs 29.2 x 20.5 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *delesserti* in having the back olive-brown tinged with rufous instead of chestnut-brown. Crown and nape slate grey. Tail less blackish above, rufous below, the four outer rectrices being rufous. Sides of breast a darker grey. White of underparts replaced by primrose yellow in fresh specimens. This colour however fades rapidly in museum skins and becomes white. The resemblance between the two forms then becomes so striking that they may casually be confused. However, wing in *gularis* usually under 100 mm, in *delesserti* usually 100 mm or over.

Young, like adult but wings richer in colour; ashy grey of breast mixed with rusty; crown black fringed at base with rufous.

MEASUREMENTS

COLOURS OF BARE PARTS. Iris reddish brown. Bill black. Legs and feet yellowish orange.

GARRULAX VARIEGATUS (Vigors)

Key to the Subspecies

Edges of primaries grey.....*G. v. similis*
Edges of primaries yellow.....*G. v. variegatus*

BABLERS

23

(JBNS 16: 47), it is common in Chitral 'throughout the year up to 1800 m'. Affects open forest of fir and birch with dense rhododendron and ringal bamboo growth, patches of *Viburnum* at the forest edges as well as various types of dense jungle, especially in winter. Occasionally enters gardens. Has adapted itself to open willow groves in the Chandra and Bhaga valleys in Lahul, Himachal Pradesh (Alexander, H. G., 1951, JBNS 49: 609).

GENERAL HABITS. A great skulker. Keeps in pairs during the breeding season, otherwise in flocks up to twenty or more. Feeds among bushes but often ascends trees, hopping energetically from branch to branch close to the trunk, diving into cover on alarm. Flight weak, interspersed with short sailings, tail spread wide.

FOOD. Insects, berries and fruits.

VOICE AND CALLS. Loud musical whistles rendered as *weet-a-weer* or *weet-a-two-weer*, far-reaching and unmistakable (Bates); also transcribed as *zdrp-di-i-wiah* and *di-pi-wiah* (i pronounced as ee) often well represented by the words *choky william* 'which is immediately taken up by hidden accomplices in the bushes around' (Magrath). In the non-breeding season, when in flocks, often call with a *ple-weer* similar to that of the Streaked Laughing Thrush but louder and clearer; when alarmed, utters subdued muttering and squealing notes which sound like a nestful of young chicks clamouring for food (Bates).

BREEDING. Season, April to August, chiefly May and June. Nest, a large and somewhat untidy cup of grass with some strips of birch bark, leaves or moss, lined with rootlets, finer grass or pine needles. Usually placed in bushes, about one metre off the ground, sometimes in the fork of a small tree up to six metres or so. Eggs, normally 3, sometimes 2, rarely 4, blue or blue-green profusely blotched and spotted, especially near the large end, with liver-brown, red-brown, dark brown or brownish black. Average size of 60 eggs 27.8 x 21 mm (Baker). Both sexes incubate. Sometimes brood-parasitized by Indian Cuckoo (*Cuculus micropterus*, 576).

MUSEUM DIAGNOSIS. Differs from nominate *variegatus* (1290) in having the outer webs of wing-feathers grey and the yellow on tail replaced by grey.

MEASUREMENTS. As in 1290.

Weight 10 ♂ ♀ (Apr.-May) 59-72 (av. 64.5) g—SA.

COLOURS OF BARE PARTS. Iris peridot-green (Meinertzhagen). Bill black. Legs and feet flesh-colour.

1290. Eastern Variegated Laughing Thrush. *Garrulax variegatus variegatus* (Vigors)

Cinlosoma variegatum Vigors, 1831, Proc. Zool. Soc. London: 56
(Himalayas = Simla-Almora area, according to Ticehurst & Whistler, 1924, Ibis: 471)
Baker, FBI No. 162, Vol. 1: 173
Plate 77, fig. 13

LOCAL NAME. *Gates* (Nepal).

SIZE. Myna ±; length c. 24 cm (10 in.).

FIELD CHARACTERS. As in 1289 but grey of wings and tail replaced by yellow. Grey head, white cheeks, black band down centre of throat, yellow in wings and tail and rusty underparts are leading pointers. Sexes alike.

TIMALIINAE

22

1289. Western Variegated Laughing Thrush. *Garrulax variegatus similis* (Hume)

Trochopteron simile Hume, 1871, Ibis: 408 (Far Northwest = Gilgit)
Baker, FBI No. 163, Vol. 1: 174

LOCAL NAMES. None recorded.

SIZE. Myna ±; length c. 24 cm (10 in.).

FIELD CHARACTERS. Above, forehead tawny; lores black. Crown, nape and ear-coverts dark grey with a short white streak behind eye. Back, rump and upper tail-coverts olive-brown. Wings silvery grey with a black and a rufous shoulder-patch and a larger black patch on centre of wing; secondaries blackish tipped with white. Tail black, distally grey with white tip, the latter colour more in evidence when tail is spread. Below, chin and centre of throat black, broadly bordered with buff. Breast and flanks pale olive-brown. Lower belly and under tail-coverts rufous. Sexes alike.

The black and grey pattern of wing and tail, whitish cheeks and black band down centre of throat identify this species.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. The western Himalayas from Kohat, Chitral and Gilgit east through the mountains of northern West Pakistan, the outer ranges of Kashmir to Lahul and Chamba, meeting the nominate race in Saraj. In Kangra both subspecies may be seen on the same ground in winter, sometimes in the same flock. Breeds between 1800 and 3300 m, mostly above 2400 m. Found in winter from 1200 to at least 2100 m. 24

TIMALIINAE

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. From the Karei Lake between Dharmasala and Dalhousie (c. 76°E.) east to central Nepal. One of the highest altitude laughing thrushes; breeds from 2100 m to 3300 m on the Duala Dhar and around Simla, generally above 2400 m in Garhwal, and from 2700 m to tree-line (4100 m) in Nepal. From October to March, usually below 2100 m, down to 1000 m but also recorded as high as 2700 m at this season in Nepal. Affects forests of oak, fir or birch with dense undergrowth of rhododendron and other bushes, or dwarf rhododendron patches at or above timber-line. In winter frequents steep hillsides with dense ringal bamboo, briar and other undergrowth.

GENERAL HABITS, FOOD AND VOICE. As in 1289. Shrill musical whistles *p'ti-pieyou* or *pitit-whit* as contact calls (SA).

BREEDING. As in 1289.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit. Colouring of edgings of primaries and of rectrices very variable. Typically these are yellow, varying from golden to orange and even olive-yellow, but specimens with reddish orange, orange-brown and pink have been recorded.

Young, a dull version of the adult, a little darker above and less bright below.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♂	101-109	c. 23	c. 38	c. 120 mm
♀ ♀	98-103	—	—	— mm
		(from feathers)		(Rand & Fleming, MD)
♂ ♀	102-112	c. 20	c. 38	c. 130 mm
				(Baker)

Weight 2 ♂♂ 67, 69 g (GD).

COLOURS OF BARE PARTS. Iris pale yellow-green, brown, raw sienna-brown, pale yellowish brown. Bill black. Legs and feet pale reddish orange-brown (Hume) or iris pale yellow. Bill dark brown, yellowish at base of lower mandible. Legs and feet pale brown (HW).

1291. Ashy Laughing Thrush. *Garrulax cineraceus cineraceus* (Godwin-Austen)

Trochopteron cineraceum Godwin-Austen, 1874, Proc. Zool. Soc. London: 43
(Manipur Valley, NE. Bengal)
Baker, FBI No. 141, Vol. 1: 156
Plate 77, fig. 4

LOCAL NAME. *Lahu* (Angami Naga).

SIZE. Myna; length c. 22 cm (9 in.).

FIELD CHARACTERS. Above, forehead and centre of crown to nape black. Lores, orbital area and ear-coverts whitish. A short black eye-stripe and black moustachial stripe breaking into short streaks on sides of head. Sides of crown and back amber-brown; tail graduated, of same colour with a black subterminal band and tipped with white, especially conspicuous when tail is spread. Wing edged with ashy, the secondaries with broad

BABBLERS

25

subterminal black band tipped with a thin white crescent. *Below*, throat buffish with short dark streaks. Breast pinkish grey. Belly and under tail-coverts tawny-olive. Sexes alike.

The white crescents on black wing-tip and streaked throat in conjunction with the white tips of tail identify this species.

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to seasonal vertical movements. Assam in the Cachar hills, Nagaland and Manipur (see map, p. 22). Breeds from 1500 m upwards, generally above 1800 m. Tytler (*apud* Baker) found it breeding between 2100 and 2400 m near Kohima (Nagaland) while Ripley (JBNS 50: 496) met with it between 1200 and 1500 m in winter in the same region. Affects thick bushes in damp forest and thick scrub and secondary growth near villages or cultivation. Avoids high or shady forest.

Extralimital. The Chin Hills of Burma. The species extends to northern Burma, western Yunnan and southeastern Szechuan.

GENERAL HABITS. Keeps in pairs in the breeding season, otherwise in small parties. Feeds mostly on the ground scratching and turning over dead leaves, or even cattle dung in search of insects.

FOOD. Insects and berries.

VOICE and CALLS. A variety of low, rather musical calls. Alarm, a thrush-like call. Song, usually uttered from a bush-top, a loud *dū-dūnd* reminiscent of call of *Pomatorhinus erythrogenys* (Schäfer).

BREEDING. *Season*, April to June. *Nest*, a cup of moss, leaves, rootlets, grass and twigs, lined with rootlets or fine stems. Placed in thick bushes within two metres of the ground. *Eggs*, 2 or 3, unspotted blue. Average size of 150 eggs 25.3 × 18.6 mm (Baker). Brood-parasitized by Hawk-Cuckoo (*Cuculus varius*).

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	86-89	c. 20	c. 32	c. 100 mm (Baker)

Wing, 2 ♂♂ 90, 92; 2 ♀♀ 88, 88 mm (Heinrich).

Weight 4 ♂♂ 47-51 g (SDR).

COLOURS OF BARE PARTS. Iris creamy yellow to pinkish cream. Bill: upper mandible brownish horn, lower yellowish or whitish horn. Legs and feet pale brownish flesh.

1294. Rufouschinned Laughing Thrush. *Garrulax rufogularis rufogularis* (Gould)

Ianthocincla rufogularis Gould, 1835, Proc. Zool. Soc. London: 48

(Himalayas = Sikkim)

Cinclosoma rufimentum Hodgson, 1836, Asiat. Res. 19: 148 (Nepal = Kathmandu)

Baker, FBI No. 143, Vol. 1: 158

Plate 76, fig. 9

LOCAL NAME. *Narbigican-pho* (Lepcha).

SIZE. Myna; length c. 22 cm (9 in.).

FIELD CHARACTERS. Above, forehead and centre of crown to nape black. Lores buff. Ear-coverts black. Sides of head and back umber-brown, the latter with half-moon shaped black spots. Tail graduated, chestnut, with a broad black subterminal band and rufous tip showing as a broad rufous band when it is spread. Wings black and grey with whitish outer edges, the secondaries with subterminal black band tipped with a white crescent. *Below*, chin and under tail-coverts rufous. Throat whitish with black sides mingled with white. Breast pale greyish, flanks olive-brown, both with black spots. Belly whitish. For sex differences see Museum Diagnosis.

The black-spotted back and rufous chin identify this species.

STATUS, DISTRIBUTION and HABITAT. Resident, locally common, subject to some seasonal vertical movements. The Himalayan foothills from central Nepal east through Sikkim, Darjeeling, Bhutan and NEFA at least to the Miri Hills; from c. 600 to 1900 m, optimum zone 1000-1800 m. Reported from as low as the Buxa duars (Ingis) and exceptionally as high as 3500 m in December in Sikkim (Meinertzhagen). Elevations below 900 m are winter records. Affects dense undergrowth in oak and rhododendron forest and forest edges, scrub jungle and secondary growth near cultivation.

GENERAL HABITS. Less gregarious than most laughing thrushes. Keeps in pairs or small family parties haunting low bushes and feeding mostly on the ground. Takes to wing with reluctance; flight weak and ill-sustained. A great skulker more often heard than seen and doubtless often overlooked.

FOOD. Insects, berries and seeds.

VOICE and CALLS. Not very noisy but has the usual range of chuckles and low conversational chatter of the genus, and some loud squealing alarm-notes.

BREEDING. *Season*, April to September. *Nest*, a rather deep cup made mostly of tendrils, with some twigs, roots, leaves, scraps of bracken and grass-bents, some nests being made entirely of one or two of these materials to the exclusion of the rest; the lining is almost always of rootlets. Usually built in a fork of a bush or tree at heights varying from c. 60 cm to 6 metres. *Eggs*, normally 3, sometimes 2 or 4, white. Average size of 15 eggs 26.2 × 19.4 mm (Baker). Both sexes take part in incubation. Period undetermined. Brood-parasitized by the cuckoos *Cuculus spheeroides* and *Clemator coromandus*.

MUSEUM DIAGNOSIS. Female greyer, less olive-brown on upperparts than male; black spots smaller and paler; white tips of flight-feathers narrower. Sexes differ particularly in the colour of the underparts: greyer in male, browner in female; olive-brown of breast and flanks more extensive in male (Dieschhorst).

Young, upperparts unspotted, except crown which is slightly spotted with blackish; underparts spotted as in adult; chin pale rusty.

26

TIMALIINAE

1292, 1293. Western Rufouschinned Laughing Thrush. *Garrulax rufogularis occidentalis* (Hartert)

Ianthocincla rufogularis occidentalis Hartert, 1909, Vög. pal. Fauna 1: 635

(Dehra Dun)

Garrulax rufogularis grossenori Ripley, 1950, Proc. Biol. Soc. Washington 63: 104

(Rakcha, Dailekh Dist., western Nepal)

Baker, FBI No. 145, Vol. 1: 159

LOCAL NAMES. None recorded.

SIZE. Myna; length c. 22 cm (9 in.).

FIELD CHARACTERS. As in nominate *rufogularis* (1294) but ear-coverts rufous, white apical crescents on secondaries thinner and less apparent, upperparts, especially tail, more olive and spotting on underparts lighter.

STATUS, DISTRIBUTION and HABITAT. Resident, locally common. The western Himalayan foothills from Murree (West Pakistan) and Lolab

Garrulax rufogularis

Distributional ranges

▨ *occidentalis* (1292). ▤ *rufogularis* (1294). ▧ *rufiberbis* (1295a). ■ *assamensis* (1296). ▩ *rufitinctus* (1295).

(Kashmir) east to central Nepal; from c. 600 to 1800 m, mostly 900 to 1200 m. Affects dense thickets and scrub jungle especially on the edges of cultivation.

GENERAL HABITS, FOOD and VOICE. As in 1294.

BREEDING. *Season*, April to August. *Nest* and *eggs* (cf 2 or 3) as in 1294. Average size of 20 eggs 26.1 × 19.4 mm (Baker).

MUSEUM DIAGNOSIS. As *rufogularis* (1294) but paler, more olive, less rufous above; ear-coverts rusty red. See also Field Characters.

MEASUREMENTS and COLOURS OF BARE PARTS. As in 1294.

28

TIMALIINAE

Differs from *occidentalis* (1292) in being more rufous above and in having the tail chestnut-brown with broader subterminal black band and deeper rufous tips; ear-coverts black.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	88-98	23-24	c. 35	98-110 mm
♀♀	87-99	23-25	c. 37	97-103 mm

(BB, SA, Rand & Fleming)

Weight 5 ♂♂ 58-68; 2 ♀♀ 58, 58 g (SA).

COLOURS OF BARE PARTS. Iris crimson-brown. Bill: upper mandible horny-brown, lower pale whitish horn, darker at gape. Legs and feet greyish horny brown; claws pale horny brown.

1295. Khasi Rufouschinned Laughing Thrush. *Garrulax rufogularis rufitinctus* (Koelz)

Ianthocincla rufogularis rufitincta Koelz, 1952, Jour. Zool. Soc. India 4: 37

(Pynursla, Khasia Hills)

Baker, FBI No. 144 (part), Vol. 1: 159

LOCAL NAMES. None recorded.

SIZE. Myna; length c. 22 cm (9 in.).

FIELD CHARACTERS. As in 1294, q.v.

STATUS, DISTRIBUTION and HABITAT. Resident. Meghalaya in the Khasi and Garo hills, between 900 and 1800 m. Habitat as in 1295.

GENERAL HABITS, FOOD and VOICE. As in 1294.

BREEDING. As in 1294.

MUSEUM DIAGNOSIS. Differs from *rufiberbis* (1295a) in being paler; feathers of crown have much less pronounced black edging; black markings of back reduced in size; rusty of throat extends to breast; a rusty wash over the belly.

MEASUREMENTS and COLOURS OF BARE PARTS. As in 1294.

1295a. Burmese Rufouschinned Laughing Thrush. *Garrulax rufogularis rufiberbis* (Koelz)

Ianthocincla rufogularis rufiberbis Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 3 (between Langyang and Htaungaw, Kachin State, Upper Burma)

Not in Baker, FBI

LOCAL NAMES. None recorded.

SIZE. Myna; length c. 22 cm (9 in.).

FIELD CHARACTERS. As in 1294, q.v.

STATUS, DISTRIBUTION and HABITAT. Resident. The Patkai Range and eastern Nagaland (Ripley, JBNS 58: 281), at c. 1200 m. Habitat as in 1295.

Extralimital. Northern Burma. Another subspecies in northern Vietnam.

GENERAL HABITS, FOOD and VOICE. As in 1294.

BREEDING. Unrecorded.

BABBLERS

29

MUSEUM DIAGNOSIS. Differs from nominate *rufogularis* (1294) in being more uniformly grey, the rufous coloration of the chin paler and more restricted. Colour of back brighter, black edges of feathers somewhat larger. Crown black rather than dark brown of Himalayan races. Greyer below than *assamensis* with reduced and paler rufous on chin; paler above and on lores.

MEASUREMENTS AND COLOURS OF BARE PARTS. As in 1294.

1296. Assam Rufouschinned Laughing Thrush. *Garrulax rufogularis assamensis* (Hartert)

Ianthocincla rufogularis assamensis Hartert, 1909, Vög. pal. Fauna 1: 635 (Margherita, Assam)

Baker, FBI No. 144 (part), Vol. 1: 159

LOCAL NAME. *Mi-pa-pita* (trans-Dikku Naga).

SIZE. Myna; length c. 22 cm (9 in.).

FIELD CHARACTERS. As in 1294, q.v.

STATUS, DISTRIBUTION AND HABITAT. Resident. Assam from Margherita and Cachar south to the Chin Hills of Burma, and East Pakistan in the Chittagong Hill Tracts. Affects heavy undergrowth in forest, and cut-over scrub.

GENERAL HABITS, FOOD AND VOICE. As in 1294.

BREEDING. As in 1294.

MUSEUM DIAGNOSIS. Like *rufogularis* (1294) but chin and part of ear-coverts pale rust; crown black; black on sides of throat more extensive. Not so fulvous on upperparts. On the whole a somewhat more saturated form than 1294.

MEASUREMENTS AND COLOURS OF BARE PARTS. As in 1294.

Weight 1 ♂ 67; 1 ♀ 64 g (SDR).

1297. Giant Laughing Thrush. *Garrulax maximus* (Verreaux)

Pterorhinus maximus Verreaux, 1871, Nouv. Arch. Mus. Paris 6, Bull. 36, pl. 3, fig. 1 (Montagnes du Thibet chinois = Mouping)

Not in Baker, FBI

Plate 76, fig. 15

LOCAL NAME. *Gya tra* (Tibetan).

SIZE. Pigeon ±; length c. 35 cm (14 in.).

FIELD CHARACTERS. A large laughing thrush conspicuously spotted with white on the back, and with a very long tail.

Above, crown brown, lores whitish, ear-coverts and supercilium cinnamon-rufous. Upper back and sides of neck grey. Back brown and black with conspicuous, round white spots. Rump and upper tail-coverts rufous brown with same spots. Outer edge of wing ashy; all flight-feathers and their coverts tipped with white. Tail graduated; central rectrices greyish brown, outer rectrices dark brown tipped with white. *Below*, throat and upper breast cinnamon-rufous finely barred with pale buff on the latter. Rest of underparts buff, darker on belly and under tail-coverts, sides of breast barred with blackish. Under surface of tail dark brown with white tips. Sexes alike.

BABBLERS

31

of small twigs, lined with dry grass, and placed in a clump of bamboo c. 120 cm above the ground. The two eggs measured 36 × 22.5 and 35.2 × 22 mm (Ludlow).

MUSEUM DIAGNOSIS. See Field Characters. Birds from between the Subansiri and the Tsangpo Valley may be intermediate between *maximus* and *ocellatus*.

Young. *Above*, as in adult but spots on back less numerous, and triangular, not round. Rump and upper tail-coverts unspotted. *Below*, rufous of throat and breast duller, unbarred; rest of underparts uniform buff, no bars on breast or flanks. Tail shorter.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
11 ♂♂	133-134	31-36	[c. 43]	170-186 mm
5 ♀♀	134-141	32-35	—	177-183 mm (Ludlow)

COLOURS OF BARE PARTS. Unrecorded.

GARRULAX OCELLATUS (Vigors)

Key to the Subspecies

Tail chestnut-brown.....	<i>G. o. ocellatus</i>
Tail with much grey.....	<i>G. o. griseicauda</i>

1298. Garhwal Whitespotted Laughing Thrush. *Garrulax ocellatus griseicauda* Koelz

Garrulax ocellatus griseicauda Koelz, 1950, Amer. Mus. Novit., No. 1452: 7 (Wan, Garhwal, United Provinces, India)

Not in Baker, FBI

LOCAL NAMES. None recorded.

SIZE. Pigeon ±; length c. 32 cm (13 in.).

FIELD CHARACTERS. As in 1299, q.v.

STATUS, DISTRIBUTION AND HABITAT. Resident. Garhwal, Kumaon and west Nepal, intergrading with *ocellatus* in Nepal (Fleming & Traylor, 1964, *Fieldiana*, Zool. 35: 534). Habitat as in 1299.

GENERAL HABITS, FOOD AND VOICE. As in 1299.

BREEDING. As in 1299.

MUSEUM DIAGNOSIS. Differs from *ocellatus* (1299) in having much grey on the tail (however, Ludlow, 1944, *Ibis* 86: 74, states that the colour of the tail seems to be a variable character); also appears to have a longer tail.

MEASUREMENTS

	Wing	Bill (from skull)	Tail
♂♂	135 (type)	33	163, 167 mm
♀♀	132-136	31-32	157-164 mm (Koelz, Fleming & Traylor)

COLOURS OF BARE PARTS. As in 1299.

30

TIMALIINAE

Easily distinguished from *G. ocellatus* (1299) by the rufous throat and brown cap, and longer tail.

STATUS, DISTRIBUTION AND HABITAT. Common resident. Southeast Tibet in the lower Tsangpo Valley, between 2200 and 2900 m (up to 4900 m

Garrulax maximus* and *G. ocellatus

Distributional ranges

▨ *G. o. griseicauda* (1298).

■ *G. o. ocellatus* (1299).

▨ *G. maximus* (1297).

in Szechuan). Affects dense, dry subalpine forest with plenty of glades and undergrowth.

Appears to intergrade with *ocellatus* between the upper Subansiri and the Tsangpo Valley (*vide* Ludlow, 1944, *Ibis* 86: 74). The ranges of these two species are complementary.

Extralimital. Ranges from southeast Tibet and northwestern Yunnan to southern Kansu.

GENERAL HABITS. A secretive species but conspicuous by its loud calls. Very gregarious, often associating with other laughing thrushes. Hops on the ground where it finds most of its food, tossing over leaves with the long bill.

VOICE AND CALLS. Shrill, far-carrying notes reminding one of *Cuculus sparveroides*. Often calls in chorus: an individual starts with shrill screams *gno gnoit gno gnoit*, the others accompanying it with short, jerky, rapid and oft-repeated rattles *tscherr, tscherr, tscherr*. Voice very similar to that of *G. ocellatus* (Schäfer).

FOOD. Unrecorded. Probably as in 1299.

BREEDING. Season, presumably May to July (eggs found in June). *Nest*, (one described) a shallow, cup-shaped structure, composed of a foundation

TIMALIINAE

32

1299. Whitespotted Laughing Thrush. *Garrulax ocellatus ocellatus* (Vigors)

Cinlosoma ocellatum Vigors, 1831, Proc. Zool. Soc. London: 55 (Himalaya Mts, restricted to Darjeeling by Baker, FBI 1: 156)

Baker, FBI No. 140, Vol. 1: 155

Plate 76, fig. 16

LOCAL NAMES. *Moonali bhiakora* (Pahari); *Lho-karrem-pha* (Lepcha).

SIZE. Pigeon; length c. 32 cm (13 in.).

FIELD CHARACTERS. Resembles the Giant Laughing Thrush (1297) but has black crown, ear-coverts and throat. Upper back fulvous, lower back chestnut-brown, both spotted with black and buff. Tail chestnut with black subterminal band and white tip, the outer rectrices dark brown tipped white. Sides of neck ashy, sides of lower throat cinnamon-rufous. Underparts buff, mottled with black on breast and flanks. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. A high-elevation species. Resident, fairly common. Nepal (intergrades with *griseicauda*), Darjeeling, Sikkim, Bhutan, NEFA (Tawang, upper Subansiri, and presumably east through the Agency); from 2100 to 3450 m at all seasons, breeding mostly above 2800 m. Affects light forest with undergrowth, thick rhododendron scrub and bushes at the edges of fields, in sunny situations.

Extralimital. Chumbi Valley and southeast Tibet, possibly intergrading with *G. maximus* between the upper Subansiri and the Tsangpo (Ludlow, 1944, *Ibis* 86: 74). The species extends to northeastern Burma, northwestern Yunnan and southwestern Szechuan.

GENERAL HABITS. Much as those of *G. maximus*. Not a conspicuous bird in spite of its size, but inquisitive and easily observed. Keeps in pairs and small parties of five to eight, working through the bushes, hopping on the ground and pecking noisily among dead leaves. Often associated with *G. affinis* (1323).

FOOD. Insects; seeds and fruits. Appears to be almost entirely vegetable even in the breeding season. Nestlings are fed with insects.

VOICE AND CALLS. Very similar to those of *G. maximus*. In breeding season a piercing 8-syllabled call (Ludlow). Song, a beautiful, very human whistle *tu wee, tu wee, tu willy-o* (Proud). The birds not only answer one another but respond readily to an imitation of this call. Also: *Q-twe-twe-twe-koi-koi* emitted from the top of a bush (in winter) and a subdued *pie, pie, pie, pie* (Fleming). Smythies describes its 'call-note' as a loud *cree-cree-cree-cree-r-r-r-cree-cree-cree* at the rate of two *cree* per second; if suspicious, keeps uttering a low interrogative note which rises to a squawk of alarm if the bird is suddenly startled.

BREEDING. Little known. Season, May and June. *Nest*, a large, loose cup about 17 cm across, made of twigs, dry grass or bamboo leaves, lined with rootlets, placed in bushes or small trees within a couple of metres from the ground. Eggs, normal clutch probably 2, deep blue-green, spotted or with a few chocolate-brown specks near the broad end. Size of three eggs 30 × 21.8; 32.7 × 21.5 mm (Hume) and 30.9 × 21.2 mm (Osmaston, both in Baker). As in *G. leucolophus* and *G. albigularis*, the young leave the nest long before they are full-grown (Diesselhorst).

BABBLERS

33

MUSEUM DIAGNOSIS. See Field Characters and Key to the Subspecies; for details of plumage Baker, loc. cit.

Young, like adult but head browner; white spots on upperparts smaller, absent on rump and upper tail-coverts; throat browner and edgings less sharp. Probably not distinguishable from young of *G. maximus*. Timaline juvenile characters of wing and tail (i.e. soft blunt first primary and narrow, pointed rectrices) present. Postjuvinal moult apparently not complete.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	122-135	27-30	—	146-162 mm
♀♀	117-137	28-29	45	148-161 mm

(Rand, Fleming, T aylor, Stresemann, SA)

Weight 1 ♂ 110; 4 ♀ 110-113; 1 ♂ 114 g (Diesselhorst, SA). 1 ♂ (September) 121 g — SDR.

COLOURS OF BARE PARTS. Iris stone-yellow. Bill horny, darker on culmen and tip. Legs and feet fleshy, dusky in front (Stevens). Or: Iris greyish khaki. Legs, feet and claws pale flesh-colour (SA).

GARRULAX CAERULATUS (Hodgson)

Key to the Subspecies

	Page
A Outer rectrices tipped with white..... <i>G. c. subcaerulatus</i>	34
B Outer rectrices not tipped with white	
1 More rufous above; crown-feathers more broadly edged with black..... <i>G. c. livingstoni</i>	35

1300. Himalayan Greysided Laughing Thrush. *Garrulax caerulatus caerulatus* (Hodgson)

Cinclosoma caerulatus Hodgson, 1836, Asiatic Res. 19: 147 (Nepal)
Baker, FBI No. 123 (part), Vol. 1: 141

Plate 77, fig. 14

LOCAL NAMES. *Tarma-pho* (Lepcha); *Piang-kam* (Bhutea).

SIZE. Myna ±; length c. 25 cm (10 in.).

FIELD CHARACTERS. The only laughing thrush in its range with white underparts and grey flanks. Above, forehead and orbital area black. Ear-coverts black tipped with whitish. Crown rufous-brown, nape olive-brown fulvous on the sides, both finely barred with black giving the head a scaly appearance. Sides of throat and back olive-brown. Wings rufous brown. Tail chestnut. Below, throat, breast, belly and under tail-coverts white, the latter tinged with pink. Sides slaty. Sexes alike.

BABBLERS

35

SIZE. Myna ±; length c. 25 cm (10 in.).

FIELD CHARACTERS. As in 1300 but three outer rectrices broadly tipped with white.

STATUS, DISTRIBUTION and HABITAT. Resident. Assam in the Khasi Hills, between 1200 and 1800 m. Keeps almost entirely to undergrowth in pine forest, occasionally mixed oak and rhododendron.

GENERAL HABITS, FOOD and VOICE. As in 1300.

BREEDING. Season, May and June. Nest and eggs as in 1300. Average size of 40 eggs 29.3 × 20.8 mm (Baker).

MUSEUM DIAGNOSIS. Similar to *caerulatus* but upperparts paler; ear-coverts and cheeks above and below them white, with slight black tips. Three outer rectrices broadly tipped with white.

MEASUREMENTS and COLOURS OF BARE PARTS. As in 1300.

1302. Nagaland Greysided Laughing Thrush. *Garrulax caerulatus livingstoni* Ripley

Garrulax caerulatus livingstoni Ripley, 1952, Jour. Bombay nat. Hist. Soc. 50: 497 (Mt Japvo, Naga Hills, Assam)

Dryonastes caerulatus livingstoni Koez, 1953, Jour. Zool. Soc. India 4: 153 (Kohima, Naga Hills)

Baker, FBI No. 123 (part), Vol. 1: 141

LOCAL NAMES. None recorded.

SIZE. Myna ±; length c. 25 cm (10 in.).

FIELD CHARACTERS. As in 1300, q.v.

STATUS, DISTRIBUTION and HABITAT. Resident, fairly common. Assam in north Cachar, Nagaland, Manipur and adjacent Burma; from 1200 to 2300 m. Habitat as in 1300.

GENERAL HABITS, FOOD and VOICE. As in 1300.

BREEDING. As in 1300.

Extralimital. The species extends to northern Burma and Yunnan; also the mountains of Fukien and Formosa.

MUSEUM DIAGNOSIS. Differs from *caerulatus* in having the crown more rufous-brown, the feathers more broadly edged with black; upperparts richer, more saturated with rufous. Differs from *subcaerulatus* in lacking the broad white tipping of the three outer rectrices.

MEASUREMENTS

	Wing	Bill (from skull)	Tail
♂ (type)	118	24	125 mm (SDR)

Weight 1 ♂ 93 g (SDR).

COLOURS OF BARE PARTS. Iris brown; orbital skin dark blue. Bill black. Legs and feet pale bluish white.

34

TIMALIINAE

STATUS, DISTRIBUTION and HABITAT. Resident, locally distributed; some downward movement in winter. From central Nepal to Darjeeling, Sikkim, Bhutan and (?) NEFA. Breeding zone not satisfactorily determined: between 1500 and 2400 m in Bhutan (Ludlow); up to 2700 m in Sikkim (Stevens) and possibly as low as 1000 m (Gammie); in Nepal, Proud found it very common on Sheopuri and Phul Chowk (= Phulchauki Danda) in summer, while Biswas noted it at c. 2000 m in April and May; breeds between 1500 and 2000 m (Diesselhorst). Recorded in winter at c. 1500 m in the Nepal Valley and as low as 600 m in the Bhutan duars. Affects undergrowth in forest, and ringal bamboo and scrub-covered hillsides.

GENERAL HABITS. Keeps in parties of three to twelve or more, feeding in low bushes and on the ground. Makes a great disturbance when feeding on the latter, 'hurling earth and dead leaves in all directions with the vigour of a puppy digging for rats' (Proud). Timid in winter but bolder in spring and then in taller trees (Fleming). Flight weak and ill-sustained. Usually escapes by hopping from branch to branch in the undergrowth.

FOOD. Berries, seeds and other vegetable matter (Diesselhorst). Probably also insects.

VOICE and CALLS. Loud musical calls and liquid whistles, some of them rendered by Fleming as *orik-chorr*, *brain fever* and *new jericho* (do, si, fa, la). Also keeps up a constant flow of conversational, soft and pleasant notes, now and then breaking out in loud, discordant calls. One of its call-notes is a loud *oh dear dear*, and the alarm-note a very sharp and distinctive chitter (Harington).

BREEDING. Season, May to July. Nest, cup-shaped, made of bamboo leaves, twigs and stems of creepers, lined with rootlets. Placed in bushes, bamboo clumps or trees between one and three metres from the ground, rarely higher. Eggs, 3, sometimes 2, pale blue, unmarked. Average size of 15 eggs 30.5 × 22.1 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Subspecies.

Young, like adult but lacks the black edges to crown-feathers; flanks tinged with brown and under tail-coverts with buff (brown according to Ludlow). Postjuvinal moult complete. Postnuptial moult completed in late October.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	106-115	24-28	41-43	124-133 mm
♀♀	103-110	25-29	40-42 (114)	122-131 mm

(Rand & Fleming, SDR, BB, SA)

Weight 4 ♂♂ 82-99; 6 ♀♀ 79-84 g (GD, SA).

COLOURS OF BARE PARTS. Iris red or red-brown; orbital skin livid. Bill horny black, paler and greyer at the base. Legs and feet pale fleshy.

1301. Khasi Hills Greysided Laughing Thrush. *Garrulax caerulatus subcaerulatus* Hume

Garrulax subcaerulatus Hume, 1878, Stray Feathers 7: 140 (Shillong)
Baker, FBI No. 124, Vol. 1: 142

LOCAL NAMES. None recorded.

TIMALIINAE

36

1303. Rufousnecked Laughing Thrush. *Garrulax ruficollis* (Jardine & Selby)

Ianthocincla ruficollis Jardine & Selby, 1838, Ill. Orn. 2, pl. 21
(Himalayas = Sikkim, restricted by Meinertzhagen, 1928, Ibis: 515)
Baker, FBI No. 120, Vol. 1: 139

Plate 77, fig. 9

LOCAL NAMES. *Rapchen-pho* (Lepcha); *Pobdya*, *Hath gurri-gurri* (Bengali); *Doo-poo-leka* (Assam); *Doo-popalika* (Cachar).

SIZE. Myna; length c. 23 cm (9 in.).

FIELD CHARACTERS. A dark babbler with black forehead, ear-coverts, throat and upper breast. A large rufous patch on sides of neck and rufous vent. Crown and nape slaty. Back, rump, belly and wings dark olive-brown, the last with pale outer edges. Tail black. Sexes alike.

The only laughing thrush with a large rufous patch or collar on sides of neck. While calling with upraised bill this rufous collar becomes very prominent.

STATUS, DISTRIBUTION and HABITAT. Common resident. East Nepal (not recorded since Hodgson's time), Sikkim, N. Bengal (the Darjeeling and Jalpaiguri districts), Bhutan, NEFA to the Mishmi Hills, East Pakistan in the northeastern hills and the Chittagong region, Assam south to Tripura and the Mizo Hills, Nagaland and Manipur. A bird of the foothills and adjacent plains, ascending to 1500 m in the Himalayas and to 600 m (rarely up to 1200 m) south of the Brahmaputra.

Frequents a variety of habitats: scrub and grass, bamboo jungle, high grass and reeds, edges of cultivation, hedgerows, scrub pastures, secondary growth, tea gardens, outskirts of forest and less commonly humid evergreen forest.

Extralimital. Western and northern Burma.

GENERAL HABITS. In pairs or parties of three to twenty birds according to the season. Hops about on the ground or in low bushes, rummaging among the mulch, flicking aside or turning over dead leaves in search of food. Will often flutter up into a larger bush, gradually hopping further up towards the top, flitting its tail, and then fly down among lower bushes again. At times indulges in a noisy game of 'follow-my-leader' across open spaces, 'each venture into an opening being a good and sufficient reason for an outburst of raucous cackling' (Baker). Flight rather heavy and ungainly. Parties break up in March.

FOOD. Insects, molluscs, seeds and berries.

VOICE and CALLS. A noisy species. The birds constantly utter a running chorus of sharp rather musical notes reminiscent of the Pied Myna (*Sturnus contra*) as the flock threads its way through the thickets, often bursting out in a tumult of loud squeals or calling and answering each other. Has a three-noted mellow whistle, the first of which sounds as if produced by a broken reed (SDR). Two of the more usual calls may be rendered as: *trireet-trireet*, repeated for several minutes, and *trireet-trireet-trireet* (pause) *trireet-trireet-trireet* (pause) and so on unvaryingly for maybe a quarter-hour at a stretch. Possibly two separate individuals are involved in this. The song is varied and pleasing, one or two phrases forming the basis of the

BABLERS

37

theme, upon which many variations are grafted and often combined into phrases of fair length. While singing with upraised bill flicks wings and the depressed expanded tail and pivots from side to side on the perch.

BREEDING. *Season*, overall March to August, chiefly April and May. *Nest*, cup-shaped, rather untidy exteriorly, made of leaves, grass, roots, weed stems, occasionally dry moss and lichen, all bound together with long weed stems and tendrils. Placed in bushes, generally between one and two metres up, less often up to six metres. *Eggs*, 3 or 4, pale skim-milk blue, very rarely white. Average size of 200 eggs 25.7 × 20 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♀	96-100	23-24	36-37	101-111 mm (SA)

Weight 6 ♂ ♀ 60-73 g (SDR, SA).

COLOURS OF BARE PARTS. Iris crimson or brown; eye-rim yellow. Bill, legs, feet and claws dark horny brown.

GARRULAX MERULINUS Blyth

Key to the Subspecies

More richly coloured; spots more numerous. . . . *G. m. toxostomus*
Less richly coloured; spots less numerous. *G. m. merulinus*

1304. Assam Spottedbreasted Laughing Thrush. *Garrulax merulinus merulinus* Blyth

Garrulax merulinus Blyth, 1851, Jour. Asiat. Soc. Bengal 20: 521
(Cherra Punji, Khasia Hills)
Baker, FBI No. 179 (part), Vol. 1: 186
Plate 76, fig. 8

LOCAL NAMES. None recorded.

SIZE. Myna; length c. 22 cm (9 in.).

FIELD CHARACTERS. A very thrush-like babbler with a buff throat and breast spotted with dark brown, and a whitish stripe behind the eye. Centre of belly buff, rest of plumage brown.

STATUS, DISTRIBUTION and HABITAT. Resident, locally common: Assam in the Khasi and Mizo (Lushai) Hills, between 900 and 1800 m. Affects deep and damp forest with heavy undergrowth of *Rubus* etc. and bamboo jungle. Densely overgrown abandoned shifting-cultivation clearings are favourite haunts.

GENERAL HABITS. A true laughing thrush in its habits, noisy, gregarious and an inveterate skulker, usually extremely difficult to approach on account of its wellnigh impenetrable habitat. 'Never will you find them in any place in which it is possible even to creep about, without cutting your way' (Hume). Keeps in parties of ten to twenty individuals, feeding on the ground among fallen leaves. Flies better than most laughing thrushes.

BABLERS

39

COLOURS OF BARE PARTS. Iris pale pinkish buff; orbital skin pale leaden. Bill: upper mandible blackish, lower mandible and gape pale greyish. Legs and feet pale brown.

1306. Whitebrowed Laughing Thrush. *Garrulax sannio albosuperciliaris* Godwin-Austen¹

Garrulax albosuperciliaris Godwin-Austen, 1874, Proc. Zool. Soc. London: 45
(Manipur Valley, NE. Bengal)
Baker, FBI No. 126 Vol. 1: 144
Plate 77, fig. 8

LOCAL NAMES. None recorded.

SIZE. Myna; length c. 23 cm (9 in.).

FIELD CHARACTERS. A plain-coloured laughing thrush with buff lores outlined above the eye by a white supercilium and below by a buffish hite cheek-patch. Rest of plumage olive-brown, darker on head, throat and tail. Centre of belly buff, under tail-coverts ferruginous. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Rare resident. Nagaland, Manipur, and Assam in north Cachar, from c. 1000 to 1800 m. Affects dense forest, scrub pastures, secondary growth or bamboo and open hillsides covered with bracken and wild raspberry scrub.

Extralimital. The species extends north to Szechuan and Hupeh, and east through northern Burma to Fokien, Kwangtung and Vietnam.

GENERAL HABITS. Less shy than most laughing thrushes. Usually seen in small parties, sometimes singly or in pairs, working through scrub jungle or undergrowth. Parties break up in March.

FOOD. Seeds, berries, rice, small molluscs.

VOICE and CALLS. A noisy species. Notes more complaining and less hilarious than those of *G. leucolophus*.

BREEDING. *Season*, March to June. *Nest*, cup-shaped, similar to that of *G. ruficollis* but larger and more massive. Made of dark-coloured grass, fern, roots and bamboo leaves, bound together with weed stems and tendrils and lined with fern roots and fern stems; some nests are made almost entirely of bamboo leaves and grass. Usually placed low down in thick bushes — *Rubus* brakes etc. — or sometimes in small saplings. *Eggs*, 3 or 4, white or pale blue. Average size of 100 eggs 26 × 19.4 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters. Said to be distinguishable from other (extralimital) races by the continuous white supercilium and brown ear-coverts. See also footnote below.

Young, a little paler than adult. Upper tail-coverts and throat yellowish brown. Juvenal timinaline characters of wings and tail present, namely soft, blunt first primary and narrow, pointed rectrices. Postjuvenal moult complete.

¹ A doubtfully tenable race, but see Deignan, H. G., 1952, *Pestilla*, No. 11 (26 March). He points out that this subspecies of *G. sannio*, wholly isolated from the Chinese populations, is distinct in having a deep brown pileum, a cold dark olivaceous brown mantle and a strong vinaceous wash over the entire underparts. The post-ocular stripe is blackish brown in the adult & pale brown to dark in birds from China.

38

TIMALIINAE

FOOD. Unrecorded; presumably insects for the most part.
VOICE and CALLS. Very noisy. Has a great variety of clear, beautiful notes and a coughing, oft-repeated chuckle (Hume).

BREEDING. *Season*, from the end of April to July, mostly in June and July. *Nest*, a rather bulky cup of roots, grass, bamboo and other leaves, more or less mixed with bracken fronds and moss, lined with rootlets, or occasionally with fine creeper stems or tendrils. Materials vary according to location of nest, whether in evergreen forest or bamboo jungle. Nest placed low down in thick shrubs or well inside bamboo clumps. *Eggs*, generally 2, often 3, blue with a tinge of green, unmarked. Average size of 50 eggs 28.7 × 21.2 mm (Baker). Both sexes share in incubation; period not known. The bird is a close sitter, slinking off the nest at the last moment, then skulking quietly in the cover.

MUSEUM DIAGNOSIS. For distinction from *toxostomus* see 1305.

Young, like adult but more rufous above and on flanks, wings and tail. Post-juvenal moult complete.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	93-99	24	40	c. 96-100 mm (Baker)

Bill from skull 29 mm.

COLOURS OF BARE PARTS. Iris pale yellowish or pinkish; brown in young birds. Bill dark horny brown, black at tip and on culmen, greyish on lower mandible. Legs and feet pale to dark brown, claws darker, soles paler.

1305. Manipur Spottedbreasted Laughing Thrush. *Garrulax merulinus toxostomus* (Koelz)

Stactocichla merulina toxostomina Koelz, 1952, Jour. Zool. Soc. India 4: 38
(Karong, Manipur)
Baker, FBI No. 179 (part), Vol. 1: 186

LOCAL NAME. *Moh mapeh* (Angami Naga).

SIZE. Myna; length c. 22 cm (9 in.).

FIELD CHARACTERS. As in 1304, q.v.

STATUS, DISTRIBUTION and HABITAT. Resident, locally common. Assam in north Cachar, Nagaland and Manipur, from 900 to 2400 m. Affects dense secondary scrub and undergrowth in damp evergreen forest.

Extralimital. The adjacent hills of western Burma, and northern Burma. The species extends to Vietnam.

GENERAL HABITS, FOOD and VOICE. As in 1304.

BREEDING. As in 1304.

MUSEUM DIAGNOSIS. Differs from *merulinus* (1304) in being more richly coloured. Below, the feather bases are deeper in colour, especially on the throat. Black spots average rounder, smaller and more numerous. Under tail-coverts more ferruginous. Crown usually differentiated from back. For details of plumage see Hume, SF 11: 162.

MEASUREMENTS. As in 1304.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♀	93-104	22-25	c. 37	105-117 mm (HW)

Weight 2 ♂♂ 68, 68; 1 ♀ 56 g (SDR).

COLOURS OF BARE PARTS. Iris dull brownish maroon, liver-brown or light brown; orbital skin pale fleshy grey. Bill blackish. Legs and feet pale brown with a faint purplish fleshy tinge; claws darker.

1307, 1308. Nilgiri Laughing Thrush. *Garrulax cachinnans* (Jerdon)¹

Crotopus cachinnans Jerdon, 1839, Madras Jour. Lit. Sci. 10: 255
(Nilgiris)
Baker, FBI No. 165, Vol. 1: 176
Plate 77, fig. 2

LOCAL NAMES. None recorded.

SIZE. Myna ±; length c. 20 cm (8 in.).

FIELD CHARACTERS. An olive-brown and rufous laughing thrush with a very pronounced white eye-stripe. Above, crown slaty brown, nape slaty. A conspicuous white supercilium. Lores and a short streak behind eye black. An incomplete white eye-ring. Cheeks tawny olive. Rest of upperparts olive-brown. Below, chin black. Breast and belly ochraceous. Lower belly and flanks olive-brown. Sexes alike.

Distinguished from *G. jerdoni* by its rufous, not grey, breast.

STATUS, DISTRIBUTION and HABITAT. Resident, very common but range curiously restricted. Confined to the Nilgiri Hills (western Tamil Nadu); from c. 1200 m to the summit. A geographical representative of the closely related *G. jerdoni* of Kerala. Affects dense undergrowth in forests, sholas, even hill-station gardens or wherever there are a few bushes or a patch of scrub.

GENERAL HABITS. Much the same as those of *G. jerdoni* (1310), q.v. Generally seen in flocks of a dozen or more commonly in association with the itinerant mixed hunting parties in sholas. Feeds on the ground as well as in low bushes, climbing into trees when disturbed and hopping along branches lightly and with great agility.

FOOD. Insects and berries, especially wild raspberry (*Rubus* spp.), and 'hill guava' (*Rhodomyrtus tomentosa*).

VOICE and CALLS. Very noisy. Has loud squeals and laughing calls — some of the most characteristic bird sounds of the Nilgiris — similar to those of *G. jerdoni*. The spirited 'laughing' calls, *pe-ka-ka* etc., are uttered with bill raised vertically and tail depressed. Another member of the flock invariably beats time with a harsh *ka-ka-ka*, almost identical with one of the calls of the tree pie (*Dendrocitta vagabunda*).

BREEDING. *Season*, overall February to July, chiefly May and June. *Nest*, cup-shaped, made of roots, dead leaves, small twigs, moss, grass and some

¹ No. 1308, *Garrulax cachinnans sinensis* (Davison), 1856, *Ibis*: 204 (locality unknown) is believed to be based on two stained specimens in Trivandrum Museum, Kerala. They differ from *cachinnans* in having the black of lores and chin replaced by dark brown, and the crown hair-brown instead of slaty brown.

2 Supercilium white, extending behind eye.....*G. j. fairbanki*

BABBLERS

43

GENERAL HABITS. Keeps in parties of six to twelve birds hunting among undergrowth and in low bushes, occasionally descending to the ground. A great skulker, creeping away through cover on the least suspicion.

FOOD. Insects, berries and fruits (especially *Rubus*, *Maesa* and *Trema*).

VOICE AND CALLS. Loud shrieks, whistles and 'laughter' uttered in chorus, and a variety of pleasant call-notes, some mellow and rather like an oriole's. Members of a party keep in touch by means of a call rendered as a rousing *pee-koko*, *pee-koko*: call, answer, quiet; call, answer, quiet — and so on. Other notes: *ku-h-yu* repeated several times, a deliberate *har-har-har* and a low-pitched scolding resembling that of the Redwhiskered Bulbul (Nichols). Alarm, some squeaky shrieks rather like those of the Jungle Babbler but louder and shriller, and a low *wit-wit-wit* as the bird disappears through the undergrowth.

BREEDING. Season ill defined. Overall December to June, chiefly April to June. Nest, cup-shaped, made mostly of coarse grass occasionally mixed with moss or bracken leaves, lined with fine grass. Usually well concealed in an upright fork of a rather isolated bush, or anchored in tall brackens, within a couple of metres from the ground. Eggs, usually 2, pale blue with blotches, spots and speckles of pale reddish brown and dark brown; indistinguishable from those of *G. cachinnans*. Average size of 15 eggs 25.6 × 19.1 mm (Baker). Both sexes share in building, incubation and care of the young. Incubation period undetermined.

MUSEUM DIAGNOSIS. See Key to the Subspecies.

Young, like adult but crown and nape not so dark, less contrasting with mantle; lower breast tinged with rufous; ear-coverts browner.

MEASUREMENTS	Wing	Bill (from skull)	Tarsus	Tail
♂ ♂	83-91	21-23	33-35	86-97 mm
♀ ♀	81-86	20-23	33-35	86-92 mm (SA, HW)

COLOURS OF BARE PARTS. Adult: Iris reddish brown. Bill horny brown: mouth pink. Legs and feet slaty brown; claws brown; soles greyish yellow. Young: Iris brown. Mouth pale pinkish yellow. Rest as in adult.

1311. South Kerala Laughing Thrush. *Garrulax jerdoni meridionale* (Blanford)

Trochopteron meridionale Blanford, 1880, Proc. Asiat. Soc. Bengal: 184 (Mynall, S. Travancore Hills)
Baker, FBI No. 169, Vol. 1: 178

LOCAL NAME. *Chiluchikippān* (Malayalam).

SIZE. Myna ±; length c. 20 cm (8 in.).

FIELD CHARACTERS. As in 1310 but supercilium shorter, not extending behind the eye; grey of underparts whiter and extending down to centre of belly. Crown, nape and rest of upperparts unicolorous dull sooty grey-brown, no contrast between them.

TIMALIINAE

42

1309. Coorg Whitebreasted Laughing Thrush. *Garrulax jerdoni jerdoni* Blyth

Garrulax (?) *herdoni* Blyth, 1851, Jour. Asiat. Soc. Bengal 20: 522 (Banasure Peak)
Baker, FBI No. 167, Vol. 1: 177

LOCAL NAMES. None recorded.

SIZE. Myna ±; length c. 20 cm (8 in.).

FIELD CHARACTERS. As in 1310 but chin and cheeks black and crown slaty brown.

STATUS, DISTRIBUTION AND HABITAT. Resident. Southwestern Mysore in the Brahmagiri hills and Banasure Peak at c. 1500 to 1800 m. Habitat undescribed, probably not different from that of *fairbanki*.

GENERAL HABITS, FOOD AND VOICE. As in 1310, q.v.

BREEDING. As in 1310. Eggs, similar to those of *G. cachinnans*; two eggs measure 26.1 × 19.8 and 25.1 × 19.2 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Subspecies; for details of plumage, Baker, loc. cit.

MEASUREMENTS	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	80-83	c. 18	c. 32	c. 90 mm (Baker)

COLOURS OF BARE PARTS. Iris crimson (adult), red-brown (immature). Bill dull black. Legs, feet and claws dark plumbeous brown (Davison).

1310. Kerala Laughing Thrush. *Garrulax jerdoni fairbanki* (Blanford)

Trochopteron fairbanki Blanford, 1869, Jour. Asiat. Soc. Bengal 38: 175 (Palni Hills)
Baker, FBI No. 168, Vol. 1: 178
Plate 77, fig. 3

LOCAL NAME. *Chiluchikippān* (Malayalam).

SIZE. Myna ±; length c. 20 cm (8 in.).

FIELD CHARACTERS. Above, crown and nape dark sooty brown; a white supercilium extending behind eye and a blackish stripe below it from lores through eyes; rest of upperparts olive-brown. Below, throat, cheeks and breast grey; belly rufous. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Common resident. The hills of Kerala and western Tamil Nadu north of the Achankovil Gap (c. 9°N. lat.): Cardamom, Kannan Devan and Palni hills (not recorded from the Nelliampathies), and High Wavy Mountains; from c. 1200 m to the summits. Confined to evergreen biotope in wild raspberry and bracken thickets lining hill streams through tea and cardamom plantations, scrub and secondary jungle near hillmen's settlements, occasionally populous hill-station gardens (Kodaikanal, Munnar), and edges of sholas; appears to shun the deeper woods. Its occurrence coincides with that of the wild raspberry (*Rubus* spp.).

TIMALIINAE

44

STATUS, DISTRIBUTION AND HABITAT. Common resident. Southern Kerala ghats from the Achankovil Gap south to the Ashambu Hills, from c. 1100 m upwards. Habitat as in 1310. Has a parallel altitudinal distribution with the wild raspberry, *Rubus* spp., whose lower limit here is also the same.

GENERAL HABITS, FOOD AND VOICE. As in 1310, q.v.

BREEDING. As in 1310.

MUSEUM DIAGNOSIS. See Field Characters.

and in the Fort Sandeman district (Torkhan, Shingar and the Takht-i-Sulaiman). Breeds between 2400 and 3000 m. Moves down in winter and reaches Quetta during cold waves. Affects juniper scrub, bush-covered slopes and bushy nullahs, entering gardens in winter.

Extralimital. Eastern Afghanistan and Tadzhikistan. The species in other races extends east along the Himalayas to NEFA and southeastern Tibet.

GENERAL HABITS, FOOD and VOICE. As in 1314.

BREEDING. Season, May to July. Nest, described as a massive structure of fibrous material and bulbous plant stems, lined with fine grass stems and hair, about 120 cm up in a leafy bush. Eggs, unmarked turquoise-blue as in 1314; fade considerably after being blown. Two eggs measure 26.3×19 and 26×18.8 mm (Baker).

MUSEUM DIAGNOSIS. Paler than *gilgit* (1313); differs from it in having paler rusty, not chestnut, ear-coverts; grey, not olive-brown, rump and upper tail-coverts, and grey, not grey-brown belly; the markings on the breast are paler and yellower, not red-brown.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♀	80-85	c. 18	26-27	92-97 mm (HW, CBT)

COLOURS OF BARE PARTS. Not recorded. Probably not different from those of 1314.

BABBLERS

47

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to seasonal vertical movements. The western Himalayas from Murree and Hazara east through Kashmir (south of the main range), Himachal Pradesh, Lahul, Kulu and Uttar Pradesh to Kumaon. Intergrades with *setifer* in Kumaon-western Nepal, and with *gilgit* in Hazara. Breeds between 1200 and 3000 m; optimum zone 1800-2700 m. Altitudinal zone appears to vary according to local conditions. From October to March, it is mostly found between 1000 and 1800 m though a few birds may be seen as high as 2700 m. In Lahul it occurs between 3000 and 3600 m. Occasionally descends to 600 m during cold spells. Affects bush-covered slopes, *Berberis* and *Rosa* scrub (Lahul), wooded nullahs, cultivation, undergrowth in open forest, even venturing into gardens, courtyards of houses or verandas.

GENERAL HABITS. Seen in pairs or small parties of three to six according to the season. Keeps more to the ground than most other laughing thrushes, shuffling along in tangles of grass, bracken and low bushes, hopping or creeping on the ground like an accenter, flitting its wings and jerking its tail to one side, then to the other. Reluctant to fly; when disturbed, merely flies a short distance downhill and pitches into the nearest cover. Hops up a tree rapidly from branch to branch but seldom if ever ascends very high and does not sail from tree to tree as other members of the genus often do, but rather drops to the ground and scuttles hurriedly to the next bush, half hopping, half flying. A skulker when away from habitations.

FOOD. Insects, berries, seeds, occasionally even bread-crumbs.

VOICE and CALLS. Members of a party keep up an incessant conversational squeaking in low querulous notes rendered as *chit-chit-chitrr*, *chicker-chicker*, *willy-killy-cree* or a soft, churring *er-r-r* (HW). The oftenest heard call-note is a loud, clear whistle *p'ly-wee*, or *titty-titty-we* are uttered from a prominent perch. Alarm; a plaintive, unmistakable *twee-twee-twee* (Bates) or *sweet-pea-pea-pea* (Fleming); the Kashmiris hear it as *sheen-a-pay-pay-pay* and regard the bird as the herald of winter on first hearing it in autumn when it comes into town limits, for this call means 'oh! snow, fall, fall, fall'. Song phrases uttered during the breeding season from tree-top or branch: *tril-tru*, *trul* and *ju-wi-ye* (Magrath); a jingling squeaky whistle of three descending rather plaintive notes *pee-pi-pi* of the timbre of those of *Zosterops* or *Muscicapa thalassina* (SA). Song period: March to September.

BREEDING. Season, overall March to September, chiefly May and June. At least two broods are normally reared. Nest, a deep cup of coarse grass and dead leaves, loose and untidy on the exterior but more compactly woven inside, lined with fine grass and rootlets. Well concealed in low bushes, sometimes at the end of low fir branches, in a pollarded tree, in thick grass on sloping banks, once in a honeysuckle climbing up a veranda; usually within a metre from the ground, sometimes up to a couple of metres. Eggs, 2 to 4, normally 3, turquoise-blue, unmarked. Average size of 16 eggs 25.8×18.7 mm (Osmaston) and of 100 eggs 25.6×18.4 mm (Baker). Both sexes share in, at least, incubation. Frequently brood-parasitized by the cuckoos *Clamator jacobinus*, *Cuculus micropterus* and *C. sparveroides*.

MUSEUM DIAGNOSIS. Differs from *setifer* (1315) in being paler both above and below, with broader grey edges to the feathers of the underparts. See also Key to the Subspecies.

TIMALIINAE

1313. Gilgit Streaked Laughing Thrush. *Garrulax lineatus gilgit* (Hartert)

Ianthocincla lineatum gilgit Hartert, 1909, Vög. pal. Fauna 1: 636 (Gilgit)

Baker, FBI No. 173, Vol. 1: 182

LOCAL NAMES. None recorded.

SIZE. Bulbul \pm ; length c. 20 cm (8 in.).

FIELD CHARACTERS. As in 1314, q.v.

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to seasonal vertical movements. West Pakistan in N.W.F.P. from Safed Koh and Samana to Chitral, east to the Indus, north to Gilgit, the Hunza Valley as far as Hunza (Baltit), the Indus Valley as far as Skardu, and Astor to the north side of the Burzil Pass; from 1400 to 3600 m, mostly between 1800 and 3000 m, descending to the lower valleys in winter (but recorded as high as 2700 m in this season). Affects bushes in open pine or fir forest, wild rose scrub and other thickets, shrubby near cultivation, entering orchards at lower levels in winter. Fond of creeping about the stone walls of houses in mountain villages.

GENERAL HABITS, FOOD and VOICE. As in 1314.

BREEDING. Season, nest and eggs (c/2-4) as in 1314. Seven eggs average 24.9×18.5 mm (Baker).

MUSEUM DIAGNOSIS. Similar to *lineatus* (1314) but paler and greyer, less rufous. See also Key to the Subspecies.

MEASUREMENTS and COLOURS OF BARE PARTS. As in 1314.

1314. Simla Streaked Laughing Thrush. *Garrulax lineatus lineatus* (Vigors)

Cinclosoma lineatum Vigors, 1831, Proc. Zool. Soc. London: 56 (Himalaya Mts = NW. Himalayas vide Hume, 1875, Stray Feathers 3: 396 = Simla-Almora area)

Baker, FBI No. 172, Vol. 1: 142

Plate 76, fig. 2

LOCAL NAME. Sheen-a-pi-pin (Kashmir).

SIZE. Bulbul \pm ; length c. 20 cm (8 in.).

FIELD CHARACTERS. A small uncrested streaked laughing thrush with a greyish white terminal band on rounded tail.

Above, crown and upper back grey streaked with dark brown; middle back streaked with white; rump olive-brown. Ear-coverts and wings rufous; tail olive-brown faintly barred, rufous on sides, tipped greyish. Below, throat and breast streaked with rufous, each feather with a white shaft. Lower belly olive-brown. Tail graduated with black subterminal spot on outer rectrices and pale grey tip. Sexes alike.

The rather similar Striated Laughing Thrush (1279) is much larger and has a conspicuous mop-like crest.

TIMALIINAE

48

Young, like adult but rusty markings and shaft-streaks on breast less well defined. Head and rump browner. Primary character not present (i.e. 1st primary not blunt and soft), but rectrices narrower. Postjuvénal moult, only of body-feathers.

MEASUREMENTS

Wing 3 ♂♂ 71-81; 2 ♀♀ 78, 82 mm (Rand & Fleming).

Weight 25 ♂♂ (Apr.-May) 36-46 (av. 40.7) g—SA.

COLOURS OF BARE PARTS. Iris reddish brown. Bill dark brown, paler at base of lower mandible. Legs and feet fleshy brown.

1315. Nepal Streaked Laughing Thrush. *Garrulax lineatus setifer* (Hodgson)

Cinclosoma setifer Hodgson, 1836, Asiatic Res. 19: 148 (Nepal)

Baker, FBI No. 171, Vol. 1: 180

LOCAL NAME. Bhekura (Nepal).

SIZE. Bulbul \pm ; length c. 20 cm (8 in.).

FIELD CHARACTERS. As in 1314, q.v.

STATUS, DISTRIBUTION and HABITAT. Resident, locally common, subject to seasonal vertical movements. Nepal, Darjeeling and Sikkim; from c. 1800 to 3000 m, up to 3300 in the Langtang Valley, and 3900 m in Khumbu. Recorded in winter from 1000 to 2700 m. Affects hillside scrub undergrowth, open forest and edges of cultivation. Not confined to thick growth as most laughing thrushes are.

GENERAL HABITS, FOOD and VOICE. As in 1314.

BREEDING. As in 1314.

MUSEUM DIAGNOSIS. Differs from *lineatus* in having the head browner (less ashy), rump darker, ear-coverts and streaks of underparts darker. Black subterminal band on outer rectrices much broader.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	77-81	18-19	c. 29	90-97 mm
♀♀	72-80	c. 19	c. 29	c. 90 mm (BB, Rand & Fleming)

Weight 3 ♂♂ 39-45; 3 ♀♀ 37-43 g (GD).

COLOURS OF BARE PARTS. Iris brown. Bill horny brown, paler on commissure and lower mandible; mouth pale yellowish flesh. Legs and feet pale horny brown.

BABBLERS

1316. *Bhutan Streaked Laughing Thrush. Garrulax lineatus imbricatus* Blyth*G. (garrulax) imbricatus* Blyth, 1843, Jour. Asiat. Soc. Bengal 12: 951 (Bhutan)

Baker, FBI No. 175, Vol. 1: 183

LOCAL NAMES. None recorded.

SIZE. Bulbul \pm ; length c. 20 cm (8 in.).

FIELD CHARACTERS. As in 1314, q.v.

STATUS, DISTRIBUTION and HABITAT. Resident, locally common. Bhutan and western NEFA (Tawang region). Eastern limit unknown. Breeds between 1500 and 2400 m, locally up to 3000 m. A specimen from the Buxa duars in May. Affects thick scrub on the edges of cultivation; also bushes and long grass in uncultivated areas.

EXTRALIMITAL. Tibetan areas adjacent to its range in Bhutan and NEFA

GENERAL HABITS, FOOD and VOICE. As in 1314. Usually tame and confiding. On occasion behaves very like Jungle Babbler, hopping about picking kitchen scraps around, and even entering, occupied labourers' hutments; scuttling off with squeaky whistles into adjoining shrubby in alarm at inmates' movements, but soon returning to feed when all is quiet again.

BREEDING. Unrecorded; probably as in 1314.

MUSEUM DIAGNOSIS. Streaks darker than in other subspecies and occupying the whole feather. Rump darker than in *setifer*. Upperparts uniform dark chocolate colour with dark shafts on head and white shafts on mantle and scapulars. Underparts dark chocolate with white shaft-streaks on breast. Ear-coverts dull greyish brown with pronounced white shaft-tips. Subterminal band of tail blacker and wider.

FIELD CHARACTERS. Above, forehead and supercilium to nape white. Lores rufous-chestnut; crown and back dark brown with conspicuous

BABBLERS

51

FIELD CHARACTERS. A rufous-brown laughing thrush with underparts barred and mottled with whitish and brown. A pale wing-bar and pale grey outer edge of wing. Sides of neck finely streaked with white. Tail rufous-brown above, blackish below with white tips. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Scarce resident. Assam in the Khasi, Cachar and Mizo hills, Nagaland and Manipur; from 1800 to 2700 m, less often down to 1500 m, rarely 1200 m. Affects oak and rhododendron forest, bushes in ravines and clearings, and bamboo thickets along forest margins.

EXTRALIMITAL. Another subspecies on Mt Victoria, Chin Hills.

GENERAL HABITS. Keeps in pairs or small family parties, moving along the ground under cover of thickets, occasionally climbing in low bushes. Reluctant to fly and when forced to, does so with the usual fluttering and sailing.

FOOD. Insects and seeds.

VOICE and CALLS. A liquid three-noted whistle to meet you very reminiscent of that of *Pellonura ruficeps* but much louder; also a soft tick when working in the underbush and some loud harsh calls like a wounded tree pie (SDR). Song, a pleasant, flute-like phrase, easy to imitate, *ti-ti-ti-tia-tui-ti* the fourth note longer and lower, with several variations; call-note, a double, loud, resounding whistle *krü-krü*; alarm-note, a subdued *krüpp... krüpp... krüpp* frequently and quickly repeated (Heinrich).

BREEDING. Season, April to August, mostly the latter half of April and May. Nest, cup-shaped, made of tendrils, roots, leaves, moss, grass, etc., lined with rootlets and a few bents. Usually placed in bushes within a couple of metres from the ground, sometimes up to three metres in small trees. Eggs, usually 3, sometimes 4, occasionally 2, white. Average size of 46 eggs 26.3 x 19 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters; for details of plumage Baker, loc. cit.

50

TIMALIINAE

white shaft-streaks. Rump olive-brown with pale streaks. Tail olive-brown finely cross-rayed. Wings rufous-chestnut with whitish shoulders. Below, chin and throat chestnut shading into ochraceous-buff on rest of underparts, all except chin with white shaft-streaks. Flanks olive-brown. Sexes alike.

The larger Striated Laughing Thrush (1279) has a loose mop-like crest and no supercilium.

STATUS, DISTRIBUTION and HABITAT. Resident, locally common. Assam hills in Cachar (the whole of the hill-ranges, according to Baker), Nagaland, Manipur and Mizo Hills (see map, p. 45); from c. 900 to 2400 m. Affects damp evergreen forest with heavy undergrowth, stunted oak forest with undergrowth of ferns and other plants, and thick secondary growth.

EXTRALIMITAL. The Chin Hills of Burma.

GENERAL HABITS. Not gregarious and not as noisy as other laughing thrushes, shy and retiring. Generally keeps in pairs to thick undergrowth and on the ground, seldom showing itself.

FOOD. Chiefly insects; doubtless also berries and seeds.

VOICE and CALLS. A peculiar, soft, single-noted call and some sweet conversational notes.

BREEDING. Season, April to July. Nest, a deep, stoutly built cup of tendrils, dead leaves, grasses, roots, fine bents, bamboo-leaves, bracken and moss, lined with rootlets. Well concealed in thick bushes, from near the ground to about two metres up. Eggs, 2 or 3, more often the former, clear blue with sometimes a greenish tinge, indistinguishable from those of *G. lineatus*. Average size of 100 eggs 26 x 19.2 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters; for details of plumage Baker, loc. cit.

Baker, FBI No. 146, Vol. 1: 160

Plate 76, fig. 6

LOCAL NAME. *Deo-gajao-i-ba* (Cachari).

SIZE. Myna; length c. 22 cm (9 in.).

TIMALIINAE

52

FIELD CHARACTERS. A dark olive-brown laughing thrush with black scaly markings over the whole body, especially on back. A black supercilium and white eye, very conspicuous. Wing black with pale blue outer edge and a large rufous shoulder-patch. Both upper and under tail-coverts chestnut; tail blackish with a rufous terminal band. Sexes alike.

The similarly scaly species *subunicolor* (1320) lacks the black supercilium, has buff wings and belly, and the outer rectrices tipped white.

STATUS, DISTRIBUTION and HABITAT. Resident, uncommon in the Himalayas, more common south of Brahmaputra R. From central Nepal (Biswas, JBNHS 59: 215) east through Darjeeling, Sikkim, Bhutan and NEFA to the Mishmi Hills; the hills of Assam, Nagaland and Manipur. In the Himalayas breeds between 1000 and 2400 m, mostly 1300-2200 m (recorded at 3400 m in winter in the Darjeeling district by Meinertzhagen). In the Khasi and Cachar hills, breeds mostly between 900 and 1200 m, more sparingly to 1500 m, occasionally to 1800 m. Affects humid dense bushes, ringal bamboo and rhododendron, especially along the banks of streams and rivers.

EXTRALIMITAL. Extends to western and northern Burma, and western Yunnan; also northern Vietnam.

GENERAL HABITS. Found singly or more usually in pairs or small family parties keeping close to the ground in dense cover. An inveterate skulker, seldom taking flight when alarmed, diving into thicker cover and escaping silently and unseen.

FOOD. Insects, berries and seeds.

VOICE and CALLS. Call-note, a thrush-like *chuck* (SDR); some rich and full conversational notes (Baker); clamouring loudly when excited (Meinertzhagen). Song rendered as *car-white-to-go* and *free-for-you* (Fleming).

BREEDING. Season, April to July. Nest, a compact cup of leaves, fine twigs, grass, roots and some moss, bound with a few tendrils and long roots, lined with rootlets. Usually placed in low bushes within a couple of metres from the ground. Eggs, normally 3, often 2, seldom 4, deep blue, unmarked. Average size of 50 eggs from Assam 29.4 x 20.7 mm (Baker). Eggs taken in Sikkim by Osmaston differ in being much paler and bigger, nine eggs averaging 29.9 x 22.2 mm.

MUSEUM DIAGNOSIS. See Field Characters. Appears to be dimorphic, some birds having a bronze-coloured tail with rufous tip and the crown concolorous with the back, others a black tail and ashy crown. Sides of head and lores may be rufous or olive-brown. For details of plumage, see Baker loc. cit.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

1320. Plaincoloured Laughing Thrush. *Garrulax subunicolor subunicolor* (Blyth)

Trochaloheron subunicolor Blyth, 1843, Jour. Asiat. Soc. Bengal 12: 952 (Nepal)
Ianthocincla subunicolor griseata Rothschild, 1921, Novit. Zool. 28: 33
 (Shweli-Salween Divide, Yunnan)
 Baker, FBI No. 160, Vol. 1: 171
 Plate 76, fig. 1

LOCAL NAMES. *Tarmal-pho* (Lepcha); *Nabom* (Bhutea).

SIZE. Myna; length c. 23 cm (9 in.).

FIELD CHARACTERS. An olive-brown laughing thrush with dark scaly markings over the whole body plumage. Crown and nape washed with grey. Bill very short. Central rectrices olive-brown; the rest largely black, the outer three tipped white. A large straw-coloured patch on wing, the outer edge very pale grey, some flight-feathers with pale tips. Abdomen buff, also scaly. Sexes alike. Distinguished from *G. squamatus* by lack of the black supercilium; also by the straw-coloured wing-patch and the white-tipped outer rectrices.

STATUS, DISTRIBUTION AND HABITAT. Resident, subject to some vertical movements; locally common. Eastern Nepal [Ilam district; Ting Sang, c. 86°E. long. (Diesselhorst)]; also a probable sight record from the Chautara district, central Nepal (Biswas, JBNHS 59: 215), Darjeeling, Sikkim; Bhutan and NEFA to the Mishmi Hills. Breeds from 1800 to at least 3600 m (from 2100 to 3900 m in northern Burma). Recorded in winter from 800 to 3400 m; a withdrawal from the highest zone in the cold season is probable. Affects thickets of *Rubus* and dwarf rhododendron, bamboo, undergrowth in mixed deciduous forest, and secondary growth. Occurs both in thick forest and open areas ('over alpine meadow', Cranbrook, JBNHS 37: 353).

EXTRALIMITAL. Extends to southeast Tibet, northeast Burma and north-west Yunnan; another race in northern Vietnam.

GENERAL HABITS. Keeps in flocks of ten to twenty birds in the non-breeding season, moving through tangles of bushes and vines or on the ground.

FOOD. Insects (beetles, grasshoppers, etc.), snails, centipedes, berries and green vegetable matter.

VOICE AND CALLS. A clear whistle of four notes, a sharp alarm-note and some squeaky conversational notes.

BREEDING. Season, April to June. Nest, cup-shaped, made of grass, moss, lined with soft bamboo leaves. Placed in bushes or on a low branch within a metre or so from the ground. Eggs, 3 or 4, pale greenish blue, unmarked. Three eggs measure 29.5 × 23 to 30.3 × 23 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters; for details of plumage Baker, loc. cit.

YOUNG, like adult but upperparts, especially rump, more rusty with the black scalloping barely indicated. Throat dark brown, breast more rusty brown, scalloping absent or faintly indicated. Rectrices narrower.

Garrulax affinis bethelae Rand & Fleming, 1956, Fieldiana, Zool. 39, No. 1: 2
 (Thangu, Sikkim)
 Baker, FBI No. 161 (part), Vol. 1: 172

LOCAL NAMES. None recorded.

SIZE. Myna ±; length c. 25 cm (10 in.).

FIELD CHARACTERS. Above, head mostly black with a white malar patch, white sides to nape and white semi eye-ring. Back brown, finely scalloped. Wings olive-yellow with slate tip and outer edge, and a small black shoulder-spot. Upper tail-coverts rufous-brown. Tail olive-yellow with slate tip. Below, chin black; rest of underparts rufous-brown with grey scale-like markings. Sexes alike.

The black face with two white patches combined with yellow-and-slate wings identify this species.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. The eastern half of Nepal, Darjeeling, Sikkim, Bhutan, western NEFA [Tawang (Whistler, *Ibis* 1941: 173), Tsu Valley, Mishmi Hills

TIMALIINAE

54

Weight 3 ♂♂ 63-69 g (GD, SA).

COLOURS OF BARE PARTS. Iris straw. Bill blackish brown. Legs and feet horny brown.

1321. Prince Henry's Laughing Thrush. *Garrulax henrici* (Oustalet)

Trochaloheron Henrici Oustalet, 1892, Ann. Sci. Nat. 12: 274
 (South Tibet = Aio and Soutu)
 Baker, FBI No. 176, Vol. 1: 183
 Plate 77, fig. 11

LOCAL NAME. *Jomo* (= the lady, Tibetan).

SIZE. Myna +; length c. 25 cm (10 in.).

FIELD CHARACTERS. Above, crown and back mouse grey. Lores and ear-coverts dark chestnut-brown, with fine white supercilium above and white crescentic cheek-patch below. Folded wings ashy with a blackish shoulder-patch and a larger rufous patch. Tail blackish grey tipped with white. Below, buffish grey diffusely dark streaked, with chestnut vent and under tail-coverts. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. Southeastern Tibet and probably NEFA in Tibetan facies (upper Subansiri and Tsangpo basins).¹ Also locally in the upper Arun Valley, just north of the Nepal border (Wollaston, *Ibis* 1922: 506). The dominant laughing thrush between 2700 and 4500 m, descending to 2000 m in winter. Affects scrub in the dry as well as the wet zone.

GENERAL HABITS. Keeps in pairs during the breeding season, otherwise in small parties, always on the move, seldom showing itself, flying low from cover to cover.

FOOD. Unrecorded. Doubtless berries and insects.

VOICE AND CALLS. Has the typical noisy chattering of the genus, and a fluty call *whoh-hee* (Waddell in FBI). Its call-notes resemble those of *G. affinis* with which at times it associates (Ludlow).

BREEDING. Season, May and June. Nest, a rather untidy structure of dried grass, dead leaves, strips of bark, moss, etc. lined with dry twisted grass. Placed in low bushes and hedges. Eggs, 2 or 3, indistinguishable from those of *G. erythrocephalus*. Average size of 13 eggs, 30.5 × 21 mm (Ludlow).

MUSEUM DIAGNOSIS. See Field Characters.

YOUNG, like adult but browner; ear-coverts blackish instead of brown.

MEASUREMENTS

Wing 3 ♂♂ 103, 106, 111 mm; 10 ♀♀ 101-107 mm (Ludlow. The figure 130 given in *Ibis* 1944: 77 is a lapsus for 103 mm.)

Bill (from skull) 23; tarsus 37; tail 137 mm (MD).

Hartert (p. 632) gives

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	115	22-23	c. 37	140-150 mm
♀♀	110			

COLOURS OF BARE PARTS. Iris crimson. Bill nut-brown. Legs and feet dark plumbeous.

¹ The locality Shoaka (= Shows) given in FBI 1: 183 is not in the Mishmi Hills but in Tibet as pointed out by Ludlow, *Ibis* 1944: 77.

TIMALIINAE

56

(Bailey, JBNHS 24: 75) and probably throughout the Agency at suitable elevations). One of the highest-altitude laughing thrushes, breeding between 2400 and 4200 m, mostly above 2800 m, locally up to 4500 m. Found in winter between 1600 and at least 3600 m. Affects rhododendron bushes, scrub oak and bamboo in mixed oak and conifer, or birch and fir forest, and dwarf rhododendron above timber-line.

EXTRALIMITAL. Southeastern Tibet. The species extends to southwestern Szechuan and northern Vietnam; also Formosa.

GENERAL HABITS. Keeps in pairs during the breeding season, otherwise in small parties usually not in mixed company during the summer months, but in winter often with *Alcippe rimpectus*. Feeds mostly in bushes, often near or on the ground and also in the crowns of small trees. Runs about rat-like in the scrub over moss-covered boulders and fallen tree-trunks at great speed, seldom taking wing. Not so timid as other laughing thrushes but very noisy when excited.

FOOD. Berries (*Rubus*, *Viburnum*, *Gaultheria*, wild strawberries, etc.), crab-apples, seeds and insects.

VOICE AND CALLS. Has the usual low conversational chuckles of the genus. Alarm, a long rolling *whirr-whirr* (Stanford). Song, uttered from an elevated position, the top of a bush or rock, the bird usually remaining and hidden by overhanging foliage; described as a mournful, monotonous and continually repeated four-note strophe (Cranbrook), probably the same rendered by Diesselhorst as *ti ti ti ti wü* or by SA as a melodious whistling *to-wee* or *to-wee-you*. Fleming describes a variety of clear calls *you wryy, wheeooo, eee-rrr, kay-luck*. The song may be heard every month, but more regularly from March to August (Proud).

BREEDING. Season, May and June. Nest, cup-shaped, exteriorly made mostly of moss and fine twigs with an inner layer of dry rhododendron leaves, root fibres and a few grass blades, lined only with root fibres. Diameter of nest c. 18 cm, of cup 7.5 cm, depth of cup 5 cm. Placed in bushes, usually rhododendron, between 1 and 2.5 m from the ground. Eggs, 2 or 3, blue with a greenish tinge, marked with a few blackish-brown spots and scrolls, mostly around the larger end. Average size of 12 eggs 28.5 × 21.2 mm (Baker). Like many species of the genus, both parents get very excited, raising intense outcries against intruders.

MUSEUM DIAGNOSIS. Differs from the nominate race (1322) in having the underparts generally darker, with the edgings of the feathers dull grey ± greyish white. The crown averages blacker but this not constant. For details of plumage see Baker loc. cit.

YOUNG, a dull version of the adult; lacks grey edges to mantle and ashy edges on breast. Rectrices narrower, but juvenal timeline character of wing (soft blunt first primary) not present (Whistler).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	98-115	24 (2)	36-40 (3)	134-135 (2) mm
♀♀	102-110	23 (2)	39-42 (2)	118-127 (2) mm

(Kinntear, Rand & Fleming, SA)
 Wing 28 ♂♀ 99-109 mm (Stresemann).

BABBLERS

57

Weight 8 ♂ 67-80; 6 ♀ 66-72 g (GD, SA, SDR).

COLOURS OF BARE PARTS. Iris brown or 'olive-khaki'. Bill horny black. Legs pinkish- or horny brown; claws dark brown.

1324. Redheaded Laughing Thrush. *Garrulax erythrocephalus erythrocephalus* (Vigors)

Cinlosoma erythrocephalus Vigors, 1832, Proc. Zool. Soc. London: 171 (Himalayas, restricted to Chamba by Baker, 1920, 'Handlist': 15, an action which takes precedence over the restriction to Simla-Almora area by Ticehurst & Whistler, 1924, Ibis: 468-73, or to Simla by Vaurie, 1953, Bull. Brit. Orn. Cl. 73: 78)

Baker, FBI No. 148 (part), Vol. 1: 163

Plate 76, fig. 4

LOCAL NAMES. None recorded.

SIZE. Myna ±; length c. 28 cm (11 in.).

FIELD CHARACTERS. An olive-brown laughing thrush with rufous-chestnut crown and nape, black chin and scale-like black markings on breast, neck and upper back. Wing and sides of tail olive-yellow; a chestnut shoulder-patch. Underparts deep ferruginous. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Resident, locally common, subject to vertical movements. The Himalayas from Changla Gali and Murree east to Kumaon. Breeds between 1800 and 3300 m, optimum zone 2100-2700 m. From mid October to early April found mostly between 1200 and 2000 m and probably also higher, descending to c. 700 m during cold spells. Affects dense undergrowth of dwarf rhododendron, *Rubus*, *Berberis*, etc. on hillsides, along nullahs, and at the edge of terraced cultivation and upland pastures.

GENERAL HABITS. Keeps in pairs in the breeding season, otherwise in parties of four to six, sometimes up to thirty individuals, often in company with *G. albugularis* or *G. affinis*. Frequents low cover, flying restlessly from bush to bush or bouncing quickly over the ground, the long tail slightly raised, and digs under dead leaves; sometimes seen at medium heights in

BABBLERS

59

and streaks, mostly at the broad end. Average size of 100 eggs 28.4 × 21.4 mm (Baker). Commonly brood-parasitized by Pied Crested Cuckoo and hawk-cuckoos.

MUSEUM DIAGNOSIS. The palest member of an east-west cline. Crown entirely rufous. For details of plumage see Baker, loc. cit.

Young, as adult but mantle tinged brown, black spots absent; chin black; throat rusty-olive, no spots; ear-coverts less markedly chestnut. Underparts grey with a buffy tinge; edges to wings duller. Rectrices narrower.

MEASUREMENTS. As in 1325.

COLOURS OF BARE PARTS. Iris greyish hazel. Bill blackish brown. Legs and feet horn-brown.

1325. Nepal Redheaded Laughing Thrush. *Garrulax erythrocephalus kali* Vaurie*Garrulax erythrocephalus kali* Vaurie, 1953, Bull. Brit. Orn. Cl. 73: 78

(Lete, Kali River Valley, Baglung dist., west-central Nepal)

Baker, FBI No. 148 (part), Vol. 1: 163

58

Garrulax erythrocephalus

Distributional ranges

erythrocephalus (1324). *kali* (1325). *nigrimentus* (1326).
imprudens (1327). *godwini* (1329). *chrysopterus* (1328).
erythrolaema (1330).

moss-covered trees, less often high up in trees. Shy, a great skulker and usually silent; easily overlooked and difficult to observe even when its characteristic chuckling murmurs proclaim its proximity in the undergrowth.

FOOD. Insects, snails, leeches (once), seeds, berries and other vegetable matter. Food appears to be predominantly animal in spring and summer, and vegetal in autumn (Diesselhorst) and very likely also in winter, this being probably true for other high-altitude laughing thrushes as well.

VOICE AND CALLS. A constant series of low twitters and chuckles when moving through thickets. A deep churring alarm-note *m-u-r-r-r-r*. The song consists of several short phrases given three or four times at intervals of a few seconds: *pearl-lee, to-reaper, to-real-year, you reap* (Fleming). Other calls: a clear double whistle *phew* or *puweep* easily imitated and to which the bird responds (HW). A loud *wee-oo-wee-uhp*, the last note higher and louder [probably uttered by a different bird] (Smythies) sometimes given separately, sometimes in runs. Questing note, when looking for mate that has been shot, a soft musical single *tui-ee-you* repeated every half-second or so (once for over 10 minutes) while hopping in the shrubbery (SA).

BREEDING. Season, May to August. Nest, a substantial, cup-shaped structure of broad grass bents, fern fronds, moss and dead leaves, lined with rootlets. Usually placed in a bush within a couple of metres from the ground. Eggs, 2 or 3, turquoise-blue sparsely marked with liver-coloured blotches

60

TIMALIINAE

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. East Nepal, Darjeeling, Sikkim, Bhutan, western NEFA (Tawang) and southeast Tibet; from 2000 to 3000 m (Nepal), 3300 m (Bhutan) in summer, and from 1200 to over 3000 m in winter [recorded at 3500 m in December (Meinertzhagen) and from Buxa duars 600 m in the same month]. Affects forest with thick undergrowth and especially tangled bushes on steep sides of ravines.

x c. 1

GENERAL HABITS, FOOD AND VOICE. As in 1324.

BREEDING. As in 1324. Eggs, usually 2, rarely 3, turquoise-blue marked with liver-coloured blotches and streaks. Average size of 32 eggs 28.5 × 20.9 mm (Baker). Size of 2 eggs 31.2 × 21.7 and 28.2 × 21.5 mm (Ludlow).

MUSEUM DIAGNOSIS. Differs from *kali* (1325) in having the sides of crown grey, the rufous restricted to nape, the anterior part of crown being broadly streaked with black; ear-coverts black with pale edges.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	97-107	23-25	37-43	110-124 mm
♀♀	93-103	22-25	39-42	105-125 mm

(Rand & Fleming, SA)

Weight 14 ♂ 75-89; 7 ♀ 70-88 g (GD, SA).

COLOURS OF BARE PARTS. Iris olive-brown or hazel-brown. Bill horny black. Legs and feet brownish flesh; claws horny brown.

1327. NEFA Redheaded Laughing Thrush. *Garrulax erythrocephalus imprudens* Ripley

Garrulax erythrocephalus imprudens Ripley, 1948, Proc. Biol. Soc. Washington 61: 102 (Tidding Saddle above Dreyi, Mishmi Hills, northeast Assam)

Baker, FBI No. 150 (part), Vol. 1: 164

LOCAL NAMES. None recorded.

SIZE. Myna +; length c. 28 cm (11 in.).

FIELD CHARACTERS. As in 1324. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. NEFA from the Dafia to the Mishmi hills; limits undetermined. Altitudinal distribution and habitat presumably as in 1326.

GENERAL HABITS, FOOD AND VOICE. As in 1324.

BABBLERS

61

MUSEUM DIAGNOSIS. Differs from *nigritentus* (1326) in being darker brown on upper back, and darker olive-brown with somewhat heavier black subterminal barring on throat and breast; more fulvous whitish on nape, sides of lower throat and breast. This colour fades rapidly and foxed specimens of *nigritentus* tend to assume the reddish brown tone of *imprudens*.

MEASUREMENTS. As in 1326.

COLOURS OF BARE PARTS. Iris brown. Bill black. Legs and feet brown.

1328. Khasi Redheaded Laughing Thrush. *Garrulax erythrocephalus chrysoplerus* (Gould)

Ianthocincla chrysoptera Gould, 1835, Proc. Zool. Soc. London: 48
(Himalayas *errone* = Khasi Hills)
Baker, FBI No. 153, Vol. 1: 166

LOCAL NAMES. None recorded.

SIZE. Myna +; length c. 28 cm (11 in.).

FIELD CHARACTERS. As in 1324 but with a grey supercilium and chestnut throat. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Resident, very locally distributed. Khasi Hills between 1200 and 1900 m. Affects bushes in open pine forest.

GENERAL HABITS, FOOD and VOICE. As in 1324.

BREEDING. Season, April to July. *Nest*, as in 1324. *Eggs*, generally 3, sometimes 2, more boldly marked than those of the Himalayan races. Average size of 50 eggs 30.6 × 21.6 mm (Baker).

MUSEUM DIAGNOSIS. Differs from other races in having brown oval lunar (gibbous) spots instead of black round spots on back and breast. A broad grey supercilium. Ear-coverts rufous, more or less tinged with grey. Chin and throat dark chestnut. Yellow on wing more golden, less greenish yellow.

Young (immature). A dull edition of the adult. Spots on breast and back obsolete. Juvenal timaline characters — soft blunt first primary, narrower rectrices — present.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	101-106	20-21	c. 38	110-115 mm (Baker)

COLOURS OF BARE PARTS. Iris yellowish or greyish brown, sometimes grey. Bill dark horny brown. Legs and feet fleshy or yellowish brown.

1329. Nagaland Redheaded Laughing Thrush. *Garrulax erythrocephalus godwini* (Harington)

Trochaloipteron erythrocephalus godwini Harington, 1914, Bull. Brit. Orn. Cl. 33: 92
(Hengdan Peak, N. Cachar Hills)
Baker, FBI No. 151, Vol. 1: 165

LOCAL NAME. *Dau-qua-lok* (Cachari).

SIZE. Myna +; length c. 28 cm (11 in.).

FIELD CHARACTERS. As in 1324. See Museum Diagnosis.

BABBLERS

63

1331. Himalayan Crimsonwinged Laughing Thrush. *Garrulax phoeniceus phoeniceus* (Gould)

Ianthocincla phoenicea Gould, 1837, Icones Av., pl. 3 (Nepal)
Baker, FBI No. 156, Vol. 1: 168
Plate 77, fig. 1

LOCAL NAMES. *Tilji-pho* (Lepcha); *Ripcha* (Bhutea).

SIZE. Myna ±; length c. 23 cm (9 in.).

FIELD CHARACTERS. An olive-brown laughing thrush with bright crimson sides of head, wings and tips of under tail-coverts. A black supercilium. Crown streaked with black. Tail black with reddish tip and outer rectrices. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Resident, locally common, subject to slight vertical movements or nomadism in winter. From Nepal (not recorded since Hodgson's days and probably restricted to the easternmost part) east through Darjeeling, Sikkim, Bhutan and NEFA to the Mishmi Hills; from c. 900 to 1800 m at all seasons, reaching the foothills (duars, c. 600 m) in winter. Affects undergrowth in evergreen forest and dense thickets of secondary growth on the edge of cultivation and along streams.

GENERAL HABITS, FOOD and VOICE. As in 1332, q.v.

BREEDING. As in 1332. Average size of 50 eggs 25.9 × 18.5 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *bakeri* in being darker. For details of plumage see Baker, loc. cit.

Young, like adult but crimson of face less brilliant; upperparts less rufous; supercilium less distinct; rectrices narrower; reddish tip of tail less sharply defined.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	81-93	c. 18	c. 32	c. 100 mm (Baker)
		(from skull)		
3 ♂♂	85-93	20-22	33-35	92-110 mm
1 ♀	85	21	33	102 mm
2 ♂?	83, 87	20, 21	33, 35	90, 95 mm (SDR, SA)

Weight 2 ♂? 51, 52 g (SA).

COLOURS OF BARE PARTS. Iris brown (juv.) to deep crimson; orbital skin dull leaden-dusky. Bill dark brown to black. Legs and feet brown.

1332. Assam Crimsonwinged Laughing Thrush. *Garrulax phoeniceus bakeri* (Hartert)

Trochaloipteron phoeniceum bakeri Hartert, 1909, Bull. Brit. Orn. Cl. 33: 10

(Laitlyngkot, Khasi Hills)
Baker, FBI No. 157, Vol. 1: 169

LOCAL NAME. *Dao-yao-gajao* (Cachari).

SIZE. Myna ±; length c. 23 cm (9 in.).

62

TIMALIINAE

STATUS, DISTRIBUTION and HABITAT. Common resident. Assam in Cachar, Nagaland and western Manipur; from c. 1500 to 2800 m. Affects undergrowth in evergreen forest, stunted oak and dwarf rhododendron scrub.

GENERAL HABITS, FOOD and VOICE. As in 1324.

BREEDING. Not recorded. Probably as in 1328.

MUSEUM DIAGNOSIS. Similar to *erythrolaema* (1330) and doubtfully distinct (Peters' Check-List 10: 376). A grey supercilium, and forehead greyer.

MEASUREMENTS

Wing ♂♂ 97-103; ♀♀ 93-106 mm (SDR).

Weight ♂♂ 74-92 g (SDR).

COLOURS OF BARE PARTS. Iris dark greyish brown. Bill blackish brown. Legs and feet fleshy brown.

1330. Manipur Redheaded Laughing Thrush. *Garrulax erythrocephalus erythrolaema* (Hume)

Trochaloipteron erythrolaema Hume, 1881, Stray Feathers 10: 153
(Matchi, E. Manipur Hills)
Baker, FBI No. 149, Vol. 1: 164

LOCAL NAMES. None recorded.

SIZE. Myna +; length c. 28 cm (11 in.).

FIELD CHARACTERS. As in 1324. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Common resident. East Manipur hills south through the Mizo Hills; from 1500 to 2700 m (mostly 2500-3000 m on Mt Victoria). Affects thick bushes and bamboo in forest.

Extralimital. Chin Hills and Arakan Yomas. The species extends to southwestern Yunnan and northern Vietnam.

GENERAL HABITS and FOOD. As in 1324.

VOICE and CALLS. The song consists of three loud, far-carrying, flute-like notes *tiuuu* repeated every few seconds, the first and last notes short and on the same tone, the middle one loud and rising; another call is rendered as *kreh-krü-krü* the last 'ü' more accentuated; call-note a sharp and loud trill (Heinrich). See also 1324.

BREEDING. Season, April-May. *Nest* as in 1324. *Eggs*, usually 2. Average size of 33 eggs 29.9 × 20.5 mm (Baker).

MUSEUM DIAGNOSIS. Differs from the nominate race (1324) in having a grey forehead and supercilium, the ear-coverts pinkish rufous, the point of chin grey and the throat and breast chestnut, nearly concolorous with crown. Spots on back browner; spots on breast much smaller and triangular, not hemispherical.

MEASUREMENTS

Wing 10 ♂♂ 98-106; 8 ♀♀ 92-102 mm (Stresemann).

COLOURS OF BARE PARTS. As in 1329.

GARRULAX PHOENICEUS (Gould)

Key to the Subspecies

Paler; grey of belly more pronounced.....*G. p. bakeri*
Darker; grey of belly less pronounced.....*G. p. phoeniceus*

TIMALIINAE

64

FIELD CHARACTERS. As in 1331, q.v.

STATUS, DISTRIBUTION and HABITAT. Resident, fairly common. The hills of East Pakistan and Assam south to the Chittagong region and the Mizo Hills, Nagaland and Manipur; from 900 to 1800 m, up to 2400 m in the eastern ranges (1400 to 2500 m on Mt Victoria). Affects dense undergrowth in evergreen forest or in shady deciduous forest.

Extralimital. Western Burma. The species extends to southern Yunnan and northern Vietnam.

GENERAL HABITS. A skulker like most others of the genus. Keeps in pairs or small parties of four or five individuals according to the season, sometimes in the mixed hunting parties. Forages in undergrowth and on the ground, only occasionally going up in trees.

FOOD. Insects, seeds and berries.

VOICE and CALLS. Song, a five- to six-note phrase, the end of which is a characteristic series of three or four notes on the same tone. The second note of the song is about two tones higher than the first, the last between the second and first. Also a four-noted call, the first and last on the same tone, the second and third a half tone higher (Heinrich). It also has a variety of squeaky conversational calls both harsh and sweet, typical of the genus.

BREEDING. Season, April to July. *Nest*, a deep cup of dry leaves, grass, fine twigs and roots, occasionally some moss, lichen or other material, lined with rootlets. Usually placed low down in bushes, occasionally in saplings up to two or three metres above the ground. *Eggs*, 2 or 3, rarely 4, blue with numerous dark brown scrolls and a few spots scattered irregularly over the whole surface. Average size of 100 eggs 26.1 × 18.5 mm (Baker). Both sexes take part in incubation and feeding the young. Incubation period undetermined.

MUSEUM DIAGNOSIS. Differs from the nominate race (1331) in being paler and in having the grey of the abdomen much more pronounced. Also said to be slightly smaller.

MEASUREMENTS

Wing 7 ♂♂ 85-90; 8 ♀♀ 79-87 mm (Stresemann).

Weight 2 ♂♂ 45, 48 g (SDR).

COLOURS OF BARE PARTS. As in 1331.

1333. Himalayan Silvereared Mesia. *Leiothrix argenteauris argenteauris* (Hodgson)*Mesia argenteauris* Hodgson, 1837, Ind. Rev. 2 (2): 88 (Nepal)

Baker, FBI No. 376 (part), Vol. 1: 354

Plate 80, fig. 1

LOCAL NAMES. *Dang-rapchil-pho* (Lepcha); *Jhāṅghiri* (Pahari).

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. A bright-coloured arboreal babbler with black crown and moustachial stripe and silvery ear-coverts.

Male. Forehead yellow, throat and breast bright orange-yellow. Wing edged with yellow, with a crimson patch. Both upper and under tail-coverts crimson.

Female differs in having the under tail-coverts ochraceous and the upper olive-yellow.

Young (immature) like female but crown yellowish.

Easily distinguished from the Redbilled Leiothrix by the black crown, silvery ear-coverts, and square (not forked) tail.

STATUS, DISTRIBUTION and HABITAT. Resident, fairly common but less so west of Sikkim; subject to slight vertical or erratic movements in winter. The Himalayas from Garhwal east through Nepal, Darjeeling, Sikkim, Bhutan and NEFA to the Dihang river; from the foothills to c. 2100 m. Affects scrub-jungle, bush-clad open spaces, secondary growth, bushes in evergreen forest, especially the outskirts and more open portions, abandoned cultivation clearings and tea plantations.

GENERAL HABITS. Usually seen in parties of six to thirty birds or more outside the breeding season. Keeps to bushes in forest, sometimes going fairly high up in the canopy. Searches actively for insects among the foliage, behaving much like tits, clinging to sprigs in acrobatic positions and peering under leaves, the flocks rapidly 'flowing' from tree to tree in disorderly follow-my-leader style, all the while uttering subdued chirrups. Seemingly always in great haste. Occasionally makes fly-catching sallies after escaping insects. Pairs form in April; the birds then become very shy and hard to see.

FOOD. Insects, seeds and berries.

VOICE and CALLS. Members of a feeding party keep up a continual chirrup with occasional long-drawn, clear whistling notes *seetee-siueetee*

BABBLERS

67

MUSEUM DIAGNOSIS. More richly coloured than *argenteauris*; orange on nape deeper and more extensive, likewise that colour on forehead and underparts. In *temnyi* (1334) the orange does not descend so far on breast and back.

MEASUREMENTS and COLOURS OF BARE PARTS. As in 1333.

STATUS, DISTRIBUTION and HABITAT. Common resident. NEFA in the Mishmi Hills, Assam in the Cachar hills, Nagaland and Manipur; from c. 700 to 1500 m. Habitat as in 1333.

EXTRALIMITAL. Northern Burma and Western Yunnan. The species extends east to Vietnam and south through the Malay Peninsula and Sumatra.

GENERAL HABITS, FOOD and VOICE. As in 1333.

BREEDING. As in 1333.

MUSEUM DIAGNOSIS. Differs from *argenteauris* in having the nape yellowish olive without any golden-orange wash. Throat without any reddish wash and with an ochraceous striation. The statement by Mayr loc. cit. that it differs in its smaller size is not borne out by measurements of larger series.

MEASUREMENTS

	Wing	Tail	
♂♂	72-79	(1) 65	mm
♀♀	72-75	(2) 64, 65	mm
		(SDR, Mayr)	

Weight ♂♂ 25-26; ♀♀ 22-25 g (SDR).

COLOURS OF BARE PARTS. As in 1333.

LEIOTHRIX LUTEA (Scopoli)

Key to the Subspecies

- Inner primaries conspicuously edged with red.....*L. l. calyptga*
 Red on edge of primaries reduced or absent.....*L. l. temensis*

1335. Western Redbilled Leiothrix. *Leiothrix lutea kumziensis* Whistler*Leiothrix lutea kumziensis* Whistler, 1943, Bull. Brit. Orn. Cl. 63: 62

(Dehra Dun, United Provinces)

Baker, FBI No. 351 (part), Vol. 1: 328

LOCAL NAMES. *Nawachara* (Dehra Dun); *Peking Robin* (agriculturalists' name).

SIZE. Sparrow —; length c. 13 cm (5 in.).

TIMALIINAE

66

reminiscent of the jingling call of Blackheaded Sibia (SA). A cheerful song of seven or eight notes rendered as *u-cherit, cherit-cherit* (Stanford). Wings frequently flirited while singing.BREEDING. Season, April to August. Nest, cup-shaped, c. 8.5 cm in diameter, 8 cm in overall depth, the depth of cup being c. 6.5 cm. Made of bamboo or other leaves, grass and moss, lined with rootlets. Placed in bushes within a couple of metres from the ground, sometimes as low as a few centimetres. Indistinguishable in size, structure and situation from that of *L. lutea*. Eggs, 4, sometimes 3, rarely 5, also identical with those of *L. lutea* (1336) although eggs with a white ground are perhaps more often found among those of *argenteauris*. Average size of 200 eggs 20.9 × 16.1 mm (Baker). Building, incubation and care of young shared by both sexes. Nest completion takes about four days. Incubation begins with first egg; period c. 14 days. The birds sit closely, but even when not seen leaving the nest, soon give away the site by their fussy demonstrations.MUSEUM DIAGNOSIS. For distinction from *temnyi* see 1334 under Museum Diagnosis; for details of plumage Baker, loc. cit. In all races the back is greenish, wearing to grey.

Young (immature), male and female, dull versions of their respective adults. Birds can be sexed upon fledging: male has red tail-coverts, female rusty-green. Nestlings are covered with pale buff down. Postjuvinal moult of body, wing-coverts and tertials.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	70-81	17-19	24-26	63-72 mm
♀♀	70-78	17-18	23-24	63-70 mm
				(BB, CBT, SA)

Weight 1 ♂ 25; 1 ♀ 23 g (SA).

COLOURS OF BARE PARTS. Iris brown to red-brown. Bill orange tinged brown at base; gape light orange in nestlings. Legs and feet yellowish flesh.

MISCELLANEOUS. This species and the Redbilled Leiothrix (1336) are commonly kept as cage-birds and under the name of Silver-ear and Peking Robin respectively largely exported to Europe and the U.S.A.

1333a. Assam Silvereared Mesia. *Leiothrix argenteauris curvicalaris* (Koelz)*Mesia argenteauris curvicalaris* Koelz, 1953, Jour. Zool. Soc. India 4: 153

(Tura Mountain, Garo Hills, Assam)

Baker, FBI No. 376 (part), Vol. 1: 354

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 1333, q.v.

STATUS, DISTRIBUTION and HABITAT. Common resident. Assam in the Garo, Khasi and Mizo hills, and East Pakistan in the Chittagong Hill Tracts; from c. 900 to 1500 m. Habitat as in 1333.

GENERAL HABITS, FOOD and VOICE. As in 1333.

BREEDING. As in 1333.

TIMALIINAE

68

FIELD CHARACTERS. As in 1336 but lacks crimson on wing. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Uncommon resident, subject to slight vertical or erratic movements in winter. The western Himalayas from Kashmir (1 specimen in Brit. Mus. collected by Biddulph; 2 specimens in the Indian Museum, by Stoliczka) east to Kumaon. Breeds from 1000 to 2400 m. Recorded in winter from 1000 to 2100 m but more frequent at the lower levels. Affects scrub and secondary growth on outskirts of cultivation.

GENERAL HABITS, FOOD and VOICE. As in 1336.

BREEDING. As in 1336.

MUSEUM DIAGNOSIS. Distinguished from *calyptga* (1336) by the greyer tinge of the green on upperparts, the yellowish wash on crown greener and more restricted, and red on outer edge of inner primaries reduced or absent.

MEASUREMENTS and COLOURS OF BARE PARTS. As in 1336.

1336, 1337. Eastern Redbilled Leiothrix. *Leiothrix lutea calyptga* (Hodgson)*Behila Calyptga* Hodgson, 1837, Ind. Rev. 2(2): 88 (Nepal)*Leiothrix lutea luteola* Koelz, 1952, Jour. Zool. Soc. India 4: 39

(Mawryngkneng, Khasi Hills)

Baker, FBI No. 351 (part), Vol. 1: 328

Plate 80, fig. 2

LOCAL NAMES. *Jhāṅghiri* (Pahari); *Raphil-pho* (Lepcha); *Dachila-tuku-gojas* (Cachar).

SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. A sprightly greyish olive bird with bright yellow throat and breast, pale lores and eye-ring, and scarlet bill. Wing black with yellow-and-crimson edges, and a small orange patch. Tail forked, the outer rectrices slightly curved outwards — black above olive below, except tip and edges which are black. The long olive upper tail-coverts have a pale narrow terminal bar; under tail-coverts pale yellow.

Female differs in having the crimson of wing replaced by yellow.

The olive crown, scarlet bill, and absence of whitish ear-coverts distinguishes this species from the Silvereared Mesia (1333).

STATUS, DISTRIBUTION and HABITAT. Resident, subject to slight vertical or erratic movements in winter, locally common. From western Nepal east through Sikkim, Darjeeling, Bhutan and NEFA at least to the Abor and Mimi hills; Nagaland, Manipur and Assam in the Cachar hills. Breeds from 1500 to 2400 m, locally down to 1000 m or up to 2700 m. Winters between 699 and 2100 m. Affects undergrowth in forest, wooded ravines, secondary growth on abandoned cultivation clearings, and tea plantations.

EXTRALIMITAL. Chin Hills and Arakan Yomas of Burma. The species extends east to northern Vietnam and north to Szachuan and Anhwei. Introduced into Hawaiian Islands.

GENERAL HABITS. Keep in pairs in the breeding season, otherwise in small parties of four to six individuals, usually in association with *Stachyris*

BABBLERS

69

or other babblers. Habits similar to those of Silver-eared Mesia with which it also frequently consorts. Usually seen scuttling through undergrowth, sometimes hopping on the ground foraging and turning over dead leaves in the manner of a laughing thrush. Pairs form in April.

FOOD. Insects, seeds and berries.

VOICE and CALLS. Alarm, a series of harsh, hissing notes and a somewhat explosive *k'd'k-cha-jō-jō* followed by a call sounding like *pile-pile-pile* (the second note higher); while feeding, keeps up a clear and rather wistful but unvaried piping *pe-pe-pe-pa* (rising-low), or a rapid *pū-pū-pū-pū-pū*; also a soft, muttering *che-cha-cha* and a loud rustling call (Lister). The song is a loud, cheerful warbling reminiscent of the Red-whiskered Bulbul's, rather more prolonged and more musical (SA). Song period February to August, mainly April to June (Proud).

BREEDING. Season, April to October, chiefly May and June. Nest, cup-shaped, made of fine bents, dead leaves, moss, lichen or other materials, usually lined with rootlets. Placed low down in bushes, less often up to a couple of metres. Eggs, 3 or 4, rarely 5, pale blue, rarely white, usually marked with bold blotches of dark red-brown or umber-brown, mostly at the large end. Nest as well as eggs indistinguishable from those of Silver-eared Mesia. Average size of 200 eggs 21.9 × 16.1 mm (Baker). The female seems to do most of the nest-building, the male bringing her the material. Incubation shared by both sexes, though female appears to do the greater part. Nest location is soon given away by the fussy demonstrations of the owners. Brood-parasitization by *Cuculus canorus* reported by Baker.

MUSEUM DIAGNOSIS. Differs from *kumaiensis* (1335) in having the back greener, and conspicuous crimson outer edgings on inner primaries. For details of plumage see Baker, loc. cit. Postnuptial moult completed in October.

Young: upperparts browner, with no contrast between crown and mantle. Underparts much paler. Upper tail-coverts narrower and white tips merely indicated. Male rather brighter than female. Postjuvénal moult takes place in October.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	65-72	14-16	25-28	55-59 mm
♀♀	65-70	14-16	24-26	53-58 mm

(BB, SA, Rand & Fleming)

Weight 3 ♂♂ 20-23; 1 ♀ 20 g (Diesselhorst); 12 ♂♂ 21-25 g (SA).

COLOURS OF BARE PARTS. Iris brown or reddish-brown. Bill coral red, black at base of both mandibles. Legs, feet and claws pale horny brown.

Genus MYZORNIS Blyth

Myzornis Blyth, 1843, Jour. Asiat. Soc. Bengal 12: 984.

Type, by monotypy, *Myzornis pyrrhous* Blyth

Bill slender, nearly as long as the head, notched; culmen gently curved. Nostrils covered by a membrane. Tail about two-thirds the length of wing. Tarsus long and slender.

70

TIMALIINAE

1338. Fire-tailed Myzornis. *Myzornis pyrrhous* Blyth

Myzornis pyrrhous Blyth, 1843, Jour. Asiat. Soc. Bengal 12: 984 (Nepal)
Baker, FBI No. 367, Vol. 1: 345

Plate 72, fig. 2

LOCAL NAME. *Lho-sagrit-pho* (Lepcha).

SIZE. Sparrow —; length c. 12 cm (4½ in.).

FIELD CHARACTERS. Male. A brilliant little dark green bird with red and green tail. Crown scalloped with black. A black stripe from lores through eye. Wing black with a reddish streak, white tips and white inner edge. Female only slightly different (see Museum Diagnosis).

x c. 1

STATUS, DISTRIBUTION and HABITAT. Resident, locally distributed, subject to some vertical movements. From central Nepal (Proud, JBNHS 58: 804, breeding; Deshayes, sight record 1964), east through Darjeeling, Sikkim, Bhutan and NEFA (Pachakshiri, Ludlow, *Ibis* 1944: 86, and probably throughout the Agency at suitable altitudes); from 1600 to 3600 m. Recorded at 2700 m in winter. Breeding zone not determined but probably above 2700 m. Affects rhododendron, juniper and other bushes, also heavy jungle and bamboo thickets, preferably on sunny hillside.

Extralimital. Southeastern Tibet, northeastern and northwestern Burma. GENERAL HABITS. Usually keeps solitary, in parties of three or four or small flocks frequently in association with sunbirds, warblers and the smaller babblers, searching for food amongst bushes and shrubs, sometimes up in trees. Habitually visits flowering shrubs and trees, especially rhododendron, to probe into the blossoms for nectar. Presumably assists in their cross-pollination since shot specimens often show pollen adhering to the forehead and breast-feathers. Also takes insects and spiders from the flowers and foliage, and from moss-covered tree-trunks, running up these in the manner of a tree creeper or hovering at sprigs on rapidly beating wings, like a sunbird or flowerpecker. Occasionally captures insects by flycatcher-like aerial sallies. Observed switching up tail like a robin while hopping amongst bushes (J. Panday).

FOOD. Insects and spiders, flower nectar (*Rhododendron*, *Berberis*, etc.), tree-sap and berries.

VOICE and CALLS. Normally silent. A high-pitched *tri-tit* (Deshayes). Song, if any, not recorded.

BREEDING. The only authentic nest so far known was in a deep mossy juniper forest at c. 3700 m in Nepal. It was about 6 metres from the ground, close against the trunk of a large juniper and so imbedded in moss and lichen that details could not be seen. Both parents were feeding young at the time — late May (Desirée Proud, JBNHS 58: 804 and in *epist.*). One egg sent to Hume (but authenticity not certain) was white without markings. It measured about 17 × 13 mm.

* The tongue possesses terminal bristles, an adaptation for nectar-feeding as in the Honey-eaters of the Australasian Region, or in the Indo-Malayan genus *Chloropsis*.

BABBLERS

71

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Female, like male but red tinge of underparts duller, red on wing and tail less bright. The primary-coverts are sometimes pale blue, not always white as given in FBI.

Young, male and female, duller than their respective adults. Juvenal timeline wing and tail characters (i.e. soft blunt first primary; narrower rectrices) not present.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
5 ♂♂	57-63	15-16	23-24	45-48 mm
8 ♀♀	56-62	13-18	23-24	40-47 mm

(not 70-75 as in FBI)

(SA, MD, Stresemann)

Weight 3 ♂♂ 11-13; 3 ♀♀ 11-12.5 g (SA, SDR).

COLOURS OF BARE PARTS. Iris dark brown. Bill black. Legs and feet yellowish brown.

Genus CUTIA Hodgson

Cutia Hodgson, 1836, Jour. Asiat. Soc. Bengal 5: 773.

Type, by original designation, *Cutia nipalensis* Hodgson

Bill somewhat curved, notched, pointed, slightly longer than half length of head; rictal bristles very short; nostrils longitudinal, covered by a membrane; frontal bristles short and firm. Tail slightly rounded, about two-thirds length of wing; upper tail-coverts very long, reaching nearly to tip of tail.

1339. Nepal Cutia. *Cutia nipalensis nipalensis* Hodgson

Cutia nipalensis Hodgson, 1836, Jour. Asiat. Soc. Bengal 5: 774 (Nepal)

Cutia nipalensis nagaensis Koels, 1954, Contrib. Inst.

Regional Exploration, No. 1: 9 (Kohima, Naga Hills)

Baker, FBI No. 353, Vol. 1: 329

Plate 80, fig. 3

LOCAL NAMES. *Khatya* (Nepal); *Motum-pho*, *Rapnün-pho* (Lepcha).

SIZE. Bulbul; length c. 20 cm (8 in.).

FIELD CHARACTERS. Male. A handsome but rather dumpy, arboreal bird with white underparts and bold black rib-like markings on flanks. Crown slaty blue. A broad black band from lores to nape. Wing black and slaty blue. Back and upper tail-coverts a striking rufous, the latter covering all but the tip of the tail which is black. Under tail-coverts buff. Under surface of wing white and black.

x c. 1

Female duller than male. Head-band chocolate-brown instead of black. Back dull rufous-brown with drop-like oval black spots.

In flight, this species looks like a short, squat woodpecker with rufous upper tail-coverts.

72

TIMALIINAE

STATUS, DISTRIBUTION and HABITAT. Resident, locally distributed. From Kumaon (specimens in Field Mus. Chicago) and Nepal (mostly in Kathmandu Valley) east through Darjeeling, Sikkim, Bhutan and NEFA; also Nagaland, Manipur and Assam in Cachar and Mizo hills; from c. 1350 to 2500 m. Recorded in winter up to 2100 m in Sikkim, and at c. 900 m in Cachar. Breeding zone not determined but probably above 1500 m. Affects heavy oak and mossy evergreen forest.

Extralimital. The Chin Hills of Burma. The species extends south through the Malay Peninsula and east to Vietnam.

GENERAL HABITS. Keeps in small parties, commonly in the mixed itinerant associations, usually frequenting the foliage canopy of forest trees, running swiftly along the branches or hopping up mossy trunks with rapidity; may occasionally be seen on the ground, collecting grit. Usually rather silent.

FOOD. Beetles and other insects, larvae, pupae, insect eggs, gastropods, seeds and berries (*Viburnum*, *Michelia*, *Magnolia*, etc.).

VOICE and CALLS. A loud, distinctive double chip and a shrill chip (Stanford). A loud, monotonous *chichip-chip-chichip* (*piou-piou-piou...* Smythies) repeated 6 to 160 times or more — SA.

BREEDING. Unknown. Fully fledged young noted in June on Mt Victoria (Heinrich).

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Young male, like adult but upperparts paler. Young female, like adult female but crown darker; lores, ear-coverts and sides of neck nearly black; spots on back rounder. Barring on flanks in both sexes replaced by twin spots on the feathers. Timeline primary and tail characters not present (HW).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	88-101	20-23	30-33	53-66 mm
♀♀	83-93	19-21	27-30	56-60 mm

(SA, BB, Stresemann)

Weight 9 ♂♂ 48-56; 3 ♀♀ 40-46 g (GD, SDR, SA).

COLOURS OF BARE PARTS. Iris dull crimson-brown. Bill black, basal half of lower mandible bluish. Legs and feet bright (gamboge) yellow.

Genus PTERUTHIUS Swainson

Pteruthius Swainson, 1832, Fauna Boreali-Americana, Bds.: 491.

Type, by original designation, *Lanius erythrorus* Vigors

Hilarocichla Oates, 1889, Fauna Brit. India, Bds. 1: 243.

Type, by monotypy, *Pteruthius rufoenter* Blyth

Bill about half the length of the head, notched and strongly hooked at the tip. Rictal bristles weak. Tarsus strong. Sexes dissimilar.

1340. Rufousbellied Shrike-Babbler. *Pteruthius rufiventris* Blyth

Pteruthius rufiventris Blyth, 1842, Jour. Asiat. Soc. Bengal 11: 183
(no locality = Darjeeling)
Baker, FBI No. 360, Vol. 1: 337
Plate 80, fig. 4

LOCAL NAMES. None recorded.

SIZE. Bulbul; length c. 17 cm (7 in.).

FIELD CHARACTERS. Male. Above, head, wings and tail black, the last and the secondaries narrowly tipped with chestnut. Back and rump chestnut. Below, throat and breast ashy, divided from black of head by a white line. A yellow patch on sides of breast. Belly vinous-brown darker on flanks.

Female. Above, head grey, back of crown and ear-patch black. Back and folded wings bright greenish yellow, the secondaries tipped with chestnut. Lower rump and upper tail-coverts chestnut. Central rectrices green, outer mostly black, all narrowly tipped with chestnut. Below, as in male.

STATUS, DISTRIBUTION AND HABITAT. Sparse resident. East Nepal (Jiri, November 1960 — Fleming & Traylor, *Feldiana*, Zool. 35: 536, the only post-Hodgsonian record) east through Darjeeling, Sikkim, Bhutan and NEFA to the Mishmi Hills, Nagaland and Manipur; between c. 1500 and 2500 m (recorded at 2700 m in winter in Burma). Seasonal movements, if any, unknown. Affects dense, moss-covered oak and evergreen forest, and occasionally secondary scrub.

Extralimital. The Chin Hills and northern Burma into Yunnan; another race in northern Vietnam.

GENERAL HABITS. Keeps in small parties in company with tits and babblers. A fearless, rather lethargic bird feeding near the ground as well as in the tops of lofty trees, hopping from twig to twig.

FOOD. Lepidoptera, beetles and other insects.

VOICE AND CALLS. Not described; usually very silent. 'A curious shrill whirr-i-oh heard from a flock which contained some of these birds was possibly uttered by them' (Stanford).

BREEDING. Unknown.

MUSEUM DIAGNOSIS. See Field Characters.

Young (sex?), very like adult female with dull black head and green back; lesser, median and greater coverts tipped with the greenish colour of the mantle; wings as in adult male; underparts grey shading into white on belly (HW).

BABBLERS

75

STATUS, DISTRIBUTION AND HABITAT. Resident, fairly common, subject to some vertical and erratic movements in winter. The Himalayas from Murree and Kashmir (one record, Dickinson, JBNHS 63: 204) east to the Mishmi Hills; the hills of Assam south to the Mizo Hills; Nagaland and Manipur. East Pakistan hills (?). Breeds between 1500 and 2500 m; winters mostly between 1200 and 2000 m sometimes higher, seldom descending as low as 300 m (Nepal, Rand & Fleming). Affects heavy broad-leaved forest of oak, rhododendron, etc.; in the western Himalayas also pine, deodar and spruce.

Extralimital. Western and northwestern Burma. The species extends north to Szechuan, east to Vietnam, Kwangsi and Fukien, south to Sumatra, Java and northern Borneo.

GENERAL HABITS. Strictly arboreal. Keeps in pairs in the breeding season, otherwise in parties of six to ten birds or singly in the mixed associations of tits, minivets, drongos and other species. Feeds mostly in the higher canopy, running along the boughs and hopping from branch to branch, exploring leaves and crevices and under the moss; or it works its way slowly up a tree, often hopping sideways along a branch or clinging on the trunk sideways like a nuthatch; 'having arrived at the top it may spend half an hour or more calling persistently before resuming its feeding on another tree' (Smythies). Often seen sitting and peering about in a curious short-sighted manner. A remarkably fearless bird, but sluggish in its movements and easily overlooked. Flight jerky, dipping with weak and hurried wing-beats.

FOOD. Beetles, caterpillars and other insects, seeds and berries.

VOICE AND CALLS. A harsh, grating call like the 'churring' of a shrike uttered now and again 10 or more times in quick succession while foraging, varied occasionally by a loud quick-repeated *kekew-kekew*, 3 or 4 times. Each is usually prefaced by a subdued *tik*, audible only at close range. In timbre and cadence this call is strangely reminiscent of the 'wailing' of a domestic chicken that has got separated from its mother hen! Song loud and far-carrying, rendered as *cha-cher, cha-cha-chip* and *cha-wip-chip-chip* (Smythies). Song period in Nepal: February to June (Proud).

BREEDING. Season, April to June. Nest, a loosely made cup of rootlets, fibres and a few twigs, coated on the outside with moss and lichen, lavishly plastered with cobwebs and lined with rootlets. Suspended hammock-wise (like an oriole's nest) in a horizontal fork toward the extremity of a branch, very high up near the top of trees. Extremely difficult to find. Eggs, 2 to 4, pinkish white, profusely marked with tiny flecks and spots of purple-brown, forming a ring around the large end. Variable in size between c. 24 x 19 and 21 x 16 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters and Key to the Species. For details of plumage see Baker, loc. cit.

Young male: head grey tinged fulvous; post-ocular streak as in adult; lores, under eye and ear-coverts dark grey. Mantle olive-brown; upper tail-coverts greenish olive. Wings and tail as in adult but lesser, median and greater coverts edged yellowish white, tips of tail yellow. Female differs from adult female in having the head grey-brown like the mantle; ear-coverts dark slate-grey.

Postjuvinal moult involves body, lesser, median and inner half of greater coverts. First-winter birds recognized by remains of edging on the outer greater coverts.

74

TIMALIINAE

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	85-90	20-22	29-31	(75) 80-84 mm
♀♀	86-89	20	32 (1)	79-85 mm

Weight 7 ♂♂ 44-48; 2 ♀♀ 42, 44 g (SDR, SA).

COLOURS OF BARE PARTS. Variable. Iris grey to blue-grey (brown in one ♀); orbital skin grey. Bill: upper mandible black, lower pale grey to blue-grey, pale flesh to grey at tip. Legs and feet pale pinkish brown to chocolate-brown or fawn colour; claws brown to chocolate or grey-brown; soles yellow (one grey) (Stanford).

1341. Redwinged Shrike-Babbler. *Pteruthius flaviscapitis validirostris* Koelz

Lanius erythropterus Vigors, 1831, Proc. Zool. Soc. London: 22 (Himalaya Mountains = Murree, Punjab, vide Baker, 1922, 'Fauna' 1: 331), *not Lanius erythropterus* Shaw, 1809, preoccupied

Pteruthius erythropterus validirostris Koelz, 1951, Jour. Zool. Soc. India 3: 28 (Kohima Naga Hills, Assam)

Pteruthius erythropterus nocereus Koelz, 1952, Jour. Zool. Soc. India 4: 40 (Tura Mountain, Garo Hills)

Pteruthius validirostris riptigi Biswas, 1960, Bull. Brit. Orn. Cl. 80: 106. New name for *Lanius erythropterus* Vigors, preoccupied
Baker, FBI No. 354, Vol. 1: 331
Plate 80, fig. 8

LOCAL NAME. *Dao-kranji* (Cachari).

SIZE. Myna —; length c. 16 cm (6½ in.).

FIELD CHARACTERS. Male. A stocky short-tailed black and white arboreal bird with chestnut in wings.

Above, head black with a white post-ocular stripe; back ashy grey. Wings black tipped with white, the inner secondaries chestnut. Inner edge of primaries white, conspicuous in flight. Tail black, short. Below, pale ashy, nearly white, the lower flanks vinous brown.

Female. Above, head grey, back brownish grey. Outer edge of folded wing yellowish green tipped white, the inner secondaries chestnut. Central rectrices green, outer blackish tipped yellow. Underparts pale buff.

The chestnut inner secondaries distinguish both sexes. In flight white inner edges to the primaries flash, combining with the underside to give the bird a very white appearance.

76

Pteruthius [sic] xanthochlorus [sic] occidentalis Harington, 1913, Bull. Brit. Orn. Cl. 33: 82 (Dehra Dun)
Baker, FBI No. 359, Vol. 1: 336

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 13 cm. (5 in.).

FIELD CHARACTERS. Male. Above, head grey. Back olive-green. Closed wing greenish with blackish shoulder-patch and a faint, pale wing-bar. Tail with narrow white tip. Below, throat and breast pale ashy; belly yellow. Female slightly duller than male.

STATUS, DISTRIBUTION AND HABITAT. Uncommon resident, subject to some vertical movements. The Himalayas from Murree to western Nepal (Doti district, Fleming, JBNHS 65(2): 331, 1968). Breeds between 1800 and 3000 m, optimum zone 2100-2700 m. Descends in winter to 1200 m but is however regularly seen at this season up to at least 2400 m. Affects forests of oak, spruce, hemlock (*Tsuga*) and deodar.

GENERAL HABITS. Strictly arboreal. A quiet and inconspicuous little bird usually found in groups of two to four in the mixed hunting parties of tits, leaf warblers and tit-babblers, among whom it is easily overlooked.

Often looks deceptively like some leaf-warbler in such a mixed gathering but does not droop or nervously flick wings in the characteristic phylloscopine manner. Distinguished also by comparatively sluggish movements and stiff, upright carriage. Frequent the tops of trees where it hops from twig to twig; also descends to the undergrowth. Often perches along a branch instead of across it, and may sometimes be seen clinging to tree-trunks or creeping along a branch like a nuthatch.

FOOD. Insects (ants, beetles, etc.), berries and seeds.
VOICE and CALLS. Usually very silent. Call, a quick-repeated single note *whit*. For description of song, see 1344.

BREEDING. *Season*, April to August. *Nest*, a deep purse-shaped structure, flimsy and fragile-looking, made of fine fibres and hair-like lichen bound together with cobweb, lined with rootlets and exteriorly decorated with a few flakes of lichen. Suspended hammock-wise in the fork of a small branch by means of cobweb, from about half a metre to 5 m above the ground. *Eggs*, 2 to 4, cream-coloured with blotches of red-brown mostly in a zone at the large end. Average size of 34 eggs 18.4 × 13.7 mm (Baker).

MUSEUM DIAGNOSIS. Like nominate race (1343) but whole crown and nape ashy grey and underparts paler.

Young, as adult but upperparts duller, more olive-brown; grey of head and face not differentiated from upperparts. Underparts paler. Greater and median coverts tipped yellow. Postjuvinal moult involves body, lesser, median and inner greater coverts. First-winter birds distinguished by pale tips of unmoulted greater coverts.

MEASUREMENTS. As in 1343.

COLOURS OF BARE PARTS. Iris grey-brown. Bill blue-grey, pale at tip. Legs and feet fleshy grey.

1343. Eastern Green Shrike-Babbler. *Pteruthius xanthochlorus xanthochlorus* Gray

Pteruthius xanthochlorus Gray, 1846, Cat. Mamm. Bds. Nepal: 95, 155 (Népal)
Baker, FBI No. 358, Vol. 1: 335
Plate 80, fig. 5

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. As in 1342 but crown blackish in male, grey in female.

STATUS, DISTRIBUTION and HABITAT. Resident, locally common, subject to some vertical movements. The eastern Himalayas from central Nepal east through Darjeeling, Sikkim and Bhutan into NEFA (Tawang, and probably through the Agency). Affects deciduous or coniferous forest, from 2100 to 3000 m at all seasons, probably descending lower in winter. Recorded at Tawang [27°33'N., 91°48'E.] 3600 m (Whistler MS.; date not given but probably in summer).

GENERAL HABITS and FOOD. As in 1342, q.v.

VOICE and CALLS. As in 1344.

BREEDING. *Season*, chiefly May and June. *Nest*, as in 1342 but apparently somewhat higher — three to eight metres above the ground. *Eggs*, 3 or 4, variable in colour though typical of the genus in character. For details see Baker (*Nidification* 1: 313). Average size of 15 eggs 18.8 × 14.7 mm.

MUSEUM DIAGNOSIS. See Key to the Subspecies. For details of plumage see Baker, loc. cit.

1345. Chestnut-throated Shrike-Babbler. *Pteruthius melanotis melanotis* Hodgson

Pteruthius melanotis Hodgson, 1847, Jour. Asiat. Soc. Bengal 16: 448 (Terai, Southeast Himalayas = Nepal *sic* Gadow, 1883, Cat. Bds. Brit. Mus. 8: 118)
Pteruthius melanotis melanotis Koelz, 1952, Jour. Zool. Soc. India 4: 40 (Kohima, Naga Hills)
Baker, FBI No. 356, Vol. 1: 333
Plate 80, fig. 7

LOCAL NAME. *Ku-er-pho* (Lepcha).

SIZE. Sparrow —; length c. 11 cm (4½ in.).

FIELD CHARACTERS. Male. *Above*, olive-green with yellow forehead and a grey nuchal collar. A conspicuous white eye-ring and a greyish white supercilium. Lores and round the eye black. A black crescentic line behind yellow ear-coverts. Wing grey with a broad black bar between two narrow white bars. Tail greenish and black with white outer rectrices and tips. *Below*, throat and upper breast chestnut, rest yellow.

Female, like male but head markings less distinct, black area around eye replaced by grey. Eye-ring conspicuous. Throat mostly buffish with cinnamon sides or moustache. Wing greenish, the broad black bar between two narrow salmon-rufous ones instead of white.

P. aenobarbus (1346) male has a chestnut forehead and lacks the black upright crescent on sides of neck. The female has a rufous forehead (v. yellow).

STATUS, DISTRIBUTION and HABITAT. Uncommon resident, subject to vertical movements. From central Nepal east through Darjeeling, Sikkim, Bhutan and NEFA to the Mishmi Hills; from c. 1800 to 2700 m, optimum zone 2100-2400 m, in winter between 700 and 2000 m. Also, more scarcely, Nagaland, Manipur and Assam in the Cachar and Khasi hills (not found in the Garo Hills where Koelz collected *aenobarbus*), south to the Chittagong Hill Tracts of East Pakistan, from 1200 m up to at least 2100 m. Affects humid but cool, deep evergreen forest in the more open parts (glades, stream-sides, etc.).

Extralimital. Extends east through Burma to northern Vietnam; another subspecies in the Malay Peninsula.

GENERAL HABITS. Entirely arboreal; frequents mostly the canopy of trees. In the non-breeding season found either singly, in pairs or in small groups usually in the large mixed roving parties of tits, leaf warblers and other small babblers, sivas, minlas and flycatchers such as *Rhipidura hypoxantha* and *Culicicapa*. Tends to be overlooked amongst these restless gatherings, but its comparatively sluggish movements, dumpy build and upright carriage unmask its identity.

FOOD. Insects (large green grasshoppers etc.).

VOICE and CALLS. Usually silent. Call-note, a pleasant *too-tweet, too-tweet* not often uttered unless the birds are separated (Baker).

BREEDING. *Season*, April to June. *Nest*, a flimsy but strong cup of ferns, the roots, twigs, bits of tendrils and lichen, strengthened with cobweb, the outside more or less covered with moss and lichen; lining, usually scanty,

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	60-64	12-13	20-23	45-49 mm
♀♀	58-64	12 (1)	22 (1)	45 (1) mm

(Rand & Fleming, Kinnear, SA, Stresemann)

Weight 2 ♂♂ 14, 14; 1 ♀ 15 g (SA).

COLOURS OF BARE PARTS. As in 1342.

1344. Chin Hills Green Shrike-Babbler. *Pteruthius xanthochlorus hybridus* Harington

Pteruthius [sic] pallidus hybridus Harington, 1913, Bull. Brit. Orn. Cl. 33: 82 (Mt Victoria, Chin Hills)
Not in Baker, FBI

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. As in 1343, but male with a conspicuous white eye-ring.

STATUS, DISTRIBUTION and HABITAT. Scarce resident. Nagaland and Assam in the Mizo Hills (specimens in the Koelz coll.). Affects primeval deciduous forest with dense undergrowth.

Extralimital. The Chin Hills of Burma. The species extends to western Szechuan, southeastern Yunnan and northwestern Fukien.

GENERAL HABITS. Described by Heinrich as a very restless bird found mostly in the undergrowth of forest.

FOOD. As in 1342.

VOICE and CALLS. The song is a rapid, monotonous repetition of a single note reminding one very much of the song of *Stachyris chrysaea* (1212) although not so full and melodious, without any pause between the first and the following notes (Heinrich). Call-note, a single *whit* (Stanford).

BREEDING. Unrecorded.

MUSEUM DIAGNOSIS. Differs from the nominate race (1343) in having a white ring round the eye; head not so dark; sides of neck and flanks paler yellow.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	59-63	11	20-21	45-48 mm
♀♀	59-64	11	19	44-48 mm

(HW, Heinrich)

COLOURS OF BARE PARTS. Iris red-brown. Bill black, lower mandible slaty grey. Legs and feet brown to smoke-brown.

is of rootlets. The nest is suspended between forking horizontal twigs between c. 2 and 5 metres from the ground. *Eggs*, 4 or 5, occasionally 2 or 6, normally pale lilac-white or pale cream stippled with purplish brown or light rufous, especially around the large end. Average size of 40 eggs 17.9 × 13.5 mm (Baker). Incubation by both sexes; period undetermined.

MUSEUM DIAGNOSIS. See Field Characters.

Young, ♂ and ♀ like adult ♀ but browner on upperparts; underparts paler. Postjuvinal moult of body and wing-coverts which then show the sexual distinction (HW).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	55-63	11-12	20-22	39-45 mm
♀♀	56-59	11-13	20-22	38-42 mm

(SA, Rand & Fleming, BB, SDR)

Weight 4 ♂♂ 10-15; 1 ♀ 14 g (SDR, SA).

COLOURS OF BARE PARTS. Iris brown (red-brown, grey in a spring bird — Stanford). Bill: upper mandible dark slate-grey, lower grey to pale flesh. Legs whitish brown to pale fleshy brown.

1346. Chestnutfronted Shrike-Babbler. *Pteruthius aenobarbus aenobarbulus* Koelz

Pteruthius aenobarbus aenobarbulus Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 9 (Nokrek, Garo Hills)
Baker, FBI No. 357, Vol. 1: 335 (= *intermedius*)
Plate 80, fig. 6

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 11 cm (4½ in.).

FIELD CHARACTERS. Male. *Above*, forehead chestnut; forecrown yellow; rest of upper plumage olive-green. A conspicuous white eye-ring surrounded by an incomplete black ring; a greyish white supercilium behind which a patch of grey (not forming a nuchal collar); ear-coverts yellow. Wing green with white outer edge and white tips to secondaries, and a large black shoulder-patch across which are two broad white bars. Outer rectrices black tipped white, the outermost white with a black streak near tip of outer web. *Below*, throat deep chestnut; rest of underparts yellow.

Distinguished from *melanotis* mainly by the chestnut forehead (v. yellow) and absence of the crescentic black patch on side of neck.

Female, forehead rufous-chestnut; no black round white eye-ring; shoulders olive-green with two salmon-buff bars. Throat pale ochraceous; rest of underparts greyish white with a tinge of yellow. Distinguished from female *melanotis* by same characters as male.

STATUS, DISTRIBUTION and HABITAT. Known only from the type specimen collected by Koelz in the Garo Hills, Assam. Altitude not given. Affects fairly open forest and edges of evergreen.

Extralimital. The species extends east to Vietnam and Kwangsi, and south through the Malay Peninsula and Java.

BABBLERS

81

GENERAL HABITS. Similar to those of *melanotis*; seems to frequent lower trees and bushes.

FOOD. Insects.

VOICE and CALLS. Unrecorded.

BREEDING. Season, probably April and May; Koelz reports his specimen of 7 March as 'breeding male'. Nest and eggs not recorded in detail but appear to be similar to those of *melanotis*. Average size of 9 eggs 18.5 x 13.3 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters. Differs from *intermedius* of Burma in having the brown of throat much restricted, not descending over the breast, but sharply defined as a throat-patch. Yellow of forehead deeper; upperparts more yellow, less green (Koelz).

MEASUREMENTS and COLOURS OF BARE PARTS. Unrecorded.

Genus *GAMPSORHYNCHUS* Blyth

Gampsorhynchus Blyth, 1844, Jour. Asiat. Soc. Bengal 13 (1): 370.

Type, by monotypy, *G. rufulus* Blyth

Tail longer than wing, much graduated. Bill about half the length of head; upper mandible curved at tip. Rictal bristles very long and stiff.

1347. Whiteheaded Shrike-Babbler. *Gampsorhynchus rufulus rufulus* Blyth

Gampsorhynchus rufulus Blyth, 1844, Jour. Asiat. Soc. Bengal 13 (1): 371

Regional Exploration, No. 1: 4 (Nichuguard, Naga Hills)

Baker, FBI No. 232, Vol. 1: 231

Plate 78, fig. 1

LOCAL NAMES. *Gungto-phet-pha* (Lepcha); *Daphlantu-tiba* (Cachari).

SIZE. Bulbul +; length c. 23 cm (9 in.).

FIELD CHARACTERS. Whole head, nape, a shoulder-patch, throat, breast and belly white, the latter washed with buff. Under tail-coverts buff. Rest of plumage olive-brown, wing with buff inner edge. Tail strongly graduated and tipped with buff. Sexes alike.

Young (immature) has light chestnut head and breast.

STATUS, DISTRIBUTION and HABITAT.

Resident, generally common. The base of the hills from eastern Nepal (specimens in Brit. Mus.) through Darjeeling, Sikkim, N. Bengal (Jalpaiguri dist., Bhutan, and NEFA to the Mishmi Hills; Nagaland, Manipur and the hills of Assam south to the Chittagong region of East Pakistan; from the edge of the plains to c. 1200 m. Affects secondary growth, bamboo, bush and grass jungle and undergrowth in evergreen forest in broken foothills country.

1348. Himalayan Barwing. *Actinodura egertoni egertoni* Gould

Actinodura Egertoni Gould, 1836, Proc. Zool. Soc. London: 18 (Nepal)

Baker, FBI No. 321, Vol. 1: 303

Plate 78, fig. 4

LOCAL NAME. *Ramio-pha* (Lepcha).

SIZE. Bulbul +; length c. 23 cm (9 in.).

FIELD CHARACTERS. Above, forehead rufous; loose, mop-like ashy brown crest, and ear-coverts paler. Back and rump rufous-brown. Wing narrowly cross-banded, a black patch within a large rufous patch, and a pale outer edge. Tail strongly graduated, rufous-brown, narrowly cross-banded, each feather tipped white. Below, chin rufous, throat and breast pinkish brown; rest of underparts tawny olive, centre of belly white. Under surface of tail dark grey with white spots. Sexes alike.

May be mistaken for *Garrulax lineatus* but distinguished by barred wings. *Actinodura nipalensis* and *A. waldeni* have a darker crown and black tail.

STATUS, DISTRIBUTION and HABITAT. Common resident. The Himalayas from central Nepal (Biswas, JBNHS 59: 220; Stevens *et al.* Baker, *Nidification* 1: 281), east through Darjeeling, Sikkim, Bhutan and NEFA to the Miri Hills. Breeds from 1200 to at least 2000 m (2400 m, Osmaston *et al.* Baker); recorded in winter from 1000 to 1800 m and around Buxa duars (W. Bengal). Affects dense secondary growth and mixed trees-and-scrub in evergreen forest.

GENERAL HABITS. Keeps in pairs during the breeding season, otherwise in small slow-travelling parties of six to twelve, usually not associating with other species though sometimes found in company of sibilas and laughing thrushes whose habits and behaviour are very similar. Frequents dense thickets, bushes and low trees, occasionally the high canopy, clambering about and poking into holes and crannies, and foraging about amongst clumps of orchids and other epiphytes, at times clinging upside-down like a tit or fluttering in front of a sprig. Dives into undergrowth when alarmed. Pairs form in the latter half of April.

FOOD. Mainly insects (grasshoppers, ants, etc.); also berries, figs and seeds.

VOICE and CALLS. A feeble conversational *chee* constantly uttered while feeding (SA). For description of song see 1351.

BREEDING. Starts, April to July. Nest, cup-shaped, made of fern, bamboo or other dead leaves held together with fibrous roots, coated exteriorly with green moss and lined with rootlets; amount and proportion of each material

82

TIMALIINAE

Extralimital. Burma. The species extends east to Vietnam and south through the Malay Peninsula.

GENERAL HABITS. Arboreal, gregarious and noisy. Keeps in parties up to fifteen, often in association with wood shrikes, drongos, scimitar babblers and others in thick shrubbery and clumps of bamboo. Usually tame and inquisitive. More active on the wing than most Timaliidae. General appearance, flight and behaviour reminiscent of the bulbuls.

FOOD. Insects; berries (?).

VOICE and CALLS. A weird, grating *kaw-ka-yark* (Smythies), and a variety of calls incessantly uttered.

BREEDING. Season, end of April to August, chiefly May. Nest, a shallow flimsy saucer of dead leaves, twigs, roots and lichen bound together with roots and tendrils, plastered with cobweb, and lined with fine grass and rootlets. Placed in bushes a couple of metres from the ground. The species appears to move into deeper evergreen forest for breeding purposes. Eggs, 3 or 4, of two types: pale green with blotches of dark brown and secondary markings of dull grey scattered over the whole surface but more numerous at the larger end; or pale dull reddish with primary markings of reddish brown. Except for size, they resemble the eggs of *Pellorneum albiventre* (1164). Average size of 20 eggs 29.9 x 17.6 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters. For details of plumages see Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	90-100	20-21	26-31	110-120 mm (Baker, SA)

Weight 1 ♂ 57 g (SDR).

COLOURS OF BARE PARTS. Iris yellow ('orange-straw' — SA). Bill plumbeous, paler on lower mandible. Legs, feet and claws flesh; soles yellowish.

Genus *ACTINODURA* Gould

Actinodura Gould, 1836, Proc. Zool. Soc. London: 17.

Type, by original designation, *Actinodura Egertoni* Gould

Sibia Hodgson, 1836, Asiat. Res. 19: 145. Type, by monotypy, *Sibia*?

Nipalensis = *Cinclosoma*? *Nipalensis* Hodgson

Irops 'Hodgson' = Blyth, 1843, Jour. Asiat. Soc. Bengal 12: 929, 953.

Type, by monotypy, *Cinclosoma Nipalense* Hodgson = *Sibia Nipalensis* Hodgson

Bill about half the length of head. Rictal bristles long; chin feathers with hair-like tips. Wing feathers narrowly cross-banded. Tail graduated, considerably longer than wing.

Key to the Species

84

TIMALIINAE

varies in different nests. Placed in bushes or small trees from one to six metres above the ground. Eggs, 3, or sometimes 4, pale blue, marked all over with dark brown blotches, spots, loops, whorls and fine lines. Many eggs very similar to those of *Garrulax phoeniceus* (1332). Average size of 25 eggs 22.9 x 17.7 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Subspecies. For details of plumage see Baker, loc. cit.

Young, like adult but crown brown instead of ashy brown; underparts more uniformly ochraceous brown, no white on belly.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♀	79-90	17-19	29-33	93-115 mm (SA, Stresemann)

Weight 2 ♂♂ 33, 37; 2 ♀♀ 33, 36 g (SA).

COLOURS OF BARE PARTS. As in 1349.

1349. Mishmi Barwing. *Actinodura egertoni levisi* Ripley

Actinodura egertoni levisi Ripley, 1948, Proc. Biol. Soc. Washington 61: 105

(Drey, Mishmi Hills)

Not in Baker, FBI

LOCAL NAME. None recorded.

SIZE. Bulbul +; length c. 23 cm (9 in.).

FIELD CHARACTERS. As in 1348, q.v.

STATUS, DISTRIBUTION and HABITAT. Common resident. NEFA in the Mishmi Hills (Ali & Ripley, JBNHS 48: 28; Baker, *Records Ind. Mus.* 8: 263), probably intergrading with *egertoni* in the Abor Hills. Affects scrub jungle and dense shrubbery in evergreen forest.

GENERAL HABITS, FOOD and VOICE. As in 1348.

BREEDING. Unrecorded; probably as in 1348.

MUSEUM DIAGNOSIS. Differs from *egertoni* (1348) in having pronounced dark edgings on a very grey head, in having more dark grey wash on the neck, a darker back, and a tendency to broader striping on the tertaries. Differs from *khasiana* in being darker and not having the pronounced barring on the central rectrices. Differs from *riptoni* in being much darker, more rufous brownish on the back and more rufous on tail.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
4 ♂♂	81-90	20	29-31	104-116 mm
8 ♀♀	81-91	19-20	29-31	101-111 mm (MD)

COLOURS OF BARE PARTS. Iris brownish grey. Bill: upper mandible brown, lower mandible yellow at base, fleshy at tip. Legs and feet brownish flesh.

BABBLERS

(Khasia Hills)

Actinodura egertoni montivaga Koels, 1954, Contrib. Inst.
Regional Exploration, No. 1: 7 (Kohima, Naga Hills)
Baker, FBI No. 322, Vol. 1: 304

LOCAL NAMES. *Nya-si, Kō-yu* (Naga).

SIZE. Bulbul +; length c. 23 cm (9 in.).

FIELD CHARACTERS. As in 1348, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident. Assam in the Khasi and Cachar hills, Nagaland and Manipur. Breeds between c. 1200 and 2200 m. Affects dense evergreen forest, scrub jungle and secondary growth.

GENERAL HABITS, FOOD AND VOICE. As in 1348.

BREEDING. As in 1348. Average size of 100 eggs 23.4 × 17.7 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *lewisi* (1349) in being pale and having more pronounced barring on central rectrices. Differs from *egertoni* (1348) in having the crown browner, less ashy and not so contrasting with mantle, the rufous of forehead paler and not extending to the crown; back, rump and upper tail-coverts more ochraceous; central rectrices more distinctly barred.

MEASUREMENTS. As in 1349.

Weight 3 ♂♂ 38 (3); 1 ♀ 35 g (SDR).

COLOURS OF BARE PARTS. As in 1349.

1351. Mizo Barwing. *Actinodura egertoni ripponi* Ogilvie-Grant

Actinodura ripponi Ogilvie-Grant, 1907, Ibis: 186

(Mt Victoria, Chin Hills, 6000-7000 feet)

Baker, FBI No. 323, Vol. 1: 305

LOCAL NAMES. None recorded.

SIZE. Bulbul +; length c. 23 cm (9 in.).

FIELD CHARACTERS. As in 1348, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to some vertical movements. Assam in the Mizo Hills. Altitudinal distribution undetermined here, but in the Chin Hills breeds above 1500 m and on Mt Victoria between 2000 and 2600 m; descends in winter to 1200-1800 m, some straying down to the foothills. Affects high bushes and low trees in dense, shady, primeval forest.

Extralimital. Southwestern Burma.

GENERAL HABITS AND FOOD. As in 1348.

VOICE AND CALLS. The song consists of a three-noted whistle reminding one of the notes of the Grey Tit but louder and sharper, rendered as *ti-ti-ti*, the first note accentuated, the last lower (Heinrich).

BREEDING. Mostly April and May. Nest and eggs as in 1348. Average size of 30 eggs 22.6 × 17.4 mm (Baker).

MUSEUM DIAGNOSIS. Like *khasiana* (1350) but crown dark grey; back, rump and upper tail-coverts olive-brown.

BABBLERS

87

Actinodura nipalensis and *A. waldeni*

Distributional ranges

▨ *A. n. nipalensis* (1352) ▨ *A. n. vinctura* (1353) ▨ *A. w. dalensis* (1354).
▨ *A. w. waldeni* (1355) ▨ *A. w. polioptila* (1356).

FOOD. Mostly insects (beetles, caterpillars, etc.); also gastropods, berries, seeds, nectar, flower-buds and moss.

VOICE AND CALLS. A whistle *tui whee-er* very like that of the Streaked Laughing Thrush (Proud). Alarm, a loud, rapid *je-je* . . . repeated eight or ten times (Fleming).

BREEDING. Little known. Season, May and June. Nest, a neat, compact cup, rather small for the size of the bird, made of fine grass bents with some lichen and moss on the exterior, lined with rootlets. One nest was reported to be placed on a sapling. Eggs, apparently 2, pale pinky white marked with bold blotches of reddish brown and secondary blotches of inky grey, forming a well-defined ring at the large end. Two eggs measured 27.1 × 18.7 and 25.2 × 18.8 mm (Baker).

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Young, as adult. Primary and tail characters of juvenal *timaliinae* not present.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	90-96	21-22	c. 31	82-84 mm
♀♀	83-97	21-22	—	77-80 mm

Weight 5 ♂♂ 44-48; 5 ♀♀ 39-45 g (GD).

COLOURS OF BARE PARTS. Iris brown. Bill dark brown. Legs and feet fleshy to greyish brown or brown.

86

TIMALIINAE

MEASUREMENTS

Wing 10 ♂♂ 86-93; 3 ♀♀ 83-90 mm (Heinrich)

Tail ♂♂ 113-122 mm (Ticehurst)

COLOURS OF BARE PARTS. Iris olive-yellow; orbital skin grey-green. Bill brown, yellow at gape. Legs and feet grey-brown.

ACTINODURA NIPALENSIS (Hodgson)

Key to the Subspecies

Black band on tail over 20 mm wide *A. n. vinctura*
Black band on tail under 20 mm wide *A. n. nipalensis*

1352. Nepal Hoary Barwing. *Actinodura nipalensis nipalensis* (Hodgson)

Cinclosoma? Nipalensis Hodgson, 1836, Asiat. Res. 19: 145

(Nepal, restricted to slopes of Kathmandu Valley, central Nepal, by Ripley)

Baker, FBI No. 326 (part), Vol. 1: 307

Plate 78, fig. 2

LOCAL NAMES. None recorded.

SIZE. Bulbul; length c. 20 cm (8 in.).

FIELD CHARACTERS. Above, forehead and loose mop-like crest dark brown with pale shaft-streaks. A pale eye-ring. Ear-coverts grey. Moustachial stripe black. Back and rump rufous-brown. Wing rufous, narrowly barred with black; a black shoulder-patch (primary-coverts) and a grey patch above it (tips to secondary-coverts). Tail graduated; central rectrices narrowly barred, terminal third and outer rectrices black, the latter tipped with white. Throat and breast grey, lower belly and under tail-coverts rufous-brown. Sexes alike.

A. waldeni is very similar but has the underparts entirely rufous-brown. *A. egertoni* is distinguished by the longer tail, rufous breast, white centre of belly, lack of grey patch on wing and lack of black on upper surface of tail.

STATUS, DISTRIBUTION AND HABITAT. Common resident. Western and central Nepal from 1800 to 3300 m; probably does not breed at the lower levels of this zone. Not recorded below 1800 m even in winter. Affects the upper oak forest and mixed oak, conifer and rhododendron with plenty of undergrowth.

GENERAL HABITS. Arboreal. Keeps in small parties of three to ten in company with yuhinas, sivas and sibilas. Frequents mostly the upper branches of middle-sized trees, feeding chiefly on insects concealed in the mossy growth adhering to trunks and branches. May be seen hopping swiftly up a tree-trunk or feeding while clinging to it. Occasionally descends to or near the ground.

TIMALIINAE

1353. Eastern Hoary Barwing. *Actinodura nipalensis vinctura* Ripley

Actinodura nipalensis vinctura Ripley, 1950, Proc. Biol. Soc. Washington 63: 104

(Mangalbari, Dankuta District, east Nepal)

Baker, FBI No. 326 (part), Vol. 1: 307

LOCAL NAME. *Ramnio-pho* (Lepcha).

SIZE. Bulbul; length c. 20 cm (8 in.).

FIELD CHARACTERS. As in 1352, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident. Eastern Nepal from the Okhaldunga district east through Darjeeling, Sikkim and Bhutan; from 2100 to at least 3000 m at all seasons. Affects evergreen forests of oak, fir, rhododendron with dense undergrowth of ringal bamboo, *Rubus*, etc.

GENERAL HABITS, FOOD AND VOICE. As in 1352.

BREEDING. As in 1352.

MUSEUM DIAGNOSIS. Differs from the nominate race (1352) chiefly by the wider black terminal band on upper surface of tail.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
3 ♂♂	89-94	19-21	31-34	85-88 mm
4 ♀♀	83-88	19-23	29-34	79-84 mm (SA)

18 ♂♂ 86-94 mm (Stresemann)

Weight 2 ♂♂ 44, 46; 3 ♀♀ 39-44 g (SA).

COLOURS OF BARE PARTS. As in 1352.

ACTINODURA WALDENI Godwin-Austen

Key to the Subspecies

Throat and breast grey, streaked with rufous-brown . . . *A. w. dalensis*
Throat and breast tawny brown with fulvous streaks . . . *A. w. waldeni*

1354. NEFA Barwing. *Actinodura waldeni dalensis* Godwin-Austen

Actinodura dalensis Godwin-Austen, 1875, Ann. Mag. Nat. Hist. 16: 340
(Dafia Hills, NE. Bengal)

Baker, FBI No. 329, Vol. 1: 309

LOCAL NAMES. None recorded.

SIZE. Bulbul; length c. 20 cm (8 in.).

FIELD CHARACTERS. Above, very similar to *A. nipalensis* but crown-feathers a darker brown with pale edges, giving the crown a scalloped aspect. Rest of upperparts as in *nipalensis*. Moustachial stripe and ear-coverts paler, streaked with whitish. Below, grey with rufous-brown streaks on throat and breast (*A. nipalensis* has plain grey underparts). Sexes alike.

Distinguished from *A. egertoni* by the shorter tail, black on its upper surface terminal half, and by the lack of white on belly.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to some vertical movements. NEFA from the Dafia Hills to the Mishmi Hills; from

BABBLERS

89

c. 2400 to 3300 m in summer, descending to c. 1500 m in winter. Affects mossy evergreen and mixed forest.

Extralimital. Southeastern Tibet in the Pachakshiri area.

GENERAL HABITS AND FOOD. As in 1355.

VOICE AND CALLS. As in 1355.

BREEDING. Unknown; presumably as in *nipalensis* (1352).

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS AND COLOURS OF BARE PARTS. As in 1355.

1355. Manipur Barwing. *Actinodura waldeni waldeni* Godwin-Austen

Actinodura waldeni Godwin-Austen, 1874, Proc. Zool. Soc. London: 46, pl. 12 (Japoo Peak, Naga Hills)

Baker, FBI No. 327, Vol. 1: 308

Plate 78, fig. 5

LOCAL NAMES. None recorded.

SIZE. Bulbul; length c. 20 cm (8 in.).

FIELD CHARACTERS. As in 1354, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident, probably subject to some vertical movements. Manipur, Nagaland and adjacent north Cachar (Baker, JBNHS 8: 203); from 2200 m up in summer. Affects shady moss forest in steep valleys.

Extralimital. The subspecies *saturation* is found in northeastern Burma and northwestern Yunnan; the subspecies *poliotis* (1356) with deep rufous or maroon-brown upperparts and dark grey ear-coverts is found in the Chin Hills of Burma and may occur in the Mizo Hills.¹

GENERAL HABITS do not differ from those of *A. nipalensis* (1352). Usually seen clambering about mossy trunks, pulling the moss to pieces and feeding on the insects it harbours. Generally keeps to medium heights in trees but does not shun low bushes. Actions somewhat phlegmatic; remarkably tame and unperturbed by the presence of man.

FOOD. As in 1352.

VOICE AND CALLS. Call-note, a soft *chup, chup*; also a mewling note and a *churr* (Smythies).

BREEDING. Unknown; presumably as in *A. nipalensis* (1352).

MUSEUM DIAGNOSIS. Differs from *dafiensis* (1354) in being paler above with the chestnut brighter; underparts entirely tawny brown with paler, fulvous streaks on throat and breast.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	89-97	21	31	79 mm
♀♀	86-99	22	32	75 mm

(Wing SDR. Bill, tarsus, tail 1 ♂, 1 ♀, MD)

Weight 10 ♂♂ 39-56; 8 ♀♀ 41-53 g (SDR).

COLOURS OF BARE PARTS. Iris brownish grey. Bill dark brown. Legs and feet brown.

¹ Omitted here for want of any definite record within Indian limits. It is rare on Mt Victoria.

BABBLERS

91

branches, clinging upside down and sideways to the sprigs and working through the foliage in the manner of tits, but slower in its movements. Sometimes makes short hopping or sidling spurts along the moss-covered trunks and branches like a creeper or nuthatch; searching methodically for insects under the moss and lichen.

FOOD. Chiefly insects and their larvae; also seeds.

VOICE AND CALLS. A peculiar, rattling, shrill *tri-krō... tschitsa... tri-krō* (Heinrich). A high-pitched *ui-ui-ui*; a loud *chik* repeated seven or eight times; a frequent, high-pitched *tsi... tsi*; a high-pitched *chitititit*; a tit-like *whi-whi-te-rik-rik*; song, some loud, ringing notes: *tuiyi-tuiyuu*... (Lister; for more details see JBNHS 52: 32).

BREEDING. Little known. *Season*, May and June. *Nest*, a rather deep cup of moss and rootlets, lined with hair and rootlets, and placed in the fork of 'some bushy tree at no great height from the ground' (Hodgson). *Eggs*, 2 to 4, pale blue, marked with specks and tiny spots of black or reddish brown, generally forming a ring around the large end. Average size of 12 eggs 19.4 × 14.4 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters. For details of plumages see Baker, loc. cit.

Young, like adult female but mantle slightly darker and white parts of plumage not so pure.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	63-70	12-14	20-22	52-58 mm
♀♀	59-66	12-14	19-21	51-58 mm

(SA, Rand & Fleming, Kinnear, Mayr)

Weight ♂♂ 12-16; ♀♀ 11-16 g (SDR, GD, SA). 5 ♂♂ 13-18 g (SA).

COLOURS OF BARE PARTS. Iris brown to pale yellow. Bill blackish brown, plumbeous on lower mandible. Legs, feet and claws olive-brown; soles yellow.

(Central and northern regions of the hills, Nepal)

Baker, FBI No. 377, Vol. 1: 355

Plate 80, fig. 12

LOCAL NAMES. *Minla* (Nepal); *Megblim-ayens*, *Megblim-adam* (Lepcha); *Pobhum dasin* (Dafia).

SIZE. Sparrow; length c. 14 cm (5½ in.).

FIELD CHARACTERS. Male. *Above*, head black with a long, white supercilium from lores to nape. Back chocolate-brown. Wings black with white tips and crimson outer edge. Tail black with crimson outer edge and tip; a white patch at base. *Below*, chin and throat whitish, rest pale yellow.

Female, like male but back olive-brown, red on wings and tail and yellow of underparts paler. When flitting high up in tall trees, the tail looks comparatively long and narrow, reminiscent of Redheaded Tit (1819).

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to marked vertical movements. From central Nepal east through Darjeeling, Sikkim, Bhutan and NEFA; also Assam in Cachar and Khasi (?) hills, Nagaland and Manipur, south to the Chittagong region in E. Pakistan. From 1800 to 3100 m, locally up to 3400 m (Nepal—Diesslhorst) and perhaps as low as 1350 m (Sikkim—Stevens). Winters mostly below 1800 m (but recorded at 2400 m) and commonly reaches the foothills and duars (e.g. Buxa—Inglis, JBNHS 26: 990). Affects humid, dense forest, mixed, deciduous or evergreen, in the breeding season being most common in oak and arborescent rhododendron forest.

Extralimital. The species extends to southeastern Szechuan, Kwangsi and northern Vietnam.

GENERAL HABITS. Arboreal, sociable, and very similar to those of its congeners. Usually found in parties, sometimes of considerable size, with yuhinas, shrike-babblers, tits, sunbirds, etc. Frequents tree-tops and higher

TIMALIINAE

92

FIELD CHARACTERS. As in 1359, q.v.

STATUS, DISTRIBUTION AND HABITAT. Fairly common resident, subject to vertical movements. The western Himalayas from Kangra to western Nepal (Fleming, *Fieldiana* 53: 175). Breeds from 2100 m (Kangra) and 2400 m

Minla strigula

simlaensis (1358).

strigula (1359).

yunnanensis (1360).

cinereigula (1361).

(Garhwal) up to 3600 m. Winters between 1300 and 2250 m. Affects open forest of birch, willow, barberry, etc., oak and rhododendron scrub or other low bushes; in winter frequents bushes in heavy jungle.

GENERAL HABITS AND FOOD. As in 1359.

VOICE AND CALLS. A distinctive, varied combination of *pip* and *peep* (HW). In the breeding season, a melancholic whistle of three notes uttered somewhat slowly and deliberately at equal intervals, the last note lower (Osmaston); see also No. 1359.

BREEDING. As in 1359. Average size of 12 eggs 20.4 × 15.3 mm (Baker).

MUSEUM DIAGNOSIS. Like *strigula* (1359) but crown paler; back with variable amount of grey; chestnut on tail confined to basal half and rather paler.

MEASUREMENTS AND COLOURS OF BARE PARTS. As in 1359.

Plate 80, fig. 9

LOCAL NAME. *Megblim* (Lepcha).

SIZE. Sparrow; length c. 14 cm (5½ in.).

BABBLERS

93

FIELD CHARACTERS.

x c. 1

Above, crown orange-brown, slightly tufted. A pale yellow eye-ring and post-ocular stripe. Ear-coverts grey. Back greyish olive. Closed wing with a bright orange outer edge, a black shoulder-patch; secondaries pale ashy and black, tipped with white. Tail black, partly chestnut on the basal half, edged and tipped with bright yellow. *Below*, chin orange; throat whitish narrowly barred with black; a black malar stripe. Rest of underparts including under surface of tail yellow. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical movements. From west-central Nepal east through Darjeeling, Sikkim and Bhutan. Breeds between 1800 and 3600 m, chiefly in the subalpine forest at timber-line. Winters mostly between 1300 and 2700 m [recorded as low as 800 m (Meinertzhagen) and as high as 3700 m (Schäfer) in Sikkim during the cold season]. In the breeding season, affects mostly subalpine oak and rhododendron forest. In winter it is met with in pine, mixed forest, bamboo and scrub jungle.

GENERAL HABITS. Arboreal. Keeps in restless parties of six to twenty individuals, usually in the mixed itinerant bird associations, often with Redtailed Minlas and Bluewinged Sivas, hunting actively in the higher bushes and crowns of medium height trees, in the same niche as *Tuhina-gularis*. The birds run or slide up branches and hanging creepers with the agility of a mouse, and 'flow' in waves from tree to tree. Sometimes they may be seen resting side by side on a twig, snuggled up in the manner of munias.

Display. 'The birds collect into flocks of fifteen to fifty birds, and these break up into pairs which all remain together in the same tree. The two birds of each pair sit very close together, tails on opposite sides of the branch and separated by at least six inches (15 cm) from the next pair. They then alternately bow and stretch their heads up to the fullest extent, the feathers of the head and neck fluffed out, all the time keeping up a continual churring note and a sweet whistle. They frequently reverse their positions on the branch, and both birds always do this at the same instant as if at a signal, so that they never both have their tails the same side of a branch even for a second. The whole performance is like an elaborate dance and will continue for an hour or more without a break. Each pair normally takes no notice of any other birds in the tree, but I have occasionally seen one bird leave its partner and commence to bow to the nearest bird of the next pair, this leading to much scuffling and disturbance. The three-noted song is not heard during this display which appears to be performed only collectively' (Proud, JBNHS 53: 59).

FOOD. In summer almost exclusively insects (caterpillars, beetles, etc.); berries and seeds are also taken in other seasons. Often visits rhododendron blossoms for nectar and insects.

VOICE and CALLS. Song, a loud, rather hoarse-sounding strophe, most often of four syllables, rendered as *ti-ti-ti-ti* (Diesselhorst) or *too-sweet-sweet*, the second note highest (Heinrich, Smythies). Another song is described

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 14 cm (5½ in.).

FIELD CHARACTERS. As in 1359, q.v.

STATUS, DISTRIBUTION and HABITAT. Resident, uncommon or rare. Western Nagaland (Mt Japvo) and presumably the adjacent region of northwestern Manipur, and Assam in the Khasi Hills above 1800 m (Godwin-Austen). Affects oak and rhododendron forest, and bamboo-and-scrub jungle.

GENERAL HABITS, FOOD and VOICE. As in 1359.

BREEDING. Not recorded; probably as in 1359.

MUSEUM DIAGNOSIS. Differs from *yunnanensis* in having a whitish eye-ring and whitish supercilium; sides of cheeks grey, mottled with whitish and dusky. Differs from *strigula* in being darker, more brownish orange on the crown and more olive brownish on back and having a greater area of chestnut on tail; eye-ring, supercilium and cheeks greyish rather than suffused with yellowish; chin colour less bright.

94

TIMALIINAE

as a jumble of sweet notes mingled with harsh squeaks and chirps uttered continuously for a minute or more. Song period in Nepal: March to July with a resumption in October (Proud). Call-note, a mellow *pe-ra-trip* and a louder *pe-eo*.

BREEDING. Season, end of April to July. Nest, a cup of grass, bamboo leaves, moss and birch bark, held together with thread-like *Umsa* lichen, and lined with hair, rootlets, pine needles, or fern stalks. Placed in bushes, usually within three metres from the ground. Eggs, normally 3, deep blue or blue-green (fading quickly if exposed to light), lightly spotted or freckled with black or pale red at the larger end. Average size of 10 eggs, 20.4 x 15.3 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Subspecies. For details of plumage, see Baker, loc. cit. Skins fade rapidly; some old skins lose all trace of yellow. Fresh specimens are much richer yellow.

Young, like adult but crown and mantle paler. Underparts paler, throat-barn less distinct.

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
		(from skull)		
♂♂	65-76	12-16	25-28	66-75 mm

Baker, FBI No. 333 (part) and 334 (part), Vol. 1: 313-14

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 14 cm (5½ in.).

FIELD CHARACTERS. As in 1359, q.v.

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical movements. NEFA from the Dafa to the Mishmi hills, Nagaland and Manipur? (Whistler MS.); from 1300 (winter) to 3600 m (summer). Affects forests of oak and rhododendron, bamboo and bushes.

Extralimital. Southeastern Tibet, western and northern Burma, Yunnan and northern Vietnam; other subspecies in northwestern Thailand and the Malay Peninsula.

GENERAL HABITS, FOOD and VOICE. As in 1359.

BREEDING. As in 1359.

MUSEUM DIAGNOSIS. Darker and more slaty on upperparts than other races. Chestnut of tail extending to c. 20 mm from tip.

96

TIMALIINAE

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. *Above*, slightly tufted crown dark blue striped with whitish; supercilium and eye-ring white. Back fulvous, paler on rump. Folded wing blue with a small white spot and white tips. Upper surface of tail dark grey with blue edges, narrowly tipped with white; spread tail shows white outer rectrices edged with black: *Below*, entire underparts and ear-coverts pale vinous grey, centre of belly whitish. Under surface of tail white edged with black. Sexes alike.

Blue of head, wing and tail not noticeable except at very close range. The head appears grey, contrasting with the fulvous back. The bird appears long and thin with a flat head and very clear-cut square-ended tail—a curious, distinctive shape.

STATUS, DISTRIBUTION and HABITAT. Resident, locally common; subject to vertical movements. The Himalayas from Naini Tal east through Nepal, Darjeeling, Sikkim, Bhutan and NEFA to the Mishmi Hills; also the hills of Assam, Nagaland and Manipur south to the Chittagong Hill Tracts of East Pakistan. Altitudinal distribution in summer not satisfactorily determined: Smythies (JBNHS 49: 514) records it as a resident above 2400 m in central Nepal while Stevens (JBNHS 29: 736) found it up to 1800 m in summer in Sikkim; its breeding zone thus probably lies between 1500 and 2500 m; most other Himalayan data are winter records. In this season it is found mostly between 1200 and 2200 m and reaches the foothills in Sikkim, Bhutan and NEFA, even entering a short distance the plains of the Brahmaputra. In Assam it appears to breed above 1800 m and up to the highest peaks, descending to 1200 m, rarely 600 m in winter (Baker, JBNHS 8: 206 and 17: 788). In Manipur it occurs above 1400 m (Hume) and on Mt Victoria between 1400 and 2600 m (Heinrich). Affects bushes in evergreen forest or mixed deciduous and evergreen secondary growth; also cultivations, pine and bamboo.

Extralimital. Western Burma. The species extends to Szechuan, Kwangsi, Vietnam and the Malay Peninsula.

GENERAL HABITS. Usually met with in parties of five to fifteen; a regular constituent of the large roving associations of yuhinas, mesias, shrike-babblers, etc. Moves through the tops of bushes and trees much like mesias. Pairs form in April.

FOOD. Mostly insects.

VOICE and CALLS. Call-note, a chick-like *cheep* or *cree-cree*. Song, a three-noted whistle, the first lowest, the second highest, the third between these two.

BREEDING. Season, May and June. Nest, cup-shaped, made of bamboo leaves, rootlets and moss, tightly held together by tendrils and creeper stems; the exterior of the nest is often completely covered with moss; lining is usually of rootlets, sometimes hair. Well hidden in bushes, with a preference for stream banks, within a couple of metres from the ground, generally under one metre. Eggs, normally 3 or 4, deep blue, marked with a few small black spots at the larger end. Average size of 24 eggs, 18.4 x 14.1 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters. For details of plumage see Baker, loc. cit.

BABBLERS

97

Young, like adult but upperparts paler. Tertiaries edged grey-buff. Underparts more buffish. Primary character of juvenal timaline wing absent. Postjuvinal moult partial. Postnuptial moult completed in October.

MEASUREMENTS

GENERAL HABITS, FOOD AND VOICE. As in 1363.

BREEDING. As in 1363.

MUSEUM DIAGNOSIS. Differs from *rufigenis* by the absence of rufous patch above the posterior part of the supercilium where only a few scattered rufous feathers are found. Differs from *castaneiceps* by the grey, not rufous crown.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	58-62	11	16	53-57 mm
♀♀	58-62	—	—	50-57 mm

(SDR, Mayr)

Weight 2 ♂♂ 11, 12 g (SDR).

COLOURS OF BARE PARTS. As in 1363.

1365. Chestnut-headed Yuhina. *Yuhina castaneiceps castaneiceps* (Moore)*Ixulus castaneiceps* Moore, 1854, in Horsfield & Moore,*Cat. Bds. Mus. E.I. Co.* 1: 411 (Afghanistan, *errone* = Cachar)

Baker, FBI No. 330, Vol. 1: 310

LOCAL NAME. *Dantika-ragani* (Cachar).

SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. As in 1363, but crown rufous-brown scalloped with pale grey on forehead.

STATUS, DISTRIBUTION AND HABITAT. Common resident. Western Nagaland, Manipur and the hills of Assam south to the Chittagong Hill Tracts of East Pakistan, from 600 to 1500 m. Affects secondary scrub and evergreen forest.

EXTRALIMITAL. Chin Hills and Arakan Yomas.

GENERAL HABITS, FOOD AND VOICE. As in 1363.

BREEDING. As in 1363.

MUSEUM DIAGNOSIS. Differs from other races by its rufous crown. For details of plumage see Baker, loc. cit.

TIMALIINAE

98

1363. Sikkim Whitebrowed Yuhina. *Yuhina castaneiceps rufigenis* (Hume)*Ixulus rufigenis* Hume, 1877, *Stray Feathers* 5: 103

(Himalayas = Darjeeling)

Baker, FBI No. 332 (part), Vol. 1: 311

Plate 78, fig. 13

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. Above, head crested, grey scalloped with paler grey; ear-coverts rufous-brown; a narrow white supercilium. Back and wings grey-brown. Tail dark brown, rounded when spread and showing white tips of outer rectrices. Below, greyish white. Sexes alike.

The only yuhina with white in tail.

STATUS, DISTRIBUTION AND HABITAT. Resident, fairly common. The Himalayan foothills from Darjeeling and Sikkim east through Bhutan and NEFA to the Subansiri river (Stevens, JBNHS 23: 243), from c. 600 to 1500 m. Affects secondary forest with shrubby undergrowth.

GENERAL HABITS. Keeps in parties of as many as twenty or thirty birds, often in the mixed itinerant associations, hunting feverishly among the foliage of higher bushes or lower trees, and rapidly sweeping on to the next tree in disorderly 'follow-my-leader' fashion. Movements reminiscent of tits, as they cling to the leaves and branches.

Display (?). 'Has a curious habit of soaring 20 or 30 feet into the air and then sinking down with outstretched wings to the lower bushes' (Baker).

FOOD. Chiefly insects; also seeds. Visits flowers of various trees for nectar. Partial to aphid-infested trees.

VOICE AND CALLS. Flocks keep up a comparatively loud cheeping or twittering rendered as *chir-chit* . . . *chir-chit*.

BREEDING. Season, April to July, mostly April and May. Nest, a compact cup of very fine and soft shreds of grass and some silk-like vegetable material, surrounded by moss, dead leaves, roots and fibres. Placed in bee-eaters' or kingfishers' burrows, or any natural hollow in steep banks, usually in roadside cuttings. Eggs, 3 or 4, white, marked with small, brown or reddish brown blotches, more numerous at the large end. Average size of 100 eggs 16.6 × 13.3 mm (Baker). Incubation by both sexes; period c. 12 days.

MUSEUM DIAGNOSIS. Differs from *plumbeiceps* by the presence of a rufous patch above the posterior part of the supercilium.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
4 ♂♂	60-62	11-12	16-18	54-55 mm (SA)

Weight 2 ♂♂ 12, 12 g (SA).

COLOURS OF BARE PARTS. Iris reddish brown. Bill horny brown with a pinkish tinge. Legs and feet brownish yellow; claws horny brown.

TIMALIINAE

100

Young, as adult but upperparts tinged brown. Edges of secondaries and coverts browner; occipital feathers not so long.

MEASUREMENTS. As in 1364.

COLOURS OF BARE PARTS. Iris pale hazel. Bill light reddish horny, gape and base of both mandibles purplish. Legs and feet dull reddish or flesh colour.

1366. Whitenaped Yuhina. *Yuhina bakeri* Rothschild*Siva occipitalis* Blyth, 1844, *Jour. Asiat. Soc. Bengal* 13: 937 (Darjeeling)*Yuhina bakeri* Rothschild, 1926, *Novit. Zool.* 33: 276.New name for *Siva occipitalis* Blyth, 1844, preoccupied.*Yuhina occipitalis atrocinerea* Koelz, 1954, *Contrib. Inst.*

Regional Exploration, No. 1: 8 (Lailuk, Cachar)

Baker, FBI No. 344, Vol. 1: 321

Plate 78, fig. 19

LOCAL NAMES. *Temgyeng-pho*, *Turringing-pho* (Lepcha).

SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. A perky hair-brown tit-like bird with chestnut head and upstanding crest, conspicuous blackish lores and a white nape-patch.

Above, head, upper back and sides of neck rusty brown; crest erect, posteriorly white; ear-coverts streaked with white; lores blackish. Rest of upperparts olive-brown with inconspicuous white shaft-streaks. Below, throat white; breast vinaceous with fine dark streaks; belly olivaceous; under tail-coverts ferruginous. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. From eastern Nepal¹ (Ripley, JBNHS 49: 397, sole post-Hodgsonian record) east through Darjeeling and Jalpaiguri districts, Sikkim, Bhutan and NEFA to the Mishmi Hills; Nagaland, Manipur, Assam in the Cachar and Khasi hills, and East Pakistan in the northeastern highlands (winter). There are no records for Garhwal nor for the Chittagong Hill Tracts as given in FBI. Altitudinal distribution not satisfactorily known, especially in summer. Recorded in winter from the foothills to c. 2000 m. Gammie (*quid* Hume & Oates's *Nests and Eggs*) found a nest at about 3000 feet (900 m), this being the only Himalayan breeding record. In Assam, according to Baker (*Nidification* 1: 300) it is common between 900 and 1500 m and 'although doubtless it often breeds much higher, I never found its nest below 2500 feet' (750 m). Affects secondary jungle and evergreen forest.

EXTRALIMITAL. Northern Burma.

¹ Rand & Fleming's records of 'Chestnut-headed Ixulus' in west-central Nepal (*Fulldiens* 41: 159) do belong to *T. s. occipitalis* Hodgson, not to *T. bakeri* as reported by Birwa, JBNHS 59: 222 (confirmed by Rand, *in cit.*).

Birwa's record for Khumbu 3960 m (JBNHS 59: 222) was reported as *bakeri* because of a nomenclatural confusion. It also pertains to *T. s. occipitalis* Hodgson (confirmed by Birwa, *in cit.*).

BABLERS

101

GENERAL HABITS. Arboreal. In the non-breeding season, keeps in parties, commonly in association with other small insectivorous species, moving about in tree-tops and bushes.

FOOD. Mainly insects; also berries.

VOICE AND CALLS. A shrill *chip* and a soft chatter.

BREEDING. Season, April to July, chiefly May and June. Nest, cup-shaped or domed according to the site selected: domed when unsheltered, a deep cup when built in a hollow in a bank, low down in bushes, against a moss-covered trunk or other well-protected position. Generally made of moss more or less mixed with dead leaves, roots and bits of bracken, lined with fine rootlets. Comparatively open forest is chosen for the purpose, such as along paths, streams, clearings or forest edges. Eggs, normally 4, occasionally 3, white, marked with blotches varying from reddish brown to deep umber-brown, more numerous at the large end. Average size of 60 eggs 19.3 x 14.2 mm (Baker). Building of nest and incubation by both sexes.

MUSEUM DIAGNOSIS. See Field Characters:

Young, like adult but mantle browner, underparts paler, streaks less sharply marked, ferruginous paler. Primary and tail characters of juvenal *timalines* present, i.e. soft blunt first primary and narrow, pointed rectrices.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	62-71	12-16	20-22	50-53 mm
♀♀	65-72	11-13	20-23	46-50 mm
				(SA, SDR)

Weight 4 ♂♀ 14-21 g (SA).

COLOURS OF BARE PARTS. Iris brown, yellowish brown or reddish brown. Bill dark brown. Legs, feet and claws brown; soles yellow.

YUHINA FLAVICOLLIS Hodgson

Key to the Subspecies

		Page
A	Nuchal collar narrow, yellowish rust colour.....	<i>Y. f. albicollis</i> 101
B	Nuchal collar broader, more rufous

1367. Western Yellownaped Yuhina. *Yuhina flavicollis albicollis* (Titchhurst & Whistler)

Ixulus flavicollis albicollis Titchhurst & Whistler, 1924, Bull. Brit. Orn. Cl. 44: 71 (Dharnasala, 4000 feet, Kangra)
Baker, FBI No. 345 (part), Vol. 1: 322

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 13 cm (5 in.).

FIELD CHARACTERS. As in 1368 but nuchal collar less conspicuous and almost reduced to patches on the sides of neck.

BABLERS

103

FOOD. Mainly insects and their larvae; also flower-nectar, berries (*Rubus*, *Galium*, *Trema*, etc.) and small seeds (*Michelia cathartica* and others). Stanford records small snails taken on the ground.

VOICE AND CALLS. Flocks keep up a continual murmuring twitter punctuated by a harsh *chi-chi-chiu* (SA). Song rendered as *twe-tyurui-tyawi-tyawa* (Lister). Other notes described as a metallic *tse-king* (Jones) and a querulous screech followed by a pleasant warble.

BREEDING. Season, May and June. Nest, either domed or cup-shaped, made mostly of moss with some rootlets and thickly lined with the latter, sometimes with wool. Suspended to some twigs or among the moss of a branch at heights up to two, rarely four metres, or in a bank among roots or tufts of grass. Eggs, 3 or 4 similar to those of *Y. bakeri*. Average size of 28 eggs 19.8 x 14.2 mm (Baker). Building of nest and incubation by both parents; period 13 or 14 days.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit. For distinction from *albicollis* and *rouxi* see 1367 and 1370 respectively. Young very similar to adult.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	58-66	13-17	19-22	45-53 mm
♀♀	58-66	12-15	19-22	45-54 mm
				(SA, BB, Kinnear)

Weight 2 ♂♂ 16, 18; 3 ♀♀ 14-16; 30 ♂♂ 13-22 g (SA).

COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible dark brown, lower light brown. Legs and feet yellowish brown or yellowish flesh.

1370. Assam Yellownaped Yuhina. *Yuhina flavicollis rouxi* (Oustalet)

Ixulus rouxi Oustalet, 1896, Bull. Mus. d'Hist. Nat. Paris 2: 184, 186 (Ly-Sien-Kiang or Black River, Yunnan)
Ixulus flavicollis harterti Harrington, 1913, Bull. Brit. Orn. Cl. 33: 62 (Sinlum, Bhamo)
Baker, FBI No. 346 and 347, Vol. 1: 323

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 13 cm (5 in.).

FIELD CHARACTERS. As in 1368, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. NEFA in the Mishmi Hills, south through Nagaland, Manipur, the hills of Assam and the Chittagong Hill Tracts of East Pakistan. Breeding zone in NEFA probably as in 1368; in winter, from the edge of the plains to 2600 m. On Mt Victoria, breeds mostly between 2000 and 2600 m while in Assam it breeds down to c. 1000 m. Affects broad-leaved forest.

GENERAL HABITS, FOOD AND VOICE. As in 1368.

BREEDING. As in 1368.

MUSEUM DIAGNOSIS. Somewhat more richly coloured than *flavicollis* (1368), particularly in the colour of the nuchal collar and of the back; yellow wash of underparts slightly richer; crown darker; lower flanks and thighs more suffused with olive-brown.

102

TIMALIINAE

STATUS, DISTRIBUTION AND HABITAT. Resident, subject to vertical movements, locally common. The western Himalayas from Chamba to west central Nepal; from c. 1700 to 3000 m in summer and from 1200 m (occasionally lower) to at least 2300 m in winter. Affects oak forest and open jungle.

GENERAL HABITS, FOOD AND VOICE. As in 1368.

BREEDING. As in 1368.

MUSEUM DIAGNOSIS. Like nominate *flavicollis* but nuchal collar narrower and much paler. Colour of back slightly less olive.

MEASUREMENTS AND COLOURS OF BARE PARTS. As in 1368.

1368, 1369. Eastern Yellownaped Yuhina. *Yuhina flavicollis flavicollis* Hodgson

Yuhina? flavicollis Hodgson, 1836, Asiat. Res. 19: 167 (Nepal, restricted to central Nepal by Ripley, Synopsis: 408)
Yuhina flavicollis baileyi Baker, 1914, Bull. Brit. Orn. Cl. 35: 17 (Tembang, Drang Valley, 7000 ft)¹
Baker, FBI No. 345 (part), Vol. 1: 322
Plate 78, fig. 15

LOCAL NAME. *Srip-chong-pho* (Lepcha).

SIZE. Sparrow; length c. 13 cm (5 in.).

FIELD CHARACTERS. Above, crested head chocolate-brown, ear-coverts and nape paler; a white eye-ring, a dark brown malar stripe and a rusty yellow nuchal collar. Rest of upperparts olive-brown. Below, chin and throat white, the latter with fine dark streaks. Centre of breast and abdomen washed with yellow; flanks olivaceous with a few white streaks on sides of breast. Vent and under tail-coverts buff. Sexes alike.

The erectile crest, white eye-ring and rusty yellow nape are conspicuous characters. May be confused with *occipitalis* (1373), q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. From central Nepal east through northern Bengal (Darjeeling and Jalpaiguri districts), Sikkim, Bhutan and NEFA to the Abor-Miri hills. Intergrades with *albicollis* in west-central Nepal and with *rouxi* in NEFA. From 1800 to 3000 m in summer and from the edge of the plains to 2700 m in winter. Affects deciduous forest and secondary jungle.

GENERAL HABITS. Arboreal; similar to other yuhinas etc. Keeps in small parties, associating with tits, warblers, nuthatches, sibilas and other small babblers. Frequents bushes and lower branches of trees. Actions very tit-like. Sometimes also makes vertical aerial sallies from a bush-top after winged insects, doubling back to the perch after the capture. In pairs during the breeding season.

¹ As already pointed out by Bailey, JBNHS 24: 75, the type locality is not in the Mishmi Hills as given by Baker (loc. cit.), Ripley (*Synopsis*: 408) and Deignan (*Peter's Check-list* 10: 423). According to Bailey's itinerary, Tembang is located between Tulang La and Drang Dzong in western NEFA. In his manuscript, Whistler states that this race does not seem to be separable from typical *flavicollis*, while Ripley (JBNHS 58: 282) would include the Mishmi Hills population with *rouxi* of Assam and northern Burma. It thus appears unnecessary to retain a name for this intermediate population of a very variable species.

104

TIMALIINAE

Note. The yellow of underparts fades rapidly in museum specimens while the upperparts tend to become darker.

MEASUREMENTS AND COLOURS OF BARE PARTS. As in 1368.

Weight 2 ♂♂ 15, 19; 1 ♀ 16 g (SDR).

YUHINA GULARIS Hodgson

Key to the Subspecies

Paler.....	<i>Y. g. riox</i>
Darker.....	<i>Y. g. gularis</i>

1371. Western Stripethroated Yuhina. *Yuhina gularis riox* Koelz

Yuhina gularis riox Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 8 (above Luni, Tehri, United Provinces, 10,000 feet)
Not in Baker, FBI

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 14 cm (5½ in.).

FIELD CHARACTERS. As in 1372, q.v.

STATUS, DISTRIBUTION AND HABITAT. Apparently uncommon. Recorded only from Garhwal, 2250 m (Osmaston, JBNHS 28: 143), from Tehri Garhwal, 3000 m (Koelz, loc. cit.) and Mussooree 1800 m (Rand & Fleming, *Fildiana* 41: 139). Altitudinal distribution and habitat probably as in 1372.

GENERAL HABITS, FOOD AND VOICE. As in 1372.

BREEDING. Unrecorded, probably as in 1372.

MUSEUM DIAGNOSIS. Differs from *gularis* (1372) by being paler generally, especially on throat and breast.

MEASUREMENTS AND COLOURS OF BARE PARTS. As in 1372.

1372. Eastern Stripethroated Yuhina. *Yuhina gularis gularis* Hodgson

Yuhina gularis Hodgson, 1836, Asiat. Res. 19: 166 (Nepal)
Yuhina yonghiensis Sharpe, 1902, Bull. Brit. Orn. Cl. 13: 12 (Yang-pi, Tali-fu road, Yunnan)
Yuhina gularis griseocincta Rothschild, 1921, Novit. Zool. 28: 42 (Shweli-Salwin Divide, Yunnan)
Baker, FBI No. 339 and 340, Vol. 1: 317, 318
Plate 78, fig. 18

LOCAL NAME. *Fupi-pho* (Lepcha).

SIZE. Sparrow; length c. 14 cm (5½ in.).

FIELD CHARACTERS. A plump active little brown bird with a well-marked erectile crest, striped throat, and orange-fulvous longitudinal bar on blackish wing. Crest brown; rest of upperparts olive-brown. Below, throat streaked

BABBLERS

105

with dark brown. Breast vinaceous brown; rest of underparts tawny olive-brown. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. From western Nepal east through Darjeeling, Jalpaiguri district (winter only), Sikkim, Bhutan and NEFA to the Mishmi Hills, then south through Nagaland, Manipur and the Chin Hills of Burma. There are no records from Assam west of Nagaland and Manipur. Occurrence in the Chittagong Hill Tracts (*vide* Rashid, 1967) needs confirming. Found in summer between 2400 and 3600 m, optimum zone 2700-3300 m, and in winter mostly between 1800 and 3000 m, rarely descending to the foothills (Jalpaiguri duars). Affects forest of oak, birch, rhododendron or mixed conifers and rhododendron, occasionally low scrub or bamboo.

Extralimital. Extends to western and northern Burma, and southwestern Szechuan; also northern Vietnam.

GENERAL HABITS. Arboreal. Usually found in small parties, by themselves or mixed with other small babblers, working through the higher bushes or lower branches of trees, sometimes in low scrub or bamboo. Movements somewhat tit-like but slower.

FOOD. Insects (beetles, wasps, etc.); also berries, flower-nectar, and seeds (*Prunus*, *Magnolia*). Regularly visits rhododendron blossoms for nectar, the forehead feathers of the birds becoming thickly coated with pollen and often giving them a startlingly new look!

VOICE AND CALLS. A quiet, rustling *shr...shr...* continually uttered and a curious and characteristic, long-drawn-out *kweeee* (Proud). A note described as 'a rather mournful tinkling call' probably refers to the same. A call-note regularly uttered is rendered as *zêi zêi* (Diesselhorst). Alarm, a sharp *cheep*.

BREEDING. Little known. *Season*, apparently May and June. *Nest* and *eggs* not well authenticated. One nest is described as a cradle of roots well interlaced, lined with finer roots, and attached to the pendent roots of plants sticking through an overhanging bank. The four eggs were dingy grey-green, speckled with dark reddish brown forming a ring or cap at the large end, rather like those of *T. nigrimenta* (1374). Size, between 17 × 12.3 and 17.5 × 12.8 mm (Baker). Other nests are described by Hodgson as large, globular structures of moss placed in a fork of a branch or between ledges of rocks.

MUSEUM DIAGNOSIS. See Field Characters; for details of plumage Baker, loc. cit. Young, as adult but rather darker rufous-brown above, especially on upper tail-coverts. Crest shorter. Primary and tail characters not present.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	70-79	17-19	21-25	56-63 mm
♀♀	68-79	16-18	21-23	53-58 mm

(BB, SA)

Weight 14 ♂♂ 19-24; 4 ♀♀ 18-22 g (GD, SDR, SA).

COLOURS OF BARE PARTS. Iris clay- or reddish brown. Bill: upper mandible dark brown, lower basally brownish yellow, distally dark brown. Legs and feet yellow, brownish yellow or orange-brown; claws dark brown.

BABBLERS

107

Weight 3 ♂♂ 12-16; 2 ♀♀ 12, 12 g (GD, SA).

COLOURS OF BARE PARTS. Iris brown. Bill pinkish or reddish brown. Legs and feet yellow-brown to orange-brown.

1374. Blackchinned Yuhina. *Yuhina nigrimenta nigrimenta* Hodgson

Yuhina nigrimenta Hodgson, 1845, in Blyth, Jour. Asiat. Soc. Bengal 14: 562 (Nepal)

Yuhina nigrimentum tiloria Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 9 (Karong, Manipur)

Baker, FBI No. 343, Vol. 1: 320

Plate 78, fig. 16

LOCAL NAME. *Turringing-pho* (Lepcha).

SIZE. Sparrow —; length c. 11 cm (4½ in.).

FIELD CHARACTERS. A small yuhina with erectile black crest, black lores and chin and black-and-red bill. *Above*, crest black with scale-like grey edgings. Lores black. Nape and sides of head grey. Rest of upperparts olive-brown. *Below*, chin black; throat white. Rest of underparts pale fulvous. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Resident, uncommon to rare west of Sikkim; common eastward. The Himalayan foothills from Garhwal (Hume collection) and Kumaon (Whymper, JBNHS 14: 607) east through the Nepal duns (Biswas, JBNHS 59: 224; Fleming & Traylor, *Fieldiana* 53: 176), Darjeeling, Sikkim, Bhutan and NEFA; Nagaland, Manipur, the hills of Assam (rare in the Khasi Hills), and the Chittagong Hill Tracts of East Pakistan. From c. 300 to 1800 m; these altitudes are winter records; breeding zone within these extremes not satisfactorily determined in the Himalayas. In Assam the breeding zone is 1000 to 1800 m (Baker). Affects evergreen forest and secondary jungle, particularly in overgrown cultivation clearings.

Extralimital. The species extends to southern Szechuan and northern Vietnam; also Fukien.

GENERAL HABITS. Very gregarious, active, restless and noisy; usually seen in flocks of 15 to 20 or in mixed parties with other 'tinies', busily hunting in the canopy of lofty trees as well as in low shrubs, clinging sideways or upside-down to the sprigs to peer under the leaves for insects. Sometimes in the tall grass which grows under trees.

FOOD. Chiefly insects; also berries, seeds and flower-nectar.

VOICE AND CALLS. Birds of a party keep up a lively chorus of low cheeping twitters occasionally breaking out into louder, shriller calls.

BREEDING. *Season*, March to July. *Nest*, a compact cup of moss and moss roots lined with very fine grass stems or rootlets. It is either suspended in the lichen hanging from branches of trees within a couple of metres from the ground, or fastened to the exposed, hanging roots on banks from which earth has fallen away. *Eggs*, normally 4, either a pale sea-green profusely spotted all over with very pale brown, small blotches forming fairly well-defined broad rings at the large end, or a pale clay or clay-green with the spots numerous but smaller. Average size of 12 eggs 16.2 × 12.3 mm (Baker).

106

TIMALIINAE

1373. Slatyheaded or Rufousvented Yuhina. *Yuhina occipitalis occipitalis* Hodgson

Yuhina occipitalis Hodgson, 1836, Asiat. Res. 19: 166 (Nepal)

Baker, FBI No. 342, Vol. 1: 319

Plate 78, fig. 17

LOCAL NAME. *Turringing-pho* (Lepcha).

SIZE. Sparrow; length c. 13 cm (5 in.).

FIELD CHARACTERS. *Above*, head, ear-coverts and neck grey; the erectile crest grey in front, bright rufous posteriorly. A conspicuous pale eye-ring and a black malar stripe. *Below*, throat and breast vinaceous; belly and under tail-coverts pale rufous. Sexes alike.

× c. 1

The somewhat similar *T. flavirostris* (1368) has a brown crest and a rusty yellow neck.

STATUS, DISTRIBUTION AND HABITAT. Common resident. From west-central Nepal (Rand & Fleming, *Fieldiana* 41: 139; see footnote p. 100) east through Darjeeling, Sikkim, Bhutan and NEFA; from 2400 to 3900 m in summer and between 1500 and at least 2700 m in winter. Affects evergreen forest, especially rhododendron and oak.

Extralimital. Southeastern Tibet. The species extends to northern Burma and northwestern Yunnan.

GENERAL HABITS. In the non-breeding season keeps in parties up to fifteen individuals in company with tits, Nepal Babblers, Bluewinged Sivas, and other small babblers. Hunts in the high foliage, on moss-covered trunks and branches, and in bushes; seems to keep more to the canopy than *T. gularis* with which it often associates.

FOOD. Mostly insects in summer. Very partial to rhododendron blossoms, probing into the flowers in quest of nectar and probably also insects. Berries are also taken in winter.

VOICE AND CALLS. A deep churring conversational note; a harsh, grating series of alarm-notes; 'a gay little song'.

BREEDING. *Season*, April to June. The only nest known is described as a cup of moss and leaves, built into a large lump of moss which formed a dome over the nest. It was in the fork of a small tree about three feet (90 cm) from the ground, and well masked since similar large lumps of moss were found on practically every bush and tree in this damp area. It was lined with fine roots and contained two young, sparsely covered with long black down (Proud).

MUSEUM DIAGNOSIS. See Field Characters.

Young, like adult but crest shorter; rufous of nape paler; vinaceous of breast less marked.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	62-66	15-17	18-19	51-53 mm

FIELD CHARACTERS. *Above*, entirely olive-green, edges of tail yellow; head tufted. *Below*, and ear-coverts greyish white; under tail-coverts yellow. Sexes alike.

× c. 1

STATUS, DISTRIBUTION AND HABITAT. Resident, locally common, subject to vertical or erratic movements. From extreme western Nepal (Fleming & Traylor, *Fieldiana* 53: 176), east through Sikkim, Bhutan and NEFA; Nagaland, Manipur, the hills of Assam (scarce or rare) and the Chittagong Hill Tracts of East Pakistan. Breeding zone not satisfactorily determined. Appears to have a wide altitudinal range, both summer and winter, remarkably so in the latter season. Biswas found it in the duns at c. 600 m in May which is the breeding season, while Fleming recorded it at 2250 m and 900 m in winter. According to Proud it is most common around 1500 m in autumn and winter. In Sikkim it is found below 1000 m *vide* Stevens while Salim Ali noted it from 360 to 2250 m in winter. Farther east it is said to be common in the duns and to extend well into the plains of north Lakhimpur in winter (Stevens) and up to 2600 m in northern Burma in the same season. In Assam it is found from the foothills to 900 m, breeding mostly between 300 and 600 m, once only as high as 1200 m (Baker). Affects rhododendron trees, secondary growth and evergreen forest, especially in open spaces such as glades, stream sides or forest edges, and light deciduous forest.

BABBLERS

109

Extralimital. Extends to Burma and western Thailand. The species ranges north to northwestern Yunnan, east to Fukien, Kwangtung and Vietnam, south through the Malay Peninsula to Sumatra and Borneo.

GENERAL HABITS. Seems to be less gregarious than other yuhinas; often found solitary, in pairs or in small parties by themselves although they also consort with tits, minlas and other small babblers, the flocks 'flowing' rapidly from tree to tree. Frequents mostly the lower canopy and higher bushes, clinging to sprigs and searching the foliage like a tit. Its sprightly and restless disposition reminds one also of *Phylloscopus* or *Zosterops*.

FOOD. Mostly insects and their larvae, particularly small caterpillars; also berries and flower-nectar.

VOICE AND CALLS. Unrecorded; a very silent species.

BREEDING. Season, from the end of March through April and May. Nest, a little cup of fine fibres, moss and rootlets, lined with fine, dark-coloured leaf-stems. Suspended between two horizontal twigs from about half a metre to 2 m above the ground, usually around one metre. Banks of streams, glades and forest edges are favourite nesting-sites. Eggs, 2 or 3, white, thinly marked with speckles and small blotches of pale pinkish red, sometimes forming an ill-defined ring at the large end. Average size of 20 eggs 16.7 × 12.7 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters.

Young, a dull edition of the adult; upperparts with a brownish cast. Primary and tail characters present; postjuvinal moult complete.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	66-72	14-15	16-19	44-49 mm
♀♀	60-66	14-15	16-18	42-47 mm

(HW, SA, Heinrich)

Weight 4 ♂♂ 12-17; 2 ♀♀ 11, 12 g (GD, SDR). 2 oo? 8, 11 g (SA).

COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible brown, lower whitish grey. Legs and feet whitish grey.

Genus *ALCIPPE* Blyth

Alcippeornis Oberholser, 1922, Smith. Misc. Coll. 74: 1. New name for *Alcippe* Blyth (based on type, *Alcippe cinerea* Blyth nec Eyton)

Cf. Riley, J. H., 1933, Auk 50: 363-4 (use of *Alcippe* and genotype).

BABBLERS

111

GENERAL HABITS. A confiding species met with in large parties of up to fifty birds in the non-breeding season, sometimes associated with parrotbills (*Paradoxornis nipalensis*) or other small babblers. Forages low down in thickets, 'flowing' on from bush to bush. Movements very tit-like; often seen hanging upside-down on a sprig peering under the leaves for insects.

FOOD. Insects, small berries and seeds.

VOICE AND CALLS. Utters a continual low twitter as it flits from twig to twig. Not intelligibly described.

BREEDING. Not recorded since Hodgson. Season, May and June. Nest, egg-shaped, fixed with its longest diameter perpendicular to the ground in a bamboo clump, between the small lateral shoots, a few feet from the ground; entrance on the side. Made of bamboo leaves and broad blades of grass, lined with a little grass and rootlets. Eggs, 3 or 4, pinkish white, thinly speckled and spotted with brownish red, tending to form a cap or zone at the large end. Measurements, c. 12.7 × 17.7 mm (Hodgson in Hume & Oates's *Nests and Eggs*, Vol. 1: 120).

MUSEUM DIAGNOSIS. Differs from *albilineata* in lacking the white coronal stripe. For details of plumage, see Baker loc. cit.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	52-54	10 (5)	20-22	46-49 mm
♀♀	50-55			

(Kinnear, SA)

Weight 1 ♂ 5.5 g (SA).

COLOURS OF BARE PARTS. As in 1377.

1377. Assam Goldenbreasted Tit-Babbler. *Alcippe chrysotis albilineata* (Koelz)

Lioparus chrysotis albilineatus Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 7 [Karong (Sungtun), Manipur]
Baker, FBI No. 309 (part), Vol. 1: 293

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 11 cm (4½ in.).

FIELD CHARACTERS. Like 1376 but with a white coronal stripe from forehead to nape.

STATUS, DISTRIBUTION AND HABITAT. Scarce resident. Assam in the Cachar Hills, Nagaland and Manipur, from 1800 to 2700 m. Same biotope as 1376.

GENERAL HABITS, FOOD AND VOICE. As in 1376.

BREEDING. Unrecorded; probably as in 1376.

MUSEUM DIAGNOSIS. Differs from *chrysotis* (1376) in having a conspicuous white coronal stripe and a richer colour overall.

MEASUREMENTS

10 ♂♂ Wing 49-55 mm (Koelz)

COLOURS OF BARE PARTS. Iris hazel. Bill: upper mandible yellow on distal half, orange on basal half, bluish on the commissure; lower mandible blue, paler at tip. Legs and feet purple-flesh; soles tinged yellow (Koelz).

110

TIMALIINAE

Bill stout, slightly curved. Nostrils covered by a membrane. Rictal bristles well developed in most species. Wing short and rounded.

1376. Himalayan Goldenbreasted Tit-Babbler. *Alcippe chrysotis chrysotis* (Blyth)

Pr. (oparus) chrysotis Blyth, 1844, Jour. Asiat. Soc. Bengal 13: 938

(Himalaya = Nepal)

Baker, FBI No. 309 (part), Vol. 1: 293

Plate 80, fig. 11

LOCAL NAME. *Prong-samyer-pho* (Lepcha).

SIZE. Sparrow —; length c. 11 cm (4½ in.).

FIELD CHARACTERS. Above, crown and nape blackish; ear-coverts pale silver-grey. Back olive. Wing blackish with orange-yellow outer edge and an orange longitudinal patch; inner edge white; secondaries tipped with white. Tail brown, the basal two-thirds edged with orange-yellow. Below, throat grey with silvery tips. Rest of underparts yellow. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. A rather scarce resident, subject to some vertical movements. The Himalayas from eastern Nepal (Stevens, JBNHS 29: 734) east through Darjeeling, Sikkim, Bhutan and NEFA; from c. 2400 to 3000 m in summer and between 2000 and at least 2600 m in winter. Affects dense growth on steep hillsides, particularly bamboo jungle.

Extralimital. The species extends to northern Burma, southwestern Szechuan and northern Vietnam.

112

TIMALIINAE

1378. Dusky Green or Yellowthroated Tit-Babbler. *Alcippe cinerea cinerea* (Blyth)

Minla cinerea Blyth, 1847, Jour. Asiat. Soc. Bengal 16: 449 (Darjeeling)

Alcippe delacouri Yen, 1936, L'Oiseau 6: 449. New name for

Minla cinerea Blyth, not preoccupied

Baker, FBI No. 301, Vol. 1: 287

Plate 78, fig. 7

LOCAL NAME. *Dao-pêrê kashiba* (Cachari).

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. Above, crown and nape yellowish green, the feathers edged with black; a black stripe on sides of crown, a conspicuous yellow supercilium from lores to nape and another black stripe from lores through eye. Rest of upperparts greyish olive. Below, yellow, olivaceous on sides and lower belly. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Resident, locally distributed. The Himalayan foothills from central Nepal (Proud, JBNHS 48: 700) east through Darjeeling, Sikkim, Bhutan and NEFA; Assam (rare) in the Khasi and Cachar hills, Nagaland, Manipur, and the Chittagong Hill Tracts of East Pakistan; from c. 1000 to 2100 m at all seasons. Affects deep evergreen forest, mainly in glades or breaks such as made by streams, jungle tracks, etc.; also bamboo clumps and cut-over scrub.

Extralimital. Extends east to northern Laos.

GENERAL HABITS. Usually found in large flocks in the roving associations of small babblers, darting in and out of the undergrowth and bustling to and fro in incessant movement.

FOOD. Unrecorded. Doubtless as in other tit-babblers.

VOICE AND CALLS. A low chip-chip (Stanford) and a soft twittering while feeding.

BREEDING. Season, April to July, chiefly May and June. Nest a deep cup, sometimes domed or semi-domed, made of bamboo leaves and fern fronds, and lined with fine shreds of grass or rootlets, the materials blending well with the surroundings. Most nests are placed on the ground, some between boulders, others low down in bamboo clumps. Eggs, normally 4, uncommonly 3, pale buff to warm buff, with reddish brown stippling, coalescing to form a well-defined ring around the large end. Average size of 60 eggs 18.3 × 14.3 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters.

	Wing	Bill (from skull)	Tarsus	Tail
♂♀	51-58	11-13	20-23	33-44 mm (Baker, SA)

Weight 2 ♀♀ 11, 11 g (SA).

COLOURS OF BARE PARTS. Iris brown (SA) or pink. Bill: upper mandible blackish, lower bone-colour. Legs, feet and claws dull yellow (Stanford).

Alcippe castaneiceps wagstaffi Wynne, 1954, North Western Naturalist, Key-List of Palaearc. and Oriental Pass. Bds., pt. 3: 397. New name for

A. brunneicauda Sharpe, preoccupied

Baker, FBI No. 302 and 303, Vol. 1: 288-9

Plate 78, fig. 6

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. Above, crown chestnut streaked with white on forehead and with rufous on crown and nape. A broad white supercilium; a blackish post-ocular stripe; ear-coverts mostly white; a narrow dark malar stripe. Wing with a noticeable black shoulder-patch behind which a rufous patch, and pale outer edge. Rest of upperparts olive. Below, whitish with olive-rufous sides.

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical movements. The Himalayas from central Nepal east through Darjeeling, Sikkim, Bhutan and NEFA; the hills of Assam, Nagaland, Manipur, and the Chittagong Hill Tracts of East Pakistan. Breeds between 1500 and 3000 m, mostly above 1800 m. Noted in winter between 700 and 2400 m. Breeds somewhat lower in Assam where recorded in winter as low as 300 m. Affects heavy evergreen undergrowth at edge of forest and on abandoned clearings.

EXTRALIMITAL. Extends to central Tenasserim and northwestern Thailand. The species ranges east to Vietnam and south through the Malay Peninsula.

GENERAL HABITS. In the non-breeding season keeps in large flocks, by themselves or mixed with minlas, yuhinas, tits, leaf warblers, etc., the composition of flocks varying according to altitude and season. Behaves much like the smaller parrotbills, hunting feverishly in the foliage of dense bushes and undergrowth, the flocks 'flowing' from tree to tree. Frequently climbs up vertical trunks, clinging to the bark or moss, searching crannies and crevices.

FOOD. Insects and, on occasion, tree sap.

VOICE and CALLS. A distinctive call of three notes *tu-twee-twee* in crescendo (Smythies). A tit-like *cheep* and a rather distinctive churring *purr* which can be very soft or loud and harsh.

BREEDING. Season, April to July, chiefly May and June. Nest, usually domed, sometimes a deep cup; made mostly of green moss with some bamboo leaves, and lined with fine grass or rootlets. Placed in a tangle of creepers climbing up trees or bushes within three metres or so from the ground, among the moss covering tree-trunks or on a sloping moss- and fern-covered

¹ In view of Biswas's remarks (JBNHS 59 (1): 225) and a subsequent re-examination, we would admit the validity of *brunneicauda* (Khasi Hills) on the basis of paler head colour. *Garoensis* and *wagstaffi*, however, seem to us synonymous with nominate *castaneiceps*.

BABBLERS

115

1381. Nepal Whitebrowed Tit-Babbler. *Alcippe vinipectus vinipectus* (Hodgson)

Siva Vinipectus Hodgson, 1837, Ind. Rev. 2 (2): 89

(Nepal, restricted to central Nepal by Ripley, Synopsis: 412)

Baker, FBI No. 304 (part), Vol. 1: 290

Plate 78, fig. 14

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 11 cm (4½ in.).

FIELD CHARACTERS. Above, crown, ear-coverts and back brown; a broad white supercilium from eye to nape, above which a darker brown stripe. Rump and wings rusty, the latter (when closed) with a black line and pale outer edge. Below, throat and breast white, lower belly olive-brown. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. A high-elevation babbler, fairly common and resident, subject to vertical movements. The Himalayas in western and central Nepal, from c. 2400 to 4200 m in summer, mostly above 3000 m, and from 1500 to 3000 m in winter. Affects rhododendron and juniper scrub, light forest of pine, birch or spruce, and forest edges with clearings and plenty of undergrowth and ringal bamboo.

GENERAL HABITS. In the non-breeding season keeps in flocks of up to twenty individuals, by themselves or in mixed company, hunting in bushes, undergrowth and low trees — even when heavily shrouded in snow in winter — in acrobatic tit-like manner though somewhat slower in its movements. Confiding and inquisitive: will often approach within arm's reach of an observer to fustily investigate. Behaviour also reminiscent of *Chrysomma sinense* and *Dumetia hyperythra*. Flocks break up during the breeding season though small groups may still be observed, probably family parties.

FOOD. In the breeding season, almost exclusively insects — caterpillars being a favourite food; at other times also takes small seeds and berries.

VOICE and CALLS. A soft, high-pitched and incessant *chip, chip* (Smythies) or a clear *trid, trid* (Schäfer). A *churr* of alarm. Song, a faint *chit-it-it-or-ky* given while flicking its tail up and its head forward (Fleming).

BREEDING. Season, mid April to July. Nest, a deep cup exteriorly made of moss and grass, followed by a layer of fibres, birch bark, bamboo leaves, then a thick layer of rootlets, finally a lining of hair. Placed in a fork in a bush within a couple of metres from the ground, or suspended among the fine branchlets of a bamboo clump. Eggs, normally 3, greenish with olive fleckings (Diesselhorst), grey-blue with a few black blotches (Baker), pale green with brown blotches (Osmaston), with a few purple freckles, all markings chiefly around the large end. Unlike any other timaline eggs in appearance. Average size of 49 eggs 18.8 × 13.7 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters. Differs from *chumbiensis* in having a white, unstreaked throat (intergrades are found in eastern Nepal). For distinction from *longrae*, see 1380 under Museum Diagnosis. Colour of crown varies in depth.

Young, like adult but upperparts more rusty; dark coronal stripes less distinct; no streaks on throat; flanks paler (Whistler).

MEASUREMENTS	Wing	Bill (from skull)	Tarsus	Tail

44: 71 (Palampur, 6000 ft, Kangra)

Baker, FBI No. 304 (part), Vol. 1: 290

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 11 cm (4½ in.).

FIELD CHARACTERS. As in 1381, q.v.

STATUS, DISTRIBUTION and HABITAT. Resident, locally common, subject to vertical movements. The western Himalayas from Dharmasala to Garhwal; from c. 2700 to over 3300 m in summer and between 1500 and at least 2700 m in winter. Affects low scrub, dwarf willow and ringal bamboo in summer, and scrub-covered hillsides and bushy nullahs in winter.

GENERAL HABITS, FOOD and VOICE. As in 1381.

BREEDING. As in 1381.

MUSEUM DIAGNOSIS. Differs from *vinipectus* (1381) by the brighter head, darker ear-coverts, more rusty lower back, rump, and edges of the primaries and their coverts, and the slightly browner abdomen (Kinnear, *Ibis* 1939: 750).

MEASUREMENTS and COLOURS OF BARE PARTS. As in 1381.

116

TIMALIINAE

Weight 6 ♂♂ 11-13; 5 ♀♀ 11-13 g (GD).

COLOURS OF BARE PARTS. Iris variable: creamy white, biscuit colour, brown or pale greenish yellow. Bill horny brown, flesh-colour at base of lower mandible. Legs, feet and claws horny brown, somewhat lighter than bill.

1382. Eastern Whitebrowed Tit-Babbler. *Alcippe vinipectus chumbiensis* (Kinnear)

Fulvetta vinipecta chumbiensis Kinnear, 1939, *Ibis*: 751

(Yatung, Chumbi Valley)

Baker, FBI No. 304 (part), Vol. 1: 290

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 11 cm (4½ in.).

FIELD CHARACTERS. As in 1381 but throat streaked with brown.

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical movements. Eastern Nepal, from the Okhaldunga district east through Darjeeling, Sikkim and Bhutan to the Rudo La, east of which it appears to be replaced by *A. cinericeps*; however it probably occurs through NEFA at suitable altitudes since the species is found again in northern Burma. Both this species and *cinericeps* occur in the same ranges south of the Brahmaputra. Altitudinal distribution and biotope as in 1381.

GENERAL HABITS, FOOD and VOICE. As in 1381.

BREEDING. As in 1381.

MUSEUM DIAGNOSIS. Differs from *vinipectus* in being generally darker and with dusky streaks on throat and upper breast.

MEASUREMENTS	Wing	Bill (from skull)	Tarsus	Tail

Weight 6 ♂♂ 11-13 g (SA).

COLOURS OF BARE PARTS. As in 1381.

1383. Assam Whitebrowed Tit-Babbler. *Alcippe vinipectus austeni* (Ogilvie-Grant)

Properus austeni Ogilvie-Grant, 1895 Bull. Brit. Orn. Cl. 5: 3

(Manipur and the Naga Hills)

Baker, FBI No. 305, Vol. 1: 291

LOCAL NAME. *Deo-péi-géies* (Cachari).

SIZE. Sparrow —; length c. 11 cm (4½ in.).

FIELD CHARACTERS. As in 1381, q.v.

STATUS, DISTRIBUTION and HABITAT. Resident, Nagaland, Manipur and Assam in the Barail range, from 1500 to at least 2700 m in winter, probably higher in summer (since the adjoining extralimital subspecies *nipponi* is

BABBLERS

117

found from 2500 m to the highest peak on Mt Victoria). Affects stunted rhododendron and oak forests, dense reed-bamboo and scrub at the edge of forest.

Extralimital. The species extends to southeastern Szechuan and northern Vietnam.

GENERAL HABITS, FOOD AND VOICE. As in 1381.

BREEDING. Unrecorded; probably as in 1381.

MUSEUM DIAGNOSIS. Differs from *vinipictus* in having the head duller brown, the coronal stripes more reddish brown, and the throat streaked with reddish brown. For distinction from *persiata* of Burma, see JBNHS 50: 502.

MEASUREMENTS AND COLOURS OF BARE PARTS. As in 1381.

Weight 2 ♂ 11, 12 g (SDR).

ALCIPPE CINEREICEPS (Verreaux)

Key to the Subspecies

- Throat white with dark streaks.....*A. c. ludlowi*
Throat smoke-grey with dark streaks.....*A. c. manipurensis*

1384. Himalayan Brownheaded Tit-Babbler. *Alcippe cinereiceps ludlowi* (Kinnear)

Fulvetta ludlowi Kinnear, 1935, Bull. Brit. Orn. Cl. 55: 134
(Sakden, eastern Bhutan, 9000 ft)

Not in Baker, FBI

Plate 78, fig. 10

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 11 cm (4½ in.).

FIELD CHARACTERS. Above, head chocolate-brown, sides of head and nape reddish brown. Rest of upperparts and underparts as in *A. vinipictus* (1381). Distinguished from the latter species by the absence of white supercilium and the dark brown line above it. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to some vertical movements. Eastern Bhutan and southeast Tibet in the Pachakshiri district and the upper Subansiri, NEFA in the Tawang area, probably occurring throughout the Agency at suitable altitudes; from 2200 m (winter; possibly also lower) to 3500 m (summer). Affects bamboo and rhododendron forest.

GENERAL HABITS, FOOD AND VOICE. As in 1385.

BREEDING. Unknown.

MUSEUM DIAGNOSIS. Differs from *manipurensis* in having a white ground colour to throat. For details of plumage see *Ibis* 1937: 38.

Young (juvenile) like adult but paler.

MEASUREMENTS

Wing, ♂ 59–64; ♀ 56–60 mm (NBK). Other measurements as in 1385.

COLOURS OF BARE PARTS. Iris brown. Bill dark horn, fleshy at base of lower mandible. Legs and feet fleshy brown (Ludlow. More details under 1385).

BABBLERS

119

FIELD CHARACTERS. Above, brown with darker streaks on head, nape and upper back; lores black; wing chestnut with a pale grey outer edge. Below, throat and breast white, conspicuously streaked with dark brown. Belly whitish grey. Sexes alike.

Distinguished from both *vinipictus* and *cinereiceps* by the dark brown streaks on upper back and the lack of rusty on rump.

STATUS, DISTRIBUTION AND HABITAT. Not recorded within our limits but it may occur in northern NEFA since it has been collected by Ludlow in many localities of southeast Tibet north of the main range, from the Tsari Valley (upper Subansiri) to Tripé (*Ibis* 1944: 81 and 1951: 556). Also obtained at Tripé by Bailey [JBNHS 24: 75, but erroneously identified as *vinipictus* by Baker, *vide* Ludlow (1944)]. Has a wide altitudinal range in summer, from 2800 to 4200 m. Replaces *vinipictus* at higher altitudes when both occur. There is presumably a withdrawal from the upper altitudes in the cold season. Affects shrubbery and is particularly fond of rhododendron and holly-oak.

Extralimital. Extends to eastern Szechuan and southwestern Kansu.

GENERAL HABITS. A gregarious, confiding but inconspicuous species. Very active.

FOOD. Unrecorded.

VOICE AND CALLS. A clear *tserrr-tserrr*, deceptive as it varies in intensity, so that one may believe the bird to be a stone's throw away while it suddenly appears within a couple of metres (Schäfer).

BREEDING. A nest found by Bailey on 15 July was made of grass, covered with moss and lichen on the outside and lined with hair. It was 'hanging in a branch of bamboo' and contained four eggs.

MUSEUM DIAGNOSIS. See Field Characters.

Young, like adult but darker above and duller below.

MEASUREMENTS

Wing 6 ♂ 61–62; 7 ♀ 58–60 mm (Kinnear)

Bill from skull c. 12; tarsus c. 23; tail c. 59 mm

COLOURS OF BARE PARTS. Iris yellowish white to lemon-yellow. Bill: upper mandible horny, lower fleshy pink. Legs and feet horny brown to fleshy brown.

ALCIPPE RUFOGULARIS (Mandelli)

Key to the Subspecies

- Darker on crown; back rufescent brown.....*A. r. collaris*

Baker, FBI No. 300 (part), Vol. 1: 286

Plate 78, fig. 8

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 12 cm (4½ in.).

118

TIMALIINAE

1385. Manipur Brownheaded Tit-Babbler. *Alcippe cinereiceps manipurensis* (Ogilvie-Grant)

Proparus manipurensis Ogilvie-Grant, 1906, Bull. Brit. Orn. Cl. 16: 123
(Owenkuno Peak, Manipur Hills)
Baker, FBI No. 307, Vol. 1: 292

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 11 cm (4½ in.).

FIELD CHARACTERS. As in 1384 but ground colour of throat pale smoke-grey instead of white.

STATUS, DISTRIBUTION AND HABITAT. Resident, probably subject to some vertical movements. Nagaland, Manipur (Owenkuno Peak) and Assam in the Barail Range, from 1500 m in winter to over 2500 m in summer. Appears to occupy a slightly lower zone than *A. vinipictus* and to replace it, the two species having never been recorded in the same area. Affects secondary scrub-jungle, especially bramble, and also dense bamboo.

Extralimital. Extends through Burma (including the Chin Hills) to western Yunnan. The species ranges north to southwestern Kansu and Hopeh, and east to northern Vietnam, Fukien and Formosa.

GENERAL HABITS. Very similar to those of *A. vinipictus* (1381). In the non-breeding season keeps in parties of six to ten, often in company with other small babblers or leaf warblers. The birds scramble about in shrubs close to the ground, sometimes ascending trees. Usually very confiding.

FOOD. Chiefly insects.

VOICE AND CALLS. A rattling song of three or four notes (Stanford). Call, a tit-like *cheep* (SDR).

BREEDING. Unknown. Season, apparently beginning in April.

MUSEUM DIAGNOSIS. Differs from *ludlowi* (1384) in having the ground colour of throat pale smoke-grey instead of white. For details of fresh plumage see JBNHS 50: 503.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
2 ♂♂	55, 56	10, 10	23, 23	52, 53 mm
1 ♀	51	10	—	50 mm (SDR)

Wing ♂ ♀ 51–57; tail 49–54 mm (Mayr)

Weight 2 ♂♂ 10, 10 g (SDR).

COLOURS OF BARE PARTS. Iris variable: pale pinkish yellow or straw yellow (Stanford); ♂ yellowish brown, ♀ pale pinkish brown (SDR). Bill: ♂ black, ♀ dark brown. Legs and feet: ♂ dark brown to greyish brown, ♀ brownish flesh; claws grey or bone colour.

1385a. Streakthroated Tit-Babbler. *Alcippe striatocollis* (Verreaux)

6: 38 (Muping)

Not in Baker, FBI

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 11 cm (4½ in.).

120

TIMALIINAE

FIELD CHARACTERS. Above, crown rufous-brown bordered by a broad black stripe from forehead to nape. Lores, supercilium and eye-ring white. Ear-coverts dark brown. Rest of upperparts brown. Below, chin and throat white with a wide chestnut band across the latter. Centre of belly whitish, sides olive-brown; under tail-coverts fulvous. Sexes alike.

The chestnut throat-band easily identifies this species.

STATUS, DISTRIBUTION AND HABITAT. Resident, fairly common. The Himalayan foothills from the Jalpaiguri duars east to the Dihang river, from the plains level to c. 900 m. Affects undergrowth in evergreen forest.

GENERAL HABITS, FOOD AND VOICE. As in 1387.

BREEDING. As in 1387.

MUSEUM DIAGNOSIS. See Field Characters. For distinction from *cellaris* see 1387.

MEASUREMENTS AND COLOURS OF BARE PARTS. As in 1387.

1387. Assam Redthroated Tit-Babbler. *Alcippe rufogularis collaris* Walden

Alcippe collaris Walden, 1874, Ann. Mag. Nat. Hist. 14: 156
(Sadiya, upper Assam)

Baker, FBI No. 300 (part), Vol. 1: 286

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 12 cm (4½ in.).

FIELD CHARACTERS. As in 1386, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident. NEFA east of the range of the nominate race (about the Dihang river) and south through the Sadiya Frontier Tract, the Patkai Range, Nagaland, Manipur, Assam in the Cachar hills, and East Pakistan in the northeastern highlands and the Chittagong Hill Tracts; from the plains level to c. 900 m. Affects bamboo jungle, scrub, secondary growth and undergrowth in evergreen forest.

Extralimital. The species extends east to Vietnam.

GENERAL HABITS. Creeps about and skulks in dense cover close to the ground, in small restless parties often mixed with *Stachyris* and other small babblers, also feeding on the ground. In pairs in the breeding season.

FOOD. Mainly insects.

VOICE AND CALLS. A musical *chip-churr* (Stanford) or cheeping *chrr-chrr* while on the move (SA).

BREEDING. Season, March to June, mostly April. Nest, domed, rather loosely made of dead leaves, grass, roots, moss and a few tendrils, lined first with rootlets with an inner layer of dead leaves. Usually placed on the ground or on fallen rubbish, rarely at the bottom of a bush or in tangles of creepers and cane, generally blending well with the surroundings. Eggs, normally 3, seldom 4, similar to those of *A. brunnea* (1388) but paler, less brown and more grey. Average size of 100 eggs 19.5 × 14.7 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *rufogularis* (1386) in being darker on the crown and rufescent on the back. Flanks more heavily washed with brown.

1388. Rufousheaded Tit-Babbler. *Alcippe brunnea mendelli* (Godwin-Austen)*Mitla mendelli* Godwin-Austen, 1876, Anp. Mag. Nat. Hist. 18: 33 (Naga Hills, Northeast Bengal)*Schoeniparus dubius certus* Koelz, 1952, Jour. Zool. Soc. India 4: 39 (Shillong Peak, Khasi Hills)

Baker, FBI No. 293, Vol. 1: 284

Plate 78, fig. 3

LOCAL NAME. *Das-chitter* (Cachari).

SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. Above, crown rufous-brown, more rufous on forehead, bordered by black stripes starting above the eye and meeting on the upper back. A broad white supercilium; lores dark brown; ear-coverts umber-brown. Rest of upperparts olive-brown. Below, buffish white. Sexes alike.

Very similar to *A. rufogularis* but lacks the chestnut band on throat.

STATUS, DISTRIBUTION and HABITAT. Common resident. Assam in the Khasi and Cachar hills,

Nagaland and Manipur. Two records north of the Brahmaputra: Dafa Hills [Godwin-Austen? (Whistler's MS.)] and Kobo (Baker, 1913, *Rec. Ind. Mus.* 8: 273; from 900 m to 1800 m in Assam and from c. 1400 to 2400 m in Nagaland. Affects dense bushes, especially bracken and brambles in forest margins or light forest; in winter may be seen in bamboo jungle, scrub and secondary growth.

EXTRALIMITAL. The Chin Hills of Burma. The species extends north to Szechuan and Anhwei and east to Kiangsi, Fukien and Formosa (whence the nominate race).

GENERAL HABITS. Keeps in small parties often in company with *Stachyris*, hunting in dense undergrowth, close to or on the ground. In spite of being shy and secretive, it seldom escapes notice thanks to its restless vivacity. Keeps in pairs in the breeding season.

FOOD. Mainly insects.

VOICE and CALLS. A constant *chir-r-r-r* alternating with a sharp *chit* while hopping through cover. Also a chattering note of alarm and a distinctive *chee-chee-chee-chee-kpuri* (Smythies).

BREEDING. Season, April to June. Nest, oval-shaped with entrance near the top sometimes occupying so much of the side that the nest looks semi-domed or even a deep cup in shape. Made of bamboo leaves, grass, bracker

TIMALIINAE

122

leaves and roots, lined with rootlets with an inner layer of dead leaves. Placed on the ground or on fallen leaves and rubbish, concealed among bracken, preferably on sloping ground. Eggs, 3 or 4, occasionally 5, clay-white to deep clay-colour marked with dark brown spots and a few short lines and blotches, with secondary smudges of paler brown or grey. Average size of 200 eggs 20.8 × 15.6 mm (Baker). Building and incubation by both sexes; incubation period undetermined.

MUSEUM DIAGNOSIS. See Field Characters.

(Mahabaleshwar)

Baker, FBI No. 289, Vol. 1: 278

LOCAL NAME. *Setimār. lalido* (Gujarati).

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 1390, q.v.

STATUS, DISTRIBUTION and HABITAT. Resident, locally very common. The hills of the Indian peninsula [except for the range of the nominate race (1390, q.v.)], south of a line running from Kathiawar and Mt Abu across southern Madhya Pradesh (Pachmarhi, Balaghat) to Parasnath (southern Bihar); from the foothills to the highest elevations. Affects wet forest of teak, mixed deciduous or evergreen as well as bamboo jungle and frequently open scrub, occasionally gardens.

GENERAL HABITS, FOOD and VOICE. As in 1390.

BREEDING. Season, nests or birds in breeding condition have been recorded from January to November; main period appears to be January to April. Nest and eggs as in 1390. Average size of 35 eggs 20 × 15 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *poioicephala* (1390) in being paler. Crown and nape a clearer colder grey; rest of upperparts greyer, less brown. Wings and tail not so dark. Lower parts also much paler, washed with greyer brown (c. rich fulvous) Perhaps slightly larger.

(Coonoor Ghat, Nilgiris)

Baker, FBI No. 288, Vol. 1: 277

Plate 78, fig. 11

LOCAL NAME. *Kens chilippen* (Malayalam).

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. A nondescript olive-brown babbler with grey crown and nape, rusty brown on wings and tail, and pale fulvous underparts. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Common resident. Western Mysore along the Ghats south through Kerala and western Tamil Nadu (Nilgiris and Palnis). Intergrades with *brucei* in southwestern Maharashtra, Goa and the Biligirirangan Hills; from the foothills to 2100 m. Affects evergreen and moist-deciduous forest, sholas, ravines, mixed bamboo jungle and canebrakes.

TIMALIINAE

124

GENERAL HABITS. Usually seen in parties of six to ten individuals, sometimes up to twenty or more, hopping about among the undergrowth, often ascending to the canopy, flitting from sprig to sprig, clinging upside-down in acrobatic positions, continually calling to each other; often forming the nucleus of the mixed hunting parties of small insectivorous species. Behaviour very similar to that of *Macronous gularis* (1228).

FOOD. Ants and other insects. Very fond of nectar, especially of *Erythrina* spp.

VOICE and CALLS. Members of a party maintain contact by a harsh, rather subdued *chur-r-chur-r*. Song, most often heard in the first half of the year, a quavering trill of four (sometimes up to 7 or 8) sweet whistling notes of Magpie-Robin quality recalling those of the Spotted Babbler — constantly uttered (SA). See also 1391.

BREEDING. Season, not well defined; chiefly January to May but nests also found in August and October. Nest, a roughly built cup of green moss, rootlets, lichen, leaves and grass, lined with rootlets and placed in a fork or suspended from a branch, usually between one and three metres above the ground, in bushes or saplings. Eggs, usually 2, sometimes 3, pale salmon, marked with blotches and smudges of deep purple-brown with secondary markings of pale grey or pinkish grey, and in many eggs, some short lines and hieroglyphic markings. Average size of 42 eggs 20 × 15.1 mm (Baker). Incubation by both sexes; period undetermined.

MUSEUM DIAGNOSIS. More richly coloured than *brucei*; for distinction from it see 1389; for details of plumage Baker, loc. cit.

Young, similar to adult, but showing the juvenal timeline characters — soft blunt first primary, narrow, pointed rectrices.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	68-73	15-16	c. 23	60-67 mm
♀♀	65-75	15-16	c. 23	61-65 mm (SA)

COLOURS OF BARE PARTS. Adult: Iris greyish brown. Bill dark horny brown; commissure and lower mandible greyish; mouth pale flesh-colour. Legs, feet and claws greyish brown. Young: Iris slaty grey. Gape and mouth bright yellow; paler portions of bill yellowish. Legs, feet and claws as in adult.

FIELD CHARACTERS. As in 1390, q.v.

STATUS, DISTRIBUTION and HABITAT. Common resident. East Pakistan in the northeastern highlands and the Chittagong Hill Tracts, Assam in the

BABLERS

125

Khasi and Cachar hills, Nagaland and Manipur (where it intergrades with *phayrei*); in the foothills up to 1000 m and adjacent plains. Affects deep evergreen forest, bamboo jungle and secondary growth.

Extralimital. Extends to northwestern Burma. The species ranges east to Vietnam. *A. brunneicauda* of the southern Malay Peninsula, Sumatra and Borneo and *A. pyrrhoptera* of Sumatra are considered as subspecies by De-la-cour; their ranges are complementary.

GENERAL HABITS AND FOOD. As in 1390.

VOICE AND CALLS. Has a distinctive musical *chevy-chevy-chevy-chevy-chevy* uttered quickly with each *chevy* alternately higher and lower in pitch; may be heard the whole year (Smythies). See also 1390.

BREEDING. Season, overall March to September, chiefly April to June. Nest and eggs as in 1390. Average size of 150 eggs 19.6 × 15 mm.

MUSEUM DIAGNOSIS. Like *poioicephala* but not so fulvous above; ear-coverts and sides of neck ochraceous; edges of wings and tail fulvous-olive; underparts more ochraceous.

Young, like adult but upperparts, edges of wings and tail browner. Timaline juvenal characters, i.e. soft blunt first primary and narrow, pointed rectrices present. Postjuvenal moult complete.

MEASUREMENTS

Type, by monotypy, *Leioptila annectans* [sic] Blyth

Bill shorter than head, slender and curved; nostrils covered by a membrane. Rictal bristles moderate. Tail long, well graduated.

TIMALIINAE

126

Bhutan and western NEFA in the Darrang district (where it intergrades with *commoda*), and Assam in the Garo and western Khasi hills; from the foothills to c. 1800 m in winter, and up to 2400 m (locally) in summer; lower limit of breeding zone not satisfactorily known: mostly above 1500 m in Nepal, but apparently lower down farther east. Affects moist-deciduous or evergreen forest with dense undergrowth.

GENERAL HABITS. Keeps in active, restless flocks, often in company with other small insectivorous species. Feeds mostly in the undergrowth and in the crowns of lower trees, occasionally on the ground. May be seen clinging sideways or upside-down on twigs, racing along some branch or fluttering in front of a sprig in its feverish search for food, the flocks rapidly 'flowing' from tree to tree. Pairs form in March.

FOOD. Insects and berries, the latter forming a large part of its diet in the non-breeding season; also flower-nectar.

VOICE AND CALLS. A constant twittering given while foraging — 'a shrill whinnying note' (Stanford). One call is rendered as *p-p-p-p-jet* (Fleming), others as a rapid *dzi-dzi-dzi-dzi-dzi* and a soft, high-pitched *pi-pi-pi-pi* (Lister).

BREEDING. Season, March to July. Nest, a deep cup of bamboo leaves, grasses, fern fronds, roots, bark fibre or other materials, lined with rootlets. Placed in bushes or bamboo clumps, generally between upright twigs, occasionally semi-pendent in a horizontal fork, between 30 and 150 cm above the ground. Eggs, 3 or 4, less often 5, very variable: white to pink with reddish specks, spots or blotches forming a ring or cap around the large end (for more details see Baker, *Nidification* 1: 242). Average size of 200 eggs including those of the Assam race, 18.4 × 14 mm (Baker). Building and incubation by both sexes; period about 12 days.

MUSEUM DIAGNOSIS. See Field Characters. For distinction from *commoda*, see 1393.

Young, like adult but upperparts richer fulvous, flanks and under tail-coverts more fulvous. Juvenal timaline primary and tail characters present.

MEASUREMENTS

Plate 80, fig. 14

LOCAL NAME. *Rubnun-pho* (Lepcha).

SIZE. Bulbul; length c. 18 cm (7 in.).

FIELD CHARACTERS. Above, crown, ear-coverts, sides of neck and sides of upper back black; hindneck streaked with white. Centre of back, rump and upper tail-coverts chestnut. Wing black with a chestnut bar, pale ashy edges to primaries and white tips to secondaries. Tail black, graduated, the rectrices tipped with white. Below, white; flanks, vent and under tail-coverts fulvous. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. A rather scarce resident except in Manipur where it is common; subject to vertical movements. From Darjeeling and Sikkim east through Bhutan and NEFA; Assam in the Khasi, Cachar and Mizo hills, Nagaland and Manipur; from c. 1200 to 2300 m in summer, straying down to the foothills in winter. Affects dense, humid evergreen forest.

Extralimital. Extends to western Burma and western Yunnan. The species ranges east to Vietnam.

GENERAL HABITS. Arboreal. Small parties keep to the canopy of tall trees. Creeps along the branches or clammers on the trunks like a nuthatch, searching amongst the moss, lichen and crevices of bark for insects.

FOOD. Beetles and other insects; also seeds.

VOICE AND CALLS. Song: 'a musical phrase of four notes, the first two on the same pitch, followed by two notes dropping in pitch, the whole sometimes preceded by an introductory grace note' (Smythies). Alarm-note *chirr-r-r* (Baker). A clear single whistle has also been recorded.

BREEDING. Season, May and June. Nest, cup-shaped, very neatly and compactly built; exteriorly of moss with a few leaves and fine grass, followed by a deep layer of grass, bamboo or other leaves and lined with fine fibres, rootlets or rhizomorphs. Usually placed on a branch of a small tree between two and six metres from the ground, generally in a fork of an outer branch, slender and difficult to reach. Eggs, normally 3, sometimes 2, exceptionally 4, very variable: the most common type is a very pale blue-grey or green-grey marked with blotches and smears of reddish brown, a few spots and

BABBLERS

129

short wavy lines of the same colour, and secondary blotches of pale lavender and pale brown. For further details see Baker, *Nidification* 1: 279. Average size of 25 eggs 22×15.5 mm (Baker). Incubation by both sexes. When disturbed from the nest, the bird's persistent alarm-notes draw attention to it.

MUSEUM DIAGNOSIS. See Field Characters; for details of plumage, Baker loc. cit.

COLOURS OF BARE PARTS. Iris brownish to deep crimson. Bill black, yellow at base of lower mandible. Legs and feet wax yellow; claws brownish.

1396. **Western Blackcapped Sibia.** *Heterophasia capistrata capistrata* (Vigors)

Cinclosoma capistratum Vigors, 1831, Proc. Zool. Soc. London: 56

(Himalayas; restricted to Simla by Ripley, Synopsis)

Malacia capistrata pallida Hartert, 1891, Kat. Vög. Mus. Senckenb.: 21

(northwestern India; restricted to Simla by Baker, 1921, JBNHS 27: 460)

Baker, FBI Nos. 311 (part), 312, Vol. 1: 296, 298

Plate 80, fig. 13

LOCAL NAMES. None recorded.

SIZE. Bulbul +; length c. 21 cm (c. 8 in.).

FIELD CHARACTERS. Above, ear-coverts, crown and erectile crest black. Back, rump and part of tail rufous, the middle back tinged with greyish brown. Wings slaty with paler outer edge and a black shoulder-patch; a white patch conspicuous in flight. Tail long, graduated, rufous with black outer edge and subterminal band, tipped with slaty grey. Below, entirely cinnamon. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical movements. The western Himalayas from Murree to extreme western Nepal (Fleming & Traylor, *Feldiana* 53: 177). Breeds between 1800 and 2700 m; from October to March it is found mostly between 1200 and 2100 m but may also be seen as high as 2700 m and has strayed down to c. 100 m. Affects various types of forest but shows a preference for mixed evergreen: oak, fir, chestnut, etc.

GENERAL HABITS. Keeps in pairs or small parties according to the season. Strictly arboreal; hunts in the canopy and on moss-covered trunks and branches of tall trees, occasionally descending to the undergrowth. Very active and lively; hops swiftly from branch to branch like a laughing thrush, hanging upside-down on sprigs to peer under leaves, occasionally flying out to catch an insect on the wing; often flies up to a trunk and clings to the bark while exploring crevices. Flight rather laboured.

BABBLERS

131

Young (juvenile). Crown and sides of head brownish black with a tendency to pale shaft-lines. Rest of upperparts bright rufous, darker on upper tail-coverts and tinged with brown on mantle. Underparts paler rufous. Wing and tail much as in adult, but white on greater coverts not so extensive and tinged with buff. Outer tail-feathers narrower. Postjuvénal moult of body and probably lesser, median and greater coverts.

MEASUREMENTS

Wing 11 ♂♂ 100-110; ♀♀ 99-110 mm (Kinnear)

COLOURS OF BARE PARTS. Iris reddish brown. Bill black. Legs and feet flesh-brown.

1397. **Nepal Blackcapped Sibia.** *Heterophasia capistrata nigriceps* (Hodgson)

Sibia nigriceps Hodgson, 1839, Jour. Asiat. Soc. Bengal 8: 38

(Nepal, restricted to central Nepal by Ripley, 1950, JBNHS 49: 399)

Baker, FBI No. 311 (part), Vol. 1: 296

LOCAL NAME. *Sibya* (Nepal).

SIZE. Bulbul +; length c. 21 cm (c. 8 in.).

FIELD CHARACTERS. As in 1396, but back rufous v. greyish brown.

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical movements. Nepal, meeting *capistrata* in the western extremity of its range and *bayleyi* in the eastern extremity (Fleming, JBNHS 65: 331-2). Breeds from c. 2000 to 3500 m, locally as low as 1600 m. Winters (October to March) between 1000 and 2700 m. Affects evergreen or deciduous forest in wet zone; a characteristic species of oak forest.

GENERAL HABITS, FOOD and VOICE. As in 1396.

BREEDING. Season, May to August. Nest and eggs as in 1396.

MUSEUM DIAGNOSIS. Differs from both *capistrata* and *bayleyi* in having the centre of back rufous, hardly tinged with brown.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	88-102	22-24	c. 28	99-106 mm
♀♀	89-93	22-24	c. 28	94-99 mm

Weight 9 ♂♂ 37-47; 4 ♀♀ 36-41 g (GD).

COLOURS OF BARE PARTS. As in 1396.

1398. **Eastern Blackcapped Sibia.** *Heterophasia capistrata bayleyi* (Kinnear)

Leiotila capistrata bayleyi Kinnear, 1939, Ibis: 752

(Takto, near Sakdan, E. Bhutan)

Baker, FBI No. 311 (part), Vol. 1: 296

LOCAL NAMES. *Sambrik-pho* (Lepcha); *Serigens* (Bhutane).

SIZE. Bulbul +; length c. 21 cm (c. 8 in.).

FIELD CHARACTERS. As in 1396, q.v. See Museum Diagnosis.

130

TIMALIINAE

Heterophasia capistrata and *H. gracilis*

H. c. capistrata (1396).
 H. c. nigriceps (1397).
 H. c. bayleyi (1398).
 H. gracilis (1399).

FOOD. Insects and berries. Often visits flowers of Silk Cotton trees and rhododendron for insects and nectar.

VOICE and CALLS. Song, a clear, flute-like, very pleasing and far-carrying *tee-dee-dee-dee-dee-o-lu*, the first five notes on the same tone, the sixth lowest and the last in between, sometimes shortened of the first two or three notes but ending always typical (Desfayes); a very characteristic sound of the forests of its zone. Alarm, a harsh, rasping *chrai-chrai-chrai-chrai-chrai* (Lister). Call-note, a loud, rapid *chi-chi* (Fleming); *tee-riri-tee-riri*, like the jingle of a silver bell, repeated every half-minute or so (SA).

BREEDING. Season, April to August, chiefly June and July. Nest, a neat cup of green moss, dry grasses and leaves, firmly interwoven and lined with rootlets, pine needles or other fine materials. Generally built on trees or bushes, often near the extremity of a branch, from two to eighteen metres above the ground, on average about seven or eight metres. Eggs, usually 3, sometimes 2, very distinctive: pale bluish grey, clouded, spotted and lined with various shades of brown. For further details see Baker, *Nidification* 1: 272-4. Average size of fifty eggs 25.5×18.3 mm (Baker). Both sexes share in nest building. Incubation apparently by female alone. The birds desert the nest on the least provocation—merely climbing the tree and peeping into the nest in some cases is enough.

MUSEUM DIAGNOSIS. Differs from *nigriceps* (1397) in being paler and having the centre of the back pale brownish grey. Also a little larger. Postnuptial moult in September-October.

132

TIMALIINAE

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical movements. Eastern Nepal from the Okhaldunga district east through Darjeeling, Sikkim, the Chumbi Valley, Bhutan, and NEFA to the Dafia Hills; from c. 1800 to at least 2500 m in summer, descending to the foothills in winter. Affects tall moist-deciduous or evergreen forest.

GENERAL HABITS, FOOD and VOICE. As in 1396.

BREEDING. As in 1397.

MUSEUM DIAGNOSIS. Differs from *nigriceps* in having the back sooty brown tinged with grey.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	88-101	22-23	28-31	102-107 mm
♀♀	83-92	21-23	27-30	90-109 mm

Weight 25 ♂♀ 28-45 (av. of 15, 39.4) g—SA.

COLOURS OF BARE PARTS. Iris brown. Bill black. Legs and feet brownish flesh; claws horny brown.

1399. **Grey Sibia.** *Heterophasia gracilis* (McClelland)

Hyppipetes gracilis McClelland, 1839 (1840), Proc. Zool. Soc. London: 159

(Assam, restricted to Naga Hills by Koelz, 1954, loc. cit. below;

but see Biswas, 1963, JBNHS 60: 683)

Leiotila gracilis ordanica Koelz, 1954, Contrib. Inst.

Regional Exploration, No. 1: 7 (Mawphlang, Khasi Hills)

Leiotila gracilis dorsalis Stresemann, 1940, in Stresemann & Heinrich,

Mitt. Zool. Mus. Berlin 24: 153 (Mount Victoria, Upper Burma)

Baker, FBI No. 313, Vol. 1: 298

Plate 80, fig. 17

LOCAL NAME. *Tit* (Angami Naga).

SIZE. Bulbul +; length c. 21 cm (8 in.).

FIELD CHARACTERS. Above, crown and ear-coverts black. Back and rump grey. Wing black, tertiaries grey. Tail graduated, grey with broad black outer edges and subterminal band; tip grey. Below, throat and centre of belly white; sides pale ashy; under tail-coverts buff. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Common resident. Assam in the Khasi and Cachar hills, the Patkai Range, Dibrugarh, Nagaland and Manipur, from 1200 m to the highest summits (1400 to 2800 m on Mt Victoria). Wanders down to about 900 m in the cold weather. A geographical representative of *H. capistrata*, differing from it only by the lack of any rufous pigment. Affects deciduous or evergreen primeval forest and, in the Khasi Hills, mostly pine forest.

Extremal. Western and northern Burma to western Yunnan.

GENERAL HABITS. Arboreal, active and restless. Keeps in pairs or small parties according to the season, often in mixed company. Frequent the tops of trees, hopping along the branches, sometimes momentarily cocking tail like a magpie-robin, dodging in and out of clumps of epiphytes; only occasionally descending to bushes.

BABBLERS

133

FOOD. Insects, berries and seeds; often visits the blossoms of various trees for nectar and insects.

VOICE AND CALLS. A melancholy song of four flute-like descending notes, oft-repeated at short intervals; a variation consists of the first and second notes being doubled (Heinrich); this song appears to be very similar, if not identical with that of the Blackheaded Sibia. Alarm-note, a *churr* heard especially when going to roost (Stanford). Also various notes of a conversational character.

BREEDING. *Season*, chiefly May and June, extending into August. *Nest*, a deep, compact cup of moss-roots, leaves and fibres, covered exteriorly with green moss, lined with rootlets or rhizomorphs. Usually placed in the crown of trees, especially pine, very difficult to find. *Eggs*, 2 or 3, one as often as the other, occasionally 4, pale bluish or greenish grey, lightly freckled with reddish brown or dark brown, more numerous at the large end. Average size of 60 eggs 23.9 × 17.7 mm (Baker). Building of nest, incubation and care of young by both sexes. Incubation period unknown.

MUSEUM DIAGNOSIS. See Field Characters.

Young, like adult but colours not so pure.

MEASUREMENTS

Wing ♂ ♀ 84-95; tail 101-112 mm (Stanford)

Wing 10 ♂ 89-96; 10 ♀ 87-95; tail 100-110 mm (Stresemann)

Bill from skull c. 24; tarsus c. 28 mm

Weight ♂ ♀ 34-42 g (SDR).

COLOURS OF BARE PARTS. Iris red, reddish brown to brown. Bill black. Legs and feet dark brown to black; soles yellow.

1400. Beautiful Sibia. *Heterophasia pulchella* (Godwin-Austen)

Sibia pulchella Godwin-Austen, 1874, Ann. Mag. Nat. Hist. 13: 160
(Kunho Peak, eastern Barail Range, Naga Hills)

Lioptila pulchella caeruleoflora Rothschild, 1921, Novit. Zool. 28: 38
(Shweli-Salwin Divide)

Lioptila pulchella nigraurita Kinnear, 1944, Ibis 86: 83

(Lhalung, Pachakshiri dist., SE. Tibet, 7000 ft)

Baker, FBI No. 320, Vol. 1: 302

Plate 80, fig. 15

LOCAL NAMES. None recorded.

SIZE. Bulbul +; length c. 22 cm (9 in.).

FIELD CHARACTERS. *Above*, head bluish slate; forehead, lores and line through eye black. Back and rump slaty. Wing with pale bluish outer edge and a conspicuous black shoulder-patch. Centre of tail dark brown with black edges and subterminal band; terminal band slaty. *Below*, uniformly slate-grey, paler than above. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Resident, subject to vertical movements. NEFA from the Daffa to the Mishmi hills, Nagaland and Assam in the Cachar and Khasi hills (winter only ?); from 1200 to 2700 m in winter, breeding mostly above 2100 m and up to 3000 m. Affects mossy forest.

Extralimital. Southeastern Tibet, northern Burma and western Yunnan.

FLYCATCHERS

135

STATUS, DISTRIBUTION AND HABITAT. Resident, locally common; some altitudinal movements with the seasons. The Himalayan foothills from Nepal (not recorded since 1879 when Scully found it 'tolerably common about Nimboatar [central dun] in winter') east through Darjeeling, Sikkim, Bhutan and NEFA to the Mishmi Hills, thence south to Nagaland; from the base of the hills to c. 900 m in winter and probably somewhat higher in summer (up to 2000 m in northern Burma). Affects forest, open scrub with large trees or clearings in evergreen forest.

Extralimital. Extends to northeastern Burma. The species ranges east to Vietnam and south to the Malay Peninsula and Sumatra.

GENERAL HABITS. Keeps in pairs or in parties according to the season, sometimes numbering up to thirty or forty individuals. Frequents mostly the tree-tops. 'A curious blend of tree-pie, drongo and fantail flycatcher, swinging their tails, cocking them up over their backs, then crouching on a branch with outspread tail, or drifting from tree to tree following one behind another' (Stanford).

FOOD. Insects, flower-buds and seeds; feeds regularly on the nectar of *Salmalia*, *Erythrina*, *Prunus* and other flowers in company with drongos and Black Buleuls, the forehead often becoming so thickly coated with whitish pollen as to give the bird an intriguingly novel look.

VOICE AND CALLS. Song, a rich, whistling six-note phrase of thrush-like quality ending in *wheet-wheet*, reminiscent in cadence of *Alcippe poioicephala* but much louder (SA). Call-note, a high-pitched but not loud *trip-trip-trip* uttered rapidly (Smythies).

BREEDING. Known only from a few nests found by Stevens. *Season*, April to June. *Nest*, a deep cup made mostly of moss, lined with rootlets or rhizomorphs and placed high up in pines on a horizontal branch, carefully hidden. *Eggs*, very similar to those of *H. gracilis*, pale grey-green marked with very small blotches of reddish brown, more numerous at the large end. Clutch size not given. Average size of 5 eggs 24.5 × 18.1 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♀	109-125	24-26	30-31	205-220 mm (Baker, SA)

Tail 1 ♂ 199; 1 ♀ 188 mm (Mayr).

COLOURS OF BARE PARTS. Iris red or crimson, sometimes brown. Bill black. Legs and feet dusky grey; claws horny brown.

Subfamily MUSCICAPINAE: Flycatchers

For description see Van Tyne, J. & Berger, A. J., 1959: 526 (Family Muscicapidae)

Cf. Mayr, E., in Delacour, J. & Mayr, E., 1945, *Zoologica* 30 (3): 113

Ripley, S. D., 1955, *Auk* 72: 86-8 (Muscicapinae)

134

TIMALIINAE

GENERAL HABITS. Keeps in pairs or small parties according to the season, sometimes in company with Hoary Barwings or other babblers. Frequents tall trees, feeding mostly on the lichen- and moss-grown trunks and branches, hopping actively along the big boughs, stopping abruptly at intervals, or moving about slowly on the outer branches. On a fleeting glimpse the quick jerky movements may be easily mistaken for a squirrel's. Often sits up in the top branches of a dead tree.

FOOD. Insects and their larvae, seeds and other vegetable matter. Regularly probes into the blossoms of rhododendron, *Prunus*, *Magnolia*, etc. for nectar and insects, its forehead and breast sometimes becoming so thickly plastered with pollen as to make it look like a different species.

VOICE AND CALLS. 'Often very silent but at times bursts into a bewildering variety of notes, one in particular resembling the jingling of a bunch of keys' (Stanford). Song likened to the call of a Redshank with three other notes added (Granbrook); also described as a musical phrase of six notes in pairs, with a drop in pitch after each pair and also a drop after the first note (Smythies).

BREEDING. Known only from one nest taken in May, built on a horizontal branch of a small tree; it was cup-shaped, made of moss, lined with rootlets and placed nearly at the end of the branch (Field *apud* Baker, *Nidification* 1: 281). The single egg was a pale blue, unspotted, and measured 23.8 × 17.9 mm. This egg may not have been typical.

MUSEUM DIAGNOSIS. See Field Characters. Ear-coverts may be slaty or brown to black.

Young, like adult but slightly duller.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♂	101-115	25	c. 30	113-118 mm
♀ ♀	92-100	—	—	100-108 mm (SA, SDR, Mayr)

Weight ♂ ♀ 35-47 g (SDR).

COLOURS OF BARE PARTS. Iris brown. Bill black. Legs and feet brown; soles yellow.

1401. Longtailed Sibia. *Heterophasia picaoides picaoides* (Hodgson)

Sibia picaoides Hodgson, 1839, Jour. Asiat. Soc. Bengal 8: 38 (Nepal)
Baker, FBI No. 310, Vol. 1: 295

Plate 80, fig. 16

LOCAL NAME. *Matheo-pho* (Lepcha).

SIZE. Bulbul, with a long tail; length c. 30 cm (12 in.).

FIELD CHARACTERS. *Above*, dark slate-grey; wings blackish brown with a white patch. Tail very long and graduated, tipped with whitish. *Below*, uniformly grey, paler than back and still paler on belly. Under surface of closed tail appears barred black and grey. Sexes alike.

The slaty colour, extremely long graduated white-tipped tail and white patch on blackish wing make the bird easy to identify.

136

MUSCICAPINAE

Paradise Flycatcher (1461)

Key to the Genera

	Page
A Tail longer than wing.....	<i>Rhipidura</i> 205
B Tail shorter than wing	
1 Rectal bristles very long	
a Bill well hooked at tip.....	<i>Rhinomyias</i> 136
b Bill not hooked.....	<i>Culicicapa</i> 202
2 Rectal bristles short	
c Bill wide at base.....	<i>Muscicapa</i> 137
d Bill narrow and weak.....	<i>Muscicapella</i> 201

Genus RHINOMYIAS Sharpe

Rhinomyias Sharpe, 1879, Cat. Bds. Brit. Mus. 4: 367. Type, by subsequent

designation, *Alcippe pectoralis* Salvadori = *Rhinomyias umbratilis* (Strickland)

Olyeris Baker, 1930, Fauna Brit. Ind., Bds. 7: 137.

Type, by original designation, *Cyornis olivacea* Hume

Cf. Vaurie, C., 1932, *Amer. Mus. Novit.*, No. 1570: 1-36

A rather heavily set flycatcher. Tarsus booted or with a vague trace of one or possibly two anterior scutes. Bill well ridged, notched and hooked at tip. Rectal bristles well developed.

FLYCATCHERS

137

1402. Olive Flycatcher. *Rhinomyias brunneata nicobarica* Richmond

Rhinomyias nicobarica Richmond, 1902, Proc. U.S. Nat. Mus. 25: 295
(Great Nicobar)
Baker, FBI No. 631a, Vol. 8: 627
Plate 81, fig. 13

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 14 cm (6 in.).

FIELD CHARACTERS. A brown flycatcher of low shrubbery. Above, entirely brown; tail more rufous-brown; a pale eye-ring. Below, chin, throat and belly whitish; a pale brown band across breast; flanks brown. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. So far known only as a common winter visitor to the Great and Little Nicobar Islands. Not known to occur north of Little Nicobar, but may be expected in the Andamans (see Butler, JBNHS 12: 401). Affects forest, sometimes gardens.

EXTRALIMITAL. Winter range outside the Nicobars unknown. A migrant has been taken in the Strait of Malacca on 1 November. Breeding range unknown. The species as a whole breeds in eastern China (Kwangsi to Chekiang) and winters, so far as known, in the southern Malay Peninsula. This subspecies has a more rounded wing than the nominate race, suggesting that it may be less of a long-range migrant.

MIGRATION. All specimens from the Nicobars have been taken in March (but see 'Extralimital' above).

GENERAL HABITS. Keeps close to the ground, usually within three metres, in low bushes in heavy forest.

FOOD. Insects.

VOICE and CALLS. Song similar to the opening portion of that of Fantail Flycatcher, *Rhipidura a. albogularis*, but without the ending *to-lea, to-lea, to-lea* (Abdulali).

MUSEUM DIAGNOSIS. See Field Characters.

Specimens taken in March still show some ochraceous spotting of the immature on the sides of nape, tips of tertiaries and secondary coverts.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	74-80	18	17	54-59 mm
♀♀	74-75	18-19	18	52-54 mm (MD)

COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible black, lower yellowish flesh. Legs and feet yellowish flesh.

Genus MUSCICAPA Brisson

Muscicapa Brisson, 1760, Orn. 1: 32; 2: 357. Type, by tautonymy, '*Muscicapa*', i.e. *Muscicapa striata*, ibid.*Niltava* Hodgson, 1837, Ind. Rev. 1 (12): 650. Type, by original designation, *Niltava Sundara* Hodgson*Siphia* Hodgson, 1837, Ind. Rev. 1 (12): 651. Type, by monotypy, *Siphia strophiala* Hodgson

1403, 1404. Spotted Flycatcher. *Muscicapa striata sarudnyi* Snigirewskij

Muscicapa striata sarudnyi Snigirewskij, 1928, Jour. f. Orn. 76: 595, new name for *Batalis griseola* var. *pallida* Zarudny, 1903, nec *Muscicapa pallida* Müller (Eastern Iran and Transcaucasia)

Baker, FBI No. 631, Vol. 2: 202 (= *westermanni*)

Plate 81, fig. 5

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 13 cm (5 in.).

FIELD CHARACTERS. A pale greyish brown, characteristically upright-sitting flycatcher. Both in flight and at perch mistakable in the distance for Yellowthroated Sparrow (*Petronia xanthocollis*, 1949). A slight fork in the tail enhances the resemblance.

Above, drab brown, tail and wings darker; crown noticeably streaked with pale and dark brown. A whitish ring round eye. Below, whitish with dark streaks on throat and breast. Sexes alike.

M. sibirica is much darker, sooty grey on breast; *M. latirostris* has a more distinct whitish eye-ring and lores, and *M. ruficauda* has a rufous tail; none of these have a streaked crown.

¹ According to Dunajewski (in *spit.* to Whistler) a specimen from Gilgit is typical *sarudnyi* while two others are almost identical with *striata*. Since *sarudnyi* is the form breeding in adjacent Afghanistan and Turkistan (while *sarudnyi* breeds in western Siberia) it appears more logical, pending examination of more material, to consider the western Himalayan breeding form as belonging to *sarudnyi*.

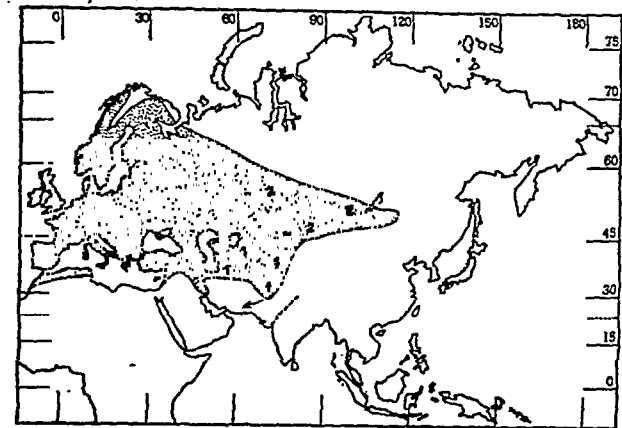

The subspecies *sarudnyi* may occur in West Pakistan on autumn migration. It differs from *sarudnyi* by lacking any yellowish rusty wash on belly.

FLYCATCHERS

141

STATUS, DISTRIBUTION and HABITAT. Common summer (breeding) visitor in the mountains of West Pakistan, from Astor, Baltistan, Gilgit and Chitral south to northern Baluchistan (Ziarat); from c. 2100 m to 3300 m. Affects open forest, especially pine. Also passage migrant (chiefly autumn) in some areas (see below).
Extralimital. Extends to Iran, Afghanistan, Transcaspia and Turkestan. The species ranges from western Europe to Mongolia.

Muscicapa striata

Distributional range
Broken line autumn passage extension
1 *sarudnyi* (1404).
2 *neumanni* (1403).

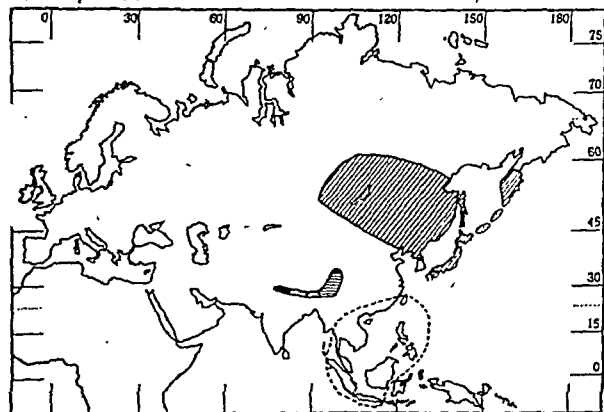

MIGRATION. Winters in east Africa. Recorded on migration as high as 4200 m (Sughet Pass, Kunlun Range) and in the plains of West Pakistan (Sind, Baluchistan — Chagai, central and coastal Makran) and north-western India as far east as Simla, western Rajasthan, northern Gujarat (Deesa), Kutch and the Kathiawar peninsula. Spring passage migration takes place at the end of April and May (but mostly, if not entirely, west of the Indus, by-passing northwestern India). Arrives on the breeding grounds in the first week of May, leaves in late August and early September. Autumn passage occurs through above areas from the last part of August till October. At this time, affects large trees, and open babool (*Acacia*) and kandi (*Prosopis*) jungle.
GENERAL HABITS. A quiet, solitary bird, usually perching on the lower branches of trees, seldom near top; makes typical sallies with rapid swerves and twists as it pursues a gnat; often returns to the same perch, or to another nearby. Frequently descends to the ground to pick up a crawling insect. Sits upright, head somewhat sunk between shoulders, tail slightly depressed like a bush chat's, and similarly switched loosely up and down from time to time, accompanied by flicks of the wings.

FLYCATCHERS

143

M. striata adult is almost entirely white below. *M. latirostris* is almost identical with *sibirica* above, but tips of its closed wings are about 15 mm shorter than tail (*v.* reaching tip of tail in *sibirica*) and its throat and chin are entirely white. *M. mutua* is distinguished by the same characters but has a diffuse dusky breast-band and rufous-brown tail. In *M. ruficauda* the tail is a richer rufous. *M. poliolegens* and *M. ferruginea* have ochraceous underparts.
STATUS, DISTRIBUTION and HABITAT. An altitudinal migrant, generally common. From Tank Zam Valley, S. Waziristan (Hudson, JBNHS 27: 402), the Safed Koh, Kohat, Chitral and Gilgit east through Kashmir (very

Muscicapa sibirica

Distributional ranges
gulmergi (1405).
cacabata (1406).
rothschildi (RE).
sibirica (RE).
Broken line: Winter range of *M. s. sibirica*

common and abundant), Spiti and Dhaola Dhar to Garhwal; from c. 2100 to timber-line (c. 3300 m), locally down to 1500 m (Kulu — Whistler, JBNHS 31: 468); optimum zone 2400-3000 m. Affects open forest of pine, deodar, fir and birch, or oak and conifers.
MIGRATION. One of the latest migrants; arrives on its breeding ground in the first half of May and leaves in September. A few birds leave their summer zone immediately after the nesting period and appear at lower levels (c. 1200 m) already in the first week of July. Passage at mid-altitudes takes place mostly in April-May and September-October. Recorded as a migrant or straggler as high as 3900 m (Lahul). Winter quarters very imperfectly known (records from November to March are totally lacking); presumably in the foothills below c. 1200 m.

142

MUSCICAPINAE

FOOD. Insects, chiefly Diptera.
VOICE and CALLS. Not recorded for this subspecies. Call-note of nominate race is a thin, shrill *tzee*; alarm-note *tzee-tzee*. Song infrequently heard, half-a-dozen squeaky notes *sip, sip, sree, sreeti, sree, sip* and variants, with pause between each note (Witherby).
BREEDING. Within our limits (Chitral, N. Baluchistan — Ziarat, Quetta), season May and June. Nest, a bunch of grass, moss and roots, lined with hair and rootlets. Placed on the branch of a tree or against the trunk, sometimes in crevices of stumps, a couple of metres from the ground. Eggs, 4 or 5, pale sea-green heavily blotched with pale reddish brown; variable (for further details see Baker, *Nidification* 2: 174). Average size of 100 eggs 18.3 x 14.2 mm (Baker). Building, incubation and care of young by both sexes.
MUSEUM DIAGNOSIS. See Field Characters. For details of plumage see Baker, loc. cit. Differs from *neumanni* in having a yellowish rusty wash on belly. See footnote p. 140.
Young, spotted with buff; much paler than young of *M. sibirica*.
MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

Darker, more brown. *M. s. cacabata*

1405. Kashmir Sooty Flycatcher. *Muscicapa sibirica gulmergi* (Baker)

Hemichelidon sibirica gulmergi Baker, 1923, Bull. Brit. Orn. Cl. 43: 155 (Gulmerg, Kashmir)
Baker, FBI No. 633, Vol. 2: 205

LOCAL NAMES. None recorded.
SIZE. Sparrow —; length c. 13 cm (5 in.).
FIELD CHARACTERS. A dark sooty-brown flycatcher, hawking midges etc. by characteristic looping aerial sallies, often returning to the same perch and sitting bolt upright.
Adult. Above, entirely grey-brown with noticeably large eyes and a pale eye-ring. Below, grey-brown with a whitish throat-patch and centre of belly. Sexes alike.
Young, sooty-brown spotted with buff and whitish, much darker than *M. striata* of corresponding age. Immatures of other flycatchers cannot be told apart except in certain cases by their behaviour.

144

MUSCICAPINAE

GENERAL HABITS. Very similar to those of the Spotted Flycatcher, but it is more of a forest bird. Particularly fond of forest glades and clearings littered with tangled brushwood, with gaunt tree-trunks and stumps standing here and there to serve as hunting bases. Felled or storm-blown trees likewise afford favourite perches. From the tip of a vertical dead branch or upturned root (now telegraph wires where available) the bird flies out in all directions to take a midge — maybe from as much as ten metres away — by agile twists and turns and circles back, sometimes diverting to seize a second victim before regaining its base. Also launches vertical sorties skyward after the quarry, tumbling back to the perch after each capture. These quick-repeated forays continue throughout the day and often well into the dusk, frequently 3 or 4 individuals hawking within a restricted clearing. May often be seen hunting close to the ground especially after rain, when it has been observed taking food from the ground.
FOOD. Insects, mostly Diptera.
VOICE and CALLS. Usually very silent. Song, very high-pitched, thin, reedy, usually of three notes *tzee-tee-tee* in descending scale in half- or quarter-tones, with occasional variations; not unlike a thin edition of the song of a Greywinged Blackbird (Lister). Call-note unrecorded.
BREEDING. Season, May to July. Nest, a compact cup c. 8 cm across and nearly as deep, composed almost entirely of moss with lichen on the outside, consolidated with cobweb and lined with fine grass, fur or hair, with an occasional feather. Usually placed on a horizontal branch of a large spruce or Silver Fir where the leafy portion commences. Often in very exposed situations; sometimes against the trunk, tucked behind the out flaking bark of a birch or similar tree; height above ground varies from two to eighteen metres. Often three or four occupied nests within a 50-metre radius. Eggs, 3 or 4, pale green, densely freckled with pale reddish especially around the large end. Average size 16 x 12.1 mm (Baker, Osmaston). Incubating female fed at nest by male whilst hovering momentarily against it. Both sexes share in tending the young; male's share in incubation, and incubation period, unrecorded.
MUSEUM DIAGNOSIS. See Field Characters. For distinction from *cacabata* see 1406.
Young (juvenile). Upperparts, wing-coverts and sides of head as in adult, but crown with central terminal ochraceous streaks; spots elsewhere. Underparts whitish with black margins, obsolete on throat and belly. Under tail-coverts pale ochraceous. Tertiaries with fulvous edges and tip. Tip of tail fulvous. Postjuvinal moult of body-feathers, lesser and median coverts, but here and there juvenal feathers are retained, with ochraceous spots faded to white.
First-year birds recognized by ochraceous tips of greater and primary coverts, fulvous edges of tertiaries and tip of tail.
MEASUREMENTS and COLOURS OF BARE PARTS. As in 1406.
1406. Nepal Sooty Flycatcher. *Muscicapa sibirica cacabata* Penard
Muscicapa sibirica cacabata Penard, 1919, Proc. New Eng. Zool. Cl. 7: 22. New name for *Hemichelidon fuliginosa* Hodgson, 1844 (Nepal), preoccupied in *Muscicapa* by *M. fuliginosa* Sparrman, 1787, and *M. fuliginosa* Gmelin, 1789
Baker, FBI No. 632, Vol. 2: 204
Plate 81, fig. 7
LOCAL NAME. Deng-chin-pa-pa (Lepcha).

FLYCATCHERS

145

SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. As in 1405, q.v.

STATUS, DISTRIBUTION AND HABITAT. An altitudinal migrant, locally common. From western Nepal east through Darjeeling, Sikkim to eastern Bhutan (Sakden) and western NEFA (Mago district — Ludlow, *Ibis* 1937: 279). Eastern limit unknown; probably occurs throughout NEFA. Breeds from 2400 to 3300 m in Nepal and up to 3600 in southeast Tibet; recorded at 3900 m at Thangu in Sikkim (Schäfer). Affects open conifer forest or clearings in oak forest.

EXTRALIMITAL. The species ranges through western China to the Altai, Kamchatka and Japan and winters in the Indochinese countries and southern China (see map, p. 143).

MIGRATION. Arrives on its breeding grounds in the first half of May, leaves in September. Spring passage takes place from the last week of March till May, return in September–October. As for *gulgmergi*, winter quarters are poorly known. Winter visitor to the Jalpaiguri district and, according to Rashid (1967), recorded in northern and northeastern East Pakistan and in the Chittagong region; there are no precise data. Has been obtained in the Khasi Hills, Shillong and Cachar Hills (Godwin-Austen) and near Aimole, Manipur at 1800 m (Hume).

GENERAL HABITS, FOOD AND VOICE. As in 1405.

BREEDING. As in 1405, but nest also found in holes in trees. Average size of six eggs 17.1 × 12.2 mm (Baker).

MUSEUM DIAGNOSIS. Like *gulgmergi* but rather darker brown; not well differentiated and not every specimen can be separated (HW).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	70–76	11–12	10–12	45–51 mm
♀♀	70–76	11–12	10–12	47–52 mm

(BB, SA)

Weight 14 ♂ 8.5–11.5 (av. 9.6) g — SA. 3 ♂ 9–11; 3 ♀ 9–11 g (GD).

COLOURS OF BARE PARTS. Iris dark brown. Bill, legs, feet and claws black; soles grey.

LOCAL NAMES. *Zakki* (Hindi); *Tāvitupākhi* (Malayalam).

SIZE. Sparrow ±; length c. 14 cm (5½ in.).

FLYCATCHERS

147

(JBNHS 55: 160) and Cardamom Hills (Sparrow, in *epist.* to Whistler; Jackson, 1971, JBNHS 68: 112–13). The resident breeding population is augmented by winter visitors. May breed also in the Chitteri Range (Eastern Ghats) where it has been obtained in June (Whistler, JBNHS 36: 85) and in the Biligirirangan Hills, obtained in July (Salim Ali, JBNHS 43: 334).

Winters erratically but sparsely over most of the Peninsula but mainly in the Ghats of the southern Peninsula, from the lowlands to c. 1500 m (stragglers recorded in Kathiawar and Kutch). Also Ceylon (all zones) up to 1300 m where it is most common from October to March. Post-breeding dispersal of southern birds already takes place in August. According to Wright (JBNHS 54: 635) it is a winter visitor to the foothills of Dehra Dun from October to February. Winters also in the Andaman Islands (common), on Car Nicobar and Camorta (Abdulali, JBNHS 64: 183); apparently very scarce in Manipur (Hume), the Cachar Hills (Baker, JBNHS 9: 126) and the Garo Hills (Godwin-Austen). Recorded in winter from all parts of East Pakistan *vide* Rashid (1967, p. 101).

Affects open, mixed deciduous forest, teak plantations, groves about villages and cultivation, margins of jungle, overgrown nullahs, edges of sholas, bamboo jungle, shady gardens and coffee plantations; partial to the vicinity of streams.

MIGRATION. Arrives on its Himalayan breeding grounds in April, departs in September. May be seen on passage, mainly in September and October, in northern India east of Punjab (Ludhiana) and Gujarat (Sasan and the Gir Forest). Has occurred as a straggler south of Chimre (Ladakh) in September.

EXTRALIMITAL. Also breeds in southern Siberia from the Yenisey to Sakhalin, Japan and Korea; winters in southeast Asia, the Philippines and Indonesia.

GENERAL HABITS. Closely resembles the Sooty Flycatcher in dress and habits; frequents mostly the lower branches of trees. Makes aerial sallies for insects from a dead branch, often returning to the same perch. Perches upright; flicks wings and depresses tail. More crepuscular than most flycatchers, a habit obviously correlated with its abnormally large eyes (SA). Usually solitary, quiet and very unobtrusive, therefore doubtless often overlooked.

FOOD. Chiefly dipterous insects.

VOICE AND CALLS. A feeble *chi-chir-ri-ri-ri* (SA) or *chik, chik-r-r* (Henry). Three or four *chiks* in rapid succession and a small shrill squeak; a weak sub-song full of trills and squeaks heard in winter (Nichols). Primary song: a single, plaintive note slowly repeated; song period in Nepal: mid April till end of June with a resumption in September (Proud). 'Has a loud note of 3 or 4 syllables and a short song freely uttered' (Whistler).

BREEDING. Season, May to July in the north, April to June in the south. Single-brooded. Nest, a compact cup made principally of moss, decorated with lichen and lined with rootlets, fine fibres and some feathers. Usually built on a bare, thick branch, some distance from the trunk, at heights varying from two to nine metres, on average about six metres from the ground. Eggs, normally 4, very similar to those of *M. ruberuloides* (1440) but more olive-grey, heavily stippled with sienna-brown. Average size of 40 eggs

146

MUSCICAPINAE

FIELD CHARACTERS. An ashy brown flycatcher with a conspicuous white ring around the strikingly large eye. Below, sullied white, tinged with grey on breast and flanks, and faintly streaked with ashy brown. Throat conspicuously white. In the gloaming, when perched within the dark foliage canopy, glistening white throat often gives the only indication of its position. Sexes alike.

× c. 1

M. striata has distinctly streaked throat and crown. *M. sibirica* is much darker below and has the white on throat reduced to a patch. *M. muttui* is very similar but has a diffuse dusky breast-band, rufous-brown tail, and yellow legs (v. dark brown); also its tertiaries are edged with rusty (v. whitish plus a thin whitish wing-bar).

STATUS, DISTRIBUTION AND HABITAT. A partial migrant having a disjunct breeding range. Movements imperfectly understood.

Himalayas: Fairly common summer visitor to the western foothills in Chamba, Dharmasala, Dhaola Dhar and Kulu between 900 and 1800 m. Much scarcer east of these localities where it has been recorded from April to July in Mussooree, Ranikhet, Naini Tal (breeding at Thal, c. 1900 m, Almora dist., mid May 1945 — SA), Nepal Valley, Jalpaiguri duars and Bhutan foothills. Said by Ward (JBNHS 17: 480) to be rare in Kishtwar (southwestern Kashmir) and 'probably not to be found west of the Chandra-Bhaga (river)'.

Muscicapa latirostris

Breeding range

Winter

Vindhya Range: A common breeder in the hills around Sehore and Mhow. The breeding population appears to be of summer visitors only.

The Ghats: A scarce breeder in the southern part of the Western Ghats at about 900 m in north Kanara (Davidson), Coorg (Betts), the Palnis

148

MUSCICAPINAE

17.4 × 13.1 mm (Baker). Incubation probably by female only (Dementiev), who is fed on the nest by the male. Incubation period undetermined.

MUSEUM DIAGNOSIS. See Field Characters. For details of plumage and moults see JBNHS 38: 298.

Young (juvenile). Upperparts and sides of head with very bold ochraceous white spots; underparts dull white on belly and under tail-coverts and spangled with dark brown margins elsewhere, heaviest on breast. Lesser and median coverts grey-brown with large ochraceous white tips. Greater coverts and tertials with fulvous white outer edges and tips. Tips of tail narrowly fulvous white. Postjuvenile moult of body, lesser and median coverts. First-year birds distinguished by fulvous white margins and tips of greater coverts. Juvenal plumage not distinguishable from that of *M. striata* (HW).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	69–76	13–15	13–15	46–54 mm
♀♀	66–73	12–15	13–14	46–51 mm

(SA, HW, Koelz)

Weight 50 ♂ 9 (October) 9–14 (once 16) g — SA.

COLOURS OF BARE PARTS. Iris dark brown. Bill horny brown, base of lower mandible fleshy yellow, or cream colour to chrome-yellow; mouth pale yellow or pale yellowish pink. Legs, feet and claws horny brown.

1408. Brownbreasted Flycatcher. *Muscicapa muttui muttui* (Layard)

Butalis muttui Layard, 1854, Ann. Mag. Nat. Hist. 13: 127

(Pt. Pedro, Ceylon)

Alstonax muttui *honoris* Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 14 (Aijal, Lushai Hills)

Baker, FBI No. 677, Vol. 2: 251

Plate 81, fig. 6

LOCAL NAME. *Muttipilla* (Malayalam).

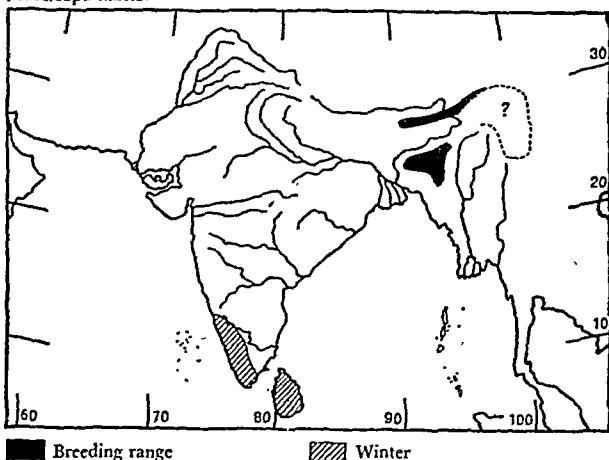

SIZE. Sparrow ±; length c. 13 cm (5 in.).

FIELD CHARACTERS. Largely as of Brown Flycatcher (1407) but with a diffuse brownish gorget or breast-band rendering white throat even more prominent by contrast. Legs yellow (v. horny brown). Above, olive-brown becoming rufous-brown on lower rump and tail. Wing-feathers with rusty edges. Lores and ring around the large eye white. Below, throat and centre of belly white; breast and sides pale brown. Sexes alike.

M. latirostris is very similar but is greyer both above and on breast, lacks the rusty edges on wing, and has dark legs (not yellow); the lower mandible is brown at tip (largely yellow in *muttui*). *M. sibirica* has a very dark breast. *M. ruficauda* has a rufous tail and lacks the white throat. *M. poliopteryx* and *M. ferruginea* have ochraceous underparts.

STATUS, DISTRIBUTION AND HABITAT. Breeding range poorly known both in India and outside. Breeds in Assam in the Khasi and Cachar hills from 1200 m upwards, mostly above 1500 m (Baker). Obtained in Manipur in April (Hume), in the Garo and Mizo hills in March, and in Nagaland

Muscicapa muttui

(Koelz). May be expected to breed in the eastern Himalayas: recorded in Sikkim from August to November (Mandelli, 1875, not noted since). Affects dense evergreen forest.

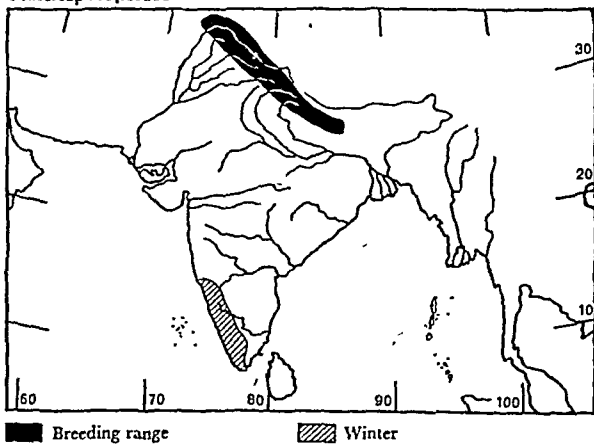

WINTER RANGE AND MIGRATION. A population of this species winters in southwestern India from Londa south through the hills of Mysore and Kerala, from the low country to c. 1000, commonest above 300 m, and in Ceylon in all zones up to c. 1500 m (scarce). In this season affects evergreen forest, frequenting dense scrub and liana tangles, preferably on the fringe of jungle, cardamom clearings and overgrown rocky streams. Arrives in its winter quarters in October and leaves in March-April, some individuals possibly staying till May (once end May in Kerala at c. 1700 m — Primrose, JBNHS 40: 502). Recorded on passage (September and October) at Madhupur (eastern Bihar), Nagpur (eastern Maharashtra) and in Andhra Pradesh (passage only?). Rashid (1967) lists it as a passage migrant in most parts of East Pakistan.

Extralimital. Northern Burma, northern Thailand, Yunnan and Szechuan; probably breeds above 1500 m in N. Burma.

GENERAL HABITS. A very quiet and secretive flycatcher, thus easily overlooked, frequenting the low vegetation, mostly within a couple of metres above the ground. Affects denser forest than *latirostris*. Often sits motionless in the lowest branches of trees or tangles in shady recesses, every now and then making sallies after winged insects, returning to the same perch or a neighbouring one; occasionally descends to the ground. Usually solitary, but frequently in loose association with other flycatcher species. Appears very territorial and paroichial; has been observed hunting in the same spot half an hour at a time. Like the Brown Flycatcher, it is also crepuscular, often hunting till late into the dusk.

2100 and 3600 m, optimum zone 2400-3300 m. Affects mixed conifer and deciduous forest, fir or deodar forest, pine and birch.

Muscicapa ruficauda

Extralimital. Russian Turkistan and adjacent Afghanistan.

WINTER RANGE AND MIGRATION. Arrives on its summer grounds in early May, departs in August or September. A specimen obtained at Sholapur (Maharashtra) in July (Davidson & Wendon, SF 7: 81). Winters (October to April) in southwestern India from north Kanara through the hills of Mysore and Kerala, from lowlands to c. 1000 m. Two records from Cachar (Baker), and listed by Rashid (authority?) as occurring in the northeast highlands and the Chittagong region of East Pakistan. In this season, frequents evergreen forest, especially along the margins, tracks and in clearings. During autumn migration (September and October) is frequently observed in the Himalayan foothills and has been recorded in southeastern Punjab, Mt Abu, Nagpur and along the Western Ghats. On spring passage in April, recorded at Raipur (eastern M.P.), Madhupur (eastern Bihar) and along the Himalayan foothills. Also obtained at Nellore (no date).

GENERAL HABITS. Solitary and very unobtrusive. Wanders about the crowns of large trees hunting mostly within the canopy rather than by sallies in pursuit outside; insect prey snapped up while flitting restlessly from one perch to another, or while fluttering about amongst the foliage and boughs. Sometimes descends to bushes. Flicks wings and bobs its body forward, thus reminding one of a chat. Frequents the edge of forest and does not seem to penetrate far into the woods.

FOOD. Insects, chiefly Diptera.

VOICE AND CALLS. Song, three or four loud clear notes repeated at short intervals, varied from time to time in several ways, reminding one of the

FOOD. Chiefly dipterous insects.

VOICE AND CALLS. 'In the breeding season it often gives vent to a soft low note, at the same time puffing out its feathers and rapidly vibrating its half-opened wings. Has a pleasant but rather feeble little song, very seldom uttered' (Baker).

BREEDING. The only records of nesting for the species in its entire range are by Baker (N. Cachar, c. 1500 m and above). Season, from the end of April till June. Nest, a very neat, compact cup made entirely of green moss and lined with fine moss-roots. Placed in bushes, creepers or other tangles of vegetation, not far from the ground. Eggs, 4 or 5, similar to those of the Brown Flycatcher: pinky brown or grey-blue stippled very closely with reddish brown. Average size of 28 eggs 16.9 x 13.8 mm. Incubation by both sexes; period undetermined.

MUSEUM DIAGNOSIS. See Field Characters. For details of plumage see Baker, loc. cit.

Young (juvenile). Upperparts covered with elongated ochraceous spots, very narrow and pointed on crown. Tips of wing-coverts, upper tail-coverts and edges of tertiaries and secondaries more rusty ochraceous. Throat and belly whitish; breast spotted like back but less distinctly so. Under tail-coverts buff. First-year birds recognized by rusty spots of greater coverts.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	72-75	16-17	13-14	49-56 mm
♀♀	67-76	16-17	13-14	48-55 mm
				(HW, SA)

Weight 13 ♂♀ (October, in winter quarters) 10-14 (av. 12) g — SA.

COLOURS OF BARE PARTS. Iris dark brown. Bill dark horny brown, lower mandible fleshy with dusky tip; mouth pale lemon-yellow. Legs and feet pale yellowish flesh or yellow, claws dusky.

1409. *Rufostailed Flycatcher. Muscicapa ruficauda* Swainson

Muscicapa ruficauda Swainson, 1838, Nat. Library, Flycatchers: 251

(India = Kashmir)

Baker, FBI No. 676, Vol. 2: 250

Plate 81, fig. 8

LOCAL NAME. *Chempucalanpakki* (Malayalam).

SIZE. Sparrow —; length c. 14 cm (5½ in.).

FIELD CHARACTERS. A drab brown flycatcher with rufous tail. A noticeable pale eye-ring. Below, throat and breast grey-brown; belly whitish. Sexes alike.

Distinguished from *muttui* and *latirostris* by the lack of white on throat; from the other brown flycatchers by its rufous tail.

STATUS, DISTRIBUTION AND HABITAT. A summer (breeding) visitor, common at suitable altitudes in the western Himalayas; from the Safed Koh, Kohat and Chitral east through Gilgit, Astor, the Indus Valley and Kashmir to Lahul and Kulu; much more scarce to the east: Garhwal and Kumaon (breeding), Nepal as far as the Kathmandu Valley [summer records by Lowndes (1955) and Rahd & Fleming (1957)]. Breeds between

song of *Monticola cinclorhynchus* (Osmaston); some phrases rendered by Magrath as *tyee-trirr, trirr-tee* or *weelitlew, ee-willu-willu* and *choi-choi* with an occasional, loud, finch-like *twoink-twoink*; all notes rapidly repeated and with a ventriloquial effect. Usually uttered from high up in leafy trees. While singing, the bird rarely stays in one spot for more than a few seconds. Alarm-note, a plaintive *peup* ceaselessly repeated and followed by a soft *churr* and sometimes a double *te-peup* when excited, as when an intruder approaches the nest (Bates & Lowther).

BREEDING. Season, May to July. Nest, a solid cup almost entirely made of moss with some bits of bark skin, liberally coated on the outside with lichen and cobweb, and lined with hair and a few feathers. The species is very versatile as to the site; the nest may be placed in bushes between one and two metres from the ground or in trees up to nine metres or more (generally under four metres); it may be built across a horizontal fork in the smaller branches, against the trunk, or in stumps of pollarded trees. It may also be found on the ground, particularly on very steep hillsides where it is sometimes placed at the foot of a small bush or in a depression in a nearly vertical bank (Bates). Eggs, 3 or 4, pale sea-green, densely freckled all over with reddish, chiefly at the broad end. Average size of 50 eggs 17.3 x 13.2 mm (Baker). The birds easily desert their nest. Their territory is very large, the male having been heard singing three or four hundred metres from the nest.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Young (juvenile). Upperparts grey-brown with ochraceous white spots; streaked on crown. Upper tail-coverts paler than in adults. Underparts and sides of head greyish white with blackish fringes, obsolete on throat and belly. Under tail-coverts buff. Median and lesser coverts with indistinct pale tips which are more marked on the greater coverts. Postjuvénal moult of body, lesser and median coverts.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	73-77	14-16	c. 17	57-60 mm
♀♀	75-77	14-16	c. 17	55-58 mm
				(SA)

Weight 13 ♂♀ (Apr.-May, in summer quarters) 12-16 (av. 13.3) g — SA.

COLOURS OF BARE PARTS. Iris dark brown. Bill: upper mandible brown, lower pale flesh-colour; mouth yellow and pink. Legs and feet brownish plumbeous; claws horny brown.

1410. *Ferruginous Flycatcher. Muscicapa ferruginea* (Hodgson)

Hemichelidon ferruginea Hodgson, 1845, Proc. Zool. Soc. London: 32 (Nepal)

Hemichelidon rufilata Swinhoe, 1860, Ibis: 57 (Amoy, Fukien, China)

Hemichelidon ferruginea rufata Koels, 1954, Contrib. Inst.

Regional Exploration, No. 1: 13 (Kohima, Naga Hills)

Baker, FBI No. 635, Vol. 2: 206

Plate 81, fig. 9

LOCAL NAME. *Dang-chim-pa-tho* (Lep.-ha).

SIZE. Sparrow —; length c. 13 cm (5 in.).

FLYCATCHERS

153

FIELD CHARACTERS. *Above*, head blackish brown with a conspicuous whitish eye-ring. Back rusty brown. Lower rump ferruginous. Tail chestnut. Wings blackish brown, margins of tertials and tips of greater coverts conspicuous pale rufous. *Below*, chin, throat and centre of belly white. Breast olive-brown with dark centres to the feathers giving a spotted effect. Rest of underparts ochraceous. Sexes alike.

Distinguished from all other brown flycatchers except *M. poliogenys* (1436) by its rusty belly. The latter has an olive-brown back and tail, no rufous edges on wing, a whitish belly, a pale ochraceous breast and a less noticeable pale grey eye-ring.

STATUS, DISTRIBUTION AND HABITAT. Probably only a summer visitor or altitudinal migrant in the central and eastern Himalayas from April to October; generally scarce, only noted as common (and breeding) by Osmaston in the Darjeeling district. Occurs from central Nepal (Sheopuri ridge, 2400 m — Proud, JBNHS 61: 534; Bigu, 3300 m east-central Nepal — Diesselhorst, 1968: 253) east through Darjeeling, Sikkim, Bhutan and NEFA (Upper Subansiri — Ludlow, *Ibis* 1944: 193) from 1800 to 3300 m, mostly above 2400 m. Also Assam in the Khasi and Cachar hills breeding mostly between 1200 and 1800 m (Baker), the Dibrugarh district (Cripps, SF 11: 106), the Mizo Hills and Nagaland near Kohima (Koelz, loc. cit. above) and Manipur near Aimole, 1800 m (Hume). Winter status unclear. According to Baker, apparently a resident in Assam while 'other birds scatter far and wide during the winter'; these may well be visitors from the Himalayas or extralimital regions. Obtained by Meinertzhagen at c. 1350 m in the Sikkim foothills in winter. Affects forest of fir or oak (Himalayas), humid stunted oak forest and dense mixed jungle (Assam).

Extralimital. Southeast Tibet, northern Burma and western China, wintering in the Indochinese countries; Burma, Malaysia and Indonesia.

MIGRATION. No data. Arrives on its breeding grounds in April. Obtained at Nellore in March, probably a straggler.

GENERAL HABITS. Typical of the brown flycatchers; frequents mostly the lower parts of the tall tree canopy, making sallies for insects from a bare branch returning to the same perch; sometimes doing this for hours. Very quiet, retiring and crepuscular.

FOOD. Chiefly dipterous insects.

VOICE AND CALLS. Unrecorded. Very silent.

BREEDING. *Season*, June to July. *Nest*, a neat cup of moss and lichen, lined with rootlets; placed on projections, natural or caused by broken branches, near the trunk of a tree, or on a branch, between three and fifteen metres above the ground; very difficult to find as they are generally placed in or on the moss with which they are built. *Eggs*, 2 or 3, very much like those of *M. sibirica* (1405). Average size of nine eggs 17.9 × 13.6 mm (Baker). Incubation by both sexes; period undetermined.

MUSEUM DIAGNOSIS. See Field Characters. For details of plumage see Baker, loc. cit.

Young, upperparts brown with ochraceous spots; head more dusky with paler streaks. Underparts ochraceous with dark margins on breast; throat whitish with dark margins.

MEASUREMENTS

Wing ♂♂ 69-72; ♀♀ 63-70 mm (Koelz)

FLYCATCHERS

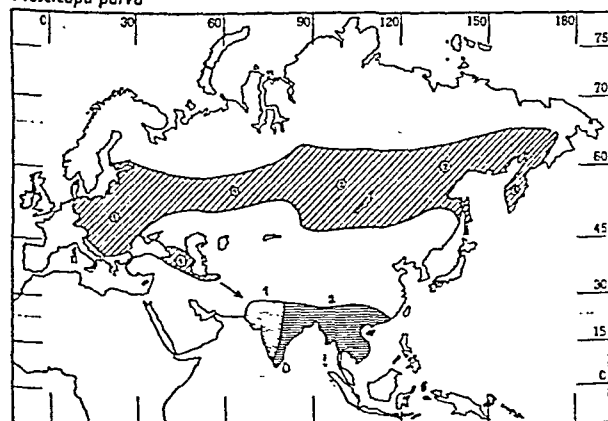

155

Male *M. p. albicilla* (1412) has a smaller throat-patch separated from the cream-coloured belly by a grey breast. Female and first-winter male not distinguishable in the field.

In adult male Kashmir Redbreasted Flycatcher (1413) throat and breast bordered with black; adult female and young male darker above, but not separable from those of *M. p. albicilla* in the field.

STATUS, DISTRIBUTION AND HABITAT. A widespread winter visitor and passage migrant. Winters from the western Himalayan foothills (Chitral and Kohat to Dehra Dun) south to Baluchistan, Sind, through Gujarat (including Kathiawar and Kutch), Maharashtra and Mysore; more common

Muscicapa parva

1 Breeding range 1, 2 2 Winter 1 3 Winter 2
1 *parva* (1411). 2 *albicilla* (1412).

in the western and central Peninsula but has been recorded in West Bengal, western East Pakistan (Rashid) and has straggled to the Jalpaiguri duars. In northern India and West Pakistan it is more common as a passage migrant and has been recorded only as such in Ladakh, Kashmir and northern Baluchistan. Affects groves, forest plantations, orchards, urban gardens with large trees, etc. May be seen in scrub on migration.

Extralimital. Breeds in eastern Europe and Russia to the Urals and the southern Caspian region. On passage migration through Afghanistan in autumn and spring.

MIGRATION. Arrives in the northwest at the end of August but the bulk of autumn passage takes place in September and October and may last till November. Spring passage starts in March, reaches its peak in April, some individuals still being seen in May. Adult males are the first to leave, females and immatures following two or three weeks later.

154

MUSCICAPINAE

Bill from skull 11; tarsus 12; tail 47 mm (MD)

Weight 1 ♀ 12 g (GD).

COLOURS OF BARE PARTS. Iris brown. Bill blackish brown, flesh to yellow at base of lower mandible. Legs and feet pale flesh.

[The Pied Flycatcher *Muscicapa hypoleuca tomentosa* Johansen may be a scarce migrant in West Pakistan. According to Briggs (JBNHS 32: 749) 'a few birds indistinguishable from the British species pass through Peshawar almost every spring. Earliest and latest dates seen February 18 and March 30. The only year I have seen the species in autumn was in 1925 when a pair fed in my compound almost every day from October 31 till I left Peshawar on January 11.' No specimen has ever been obtained within our limits.

This subspecies breeds in western Siberia from the Urals to the Yenisey and migrates through southwestern Asia to tropical Africa.

FIELD CHARACTERS. Male in spring: *above* black with a white forehead and a large white wing-patch. *Below* entirely white.

In the field can be told at a glance from male of Little Pied Flycatcher (1419) by its conspicuous white forehead and absence of broad white superciliary stripe.

Female and male in autumn: very similar to *M. parva* (1411) female, but distinguished by the conspicuous wing-patch. Call-note almost constantly uttered on migration, a sharp *whit*.]

Baker, FBI No. 638, Vol. 2: 210

Plate 81, fig. 2

LOCAL NAMES. *Tarra* (Hindi); *Tepidippān* (Tamil).

SIZE. Sparrow —; 13 cm (5 in.).

FIELD CHARACTERS. Male (adult): pale brown above, with white patches at either side of basal half of black tail prominently displayed by frequent upward flicks of tail; chin and throat orange-rufous, rest of underparts white. Tail usually carried erect like a robin's, with the wings partly drooping at the sides.

Female has a whitish throat and buffy breast.

156

MUSCICAPINAE

GENERAL HABITS. Usually keeps singly, sometimes in company with other species. Makes short darts for insects from the lower branches of trees and flits from bough to bough, sometimes hovering momentarily before a flower or sprig. Frequently descends to the ground from an overhanging branch and with a couple of smart upward flicks of the cocked tail picks up an insect and flits back to its perch. Partially crepuscular, often hawking well into the dusk.

FOOD. Insects, chiefly mosquitoes and midges.

VOICE AND CALLS. A double *tick-tick* or *click-click* uttered with a jerking of the tail and twitching of wings; a harsh, jarring alarm-note, and a plaintive *phwee-phwee-phwee* or *weeit, weeit, weeit* as of an unrolled bicycle wheel.

BREEDING. Extralimital; largely as in 1413.

MUSEUM DIAGNOSIS. Adult male differs from *albicilla* in having darker and more extensive rufous on throat. Female distinguished mainly by the dark brown, r. black tail.

First-winter male and female have brown ear-coverts; chin and throat whitish, breast and flanks greyish buff. Some first-summer males are similar to females while some have a variable amount of rufous on throat. Young in autumn differs from adult female by buff spots on wing.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	64-72	12-14	17-18	47-54 mm
♀♀	64-71	12-13	c. 17	48-54 mm
				(HW, SA)

Weight 3 oo? (October) 10-10.5 g (SA). 5 ♂♂ (spring) 10-13 g (Paludan, Afghanistan).

COLOURS OF BARE PARTS. Iris brown. Bill brown, paler at base of lower mandible. Legs and feet dark brown.

1412. Eastern Redbreasted Flycatcher. *Muscicapa parva albicilla* Pallas

Muscicapa Albicilla Pallas, 1811, Zoogr. Rosso-Asiat. 1: 462, Aves, pl. 1

(Dauria)

Baker, FBI No. 639, Vol. 2: 211

Plate 81, fig. 3

LOCAL NAMES. *Tarra* (Hindi); *Chetki* (Bengali); *Tarra eda pitta* (Telugu); *Pisuk kūrīti*, *Chidippinetta kūrīti* (Malayalam, Tamil).

SIZE. Sparrow —; 13 cm (5 in.).

FIELD CHARACTERS. As in 1411 but rufous restricted to throat; breast grey; tail black, also with white patches on either side of basal half. Female and young male not distinguishable.

Male Rustybreasted Flycatcher (1418) is slaty above; its female has the tail pale brown, nearly concolorous with the back, and lacks any white. Female Little Pied (1419) is similar but smaller, and also without any white on base of tail.

STATUS, DISTRIBUTION AND HABITAT. A widespread winter visitor and passage migrant. Common in NEFA (Abo, Miri and Dafa hills), Bhutan and Sikkim foothills, Nepal up to c. 1500 m; Assam, Nagaland, Manipur,

FLYCATCHERS

157

East Pakistan, West Bengal, Bihar, Orissa, eastern Madhya Pradesh, Andhra Pradesh, becoming scarcer farther south and west: recorded in Tamil Nadu, Rameswaram Island, Kerala (up to 2100 m), Mysore, Western Ghats in Maharashtra, Uttar Pradesh and, as a straggler, in the Kangra district. Has bred in the Dachgam Valley (Ladakh, 1800 m) according to Ward (JBNS 17: 480). Affects groves, orchards, bush-and-scrub jungle.

Extralimital. Breeds from the Urals to Kamchatka. Winters in Burma, Thailand, and the Indochinese countries.

MIGRATION. Migrates mostly through China though some birds may migrate west of central Asia, as it has been recorded in Afghanistan. Arrives in its winter quarters in September, leaves in April; some belated migrants may still be seen in May.

GENERAL HABITS AND FOOD. As in 1411.

VOICE AND CALLS. As in 1411; a long, somewhat squeaky sub-song may be heard in winter (Nichols).

BREEDING. Said to have nested in Ladakh (Ward, above). The reported nest, taken on 28 May, was a tiny cup of green dry moss, lined with soft hair and placed beside a stone, half hidden in a shallow hollow in a stone wall. Eggs, pale sea-green or pale pink more or less profusely covered with pinkish brown. Size, c. 17.5 × 12.8 mm.

MUSEUM DIAGNOSIS. Male differs from *parva* (1411) in having the rufous of throat pale and more restricted; breast ashy, belly buff. Females and first-winter males are distinguished from those of *parva* by the colder, greyer brown of the upperparts, and the black (v. dark brown) upper tail-coverts and tail; underparts whiter suffused with grey on breast, instead of creamy white suffused with buff.

Postjuvinal moult does not include tertiaries, greater and primary coverts, and wing-quills which remain from juvenile dress. This feature distinguishes juvenile from adult female (HW).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	66-72	13-14	c. 17	50-53 mm
♀♀	67-71	13-14	c. 17	48-53 mm
				(HW)

Weight 1 juv. ♂? (Sept.) 11.5; 1 ♂ 9 g (SDR).

COLOURS OF BARE PARTS. Iris hazel-brown. Bill brownish black, lower mandible paler; mouth lemon-yellow and pink. Legs and feet blackish brown.

1413. Kashmir Redbreasted Flycatcher. *Muscicapa subrubra* Hartert & Steinbacher¹

Muscicapa parva subrubra Hartert & Steinbacher, 1934, Vög. pal.

Fauna, Ergänzungsband: 233. New name for *Siphia hyperythra* Cabanis, 1866, Jour. f. Orn. 14: 391 (Ceylon) nec *Muscicapa hyperythra* Blyth Baker, FBI No. 140, Vol. 2: 212

Plate 81, fig. 4

LOCAL NAME. *Turra* (Hindi).

¹ We agree with Whistler (1932, JBNS 36: 81) that the characters of *subrubra* are sufficiently distinct from *parva* to separate the two as species. Deshayes points out (pers. comm.) that the situation is comparable to the species *Prinella immaculata* v. *P. modularis*, or *Erithacus pectoralis* v. *E. cailliepe* and deserves placing in a superspecies rather than being relegated to subspecific rank.

FLYCATCHERS

159

recorded at Darbhanga (Bihar), Kathmandu (Nepal — Proud) and near Mussooree. Obtained at Chakrata (Dehra Dun district) on 17 June (Meinertzhagen).

GENERAL HABITS. Very similar to those of *M. parva*. Takes a great part of its food when flitting from one perch to another under the shade of leafy foliage, mostly within about six metres from the ground. Appears to visit the ground more often in its winter quarters, hopping about in search of insects. Jerks its tail well above the back, at the same time flicking the wings and uttering a curious little creaking rattle.

FOOD. Insects.

VOICE AND CALLS. A sharp *chack* while flitting about; a subdued but harsh *purr* accompanying the flicking of wings and tail. Full song in breeding season, sweet, loud and robin-like but short (Bates); in its winter quarters, in Ceylon described as consisting of a single whistled note *chip-chip-chip* followed by a rattling note, uttered quite freely (Henry).

BREEDING. Season, second half of May and June. Nest, made of dead leaves, moss and strips of bark, and lined with hair and a few feathers; placed in holes. Little holes in small trees, often only about one metre above the ground, are most favoured; other nests may be found up to twelve metres. Eggs, 4 or 5, sometimes 3, very pale green, speckled with pale reddish brown, mostly around the large end. Average size of 50 eggs 16.1 × 12.3 mm (Baker) and of 36 eggs 16.6 × 12.5 mm (Osmaston).

MUSEUM DIAGNOSIS. Adult male differs from that of *parva* not merely in the darker colour of upperparts and deeper chestnut of the breast with its black border, but also in the sequence of plumages and wing formula: 2nd primary (as.) equal to or usually shorter than 7th instead of always longer. First-winter female resembles adult male rather than female as in *parva* and *albicilla*. The young female likewise agrees in resembling the adult by having much rufous wash on the breast.

Young, much darker brown than in *parva*, but similarly spotted with buff; tail blackish instead of brown.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
7 ♂♂	65-70	12-13	18-19	49-54 mm
1 ♀	67	13	18	50 mm
				(HW)

Weight 15 ♂♂ (Apr.-May) 9-12 (av. 10.4) g — SA.

COLOURS OF BARE PARTS. Male. Iris brown. Bill brown, lower mandible yellow; mouth yellow. Legs and feet sooty brown; soles dull olive. Female. Bill dark brown, basal half of lower mandible yellowish. Legs and feet black (HW).

1414. Orange-gorgeted Flycatcher. *Muscicapa strophliata strophliata* (Hodgson)

Siphia Strophliata Hodgson, 1837, Ind. Rev. 1 (12): 651-2 (Nepal)

SIZE. Sparrow; length c. 13 cm (5 in.).

158

MUSCICAPINAE

SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. Male (adult). Above, dark grey-brown; tail blackish brown, white on either side of basal half, this feature rendered conspicuous by constant flicking of the cocked tail. Below, throat, breast and upper belly deep rufous-chestnut edged with black; lower belly white.

Female (adult) darker than that of *M. parva* and with a variable amount of rufous on breast.

The black-edged rufous-chestnut underparts identifies the male. Female distinguished from that of other flycatchers by the blackish brown tail, darker than back, with white on sides of basal half.

STATUS, DISTRIBUTION AND HABITAT. Breeds commonly in NW. Himalayas in summer, in Kashmir and the Pir Panjal range between c. 1800 to 2400 m; breeding recorded as high as 2700 m (Bates). Affects temperate mixed

Muscicapa subrubra, *M. westermanni*, *M. nigrorufa*

Distributional ranges

- *M. subrubra* (1413), breeding.
- *M. subrubra* (1413), winter.

forest of hazel, walnut, cherry, willow, etc. especially where there is a dense growth of *Perrottia*. Winters in Ceylon from October to March throughout the hills above c. 750 m. Here it frequents gardens, tea estates, borders of forest, etc.

MIGRATION. Arrives on its breeding grounds in the second half of April, leaves in September. Migrates through the Peninsula in September and October, but very few records: Kangra district (Punjab), Dhulla (north-western Maharashtra) and Secunderabad (Andhra). On spring passage,

160

MUSCICAPINAE

FIELD CHARACTERS. Male (adult). Above, forehead white; upperparts olive-brown. Tail black, white on either side of basal half. Below, an orange-rufous patch on lower throat surrounded by dark slaty on breast, sides of neck and head, and by black on upper throat and chin. Belly ashy, gradually becoming white on vent; flanks olive-brown.

Female (adult), frequently wears a plumage identical with that of male; in true female dress, has a paler and smaller gorget; chin and throat ashy.

Similar tail pattern to *parva* (1411) misleading at a flashing glimpse, but combined with white forehead always diagnostic.

STATUS, DISTRIBUTION AND HABITAT. Resident, altitudinal and partial migrant, uncommon west of Nepal. The Himalayas from Kangra and the upper Indus Valley (Rupshu) east through Nepal, Sikkim, Bhutan and NEFA, then south through Nagaland and Manipur. Observed in May and June in the Barail Range around 1800 m. Breeds between 2400 and 3600 m in the western Himalayas, possibly higher in Nepal (recorded at 3950 m by Dieselselhorst); from 2700 and 3700 m in Bhutan, and between 2500 and 3000 m in the eastern ranges south to Mt Victoria. Winters from the foothills to 2400 m and spreads out sparingly in the hills south of the Brahmaputra to the Chittagong Hill Tracts. Affects forest of oak, rhododendron, conifers, birch and mixed species; may be seen in high forest with little undergrowth, as well as thick brushwood in open forest. In winter frequents shady forest, especially along the edges, by tracks and in clearings.

Extralimital. Western and northern Burma, N. Thailand and south-western China; another subspecies in central Vietnam. Winters in the Indochinese subregion.

GENERAL HABITS. Found solitary or in pairs, usually flitting from bush to bush or launching aerial sallies from a bare branch or a fallen log. At times may be seen high up in trees or descending to the ground after an insect. Flight and habits likened to a robin's; also very similar to those of Redbreasted Flycatcher (1411, 1412). Constantly jerks up its cocked tail and flicks it open, flashing the conspicuous black-and-white pattern.

FOOD. Insects.

VOICE AND CALLS. Alarm-note, a croaking *churr*. Call-note a low *tik-tik* or a single *pink* constantly uttered. Song, short, spirited, typically flycatcher — 'a triple noted *tin-ti-ti*, the first syllable metallic and far carrying, the two others soft and audible only a few yards' (Proud).

BREEDING. Season, from the beginning of April (Mt Victoria) through May and June. Nest, a loose cup of moss and rootlets, lined with finer rootlets, papery bark, and a few feathers. May be placed on the ground on a sloping bank, or in a hole or crevice of a tree up to about three metres,

FLYCATCHERS

165

female is smaller and has a rufous tail. *M. westermanni* has a whitish throat and grey back. *M. poliogenys* has a whitish throat and fulvous breast.

STATUS, DISTRIBUTION AND HABITAT. Altitudinal migrant, locally common. From central Nepal (Proud, Biswas) east through Darjeeling, Sikkim, Bhutan, NEFA to the Mishmi Hills, Nagaland, Manipur, and Assam in the Khasi Hills; breeds between 2100 and 3900 m, mostly 2400-3600 m; in the Khasi Hills above 1200 m. Winters (October to April) in the foothills up to c. 2000 m and apparently in the plains of East Pakistan *vide* Rashid. In the breeding season affects mostly pine or fir forest; in Assam, oak and rhododendron; in the non-breeding season keeps to dense forest, thick scrub, forest of large bamboo and tall trees, etc.

Extralimital. Extends to southwestern China and Thailand.

GENERAL HABITS. A quiet and shy flycatcher. Catches most of its food in the air, circling out for insects from the canopy of trees; occasionally or rarely descends to the ground. Perches fairly upright.

FOOD. Insects.

VOICE AND CALLS. Has a clear, pleasant, robin-like song (Schäfer); described by Ludlow as 'a constant ripple of whistling notes'.

BREEDING. Season, mid April till July. *Nest*, a cup of green moss mixed with a few dead leaves, scraps of roots and lichen, and lined with fine rootlets or musk-deer hair. Usually placed in hollows between rocks or stones on steep banks covered with moss and ferns, sometimes low down in a moss-covered dead stump, or on the ground under some exposed root. As in *M. hyperythra*, it has also been found within a lump of moss hanging from a branch. *Eggs*, normally 4, rarely 5, pale green to warm buff, stippled all over with light reddish. Average size of 40 eggs 17.8 × 13.4 mm (Baker). Incubation by both sexes; period undetermined.

MUSEUM DIAGNOSIS. See Field Characters.

Young. Above, dark brown with elongated ochraceous spots. Below, dull ochraceous with dark edges to the feathers, especially on breast; throat dingy white.

FIELD CHARACTERS. As in 1419, q.v.

STATUS, DISTRIBUTION AND HABITAT. Altitudinal and short-range migrant, locally common. Bhutan, NEFA, the Patkai Range, Nagaland, Manipur and Assam in the Cachar and Khasi hills. Breeds between 1200 and 2400 m. Arrives on its summer grounds in March. Winters in the foothills and in the plains of Assam and East Pakistan south to Dacca and the Chittagong region (see map, p. 158). Affects dense evergreen forest; in winter also frequents lightly wooded open country, cultivation and orchards.

Extralimital. Extends east to Yunnan and northern Vietnam. The species ranges throughout the Indochinese subregion, the Indonesian islands and the Philippines.

GENERAL HABITS. In the non-breeding season may be seen singly, in pairs or in small parties, often in company with other small insectivorous species. Keeps mostly among the crowns of trees, ever on the move from tree to tree, making little fluttering flights from one branch to another, catching most of its food on the wing but making few sorties outside the canopy; also takes insects from the crevices of bark and from the leaves. Flight easy but less agile than that of many flycatchers.

FOOD. Insects.

VOICE AND CALLS. (Song, a thin, high pi-pi-pi-pi followed by a low rattle churr-r-r-r-r or pi-churr-r-r-r-pi-pi-pi (Smythies). The song may be heard even in winter (Baker). A sub-song is described as 'very soft warbling notes interspersed fairly frequently by equally quiet grating notes' (Lister). Call-note, a single, mellow tweet.

BREEDING. Season, April to June. *Nest*, a small cup of moss, moss-roots and stems of maidenhair ferns, compactly interwoven, the moss only showing outside, lined with very fine hair-like rootlets. Placed on the ground, in hollows between stones, or under a rock on steep hillsides or in holes among exposed roots of trees. *Eggs*, 3 or 4, warm buff, so densely covered with minute specks of dark reddish brown that the ground colour can hardly be seen. Average size of 30 eggs 15.1 × 11.9 mm (Baker). Incubation by both sexes; period unrecorded.

MUSEUM DIAGNOSIS. Female compared with ♀ *collini*, less tinged with hazel on the lores and forehead, and lacking any of this colour on throat and upper breast.

166

MUSCICAPINAE

1419. Western Little Pied Flycatcher. *Muscicapa westermanni collini* Rothschild

Muscicapa collini Rothschild, 1925, Bull. Brit. Orn. Cl. 45: 90, substitute name for *Muscicapa blythi* Rothschild, 1921, Novit. Zool. 28: 48, *nee* *Muscicapa blythi* Giebel, 1875. New name for *Muscicapula melanoleuca* Blyth, 1843, Jour. Asiatic Soc. Bengal 12: 940 (Nepal, Darjeeling), *nee* *Muscicapa melanoleuca* Forster, 1817, or *Muscicapa melanoleuca* Gildenstädt, 1775

Baker, FBI No. 649 (part), Vol. 2: 224
Plate 81, fig. 14

LOCAL NAME. Turi-ti-ti (Lepcha).

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. A striking black and white, small flycatcher.

Male (adult). Above, black with a conspicuous white supercilium from lores to nape, a large white wing-patch, and white basal sides of tail.

Female. Above, olive-brown; a pale wing-bar. Upper tail-coverts bright rufous-brown. Below, throat whitish, rest smoky white.

A passable miniature of *M. ruficauda* (1409). Very similar to female *M. leucomelanura* (1424) which has a rufous tail, buffish breast and no wing-bar. Easily confused also with female *M. supercilialis* (1421) which is distinguished only by the grey upperparts and upper tail-coverts, and lack of wing-bar. Female *M. parva* (1411) has a blackish tail, white at base, and is a winter guest or passage migrant.

STATUS, DISTRIBUTION AND HABITAT. Altitudinal and short-range migrant, not common. The Himalayas from central Nepal to Sikkim and Darjeeling. Breeds between 1200 and 2500 m, locally up to 2700 m (Langtang Valley, Nepal—Polunin), optimum zone probably around 2000 m. Winters (October to March) in the foothills up to c. 1800 m, and over the plains as far as Surguja (northeastern M.P.), Manbhum (southern Bihar), Midnapore (West Bengal) and East Pakistan mostly west of the Jamuna and Ganges (see map, p. 158). Affects deciduous or evergreen forest on steep hillsides. In winter frequents the vicinity of well-wooded streams.

GENERAL HABITS, FOOD AND VOICE. As in 1420.

BREEDING. Unrecorded. Probably as in 1420.

MUSEUM DIAGNOSIS. Male not distinguishable from that of *australorientis* (1420). Female tends to have a hazel-coloured shading on the forehead, lores and around the eye, merging into the brownish grey of the crown, nape and upper back. Rump and edges of rectrices greyish drab, lacking the rufescent tones of the eastern race.

Young. Above, with large, pale ochraceous spots. Wing-coverts brown with ochraceous tips, darker in male than in female; edges and tips of tertials fulvous white. Rest of wing and tail as in adult of corresponding sex. Below, white, the feathers fringed with black; belly and under tail-coverts white.

Postjuvinal moult includes body and all coverts except primary. First-year birds usually not distinguishable from adults unless there are a few unmoulted greater coverts.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	53-61	12-14	14-16	38-47 mm
♀♀	53-60	12-13	14-16	40-43 mm

(BB, SA)

MUSCICAPINAE

168

Head and nape darker, dark mouse-grey in tone; back washed with light tawny-olive. Rump and outer edges of rectrices vary from russet to chocolate-brown, distinctly brighter and more reddish than *collini*.

MEASUREMENTS AND COLOURS OF BARE PARTS. As in 1419.
Weight 5 ♂♂ 5-7; 3 ♀♀ 5-8 g (SA). 1 ♂ 10 g (SDR).

MUSCICAPA SUPERCILIARIS Jerdon

Key to the Subspecies

- Base of tail white..... *M. s. supercilialis*
- No white in tail..... *M. s. aestigma*

1421. Whitebrowed Blue Flycatcher. *Muscicapa supercilialis supercilialis* Jerdon

M. (Muscicapa) supercilialis Jerdon, 1840, Madras Jour. Lit. Sci. 11: 16 (Ajunta, N. Ghats)
Baker, FBI No. 647, Vol. 2: 221
Plate 81, fig. 15

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. Male (adult). Above, deep blue with a white supercilium from eye to nape, and a white patch on either side of basal half of tail. Below, sides of head and neck deep blue; centre of throat, breast and whole belly white, the glistening white throat especially arresting.

Distinguished from the Slaty Blue Flycatcher (1423) by deeper blue upperparts, the blue on sides of breast forming a broken pectoral band, and — in the western Himalayas — by the conspicuous white supercilium.

Female. Above, mouse-grey; tail blackish, edged with blue. Below, sides of neck and breast greyish white; centre of throat, breast and whole belly glistening white.

Distinguished from the very similar females of *westermanni* (1419) and *leucomelanura* (1423) by the grey, not olive-brown back; the latter has a rufous, not blackish tail.

STATUS, DISTRIBUTION AND HABITAT. Common summer visitor to the western Himalayas; from Kohat (Kurram Valley, but not recorded north of the Kabul river in N.W.F.P.) east through the Murree hills, Kashmir (south of the main range) to Kumaon. Intergrades with *aestigma* in Nepal. Breeds between 1800 and 3000 m, optimum zone 2100-2500 m. Affects open, mixed forests of oak, rhododendron, pine, fir, etc., occasionally orchards. Winters in central India from Delhi south to northern Maharashtra, southeastern Mysore, northwestern Andhra Pradesh, Orissa, West Bengal and Bihar. Winter visitors to the last three States mentioned may well be, all or in part, from Nepal or Sikkim since a good percentage of this population also have a white supercilium and white basal portion of tail. A few birds winter in the Himalayan foothills. Also obtained at Bahawalpur, W. Pakistan (no date). In winter frequents various types of open deciduous forest, village groves, gardens and orchards.

× c. 1

FLYCATCHERS

169

MIGRATION. Arrives on its summer grounds in March and April, departs in September though some birds may still be seen in October while others leave at the end of August. Leaves its winter quarters in March.

GENERAL HABITS. Usually singly, in winter often in the mixed hunting parties. Keeps largely to the middle story of the forest (low trees and bushes) feeding mostly among the foliage canopy, not venturing much into the open. Occasionally descends to the ground. Constantly jerks up its tail, often accompanied by fluffing of head feathers and *trrr* note, especially in proximity of nest.

FOOD. Insects.

VOICE AND CALLS. Song, an oft-repeated *che-chi-purr* (Bates). Call-note, a soft, repeated *tick*. Alarm-note, a soft *trrr*.

BREEDING. *Season*, middle of April to early July. *Nest*, a soft structure mainly of fine moss with some strips of bark or fine grass, lined with hair and rootlets; placed in holes or clefts in trees, often ivy-covered, at heights up to seven metres, or in a depression in a steep bank. One pair was found to have appropriated a nest of *Troglodytes*. Readily takes to nest-boxes in hill-station gardens. *Eggs*, 3 to 5, usually 4, olive greenish to dull stone-buff, densely freckled all over with reddish brown or, in another type, mostly around the large end, forming a cap. Average size of 100 eggs 16 × 12.2 mm (Baker). Building of nest and incubation by both sexes; period unrecorded.

MUSEUM DIAGNOSIS. Distinguished from the eastern population *aestigma* mainly by presence of white supercilium and white patches in the base of outer tail-feathers. See also 1422, under Museum Diagnosis. Owing to much intergrading single winter specimens of females of the two subspecies cannot be separated with certainty.

Y O U N G. *Above*, with large fulvous white spots. Wing-coverts blackish tinged with blue (♂) or brownish (♀), with fulvous white tips and edges of tertials. Wing and tail as in adult of corresponding sex. *Below*, whitish tinged with cream on breast, all feathers edged with black, producing a squamated effect.

MEASUREMENTS AND COLOURS OF BARE PARTS. As in 1422.

Weight 1 ♂, 1 ♀ (Apr.-May) 8, 8 g — SA.

1422. Little Blue-and-White Flycatcher. *Muscicapa supercilialis aestigma* Gray

Muscicapa aestigma Gray, 1846, Cat. Mamms. Bds. Nepal: 90, 155. Ex Hodgson in Gray, *Muscicapa Astigma* [sic], 1844, Zool. Misc.: 84, nom. nud. (Nepal)

Cyornis supercilialis dela Koelz, 1954, Contrib. Inst.

Regional Exploration, No. 1: 14 (Mawphlang, Khasi Hills)

Baker, FBI No. 648, Vol. 2: 223

LOCAL NAME. *Turi-ti-ti* (Lepcha).

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in 1421 but lacks white supercilium and white base of tail; however, Nepal and Sikkim birds and those wintering south of these regions are intermediate and may or may not have any supercilium or white on tail. Males may be found breeding before acquiring full adult plumage.

FLYCATCHERS

171

FIELD CHARACTERS. Male (adult). *Above*, slaty blue, brighter on forehead. Tail black, conspicuously white on either side of base, displayed by constant flicking. *Below*, sides of head and throat dark slaty, almost black; throat white, rest of underparts greyish white.

Distinguished from *westerni* by slaty blue (v. black) upperparts and absence of broad white supercilium.

Female. *Above*, olive-brown; tail rufous. *Below*, buffish.

Separable from the very similar females of *westerni* and *superciliaris* by the rufous tail. *M. ruficauda* is larger and does not flick its tail. Male often breeds in 'female' dress.

STATUS, DISTRIBUTION AND HABITAT. Common altitudinal migrant. Western Himalayas from the Indus river east to central Nepal. West of the Indus river there is a March record from Kohat. Breeds between 1800 and 3300 m, winters in the foothills below 1200 m. Affects mixed forest and well-wooded areas with plenty of undergrowth.

MIGRATION. Passage at mid-elevations is leisurely and takes place from the middle of February till the end of April; in autumn from the end of July till the end of November.

GENERAL HABITS. More secretive and restless than most flycatchers; usually seen singly or in pairs, frequenting low undergrowth and lower branches of trees; takes much of its food on the ground. Both its demeanour and notes are reminiscent of the English Robin. Perches with wings drooping and often flicks its tail upwards.

FOOD. Insects.

VOICE AND CALLS. A characteristic *ee-tick* of alarm is a good indication of its presence in undergrowth; also a rapid *ee-tick-tick-tick-tick*, each note accompanied by a tail-flicking. For description of song see 1425.

BREEDING. *Season*, May to July. *Nest*, a small cup of moss well lined with rootlets, hair and an occasional feather; placed in a depression in a bank, in crevices in boulders and trees, in a rift of bark, in a hole in a trunk or wall, occasionally against trunks; when not on the ground, usually within a couple of metres from it, rarely up to six metres. *Eggs*, 3 or 4, pale pinkish cream, minutely but densely speckled with pinkish red, sometimes forming a ring or cap around the large end. Average size of 52 eggs 15.6 × 12.1 mm (Ormarston) and of 100 eggs 15.8 × 12.1 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters. For distinction from the eastern race see 1424 under Museum Diagnosis.

Young (juvenile). *Above*, olive-brown with pale ochraceous streaks. Upper tail-coverts rusty. Wing-coverts, except primary, with ochraceous tips. *Below*, dull creamy white with black margins, fainter on throat and belly. Postjuvinal moult takes place in August. First-year birds recognized by fulvous tips of coverts. First-year male resembles female.

MEASUREMENTS

SA

MUSCICAPINAE

170

STATUS, DISTRIBUTION AND HABITAT. Uncommon summer visitor. Nepal, Sikkim, Bhutan and NEFA, from c. 2000 to 2700 m, locally up to 3200 m (Diesselhorst, 1968; Bailey, JBNHS 24: 75); also Assam in the Khasi and Cachar hills, Nagaland and Manipur, breeding mostly above 1500 m. Affects fairly open forest (oak and rhododendron, pine, etc.), and open, bush-covered areas, with or without trees. Himalayan birds winter in the plains as far as southern Bihar, West Bengal and all parts of East Pakistan (Rashid); a specimen has been obtained from Darjeeling in January. Movements of Assam populations unknown; probably also descend to the plains.

Extralimital. Extends to southeastern Tibet, Szechuan and Yunnan.

MIGRATION. No data. Probably as in 1421.

GENERAL HABITS, FOOD AND VOICE. As in 1421.

BREEDING. As in 1421.

MUSEUM DIAGNOSIS. Adult male separable from the western race (1421) by the absence of white supercilium and white patches in the base of outer tail-feathers. However, there is intergradation over a wide range (the whole of Nepal and Sikkim), and birds from these areas may or may not have any white in tail. Moreover, most males from the Himalayas have at least traces of a white supercilium. Eastern birds are a little darker and particularly duller blue. Birds from Assam (Khasi Hills) show no trace of supercilium and no white in tail.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	60-66	12-14	15-17	42-48 mm
♀♀	59-64	12-13	15-16	42-45 mm

(BB, SA)

COLOURS OF BARE PARTS. Iris dark brown. Bill black; mouth pinkish grey. Legs and feet brownish black; claws black.

Plate 81, fig. 18

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in 1423, q.v.

STATUS, DISTRIBUTION AND HABITAT. Altitudinal migrant, locally common. Eastern Nepal through Sikkim, Bhutan and NEFA between 2700 and 4000 m, and the Khasi Hills above 1500 m. Winters in the foothills (up to 2100 m in central Nepal) and in the plains of the Brahmaputra from the Jalpaiguri district to Sadiya. Khasi Hills population appears to be mostly resident or subject to short vertical movements. Affects forest with plenty of undergrowth. In Nepal it is the only flycatcher to occur regularly in the subalpine *Abies-Betula* forest and occupies a higher zone than *M. supercilialis*. The two species appear to be mutually exclusive in their vertical distribution (Diesselhorst). In the Khasi Hills it affects dense, wet forest of oak and rhododendron, or pine forest if undergrowth is sufficient. In winter often frequents thickets of reeds.

Extralimital. Southeastern Tibet, northern Burma to southwestern Szechuan. The species ranges east to northern Yunnan, north Kansu and Shensi; also Indonesia. Chinese populations winter south to northern Indochinese countries.

GENERAL HABITS, FOOD AND VOICE. As in 1423.

BREEDING. As in 1423. *Eggs*, normally 3. Average size of 20 eggs 15.8 × 12 mm (Baker).

MUSEUM DIAGNOSIS. Differs from the western race (1423) in being more saturated and having the underparts tinged with rufous or olive (v. white and pure grey). Eastern Nepal population is intermediate. *Cerviniventris* is still darker above and much darker fulvous below.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

Baker, FBI No. 646, Vol. 2: 220

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 10 cm (4 in.).

FLYCATCHERS

173

FIELD CHARACTERS. As in 1423, q.v.

STATUS, DISTRIBUTION AND HABITAT. Altitudinal migrant, locally common. Assam in the Cachar Hills, Nagaland, Manipur and the Chin Hills of Burma. Said to have been found breeding at c. 1500 m in the Chin Hills (Mackenzie *apud* Baker); however, like the Himalayan subspecies, it is probably a bird of higher altitudes since on Mt Victoria Heinrich found it only above 2500 m and up to over 3000 m in the breeding season. Winters in the foothills and adjacent plains. Affects low bushes along forest edges, especially dense reed-bamboo.

GENERAL HABITS AND FOOD. As in 1423.

VOICE AND CALLS. Song, a short, unmelodious strophe of three whistled notes, something like *zich-ti-ziet* (Heinrich). See also 1423.

BREEDING. As in 1423.

MUSEUM DIAGNOSIS. Male hardly distinguishable from *minuta* though averaging darker fulvous below. Female darker above and on sides of head, and more fulvous below.

MEASUREMENTS

	Wing	Bill (from skull)	Tail
♂♂	55-59	11-12	46-51 mm
♀♀	52-54	11-12	44-49 mm

(Vauric, Stresemann)

COLOURS OF BARE PARTS. As in 1423.

1426. Sapphireheaded Flycatcher. *Muscicapa sapphira* (Blyth)

Muscicapula sapphira Blyth, 1843, Jour. Asiat. Soc. Bengal 12: 939

(Darjeeling)

Cyornis sapphira coelicolor Koeltz, 1932, Jour. Zool. Soc. India 4: 42

(Tura, Garo Hills)

Baker, FBI No. 651, Vol. 2: 225

Plate 82, fig. 2

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 12 cm (4½ in.).

FIELD CHARACTERS. Male (adult). Above, forehead, crown, nape, lower rump and tail bright ultramarine blue. Lores and a line through eye black. Sides of head and back deep purplish blue. Below, chin, throat and upper breast orange-rufous; an interrupted breast-band deep blue. Belly ashy.

Male, first-year. Like adult but crown, back and sides of neck and breast dark olive-brown. Lores and eye-ring ochraceous. No breast band. Also breeds in this plumage.

Female. Above, rufescent olive-brown, upper tail-coverts rufous-brown. Lores and eye-ring ochraceous. Below, chin and throat orange-rufous. Sides of neck and breast olive-brown. Belly whitish, washed with fulvous.

The orange-rufous throat distinguishes the female from all other brown-backed flycatchers except the female of *M. hyperythra* which has a short, fulvous supercilium and the rufous of throat extending to breast. The

♂ First-year male.

FLYCATCHERS

175

MUSEUM DIAGNOSIS. According to Ticehurst (*Ibis* 1939: 753) the males are dimorphic, one phase being that described as 'First-year male' under Field Characters. Males in this plumage appear to be more common than those in full dress.

Young (juvenile) male. Above, with ochraceous spots; upper tail-coverts bluish with ochraceous tips; greater coverts edged with blue and tipped with ochraceous. Postjuvinal moult includes body, lesser and median coverts. First-winter birds recognized by ochraceous tips of greater coverts. According to Whistler (MS.) some juveniles moult straight to adult plumage, others to the 'retarded' dress.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	59-65	12-13	16-17	44-51 mm
♀♀	57-61	12-13	16-17	40-44 mm

(SA, Kinnear)

Weight 2 ♂♂ 7.5, 8 g (SA, SDR).

COLOURS OF BARE PARTS. Iris brown. Bill black. Legs, feet and claws brownish black.

1427. Black-and-Orange Flycatcher. *Muscicapa nigrorufa* (Jerdon)

Saxicola nigrorufa Jerdon, 1839, Madras Jour. Lit. Sci. 10: 266

(Nilgiris)

Baker, FBI No. 678, Vol. 2: 253

Plate 81, fig. 10

LOCAL NAME. *Ménippikhi* (Malayalam).

SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. Male (adult). A striking orange-rufous flycatcher with slaty black crown, nape and sides of head, and wings.

Female similar but head dark olive-brown or olive-slaty with ochraceous lores and eye-ring.

STATUS, DISTRIBUTION AND HABITAT. Resident, fairly common, but patchily distributed and evidently also moving about locally. The southern section of the Western Ghats and associated hills — Nilgiris, Palnis, Anaimalais, and others — from the Wynad and the Biligirirangans south to the Ashambu hills; from 700 m to the highest summits, more common above 1500 m (see map p. 158). Affects dense, evergreen sholas with a plentiful undergrowth of *Strobilanthes* or *etla* bamboo (*Ochlandra*), cardamom and edges of coffee plantations and rattan brakes in dank ravines.

GENERAL HABITS. Found singly or in pairs, hopping about amongst the seedlings and shady undergrowth, seldom far above the ground; or perches on a low branch or fallen log, making short sallies after insects, occasionally descending to the ground. Actions and behaviour distinctly reminiscent of a small babbler. Usually tame and easy to observe.

FOOD. Insects.

VOICE AND CALLS. Alarm-note *zit-zit*; call-note, a melancholy low *pee* (Betts). Song, a somewhat metallic, high-pitched *chiki-riki-chiki* very insect-like, or *chee-ri-ri-ri* uttered every few seconds (SA).

x c. 1

174

MUSCICAPINAE

male of *M. parva albicilla* also has a rufous throat, but ashy breast and black tail with white on base.

STATUS, DISTRIBUTION AND HABITAT. Fairly common altitudinal migrant. Nepal east of the Arun Kosi, Darjeeling, Sikkim, Bhutan, (NEFA?), Nagaland, Manipur, Meghalaya and Assam in the Cachar, Khasi and Garo hills.

Muscicapa sapphira

Distributional range

Vertical distribution little known. Appears to breed between 2100 m (Nepal) and 2600 m (Nagaland — Ripley). Winters in the foothills up to 1700 m chiefly under 800 m. In Assam, breeds from 1400 m up, mostly above 1800 m. Affects evergreen forest.

Extralimital. Extends to Yunnan and northern Laos.

GENERAL HABITS. Found singly or in pairs in high undergrowth and lower branches of trees. Hunts mostly within the foliage canopy, making sallies for insects. Occasionally descends to the ground. Droops wings at sides and flicks up tail from time to time.

FOOD. Insects.

VOICE AND CALLS. Only record is a tick-tick accompanied by tail-flicking (SA).

BREEDING. Described only by Baker. Season, end of April to June. Nest, placed in hollows in tree-stumps, sometimes in banks, rather bulky for the size of the bird, being sometimes as much as 75 or 100 mm in depth. Material principally moss mixed with some roots, lichen, fern-stems, etc., the nest cup within being made of finer moss, moss-roots and a few feathers. Eggs, 4, very variable: pale yellowish grey to warm buff; either faintly or densely stippled with reddish brown, sometimes so thickly as to make the egg look all of this colour. Average size of 16 eggs 15.4 × 11.8 mm. Incubation by both sexes; period unrecorded.

MUSCICAPINAE

176

BREEDING. Season, March to July. Nest, a loose, untidy ball of dead *etla* leaves or coarse grass, sometimes lined with fine grass, sometimes unlined, very similar to that of *Rhopocichla atriceps* (1224). Usually placed in bushes, ferns or other plants within a metre from the ground, sometimes up to a couple of metres. Eggs, normally 2, pale greyish white or buffy white, faintly but profusely freckled all over with pale pinky grey or reddish; resembling those of the Verditer Flycatcher more than any others of the family. Average size of 30 eggs 18.4 × 13.1 mm (Baker). In one case observed, the female did all the collection of material but the male was in close attendance (Betts).

MUSEUM DIAGNOSIS. See Field Characters.

Young, never been collected but fledglings described from field observation by Dewar (JBNHS 16: 154) and Betts (JBNHS 50: 42): wings black; rump and tail russet as in adult; head, back and underparts speckled light and dark brown.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	60-63	13-14	19-20	47-51 mm
♀♀	55-59	13-14	19-20	41-46 mm

(SA)

Weight 5 ♂♂ 0.35-0.4 oz. (c. 10-11 g); 5 ♀♀ 0.25-0.35 oz. (c. 7-10 g) — Davison.

COLOURS OF BARE PARTS. Iris brown. Bill blackish brown; mouth pale pink or brownish pink. Legs, feet and claws greyish flesh or greyish brown.

1428. Large Niltava. *Muscicapa grandis grandis* (Blyth)

Chaitaris grandis Blyth, 1842, Jour. Asiat. Soc. Bengal 11: 189

(Darjeeling)

Niltava grandis panghai Koeltz, 1954, Contrib. Inst.

Regional-Exploration, No. 1: 14 (Sangau, Lushai Hills)

Baker, FBI No. 682, Vol. 2: 257

Plate 81, fig. 19

LOCAL NAME. *Margong* (Lepcha).

SIZE. Bulbul; length c. 20 cm (8 in.).

FIELD CHARACTERS. Male (adult). A large, rather sluggish, black-looking flycatcher. Above, forehead, lores and sides of head black; crown, rump and a patch on either side of neck brilliant cobalt blue, but seldom noticeable in the dark shade in which it is usually seen. Rest of upperparts deep purplish blue. Below, throat and breast black; belly purplish blue.

Distinguished from all blue flycatchers by its black throat and breast, and lack of any rufous.

Female. Above, forehead, sides of head and back fulvous-brown. Crown, nape and sides of head olive-brown; a pale blue patch on either side of neck. Wings and tail rufous-brown. Below, throat fulvous; rest fulvous-brown.

The similar female of *M. sundara* is smaller and has a white throat-patch. All species and both sexes of niltava flycatchers are readily diagnosed by the pale blue patch on sides of neck — the hall-mark of the group, as it were.

x c. 1

FLYCATCHERS

177

STATUS, DISTRIBUTION and HABITAT. Fairly common resident, subject to vertical movements. From central Nepal east through Darjeeling, Sikkim, Bhutan and NEFA to the Mishmi Hills, thence south through Nagaland, Manipur, and Assam in the Cachar, Garo, Khasi and Mizo hills (Koelz); generally breeds between 1800 and 2700 m (Himalayas and eastern ranges south to Mt Victoria). Winters from the foothills to at least 2000 m. In the hills of Assam, breeds from 900 m to the highest summits. Affects dense, humid forest and secondary jungle on steep hillsides and ravines, especially in the vicinity of streams.

Extremal. Extends east to the Indochinese countries and south through the Malay Peninsula. Another subspecies in Sumatra.

GENERAL HABITS. Found singly or in pairs in low undergrowth in the thickest and darkest patches of the forest where sunlight rarely filters through. Flits and skulks among low bushes and often feeds on the ground; occasionally takes insects on the wing, but it is less agile than most flycatchers and this is not its common practice.

FOOD. Insects and berries.

VOICE and CALLS. Song: a distinctive, rather mournful, ascending whistle of three or four notes ending interrogatively, thus *whew-whew-wip?* or *tee-ti-tree?* or *tee-ti-tree?*, repeated unhurriedly and monotonously for several minutes (once timed seven) at a stretch (SA). Fleming considers this bird a beautiful singer and renders its song as *more time to eat* (do, re, re, mi) with other notes like *right here, t-z-z-z-t, ha-ha-ha-ha*.

BREEDING. Season, April to July. *Nest*, placed in crevices or holes and conforms to their shape; rather bulky, made chiefly of green moss; the neat cup within is lined with rootlets. Most nests built in among boulders, among the long moss growing on the face of rocks flanking streams and waterfalls, against the trunk or among the buttress roots of large trees; occasionally in holes in dead stumps. Situated almost invariably in shady, evergreen forest. Eggs, usually 4, sometimes 5 or 3, very similar to those of *Cinclidium leucum* (1681) but pale buff instead of pale pink, often with a finely speckled pattern of darker buff and a faint indication of a coronal ring on some eggs. Average size of 38 eggs 24.7 × 18 mm (Harrison & Parker, 1966, Bull. B.O.C. 86: 71-3). Individual eggs in the same clutch very variable in coloration (D'Abreu). Share of the sexes in the domestic chores, and incubation period, undetermined. Brood-parasitism on it by cuckoo, presumably *Cuculus canorus*, reported (D'Abreu, JBNHS 27: 405).

MUSEUM DIAGNOSIS. See Field Characters.

Young. Above, upperparts and sides of head with ochraceous spots and bold black margins to the feathers; lesser and median coverts with ochraceous terminal spot; greater coverts black (edged with blue in male) with tiny ochraceous shaft-streaks at tips; primary coverts dull black. Below, squamated with large brownish yellow spots and narrow black margins.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	100-112	18-20	23-26	87-100 mm
♀♀	97-105	17-20	23-25	86-91 mm

FLYCATCHERS

179

1430. Eastern Small Niltava. *Muscicapa macgrigorae signata* (Horsfield)

Leiothrix signata Horsfield, 1840, Proc. Zool. Soc. London: 162 (Assam)

Baker, FBI No. 685 (part), Vol. 2: 260

LOCAL NAME. *Phak-tagrak-pho* (Lepcha).

SIZE. Sparrow —; length c. 11 cm (4½ in.).

FIELD CHARACTERS. As in 1429, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical movements. Sikkim (intergrading with nominate race), Bhutan and NEFA, thence south through the Patkai Range, Nagaland, Manipur, and Assam in the Cachar, Khasi and Garo hills. Breeds from c. 900 to at least 2000 m; in the Cachar, Khasi and Garo hills. Breeds from c. 900 to at least 2000 m; winters from c. 1400 m down to the foothills and in the plains of the Brahmaputra. Affects bushes along streams, shady glades and tracks in evergreen forest, and secondary scrub in forest clearings. In the plains, in winter, partial to mixed heavy reed and grass jungle interspersed with trees.

GENERAL HABITS. A retiring flycatcher, usually difficult to observe. Solitary in winter. Very sprightly and active, feeding almost entirely on the wing in typical flycatcher style among the upper bushes or undergrowth. More active in the early mornings and about dusk.

FOOD. Insects (ants, beetles, etc.); also berries in the non-breeding season.

VOICE and CALLS. Song, a four-noted strophe, very high-pitched and remarkably thin *tree-tweet-ee-tweet* rising in pitch to the second note, then falling (Smythies). Sub-song described as a curious little subdued grating song (Proud). Call-note, a very high-pitched *see-see*, the second note a quarter-tone lower (Lister).

BREEDING. Season, end of April to early July. *Nest*, usually placed in clefts in rocks well covered by vegetation, on the banks of streams; made of moss, the inner cup lined with moss and rootlets. Eggs, normally 4, sometimes 5 or 3, creamy white to pale greyish yellow, blotched or freckled more or less densely, more so at the larger end where forming an indefinite ring or cap. Average size of 100 eggs 18.1 × 13.6 mm (Baker). Both sexes take part in building though male seems to do little more than bring the materials. Incubation by both sexes; period about 12 days. Brood-parasitized by the cuckoos *Cuculus poliocephalus*, *C. sparterioides* and *C. fugax* (Baker, JBNHS 17: 353, 363, 368).

MUSEUM DIAGNOSIS. See Field Characters. Differs from the nominate race (1429) in having the breast and abdomen greyer, less whitish.

Young. Above, rufescent brown with ochraceous spots. Lesser, median and greater coverts with ochraceous tips. Below, fulvous brown with ochraceous spots; more whitish on abdomen. Postjuvinal moult of body-feathers and wing-coverts (except primary).

MEASUREMENTS and COLOURS of BARE PARTS. As in 1429. Weight ♂ 9 11-13 g (SDR, SA).

MUSCICAPINAE

Weight 6 ♂♂ 35-40; 2 ♀♀ 35, 38 g (SA).

COLOURS of BARE PARTS. Iris dark brown. Bill, legs, feet and claws black; soles greyish flesh.

MUSCICAPA MACGRIGORIAE (Burton)

Key to the Subspecies

Underparts darker, more grey.....*M. m. signata*
Underparts paler, more whitish on abdomen.....*M. m. macgrigorae*

1429. Western Small Niltava. *Muscicapa macgrigorae macgrigorae* (Burton)

Phoenicurus macgrigorae Burton, 1835, Proc. Zool. Soc. London: 152 (Himalayas, restricted to western Himalayas by Rand & Fleming, 1957, Fieldiana 41: 178)

Baker, FBI No. 685 (part), Vol. 2: 260

Plate 81, fig. 16

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 11 cm (4½ in.).

FIELD CHARACTERS. Male (adult). Above, forecrown, rump and a patch on either side of neck brilliant ultramarine blue. Forehead and lores black. Rest of upperparts deep purplish blue. Below, throat deep purplish blue; rest of underparts ashy, whitish on belly.

Female. Above, rufescent olive-brown. Wings and tail rusty brown. A pale blue patch on either side of neck. Below, throat fulvous; rest of underparts fulvous olive-brown.

Small size and blue patches on sides of neck distinguish both sexes.

STATUS, DISTRIBUTION and HABITAT. Fairly common resident, subject to vertical movements. Himalayas from Mussooree through Nepal and Darjeeling (where it intergrades with *signata*); from c. 1000 to 2100 m in summer and from the foothills to c. 1400 m in winter. Affects bushes near streams, in shady glades or alongside roads and tracks through forest, generally not far from water.

GENERAL HABITS and FOOD. As in 1430.

VOICE and CALLS. A sub-song, described as a curious little grating song uttered *sotto voce*, heard from March to May (Proud). See also 1430.

BREEDING. As in 1430.

MUSEUM DIAGNOSIS. Underparts paler and belly more whitish than *signata* (1430).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

♀♀	61-65	c. 12	c. 18	46-55 mm
				(BB, SA)

Weight 3 ♂♂ 11-13; 3 ♀♀ 12-13 g (GD).

COLOURS of BARE PARTS. Iris brown. Bill black. Legs and feet brownish plumbeous; soles hoary.

MUSCICAPINAE

180

1431. Western Rufousbellied Niltava. *Muscicapa sundara whistleri* (Ticehurst)

Niltava sundara whistleri Ticehurst, 1926, Bull. Brit. Orn. Cl. 46: 113

(Murree)

Baker, FBI No. 684 (part), Vol. 1: 259

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 1432, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Fairly common resident, subject to vertical movements. The western Himalayas from the Murree hills to Kumaon. Breeds between 1600 and 2700 m, optimum zone 1800-2400 m.

Muscicapa sundara and *M. pallipes*

□ *M. s. whistleri* (1431)

■ *M. s. sundara* (1432)

▨ *M. pallipes* (1435)

Affects undergrowth in dense forest (chestnut, fir, etc.), jungle, and along nullahs. Found in winter from c. 650 m down to the foothills and adjacent plains (Hoshiarpur, Ambala and Rawalpindi). In this season frequents bushes near water and along roads in more open areas.

GENERAL HABITS. Usually keeps singly; in winter frequently with the mixed hunting parties. Bobs its body forward and flicks and spreads its tail every few seconds. Hunts in low undergrowth close to the ground, freely descending to it for food. Both Magrath (JBNHS 19: 148) and Whistler (Ibis 1930: 95) note its very Blue Chat-like habits.

FOOD. Insects (ants and beetles recorded). Also berries, especially in the non-breeding season.

FLYCATCHERS

181

VOICE and CALLS. Song described as squeaky and grating (Proud). A call (or song?) is rendered as *s-i-i-i-f cha chuck* (Fleming). Alarm-note, a harsh, scolding *tr-r-r-ichik* (SA), and a long-drawn squeak in the neighbourhood of the nest (HW). Other notes, a soft *cha . . . cha* low-pitched and insistent, and a soft, falling *pea . . . pea* (Lister). Also a high-pitched *tzi, tzi, tzi* (Loke).

BREEDING. Season April to July, chiefly May and June. Young in nest have been found as late as August. Nest, usually placed in a hole in a bank or roadside cutting, in clefts or crevices of rocks, or in cavities in dead stumps, close to the ground. Made mostly of moss, the inner cup lined with rootlets. Eggs, normally 4, very similar to those of *M. grandis* (1428). Both nest and eggs are very reminiscent of a Robin's. Average size of 14 eggs 20.7 × 15.9 mm (Baker). Building and incubation by both sexes; period 12 or 13 days. Brood-parasitized by *Cuculus canorus*, *C. saturatus* and *C. fugax* (D'Abreu, JBNHS 27: 405).

MUSEUM DIAGNOSIS. Male differs from *sundara* (1432) in having the orange-rufous of underparts paler. Female is paler and more olive-grey above; tail paler chestnut; underparts more greyish olive.

MEASUREMENTS and COLOURS OF BARE PARTS. As in 1432.

1432. **Eastern Rufousbellied Niltava.** *Muscicapa sundara sundara* (Hodgson)

Niltava Sundara Hodgson, 1837, Ind. Rev. 1 (12): 650 (Nepal)
Cyanecula fastuosa Lesson, 1840, Rev. Zool.: 266 (Mont. Himal., restricted to Murree by Baker, 1930, Fauna Brit. India, Bds. 8: 632, re-restricted to NE. Himalayas by Titchhurst, 1931, Ibis: 351)
 Baker, FBI No. 684 (part), Vol. 2: 259
 Plate 82, fig. 14

LOCAL NAMES. *Niltava* (Nepal); *Margong* (Lepcha).

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male (adult). Above, forehead black; crown, rump, shoulders and a patch on either side of neck bright ultramarine blue. Sides of head and back dark purplish blue looking practically black. Below, throat as back; rest of underparts orange-rufous.

May be confused with the very similar *M. vivida* which lacks the well-defined blue patch (the niltava hall-mark) on sides of neck; other differences not apparent in the field.

Female. Above, olive-brown tinged with ochraceous on rump. A pale eye-ring. A blue patch on either side of neck. Wings fulvous-brown. Tail rusty brown. Below, chin and upper throat fulvous-olive. Lower throat white; rest of underparts olive-brown.

The combination of a white throat-patch and the characteristic blue spot on each side of neck identifies the female.

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical movements. Nepal, Darjeeling, Sikkim, Bhutan, NEFA, the Patkai Range, Nagaland, Manipur, and Assam in the Cachar and Khasi hills. Breeds between c. 1800 and 3200 m (Diesselhorst) in the Himalayas and the eastern

FLYCATCHERS

183

(Hume, SF 11: 111), and presumably Nagaland. Obtained in summer from 2100 to 2700 m (NEFA, Sikkim and Mt Victoria); recorded in winter from 1500 to 2000 m in Burma. Affects dense brushwood in evergreen forest.

EXTRALIMITAL. Extends to Szechuan and northern Vietnam. The species ranges to Formosa, the Malay Peninsula and Sumatra.

GENERAL HABITS. Found singly or in pairs, skulking in brushwood from which it makes sallies after insects. Behaviour and habitat preference much as in Large Niltava (1428).

FOOD. Insects.

VOICE and CALLS. 'A clear whistle' (Robinson).

BREEDING. Unknown.

MUSEUM DIAGNOSIS. See Field Characters. For details of plumages see Baker, loc. cit. Young undescribed.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
7 ♂♂	94-102	c. 16	c. 18	74-86 mm
2 ♀♀	93, 94	c. 16	c. 18	— mm

(Kinnear, Stresemann)

Weight 2 ♂♂ 1 ♀ 1.7-1.2 oz. (c. 33 g) — Hume.

COLOURS OF BARE PARTS. Iris brown to reddish chocolate. Bill black. Legs and feet dark blackish brown; soles yellowish.

1434. **Whitetailed Blue Flycatcher.** *Muscicapa concreta cyanea* (Hume)

Muscitrea cyanea Hume, 1877 (June), Stray Feathers 5: 101 (Muleyit)
 Baker, FBI No. 641, Vol. 2: 215
 Plate 82, fig. 15

LOCAL NAMES. None recorded.

SIZE. Bulbul; length c. 18 cm (7½ in.).

FIELD CHARACTERS. Male (adult). Above, deep blue, crown brighter. Tail dull blue with a large amount of white on all but the central rectrices. Below, throat and breast dark blue fading to ashy on lower breast and flanks, and to white on lower belly and under tail-coverts.

Distinguishable from all dark blue flycatchers by large size (nearly same as of Large Niltava) and by the large amount of white in tail.

Female. Above, rufescent brown; a fulvous eye-ring. Tail like male's but brown, also with much white in it.

Below, rufescent brown with a conspicuous white patch on lower throat. Flanks olive-brown; belly white.

Recognizable by the well-defined white throat-patch and extensive white in tail. Female *sundara* (1432) has blue patches on either side of white throat-patch and no white in tail. *M. moniliger* (1415) also has no white in tail, but its white throat-patch is bordered with black.

STATUS, DISTRIBUTION and HABITAT. Little known. Breeds in the Patkai Range at or above 1500 m (exact altitude unknown). Obtained in winter

× c. 1

182

MUSCICAPINAE

range south to Mt Victoria, and in Assam from 900 m to the highest summits. Found in winter (November to March) from c. 2300 m down to the foothills, in the plains of the Brahmaputra and in the Chittagong region of East Pakistan. Affects dense undergrowth in more open forest than *M. grandis*, secondary growth and brush-covered hillsides.

EXTRALIMITAL. Extends east to Yunnan and northern Laos.

GENERAL HABITS, FOOD and VOICE. As in 1431.

BREEDING. As in 1431.

MUSEUM DIAGNOSIS. For distinction from *whistleri*, see 1431.

Young, male and female similar to those of *M. grandis* respectively, but with a pale ochraceous patch on lower throat. First-winter birds recognizable by ochraceous tips of greater coverts.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	78-87	16-17	21-22	65-73 mm
♀♀	76-83	16-17	21-23	60-68 mm

(BB, SA, Stresemann)

Weight 21 ♂♂ 20-24 (av. 21); 7 ♀♀ 19-24 (av. 21.5) g — SA.

COLOURS OF BARE PARTS. Iris brown. Bill: ♂ black, ♀ blackish brown; inside of mouth fleshy. Legs and feet plumbeous brown.

1433. **Rufousbellied Blue Flycatcher.** *Muscicapa virida oatesi* (Salvadori)

Niltava oatesi Salvadori, 1887, Ann. Mus. Civ. Stor.
 Nat. Genoa 5 (2): 514 (Muleyit)
 Baker, FBI No. 652, Vol. 2: 226
 Plate 82, fig. 16

LOCAL NAMES. None recorded.

SIZE. Sparrow +; length c. 18 cm (7 in.).

FIELD CHARACTERS. Male (adult). Above, forehead and lores black. Crown and rump ultramarine blue. Back and tail dark purplish blue. Below, chin, upper throat, sides of head, neck and breast nearly black. Rest of underparts rufous.

Resembles *M. sundara* but lacks the niltava hall-mark — the well-defined blue patch on sides of neck. *M. rubiculoides* also has a dark blue throat but a white belly.

Female. Above, crown grey-brown; a fulvous eye-ring. Rest of upperparts dark olive-brown. Below, throat fulvous, rest olive-brown.

Distinguished from female *M. sundara* and *M. grandis* by lack of the distinctive blue neck-patches; from *unicolor* by fulvous throat and olive-brown breast (v. whitish and grey respectively). Females of *rubiculoides* and *banyumas* both have a rufous breast and white belly; female *concreta* has a white throat-patch. Both sexes of *M. poliolegys* have a whitish throat and rufous breast.

STATUS, DISTRIBUTION and HABITAT. Apparently rare. NEFA in the Pachakshi area (Ludlow, Ibis 1944: 194); Assam in north Cachar (one April record — Baker, JBNHS 9: 124); the highest eastern ranges of Manipur

× c. 1

MUSCICAPINAE

184

at low altitude in the Margherita-Dibrugarh area (common). Affects deep forest.

EXTRALIMITAL. Burma. The species extends east to northern Vietnam and south through the Malay Peninsula to Sumatra and Borneo.

GENERAL HABITS. More sluggish and inactive than most flycatchers. Frequents the lower branches of big trees in dense jungle, searching the leaves and branches for insects; also catches them on the wing but does not descend to the ground (Robinson). Frequently expands its tail laterally, showing the white. Females appear to be much less numerous, or perhaps shyer than males, as they are much scarcer in collections.

FOOD. Insects.

VOICE and CALLS. 'A low whistling song of three notes, in addition to the ordinary twitter' (Robinson).

BREEDING. Little known. A nest brought to Dr H. N. Coltart by Patkai Nagas on 25 June (over 50 years ago) is the only record. It was made of moss and said to have been wedged into a hole in a rocky bank of a ravine running through dense forest. The single egg looked like a very large egg of *M. rubiculoides* (1440): pale buff-stone, stippled all over with dark reddish, forming an ill-defined cap at the large end; it measured 23.9 × 18 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters. Young, spotted as in other closely related species.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♀	91-93	c. 18-19	c. 23-24	66-72 mm (Baker)
1♂	90	(from skull) 21	22	67 mm (MD)

COLOURS OF BARE PARTS. Iris brown. Bill black. Legs and feet fleshy brown.

1435. **Whitebellied Blue Flycatcher.** *Muscicapa pallipes* Jerdon

Muscicapa pallipes Jerdon, 1840, Madras Jour. Lit. Sci. 11: 15 (Coonoor Ghat)
 Baker, FBI No. 653, Vol. 2: 228
 Plate 82, fig. 9

LOCAL NAME. *Küttuneli* (Malayalam).

SIZE. Sparrow ±; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male (adult). Above, uniformly indigo-blue, forehead and supercilium brighter blue, lores black. Below, throat and breast indigo-blue; belly white.

Combination of last two characters identifies it. The Whitebellied Short-wing (1638) is slaty blue rather than indigo-blue, has a paler, bluish white forehead and supercilium, and is more terrestrial with longer legs.

Female. Above, rufescent olive-brown; lores white; tail chestnut. Below, throat and upper breast orange-rufous; breast greyish fading to white on belly.

FLYCATCHERS

185

Distinguished from female *M. rubiculoides* (1440) by larger size and chestnut tail. Both sexes of *M. parva* have a black-and-white tail. Female *M. tickelliae* (1442) is greyish above and has a blue tail.

STATUS, DISTRIBUTION and HABITAT. Fairly common resident. The Sahyadris (Western Ghats) and associated hills of southwestern India (Nilgiris, Palnis, High Wavys and others) from c. 19°N. (Bhimashanker) to southern Kerala; from the foothills to c. 1500 m; in the Nilgiris up to 1700 m (see map p. 180). Affects undergrowth of lanky seedlings in evergreen forest, sholas, *Strobilanthes* and 'channa' patches on hillsides, and cardamom ravines.

GENERAL HABITS. Found singly or in pairs, often in company with roving bands of insectivorous species. Rather sluggish. Flits unobtrusively among the undergrowth and lower trees, catching insects on the wing in typical flycatcher fashion or dropping to the ground now and again to pick up a morsel. 'When perched on a branch, bolt upright, has a peculiar way of spreading its tail and screwing it from side to side, reminiscent of the Thick-billed Flowerpecker (*Dicaeum agile*)'—SA. Its quiet and retiring habits make it seem rarer than it is. Recent mist-netting, for instance, has shown it to be quite common and breeding at Mahableshwar (c. 18°N.) whence not recorded previously.

FOOD. Chiefly insects; occasionally also berries.

VOICE and CALLS. A low *tik-tik* (Betts). A double call of two soft, tremulous notes, the second slightly lower in pitch, a little like the nasal call of the Paradise Flycatcher. Song, high-pitched, sweet and rich though 'a little squeaky, divided into phrases of as many as nine notes' (Nichols).

BREEDING. Season, February to September, but chiefly during the monsoon. Nest, a rough untidy structure mainly of green moss, the neat inner cup lined with lichen, fine grass or rootlets; generally placed on a ledge of a mossy rock, or in a hole in a dead stump or bank, not far from the ground, in humid forest. Eggs, almost invariably 4, resembling those of *Copsychus*: pale sea-green to warm yellowish stone profusely blotched all over with dark brown, more so at the large end. Average size of 45 eggs 20.2 × 15.5 mm (Baker). Other details of breeding biology not recorded.

MUSEUM DIAGNOSIS. See Field Characters. For details of plumage, see Baker loc. cit.

Young. Above, olive-brown with ochraceous streaks on head and small spots with dark margins on mantle. Lesser, median, greater coverts and tertials with ochraceous tips. Below, ochraceous, breast with dark margins, throat paler, belly whitish. Wings and tail as in adult of corresponding sex. First-winter birds recognized by pale tips of unmoulted greater coverts.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

- M. p. poliogenys* (1436).
 M. p. cachariensis (1437).
 M. p. vernayi (1438).
 M. albicaudata (1445).

FOOD. Insects.

VOICE and CALLS. Alarm-notes *tik-tik-tik-tik*. Song, a pleasing trill (Stevens); mellow and varied, rendered as 'doe-doe-chi-cha, su-wa-si-su-wa, su-wa-si-do-dee' (Fleming).

BREEDING. Season, middle of April till end of June. Nest, a compact cup mostly of green moss mixed with some dead leaves and fine grass, lined with rootlets; placed in a hollow in a bank or among boulders, or in a hole in some dead stump, within a metre from the ground. Eggs, 3 to 5, pale olive-green or olive-buff, so densely covered with reddish or red-brown specks as to appear uniformly reddish brown. Average size of 40 eggs 18.5 × 14.6 mm (Baker). Incubation by both sexes; period unrecorded.

MUSEUM DIAGNOSIS. For distinction from *cachariensis* and *vernayi* see 1437 and 1438 respectively (under Museum Diagnosis).

Young similar to that of *M. rubiculoides*.

Cyornis poliogenys Brooks, 1879, Stray Feathers 8: 469

(Salbari, Sikkim Terai)

Baker, FBI No. 673 (part), Vol. 2: 247

Plate 82, fig. 8

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 14 cm (5½ in.).

FIELD CHARACTERS. Above, olive-brown, greyer on crown and sides of head. A pale eye-ring. Tail rufous-brown. Below, throat whitish or buff, rest of underparts fulvous, darker on breast. Sexes alike.

This nondescript species may be confused with several other female flycatchers with more or less rufous underparts; these species may be eliminated as follows: *M. hypertythra* has a rufous throat and rufous-brown sides of head. *M. tickelliae* has an orange-rufous throat and blue tail. *M. hodgsonii* has an olive-buff throat and lacks any fulvous on breast and belly. *M. ferruginea* has a more rusty tail, rufous lower belly and a very prominent white eye-ring. *M. rubiculoides* has a less whitish throat, a pure white belly and under tail-coverts. *M. monileger* has a white throat with a well-defined black gorget bordering it. *M. banyumas* has a bright rufous throat and breast.

Female Blue Chat (*Eritacus brunneus*) differs only in having the sides of head olive-brown, not dark grey, and in being more terrestrial with longer legs.

STATUS, DISTRIBUTION and HABITAT. Common resident. From central Nepal through Sikkim, Darjeeling, the Jalpaiguri duars and Bhutan foothills (probably intergrading here with *cachariensis*); also the Garo, Khasi and Mizo hills of Assam, and adjacent hills of East Pakistan to the Chitragong region; from the edge of the plains to c. 1500 m. Affects evergreen and deciduous forest, more open country in winter.

GENERAL HABITS. Little recorded. Affects bushes and undergrowth though generally keeps higher up among trees. Hops over and about fallen stumps and brushwood in forest like a chat (Stevens). See also 1438.

188

MUSCICAPINAE

1437. Eastern Brooks's Flycatcher. *Muscicapa poliogenys cachariensis* (Madarász)

Siphia cachariensis Madarász, 1884, Zeitschr. Ges. Orn.: 52, pl. 1, fig. 2

(Dhilkusha, Cachar)

Cyornis poliogenys saturatior Robinson & Kinnear, 1927, Bull. Brit.

Orn. Cl. 48: 43 (Dibrugarh, Assam)

Baker, FBI No. 673 (part), Vol. 2: 247

LOCAL NAME. Deo-putti (Cachar).

SIZE. Sparrow —; length c. 14 cm (5½ in.).

FIELD CHARACTERS. As in 1436 but throat fulvous as breast.

STATUS, DISTRIBUTION and HABITAT. Common resident. NEFA south through Nagaland, Assam in the Cachar hills, and Manipur. From the edge of the plains to c. 1500 m. Affects various kinds of jungle as well as wet tropical forest.

Extrelimited. Adjacent hills of Burma.

GENERAL HABITS, FOOD and VOICE. As in 1436.

BREEDING. As in 1436.

MUSEUM DIAGNOSIS. Differs from nominate race (1436) in being darker and having the ochraceous of breast almost reaching the chin. Above browner, less greyish, the crown not differentiated from the back.

MEASUREMENTS and COLOURS OF BARE PARTS. As in 1436.

1438. Peninsular Brooks's Flycatcher. *Muscicapa poliogenys vernayi* (Whistler)

Cyornis poliogenys vernayi Whistler, 1931, Bull. Brit. Orn. Cl. 52: 23

(Sankrametta, 3500 ft, Vizagapatam dist., Eastern Ghats)

Not in Baker, FBI

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 14 cm (5½ in.).

FIELD CHARACTERS. As in 1436 but male has a bluish wash on upperparts. Looks very like Quaker Babbler, *Alcippe pinicephala* (1389) but keeps singly, not in flocks.

STATUS, DISTRIBUTION and HABITAT. Common resident. The Eastern Ghats from northern Orissa (Mayurbhanj) and northeastern Andhra Pradesh (Vishakhapatnam district); from the plains to 1000 m. Affects secondary deciduous and evergreen forest.

GENERAL HABITS. Characteristically flycatcher, but frequently descends to the ground and hops about among the debris and undergrowth looking confusingly like a female shortwing or blue chat.

FOOD and VOICE. As in 1436.

BREEDING. Unrecorded. Probably as in 1436.

MUSEUM DIAGNOSIS. Female and first-year male differ from *poliogenys* in the greyer tint of the upperparts. Adult male distinguished by a bluish wash over the whole of the upperparts, more pronounced on the head and nape, becoming a definite bright blue on the longer upper tail-coverts and outer webs of the rectrices. Males breed in both stages of plumage.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	73-78	15-16	18-20	60-68 mm
♀♀	70-74	14-16	18-20	55-60 mm

COLOURS OF BARE PARTS. As in 1436.

1439. **Pale Blue Flycatcher.** *Muscicapa unicolor unicolor* (Blyth)
Cyornis unicolor Blyth, 1843, Jour. Asiat. Soc. Bengal 12: 1007 (Darjeeling)
 Baker, FBI No. 655, Vol. 2: 230
 Plate 82, fig. 11

LOCAL NAMES. None recorded.

SIZE. Sparrow ±; length c. 16 cm (6½ in.).

FIELD CHARACTERS. Male (adult). Above, blue, brighter on forehead, supercilium and shoulder, deeper on tail. Below, throat pale blue, breast blue changing to whitish on belly. Under tail-coverts scalloped grey and white.

May only be confused with the Verditer Flycatcher (1445), which is more blue-green and lacks the whitish on belly.

Female. Above, olive-brown, wings and tail browner; pale lores and eye-ring. Below, pale grey-brown.

May be confused with female *M. hodgsonii* which is smaller, has an olive-buff throat and whitish belly. Female of *M. vivida* is darker olive below and has a fulvous throat.

STATUS, DISTRIBUTION AND HABITAT. Imperfectly known. Uncommon in the western part of its range, common but locally distributed in the east. Garhwal (A. E. Osmaston, JBNHS 28: 148), Nepal (Biswas, JBNHS 59: 815), Sikkim, Bhutan, NEFA, Nagaland, Manipur, Assam in the Cachar, Khasi and Garo hills, and East Pakistan in the Chittagong Hill Tracts (Rashid); from the foothills in winter to at least 1800 m in summer; optimum breeding altitude about 1500 m. Affects dense forest, secondary and bamboo jungle, and humid forest on steep hillsides.

Extralimital. Extends east to Laos. Another subspecies in the Malay Peninsula, Sumatra, Java and Borneo.

GENERAL HABITS. Frequents undergrowth as well as high trees. Makes sallies for insects but does not use regular perches. Twitches up its tail half-cocked between the drooping wings.

FOOD. Insects.

VOICE AND CALLS. A characteristic tr-r-r (of alarm ?) as it twitches its tail (SA). Song described as beautiful, 'arresting and characteristic' (Smythies) and richer than that of most flycatchers (Baker).

BREEDING. Little known. Season, April to June. Nest, described mostly from material brought in by locals. Said to have been placed in holes between boulders in ravines and stream banks, or in holes in tree-trunks; made mostly of moss and lichen, the inner cup lined with rootlets. Eggs, normally 4, deep yellow-buff so densely freckled as to appear uniformly chocolate-brown. Average size of 14 eggs 23.1 × 17.5 mm (Baker).

FLYCATCHERS

191

Muscicapa rubeculoides

■ Breeding range

▨ Winter

Extralimital. Adjacent Burma. The species extends to Szechuan, Hupeh and Vietnam.

MIGRATION. A summer (breeding) visitor to the Himalayas, arriving in March, leaving in September. Has been recorded in Sikkim at c. 1100 m in winter. A resident or altitudinal migrant in Assam. Winters scatteredly in the hills of southern India (low country to c. 900 m) from Belgaum southwards, Tamil Nadu, the Eastern Ghats, West Bengal (common) and in the plains and foothills of East Pakistan and Assam. Also the northern part of Ceylon where it arrives in October, up to c. 1000 m in the hills. In this season, affects well-wooded country, secondary and bamboo jungle.

GENERAL HABITS. Keeps to undergrowth of bushes and low trees; makes sallies for insects but rarely returns to the same perch or even the same tree. Frequently drops to the ground momentarily to pick up a morsel, sometimes jerking open and flicking forward the wings to stampede a cricket or grasshopper lurking amongst the mulch. Flicks up partially cocked tail from time to time while uttering its call- or alarm-note.

FOOD. Insects and grubs.

VOICE AND CALLS. Alarm-note chr-r, chr-r; call-note click, click or chik, chik (SA). Song, a clear but short phrase or metallic trill similar in pattern to that of Tickell's Flycatcher (1442) but somewhat richer; a song heard in winter has been rendered as ciccy-ciccy-ciccy-ciccy-see, the first two ciccy higher in pitch (Smythies). Often given from the low limb of a tree when sitting quietly. Song period in Nepal, mid April to mid July (Proud). Also sings sporadically in winter.

90

MUSCICAPINAE

MUSEUM DIAGNOSIS. See Field Characters.

Young. Above, spotted with rich ochraceous. Ear-coverts fulvous with darker tips. Greater coverts and tertials with ochraceous tips. Wing and tail as in adult, sex for sex. Below, dull ochraceous, paler on belly, with faint dark margins on belly and throat, well marked on breast. First-winter birds recognized by pale tips of tertials.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	80-85	17-18	17-19	70-76 mm
♀♀	76-84	17-18	17-19	67-72 mm

Weight 1 ♂ 21; 1 ♀ 21 g (SA).

COLOURS OF BARE PARTS. Iris dark brown. Bill black, base of lower mandible grey. Legs and feet dark brown.

1440. **Bluethroated Flycatcher.** *Muscicapa rubeculoides rubeculoides* (Vigors)
Phoenicurus rubeculoides Vigors, 1831; Proc. Zool. Soc. London: 35 (Darjeeling)
 Baker, FBI No. 657, Vol. 2: 231
 Plate 82, fig. 6

LOCAL NAMES. Ghatki (Bengali); Manzil pho (Lepcha); Nrelachenpan (Malayalam).

SIZE. Sparrow —; length c. 14 cm (5½ in.).

FIELD CHARACTERS. Male (adult). Above, dull ultramarine blue, brighter on forehead and supercilium. Lores black. Below, throat dark blue; breast rufous; belly and under tail-coverts white washed with buff.

Dark blue throat in conjunction with rufous breast and white belly identifies the male.

Female. Above, olive-brown tinged with rufous on rump. Pale lores and eye-ring. Below, throat buff; breast ochraceous, rest of underparts white.

Several other flycatchers, mostly females, have a rufous breast and are very similar. They may be eliminated as follows: *M. parva* and *rubra* have white tail-bases; *M. hyperythra*, *poliogenys* and *sapphira* a more or less ochraceous belly, not white; *M. tickelliae* has a bluish tail; *M. hodgsonii* has a buffish olive throat and breast; *M. banyumas* has both throat and breast rufous, and belly washed with buff, less pure white; *M. pallipes* has a chestnut tail and is larger. *M. poliogenys* is almost identical but has a whiter throat, and an ochraceous wash on belly.

STATUS, DISTRIBUTION AND HABITAT. A partial migrant, generally common on its breeding grounds, but very widely scattered in winter. Breeds in the Himalayas from Kashmir (specimens in Brit. Mus.) and Chamba to NEFA; also Nagaland, Manipur and the hills of Assam and East Pakistan south to the Chittagong Hill Tracts; from the foothills normally to c. 1500 m, locally to 1800 m and even 2100 m (Nepal, Diesselhorst). Affects forest with plenty of undergrowth, wooded nullahs, well-wooded gardens and secondary forest.

192

MUSCICAPINAE

BREEDING. Season, April to August. Double-brooded in Assam but apparently single-brooded in the Himalayas. Nest, placed in a hollow in a mossy bank or crevices in rocks on stream banks and ravines, holes in dead stumps, holes and clefts in tree-trunks or in hollow bamboo, occasionally among thick clumps of ferns and orchids growing on the trunk of a moss-covered tree; made mostly of green moss, sometimes mixed with some dead leaves, grass bents and lichen, lined with fine rootlets. Eggs, normally 4, rarely 5, occasionally 3, pale olive or yellowish stone very densely stippled with olive-brown or reddish olive-brown. Average size of 60 eggs 18.7 × 14.3 mm (Baker). Both sexes share incubation and care of young. Incubation period either eleven or twelve days.

MUSEUM DIAGNOSIS. See Field Characters. For details of plumages see Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	65-77	14-16	15-18	50-60 mm
♀♀	66-74	14-15	15-18	49-55 mm

Weight 3 ♂♂ (March) 12-18; 14 ♂♂ (October, in winter quarters) 13-19 (av. 14.9); 14 ♀♀ (ditto) 10-16 (av. 13.6) g — SA.

COLOURS OF BARE PARTS. Iris dark brown. Bill brownish black; mouth greyish pink or slaty pink. Legs and feet greyish brown (yellowish fleshy in juvenile).

1441. **Largebilled Blue Flycatcher.** *Muscicapa banyumas magnirostris* (Blyth)

Cyornis magnirostris Blyth, 1849, Jour. Asiat. Soc. Bengal 18: 814 (Darjeeling)
 Baker, FBI No. 663, Vol. 2: 236
 Plate 82, fig. 7

LOCAL NAME. Daogatang (Cachari).

SIZE. Sparrow —; length c. 14 cm (5½ in.).

FIELD CHARACTERS. Male (adult). Above, indigo-blue, brighter on forehead and shoulders; lores black. Below, throat and breast and flanks orange-rufous; belly and under tail-coverts white.

May be confused with *M. sapphira* which is more brilliant ultramarine blue on crown and rump and has a more greyish belly. *M. hodgsonii* is slaty above and has white in tail. The nearly identical *tickelliae* is not likely to occur in the range of *banyumas*.

Female. Above, olive-brown; a fulvous eye-ring. Below, throat and breast orange-rufous; belly white washed with buff.

M. sapphira is smaller, more rufescent above and has the breast tinged with olive. *M. poliogenys* has greyer sides of head and whitish throat. *M. rubeculoides* has a buff throat, paler than breast and a purer white belly. See also 1440 under Field Characters.

STATUS, DISTRIBUTION AND HABITAT. A rare and little-known species. Central Nepal (one recent record: Lowndes, JBNHS 53: 33, 1955), Sikkim (no recent records), NEFA (obtained in the Miri Hills by Godwin-Austen), the Sadiya frontier tract, Assam in the Cachar and Khasi hills (Baker),

FLYCATCHERS

193.

Nagaland (Stevens), Manipur (Hume), and possibly the Chittagong region of East Pakistan. Altitudinal distribution little known. The Nepal specimen was collected at c. 2600 m in August; in Assam, breeds between 750 and 1800 m, mostly above 1200 m, while in the Margherita area it is found as low as 300 m in summer. Himalayan population appears to winter in Burma (southern Shan States and Tenasserim) while Assam birds spread over the adjacent plains in winter. Affects shady ravines and dense, humid forest with plentiful undergrowth.

Extralimital. The species extends to Yunnan, the Indochinese countries, Java, Borneo and Palawan.

GENERAL HABITS. Unrecorded.

FOOD. Insects.

VOICE AND CALLS. 'A cheerful little song.' A song heard by Lister near Darjeeling (JBNHS 52: 43) may belong to this species; it is rendered as *tee-sea-si-e-e-e-e*.

BREEDING. *Season*, end of April to June. *Nest*, made of moss and lined with moss-roots, usually placed on the ground in some hollow among plants on a bank or between the roots of a tree, sometimes in a hole in a dead stump, or well hidden against a moss-covered trunk, quite low down. *Eggs*, 4 or 5, pale sea-green or buff-stone with small blotches of pale brown or chocolate-brown forming a broad zone at the larger end. Average size of 40 eggs 19.1 × 14.6 mm (Baker). No other details recorded.

MUSEUM DIAGNOSIS. See Field Characters.

Young. *Above*, brown with ochraceous spots. *Below*, breast ochraceous with dark margins, belly paler. First-winter birds recognized by unmoulted greater coverts.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	76-83	c. 15	c. 19	55-61 mm (Baker)

COLOURS OF BARE PARTS. Iris brown. Bill black. Legs and feet pale fleshy white to light hornny brown.

MUSCICAPA TICKELLIAE (Blyth)

Key to the Subspecies

- Deeper blue above.....*M. t. jerdoni*
Lighter blue above.....*M. t. tickelliae*

1442. Tickell's Redbreasted Blue Flycatcher. *Muscicapa tickelliae tickelliae* (Blyth)

C. (jerdoni) Tickelliae Blyth, 1843, Jour. Asiatic Soc. Bengal 12: 941
(Central India = Borabhum)
Baker, FBI No. 660, Vol. 2: 234
Plate 82, fig. 1

LOCAL NAME. *Adhārāṅḍā* (Gujarati); *Nelakkūrūri* (Malayalam, Tamil).

SIZE. Sparrow —; length c. 14 cm (5½ in.).

FLYCATCHERS

195

GENERAL HABITS. Keeps singly, often in mixed hunting parties. Perches bolt upright a couple of metres from the ground, flicking its tail and uttering a sharp *tick, tick* from time to time. Flits about in scrub and undergrowth, catching most of its food in the air, sometimes hovering at a flower or sprig to take an insect.

Display. The male, while leaning on one side, raises the feathers of his head and back and vibrates them as if to attract the female, keeping the body immobile, the tail slightly spread and bent a little sideways (Dharmakumarsinhji).

FOOD. Insects, chiefly diptera.

VOICE AND CALLS. Song, a short, metallic trill of six to ten notes, the first half descending, the second ascending the scale (Bates). Unmistakable and often the first indication of the bird's presence; uttered throughout the year, but chiefly in April-May. Call-note *tick-tick*.

BREEDING. *Season* April to August, chiefly May and June. *Nest*, placed in crevices or on ledges of rock, holes in trees or in crevices formed by the twisting aerial roots of large, parasitic fig trees; in the latter case it may be well up above the ground, but usually it is placed within a couple of metres from it. Nests have been found in walls and on window-ledges of disused houses; also under a prickly pear root in a bank and in a rubbish heap of dry leaves (Betham, JBNHS 14: 398). Main material is green moss, loosely packed, often mixed with some dead leaves or grass bents, the inner cup usually lined with fine rootlets. In drier regions, dry bamboo leaves and fine grass are used. *Eggs*, 3 or 4, occasionally 5, similar to those of *M. rubiculoides* (1440). Average size of 80 eggs 18.4 × 14.2 mm (Baker).

MUSEUM DIAGNOSIS. Male differs from the very similar *banyumas* (1441) in being a darker blue above, with the orange-rufous of breast not extending quite as far down on upper abdomen. Some males have extreme point of chin blue-black. Wing of *banyumas* averages somewhat longer.

Female very similar to male *M. poliopteryx remeyi* (1438) but blue of upper tail-coverts a little brighter and blue of forehead and supercilium somewhat more pronounced.

There is no spring moult, and the complete autumn moult takes place from the end of August to October.

Young (juvenile) shows characteristic spotting but upperparts have a dark bluish tinge; wings and tail blue in both sexes: brighter in male, duller and greyer in female.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♂	70-77	14-16	17-20	56-68 mm
♀ ♀	68-73	14-16	16-19	54-57 mm (SA, HW)

Weight 7 ♂♂ 14-16; 3 ♀♀ 12-16 g. 19 (unsexed, in ♀ plumage) 12-17 (av. 14.6) g — SA.

COLOURS OF BARE PARTS. Iris brown. Bill brownish black; mouth blackish pink, greyish pink or yellowish pink. Legs and feet greyish brown or pinkish slate.

194

MUSCICAPINAE

FIELD CHARACTERS. Male (adult). *Above*, indigo-blue, brighter (azure blue) on forehead, supercilium and shoulders. *Below*, throat and breast orange-rufous; belly white.

Almost identical with *M. banyumas*; *M. rubiculoides* is very similar but has a blue throat.

Female. Like male but duller and greyer above; lores dull bluish or whitish. Rufous of breast paler. Easily confused with *M. poliopteryx remeyi* (1438) but which has a whitish throat (v. orange-rufous concolorous with breast).

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to local movements. The Indian Peninsula from Uttar Pradesh (Dehra Dun and

Muscicapa tickelliae

Distributional ranges

▨ *tickelliae* (1442).

■ *jerdoni* (1443).

the Siwalik foothills [Osmaston], Gonda and Gorakhpur, southern Bihar and southwestern West Bengal, south to the Cardamom Hills (Kerala) and west to a line from Kutch, Mt Abu, Sambhar Lake and Mussooree; thence east through E. Pakistan (Rashid) and Assam (N. Cachar, Baker, JBNHS 9: 124). Nesting reported from Murree (Buchanan in Whistler's MS.). Breeds mostly in more broken country and hills (in southern India up to c. 1500 m) and spreads out over the plains in winter (October to May). Affects thick bushes in or near forest and streams, deciduous scrub and bamboo jungle, overgrown nullahs, village groves, wooded gardens, and orchards. Prefers a drier facies than the Bluethroated Flycatcher.

Extralimital. Extends through Burma, the Indochinese countries, Malaysia, Indonesia and the Philippines.

196

MUSCICAPINAE

1443. Ceylon Tickell's Flycatcher. *Muscicapa tickelliae jerdoni* (Holdsworth)

Cyornis jerdoni 'G. R. Gray' = Holdsworth, 1872, Proc. Zool. Soc. London: 442 (few miles from Colombo, Ceylon)

Cyornis tickelliae nesaea Oberholser, 1920, Proc. Biol. Soc. Washington 33: 86

(Walgama, Ceylon)
Baker, FBI No. 662, Vol. 2: 236

LOCAL NAMES. *Kepi-kurullā*, *Mārāwā* (Sinhala); *Kepi kūrūri* (Tamu).

SIZE. Sparrow —; length c. 14 cm (5½ in.).

FIELD CHARACTERS. As in 1442, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident, widely distributed and moderately plentiful. Ceylon, from the lowlands to c. 1300 m, occasionally higher. Affects forests and well-wooded areas.

GENERAL HABITS, FOOD AND VOICE. As in 1442.

BREEDING. *Season*, March to June, occasionally starting in late February in the low country. One nest recorded in October. *Nest* and *eggs* as in 1442; clutch size normally 3. Average size of 11 eggs 19.5 × 14.8 mm (Phillips).

MUSEUM DIAGNOSIS. Male differs from ♂ *tickelliae* (1442) in being a darker, deeper blue above and slightly more rufous on breast, showing less white on abdomen. Female slightly paler. In both sexes the bills average slightly larger and stronger.

MEASUREMENTS

Glaucopis serdida Walden, 1870, Ann. Mag. Nat. Hist. 5: 218

(Ceylon)

Baker, FBI No. 667, Vol. 2: 241

Plate 82, fig. 12

LOCAL NAME. *Giri-kurullā* (Sinhala).

SIZE. Sparrow —; length c. 14 cm (5½ in.).

FIELD CHARACTERS. A dark bluish grey flycatcher with cerulean blue forehead, black lores and whitish belly. Sexes virtually alike; female very slightly duller.

Could be easily confused with ♂ Pale Blue (1439), but for allopatry. Ranges of the two widely junct.

STATUS, DISTRIBUTION AND HABITAT. Resident, moderately plentiful; Ceylon. Confined to the Hill zone from 900 to over 2100 m, occasionally as low as 450 m in the Rattota district. Affects forest and well-wooded ravines.

FLYCATCHERS

197

Muscicapa thalassina and *M. sordida*

Distributional ranges

■ *M. t. thalassina* (1445), breeding. ▨ Winter
▨ *M. sordida* (1444).

GENERAL HABITS. Generally perches on low branches, logs or rocks close to the ground.

FOOD. Beetles, caterpillars and flying insects; also berries (*Rubus*, *Lantana*, etc.).

VOICE and CALLS. A sweet, rather loud song consisting of five or six notes, constantly repeated, uttered from a fairly high perch in a tree during the courting season. Also a subdued sub-song with the same notes and cadence (Henry). Call-note a soft, low chip-chip.

BREEDING. Season, late February to early June; above c. 1500 m nesting takes place again in August and September. Nest, placed on ledges and in crevices in moss-covered banks and vertical rock faces in heavy forest, or in cavities in tree-trunks, usually below three metres but sometimes as high as six metres in a hollow branch; made entirely of green moss, the inner cup lined with fine rootlets. Exceptionally a nest may be placed in a low fork; in this case it is a compact, well-built cup of green moss, tendrils and bits of dead leaves, lined with rootlets. Eggs, generally 2, exceptionally 3, pale creamy pink to warm salmon-pink, lightly and thinly freckled with pale reddish, the markings forming a ring or a cap around the large end. Average size of 60 eggs 20 × 14.8 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters. For details of plumages see Baker, loc. cit. Postnuptial moult takes place between August and December.

Young. Above, dull olive-brown, each feather with an elongated fulvous apical spot and indistinctly edged with blackish. Below, chin and throat fulvous gradually growing paler on breast and white on flanks, abdomen and under tail-coverts, the

FLYCATCHERS

199

GENERAL HABITS. Keeps in pairs in the breeding season; at other times, it may be seen singly or in pairs (sometimes several pairs), often in company with *Monarcha*, *Terpsiphone* and other flycatchers, ioras (*Aegintha*), leaf warblers and drongos, etc. Perches upright; flicks tail. Makes short aerial sallies for insects from the tips of tall trees as well as bushes, seldom returning to the same perch but flying from branch to branch and tree to tree. Also flutters at flower clusters and leaf sprigs to stampede insects lurking within and occasionally descends to the ground to pick up a morsel.

FOOD. Chiefly tiny winged insects.

VOICE and CALLS. Call-note *tee-ju-jui*. Also a very soft *p'p'pwe*... *p'p'pwe* before giving the song. Song, a pleasant warble rendered as *pe-tititi-wu-pititi-wu* uttered frequently at intervals of several minutes, sometimes in groups of two or three repetitions. Reminiscent of the song of *Prunella modularis* (Lister). A pleasant jingling trill, very like the White-eye's (*Zosterops*) in pattern, slightly louder. It begins almost inaudibly, waxes louder, and soon fades out as it began (SA). Often delivered from tree-tops or other exposed stances. Song period in Nepal mid March to early July with a resumption in August-October (Proud). Very silent in its winter quarters.

BREEDING. Season, April to August. Probably double-brooded. Nest, a flat thick-sided cup placed in banks, crevices of rocks, under bridges, sometimes in holes in walls, under the eaves of an occupied hill-station bungalow or rafters of a veranda; sometimes in a hollow among moss or ferns growing on a tree-trunk up to 6 m or so up. Made mostly of green moss, occasionally mixed with other materials, the neat inner cup lined with rootlets, sometimes dry grass. Eggs, normally 4, sometimes 3, rarely 5, pale creamy pink or white with a ring of tiny reddish blotches around the large end. Average size of 200 eggs 19.3 × 14.6 mm (Baker). Building, incubation and tending young by both sexes; incubation period undetermined.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit. Postnuptial moult completed by October.

Young. Grey-brown, more or less tinged with green and spotted with fulvous; he spots smaller above larger below, the edges of the feathers being darker. Spots in head and nape almost white.

MEASUREMENTS	Wing	Bill (from skull)	Tarsus	Tail
♂♂	80-90	13-15	16-19	65-75 mm
♀♀	78-84	13-15	16-19	60-71 mm

Weight 20 ♂♂ 15-20 (av. 18.25); 7 ♀♀ 16-20 (av. 18.0) g (SA).
COLOURS OF BARE PARTS. Iris dark brown. Bill, legs, feet and claws black. Mouth yellowish pink.

1446. Nilgiri Verditer Flycatcher. *Muscicapa albicaudata* Jerdon

Baker, FBI No. 668, Vol. 2: 242
Plate 82, fig. 13

LOCAL NAME. Neelakkili (Malayalam).

198

MUSCICAPINAE

feathers edged with sooty black. These edges most conspicuous on breast and disappearing on chin and vent and under tail-coverts (Whistler).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
6 ♂♂	77-82	16-17	18-19	62-65 mm
4 ♀♀	71-79	16-17	18-19	57-63 mm

COLOURS OF BARE PARTS. Iris red-brown or brown. Bill black. Legs and feet dark lead colour (Wait).

1445. Verditer Flycatcher. *Muscicapa thalassina thalassina* Swainson

Muscicapa thalassina Swainson, 1838, Nat. Library, Flycatchers 21: 252 (India)
Muscicapa melanops Vigors, 1832, Proc. Zool. Soc. London: 172,
nec *M. melanops* Vieillot, 1818
Baker, FBI No. 665, Vol. 2: 239
Plate 82, fig. 10

LOCAL NAMES. Puthir chitta, Nil-kātkātia (Bengali); Sibyll-pho (Lepcha); Dactishā lili gadaba (Cachari); Neelamēni (Malayalam).

SIZE. Sparrow ±; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male (adult). Entirely blue-green or verdigris (colour of oxidized copper), brighter on head and throat, darker on wings and tail; a black patch in front of eyes (lores) very prominent. Female duller and greyer but without accompanying male to compare with, difficult to sex.

STATUS, DISTRIBUTION and HABITAT. Common summer (breeding) visitor to the Himalayas, wintering widely spread over the whole Indian Peninsula, Assam and East Pakistan.

Breeds from the Indus Valley and Kashmir east through NEFA, thence south through Nagaland, Manipur and Assam in the Cachar and Khasi hills; from 1200 to 2700 m, locally up to 3000 m, optimum zone 1500-2400 m (see map, p. 197). Affects light forest (with a preference for broad-leaved) and bushes along streams; also evergreen and coniferous but avoids dense and tall forest.

EXTRALIMITAL. Extends east to western China and Viet Nam. Another subspecies in Sumatra and Borneo.

MIGRATION. Arrives on its summer (breeding) grounds in early March and April keeping there until October, although a downward movement already starts in July. Abundant in the lower hills in August and September. Winters from the Himalayan foothills (up to c. 750 m) south through the Indian Peninsula east of a line Sambhar Lake—Dwarka [Kutch (JBNS 61: 449), Kathiawar (JBNS 60: 456)] south to the hills of southern Kerala, and east to and including the foothills of Assam and East Pakistan to the Chittagong Hill Tracts. Keeps more to broken country and hilly regions up to c. 1000 m. Frequents edges of forest, glades, wooded compounds, groves and gardens. In both summer and winter quarters, telephone wires where available provide favourite perches. May be seen in southern India from October to February; in the more northern parts from September to March.

SIZE. Sparrow ±; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male (adult), greenish indigo-blue with bright blue forehead and supercilium, black lores, a white patch at base of outer tail-feathers, and whitish under tail-coverts.

Distinguished from the wintering Verditer Flycatcher by its much darker blue coloration and the white patch at base of tail.

Female, dull grey-brown washed with greenish blue. The white patch at base of tail identifies it.

STATUS, DISTRIBUTION and HABITAT. Common resident. The southern section of the Sahyadris (Western Ghats) from the Bababudan and the Biligirirangan hills of Mysore south through the Nilgiris, Palnis, and the associated ranges of Kerala to the Ashambu Hills; from c. 600 m to the highest summits, mostly above 1200 m (see map, p. 187). Affects overgrown streams, cardamom plantations, coffee shade, glades and edges of forest, sholas, even gardens and trees near houses. May be geographical representative of *M. unicolor* along with *M. sordida* of Ceylon.

GENERAL HABITS. Usually met with singly, often side by side with *Culicicapa ceylonensis*, *M. multii* and other flycatchers. Frequents bushes and lower branches of large trees, sometimes also the canopy where it makes short aerial sallies after winged insects. Perches somewhat upright and twitches its tail up and down while calling.

FOOD. Insects, perhaps also some berries.

VOICE and CALLS. General pattern of song that of Verditer Flycatcher; reminiscent also of Pied Bush Chat (SA); 'a sweet phrase of six to eight notes, often with a glide in each note that gives it a somewhat mournful effect' (Nichols); a sweet warble up and down the scale (Betts). Delivered from an exposed perch for long periods at a time. Call-note, a series of four or five sharp chips (Nichols). A female also recorded singing (SA).

BREEDING. Season, February to June, chiefly March and April. Nest a substantial cup of green moss, the inner cup lined with rootlets and rhizomorphs; placed in banks, holes or cracks in trees or among hanging roots; sometimes in walls, under bridges or under the eaves of a house, even an occupied one. Often the same site is used in subsequent years. Eggs, usually 3, sometimes 2, pale creamy pink sparsely freckled all over with reddish, more densely at the larger end where the markings tend to form a ring. Average size of 60 eggs 20 × 14.8 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters. For details of plumages see Baker, loc. cit.

MEASUREMENTS	Wing	Bill (from skull)	Tarsus	Tail
♂♂	75-82	14-15	18-19	59-67 mm
♀♀	74-78	13-15	18-19	56-61 mm

Weight 10 ♂♂ (March-Apr.) 12-18 (av. 15.9); 4 ♀♀ (March-Apr.) 16-12 (av. 17.5) g—SA.

COLOURS OF BARE PARTS. Iris dark brown. Bill horny black; mouth greyish pink or brownish pink. Legs, feet and claws blackish brown.

201

Genus MUSCICAPELLA Bianchi

Muscicapella Bianchi, 1907, Ann. Mus. Zool. Acad. Imp. Sci. St. Petersburg 12: 14, 43, new name for *Nitidula Blyth*, nec *Nitidula Fabricius*, 1775
Nitidula Blyth, 1861, Proc. Zool. Soc. London: 201.
 Type, by monotypy, *N. campbelli* Blyth = *Nemura hodgsoni* Moore
 Distinguished by its small size and narrow, slender bill with well-developed hairs over the nostrils.

1447. Pygmy Blue Flycatcher. *Muscicapella hodgsoni hodgsoni* (Moore)

Nemura Hodgsoni Moore, 1854, in Horsfield & Moore, Cat.
 Bds. Mus. E. I. Co. 1: 300 (Nepal)
 Baker, FBI No. 664. Vol. 2: 237
 Plate 82, fig. 3

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 8 cm (3 in.).

FIELD CHARACTERS. A diminutive, blue-and-orange flycatcher.

Male (adult). Above, dark cyan blue, brighter on crown; forehead, lores and sides of head blue-black. Below, orange-yellow.
 Female. Above, olive-brown, more rufous on rump and upper tail-coverts; below, pale yellow.

STATUS, DISTRIBUTION AND HABITAT. A scarce resident, subject to vertical movements. From central Nepal east through Darjeeling, Sikkim, Bhutan and NEFA, thence south through the Patkai Range, Nagaland and Assam in the Cachar Hills. Recorded in summer from 2100 to 3000 m (Proud, Rand & Fleming), and in winter from 1800 m (Ripley) down to the foothills. Affects dense, tall forest and secondary scrub at the edge of clearings or along hill streams.

Extralimital. Extends to Yunnan and northern Thailand. The species ranges south through the Malay Peninsula, Sumatra and Borneo.

GENERAL HABITS. A very small, lively and restless flycatcher perhaps less scarce than it appears to be but unobtrusive and often overlooked. Keeps singly, sometimes in mixed flocks with *Phylloscopi*, moving slowly from tree to tree. Frequents dense thickets and shrubs as well as tall trees, searching the leaves for insects, sometimes making short sallies within the canopy in their pursuit or fluttering before a sprig to stampede them. Fleming observed them in the tops of tall oaks, fifteen metres or more from the ground. It also descends to the ground to pick up an insect, twitching up and cocking the tail from time to time between half-drooping wings in typical flycatcher style, then looking rather like a shortwing (SA).

FOOD. Small insects.

VOICE AND CALLS. A distinctive, high-pitched song *tzit che che chee* (do, do, te, la, te) (Fleming). Call-note, a feeble *trip* (Stevens).

BREEDING. The only record is a nest taken in Nagaland (altitude ?) by Masson (*opud* Baker) on 20 July. It was a tiny saucer of green moss, lined with rootlets, wedged among the thick stems of a creeper growing over an old stump. The young were old enough to escape.

FLYCATCHERS

203

Culicicapa ceylonensis

Distributional ranges

■ *calochrysa* (breeding). ▨ Winter ■ *ceylonensis* (1449).

(Betul and Pachmarhi) but nesting not substantiated, and almost certainly the Eastern Ghats (Vishakhapatnam district) but summer data entirely wanting. Affects open wooded country.

Extralimital. Burma. The species extends to central western China, the Indochinese countries, Palawan, Borneo and the Sunda islands to Timor. A closely related species in the Philippines to Celebes.

MIGRATION. Mostly a summer visitor to the Himalayas above 1500 m from early March till September. Winters in the foothills (up to c. 1000 m in the Western Himalayas, to 1800 m in the Eastern) and in the plains west to Peshawar and Bannu, south in the plain of the Indus to Rajanpur, and over most of the Indian Peninsula west to Kutch, south to about the Krishna river. In this season affects forests and groves.

GENERAL HABITS. A lively and confiding bird. Keeps in pairs in the breeding season, in family parties thereafter. In winter usually seen singly or in separated twos and threes in the mixed hunting parties of tits, nuthatches, leaf warblers and other small birds, acting as outriders and snapping up any winged insects escaping from the main body. Frequents forest glades, wooded ravines, village groves, upcountry gardens with large trees, etc. Keeps to the lower and middle strata, generally between two and four metres above the ground. Hunts among the inner branches, actively flitting from bough to bough, turning this way and that on its perch, loosely flicking the tail. Makes agile acrobatic dashes after insects which it seizes with a loud snap of the bill, twisting and looping in the air and returning to the same base again and again, all the while uttering its distinctive, sharp twittering note. Telegraph wires through wooded country provide favourite hunting places. Body erect.

LOCAL NAME. Zārd-phūtki (Bengali).

SIZE. Sparrow —; length c. 9 cm (3½ in.).

FIELD CHARACTERS. Head, neck, throat and breast ashy grey, darker on crown. Back yellowish green, rump yellow. Belly bright yellow. Wings and tail brown edged with yellow. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Common summer visitor or resident in the hills, spreading widely over the plains in winter. The Himalayas from the Indus Valley and Kashmir (scarce) east to the Mishmi Hills, thence south through Nagaland, Manipur and the hills of Assam and East Pakistan south to the Chittagong Hill Tracts. Breeds chiefly between 1500 and 2400 m, locally up to 2700 m or even 3000 m (Nepal); in the eastern Himalayas and in Assam breeds down to the foothills. Also the central Satpuras above 900 m

204

MUSCICAPINAE

Display. A bird of a pair would keep flying without ceasing for nearly ten minutes, going round and round in a rough circle of some thirty metres in diameter, flying deliberately in front of a perched bird, presumably the female, turning and flying out again, then hovering for a moment on rapidly vibrating wings; about this time, the presumed female would fly straight at the male, then return to a perch. All the while both birds called continuously. The performance was repeated at least fifteen to twenty times (Lister).

FOOD. Tiny winged insects.

VOICE AND CALLS. Song, a surprisingly loud and lively high-pitched trill heard nearly the whole year—an interrogative *chik*... *whichee-whichee*? constantly uttered; this usually followed after a second or so by *whi-chichi*, like question and answer. In breeding season these repeated at quick and regular intervals for long periods (once timed 25 minutes at dawn) from the same stance (SA). Some variations of the song rendered as *tee-tata-tee*, *tyisi-a-tyi*, etc. (for more details see Lister, JBNHS 52: 43). Call-notes (by same observer): A very soft *pit*... *pit*... *pit* while foraging; a frequent, clear *kitwik*... *kitwik* (high-low); and a series of *kū-whi-whi* (rising-low-low); a quiet *chichitrrrr* with variations.

BREEDING. Season, April to June. Nest, a half cup of moss and lichen bound with cobweb, usually unlined, fastened against a moss- or lichen-covered trunk or rock at heights varying from near the ground to about twelve metres; generally composed of the same materials as the substrate, thus remarkably obliterated in its surroundings. Eggs, 3 or 4, pale buff, marked with grey blotches and specks, forming a ring around the large end. Average size of 40 eggs 15 × 12 mm (Baker). Share of the sexes in the domestic chores, and incubation period, unrecorded.

MUSEUM DIAGNOSIS. For distinction from *ceylonensis* see 1449.

Young, a slightly duller and paler replica of adult; no spotting.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

LOCAL NAME. Nārāyāṇpāṭiki (Malayalam).

SIZE. Sparrow —; length c. 9 cm (3½ in.).

FLYCATCHERS

205

FIELD CHARACTERS. As in 1448, q.v.

STATUS, DISTRIBUTION and HABITAT. Common resident, wandering to lower elevations in winter. The hills of southwestern India from southern Mysore to the Ashambu Hills (including the Nilgiris and Palnis), from c. 900 m to the highest summits. May also breed farther north in the Western Ghats, but summer data lacking. Also Ceylon, generally above 900 m, but down to the foothills in the southwestern Wet zone. Affects evergreen forest, sholas, bamboo facies, wooded ravines, secondary and mixed bamboo forest especially in the vicinity of streams, coffee plantations, and gardens.

GENERAL HABITS, FOOD and VOICE. As in 1448.

BREEDING. Season, March to June, mostly April in the Peninsula, and February to May, mostly March in Ceylon. Nest and eggs as in 1448. Clutch size normally 3 in the Peninsula, 3 or often 2 in Ceylon. Average size of 100 eggs 15.1 × 12 mm (Baker). Building of nest recorded as by female only.

MUSEUM DIAGNOSIS. Differs from *calochrysa* (1448) in being darker. Birds from the Peninsula are intermediate between those from Ceylon and the Himalayas.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

FLYCATCHERS

207

BREEDING. Season, May (in Assam) to June and July (Himalayas). Nest, a deep, thick-walled cup of moss, compactly matted together, plastered with cobweb and lichen, lined with fruit-stems of moss, hair or feathers; placed on a horizontal branch at least as thick as the diameter of the nest making it difficult to spot from below; usually between three and six metres from the ground. Eggs, normally 3, cream or pinkish cream, marked with reddish stippling which tends to form a zone around the large end. Average size of 24 eggs 14.4 × 11.3 mm (Baker).

MUSEUM DIAGNOSIS. Female differs from male in having the lores, ocular area and ear-coverts dark olive instead of black.

Young resembles female but has no yellow on forehead. Supercilium and underparts dull pale yellow. Back more grey.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	53-58	9-10	14-15	56-58 mm
♀♀	53-58	9-10	14-15	50-58 mm

SIZE. Sparrow —; length c. 8 cm (3 in.).

FIELD CHARACTERS. A restless, diminutive fantail flycatcher. Above, dark greyish olive. Forehead and supercilium yellow. A broad black band from lores through eye and ear-coverts. Tail brown with conspicuously white shafts and white tips. Below, bright yellow. Female differs only in having the eye-band blackish olive-brown (v. black).

x c. 1

STATUS, DISTRIBUTION and HABITAT. Common altitudinal migrant. The Himalayas from the Chenab river eastward through Nepal, Sikkim and Bhutan to the Mishmi Hills; thence south through the Patkai Range, Nagaland, Manipur, Assam in the Cachar and Khasi hills (scarce), and East Pakistan in the Chittagong Hill Tracts. Breeds up to tree-line (generally about 3600 m, but in north-central Nepal near 4000 m); lower limit in the western Himalayas not clear, probably about 2400 m; in Bhutan down to 1800 m. In Assam breeds down to c. 1000 m (Baker) and on Mt Victoria between 2000 and 2800 m. Winters (October to March) from c. 1800 m down to the Himalayan foothills and adjacent plains; in Assam and hill ranges to the east, does not appear to descend as low. Affects various kinds of forest and secondary jungle but prefers moist-evergreen biotope. In the breeding season, mostly mixed coniferous and birch or rhododendron forests.

Extralimital. Extends to southeastern Tibet, Yunnan and the Indo-chinese countries.

GENERAL HABITS. An extremely lively and restless little flycatcher usually met with singly or in pairs, almost invariably in the mixed hunting parties of small insectivorous birds during the non-breeding season. Frequents the lower canopy and higher shrubs, but often hunts from low bushes as well as the canopy of tall trees up to thirty metres or more. Flits and prances among the branches and foliage, pirouettes incessantly with fanned-out tail and partly drooping wings uttering its distinctive *sip, sip* note. Searches for insects in the foliage by fluttering against the sprigs in the manner of a *Phylloscopus*, and launches sprightly twisting and looping sallies after gnats, often springing up and returning to its perch perpendicularly.

FOOD. Tiny winged insects.

VOICE and CALLS. A very thin and high *sip, sip* constantly uttered while foraging. Song, a quick repetition of the call-note (Heinrich), described as 'a feeble little goldfinch-like trill' (Jones). Song period in Nepal, February to at least July (Proud).

¹ Position of tail wrongly shown. Characteristically it is carried erect and fully fanned out, exhibiting prominently the glistening white shafts and white tips of the feathers. The wings droop on either side of it.

208

MUSCICAPINAE

Distinguished from *R. albicollis* (1455) by its broad supercilium extending to nape and by its pure white belly and breast.

STATUS, DISTRIBUTION and HABITAT. Common and widespread resident, subject to local movements in winter. West Pakistan and India from the Indus river east along the Himalayan foothills (up to c. 600, locally 1000 m) to the Jalpaiguri duars in northern W. Bengal, and East Pakistan, including the lowlands east of the Brahmaputra. South in Sind to Karachi, and through Gujarat to southwestern and central Maharashtra (where it intergrades with *compressirostris*); eastward to Orissa. Absent from the Thar

Rhipidura aureola

Distributional ranges

aureola (1451).*compressirostris* (1452).*burmanica* (1453).

Desert, lower West Bengal and coastal East Pakistan. Affects forest, groves of mango, babool, etc., tamarisks along canals, fallow land with sparse scattered bushes and, especially in winter, wooded compounds and gardens. Prefers more open and drier country than *R. a. albigularis* (1458), but the two are sometimes found side by side in intermediate habitats.

GENERAL HABITS. Generally met with singly or in pairs or family parties, often joining the mixed hunting parties of *Turdoides*, *Dumetia*, *Prinia*, *Phylloscopus*, etc. Frequents the lower bushes and undergrowth usually near the ground, occasionally descending to the ground. Flits tirelessly from branch to branch, prancing and pirouetting with fanned, erect tail and half-drooping wings, making graceful looping sallies after winged insects which it catches with an audible snap of the mandibles. Sometimes attends grazing cattle, snapping up the tiny insects disturbed by the animal, riding momentarily on the backs of the goats and cows, using them as mobile

FLYCATCHERS

209

hunting bases. Often prances lightly in twists and turns up tree-trunks and boughs. From time to time suddenly flicks open wings and tail to stampede winged insects lurking in the crevices of the bark. Makes short aerial darts in their pursuit the moment they attempt to flee, snapping them up in its bill. Usually unafraid of man, but aggressive in mobbing predators such as cats and crows trespassing into proximity of nest, uttering harsh shriek-like 'war-cries'.

FOOD. Insects, chiefly diptera and hemiptera. The jassid mango-hoppers *Idiocerus elypealis* and *I. niveosparus* identified in stomach contents.

VOICE AND CALLS. Song, a delightful clear but rather thin human-like whistle of six to eight tinkling notes, the first part rising, the last falling, often stopping abruptly in the middle of the scale and left unfinished; rendered as *chee-chee-cheweechee-ri* (Dharmakumarsinhji). Normal call-notes a harsh *chuck-chuck* (SA). Alarm-note given as *ch'uch*.

BREEDING. Season, February to August, chiefly March to June. Nest, a neat compact cup, usually rounded off at the bottom and lacking the untidy 'tail' dangling below that of *albicollis*; inner diameter of cup c. 5 cm, depth c. 2.5 cm. Made of fine fibres and grasses, profusely plastered exteriorly with cobweb, and lined within with grass fibres. Attached to the upper surface of a small outthrusting branch, often in a horizontal fork; usually placed much higher than that of *albicollis*, seldom under a couple of metres and often up to twelve. The same site is commonly used year after year. Eggs, normally 3, cream to buff, with a zone of greyish brown specks and spots at the larger end. Average size of 100 eggs 16.8 x 12.8 mm (Baker). Building, incubation and care of young by both sexes. Incubation period undetermined.

MUSEUM DIAGNOSIS. For distinction from *compressirostris* and *burmanica* see 1452 and 1453 respectively.

Young, like adult but upperparts and wing-coverts tipped with rufous. Post-juvenile moult of body-feathers and all coverts except primary.

MEASUREMENTS

1454. Western Whitethroated Fantail Flycatcher. *Rhipidura albicollis canescens* (Koelz)

Leucocerca albicollis canescens Koelz, 1939, Proc. Biol. Soc. Washington 52: 68 (Bhadwar, Punjab)

Baker, FBI No. 703 (part), Vol. 2: 279

LOCAL NAMES. *Machharya*, *Chakdil* (Hindi).

SIZE. Bulbul —; length c. 17 cm (6½ in.).

FIELD CHARACTERS. A dark, slaty brown fan-tailed flycatcher with a prominent white band or semi-collar across the throat and short white supercilia; outer rectrices tipped with whitish. Sexes alike.

Distinguished from other members of the genus by its entirely dark belly.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. The Himalayan foothills from Murree and Kashmir to western Nepal. Breeds commonly from the foothills to 1500 m, more sparsely up to 2000 m; a June record at 3000 m in Lahul (Alexander, JBNHS 49: 610). Winters in the foothills and adjacent plains. Affects shady places in forest (pine, deciduous, evergreen, etc.), wooded nullahs, gardens, groves and secondary scrub.

GENERAL HABITS. Keeps singly or in pairs, often as outriders of the mixed hunting parties of small insectivorous birds, frequenting undergrowth and middle story. Flits tirelessly among the branches — tail fanned out and partly erect, wings drooping at the sides — usually close to the main trunk, working up or down the trunk, often moving rapidly out along a bough by a series of rapid, jerky twists and turns, continually flicking open the wings and flitting the tail purposefully. Makes sprightly looping sallies after winged insects thus disturbed, occasionally launching short sorties beyond

210

MUSCICAPINAE

SIZE. Bulbul —; length c. 17 cm (6½ in.).

FIELD CHARACTERS. As in 1451, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to local movements in winter. Southern India south of the range of the nominate race (1451); in the plains and hills up to 1000 m. Also Ceylon in the lowlands and hills up to c. 1500 m. Affects deciduous forest, groves, wooded compounds, orchards, gardens and, to a lesser extent, light and secondary scrub jungle.

GENERAL HABITS, FOOD AND VOICE. As in 1451.

BREEDING. Season, January to July, chiefly April and May. Nest and eggs as in 1451.

MUSEUM DIAGNOSIS. Differs from *aureola* (1451) in having two central pairs of rectrices black without white tips (v. one pair). White tips of outer pair of rectrices less extensive, only about half the length of the feather and not reaching the under tail-coverts (v. three-quarters in *aureola*). Upper plumage slightly darker, more sooty when freshly moulted. Tail a little shorter. There are of course complete intergrades and individual variations.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	80-87	15-16	17-18	80-92 mm
♀♀	76-85	14-15	17-18	80-90 mm
				(HW, SA)

Weight 4 ♂♂ 11-13 g (SA).

COLOURS OF BARE PARTS. As in 1451.

1453. Eastern Whitebrowed Fantail Flycatcher. *Rhipidura aureola burmanica* (Hume)

Leucocerca burmanica Hume, 1880, Stray Feathers 9: 175, footnote (Thoungyeen valley)

Baker, FBI No. 701, Vol. 2: 278

LOCAL NAME. *Dao-phari* (Cachari).

SIZE. Bulbul —; length c. 17 cm (6½ in.).

FIELD CHARACTERS. As in 1451, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident. Assam and East Pakistan (east of the range of *aureola*) in the plains and hills up to 1500 m. Affects dry, open country, parkland, scrub and bamboo jungle.

EXTRALIMITAL. Burma. The species extends east to the southern Indo-Chinese countries.

GENERAL HABITS, FOOD AND VOICE. As in 1451.

BREEDING. Season, April to July, chiefly May. Nest and eggs as in 1451. Average size of 100 eggs 17.2 x 12.8 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *aureola* in being paler above; crown not so black, more concolorous with back. Spots on coverts smaller. White on outer rectrices on average less extensive.

MUSCICAPINAE

Rhipidura albicollis

Distributional ranges	
	<i>canescens</i> (1454).
	<i>albicollis</i> (1455).
	<i>stanleyi</i> (1456).
	<i>orissae</i> (1457).
	<i>vernayi</i> (1459).
	<i>albogularis</i> (1458).

the canopy. Also hunts near the tops and outside of bushes, tumbling about them as it turns this way and that. Flight from one tree to another fairly direct and slightly dipping, with tail often fanned out.

FOOD. Insects (gnats, flies, etc.).

VOICE AND CALLS. Normal note a harsh *chuck* or *chuck-r*. Song, a group of about five thin whistling quarter-notes on a descending scale, rather feeble and jerky, rendered as *tri-riri-riri*, very reminiscent of song of *Phylloscopus magnirostris* (SA).

BREEDING. Season, March to August; double-brooded. Nest, neat, cup-shaped, rather like an inverted cone, of fine grass stems bound together by a thick external coating of cobwebs; usually without any special lining, and with an untidy 'tail' of strips of nest material dangling below. This feature usually distinguishes it from nest of *R. aureola* (1451). Built in the horizontal fork or elbow of a twig, seldom more than 3 metres from the ground, usually under two. Eggs, normally 3, varying from white to a dingy cream colour marked with grey-brown spots and specks almost invariably confined to a zone around the large end; very similar to those of *R. aureola*. Average size of 100 eggs (including those of subspecies *albicollis* and *stanleyi*) 17.3 x 13 mm (Baker). Building of nest and incubation by both sexes. Incubation period 12-13 days; young leave nest on 13th to 15th day.

MUSEUM DIAGNOSIS. Differs from *albicollis* (1455) in being paler, more ashy on back, breast and belly.

FLYCATCHERS

213

Young, like adult but body-feathers, all wing-coverts and tertials tipped with rufous. White of throat less pure and more diffuse. Postjuvinal moult of body-feathers and all coverts except primary.

MEASUREMENTS

Wing: 6 ♂♂ 77-81; 4 ♀♀ 74-76 mm (Koelz)
COLOURS OF BARE PARTS. As in *albicollis* (1455).

LOCAL NAMES. *Naklaychaya* (Paharia); *Nam-dit-nom* (Leptha); *Dumchitri* ('spread-tail'), *Chak-dayal*, *Chak-dil* (Bengali).

SIZE. Bulbul —; length c. 17 cm (6½ in.).

FIELD CHARACTERS. As in 1454, q.v.

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical movements. Western Nepal (where it intergrades with *canescens*) east to Sikkim, Darjeeling and the Jalpaiguri district, and south through the plains of East Pakistan and lower West Bengal (but in the west not south of Nepal terai). Breeds from the terai up to 1700 m, locally to 2300 m, and in the plains of East Pakistan and West Bengal to the Sunderbans.

GENERAL HABITS, FOOD and VOICE. As in 1454.
BREEDING. As in 1454.

MUSEUM DIAGNOSIS. Differs from *canescens* (1454) in being darker; from *stanleyi* in being paler, less slaty; from *orissae* in being mouse-grey on back (v. olive-brown).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

♀♀	72-80	14-16	19-20	93-102 mm

(SA, BB, Rand & Fleming)

COLOURS OF BARE PARTS. Iris brown. Bill brownish black. Legs, feet and claws horny brown.

1456. NEFA Whitethroated Fantail Flycatcher. *Rhipidura albicollis stanleyi* Baker

Rhipidura albicollis stanleyi Baker, 1916, Bull. Brit. Orn. Cl. 36: 81. New name for *R. albicollis kempi* Baker, 1913 (Sept.), Rec. Ind. Mus. 8: 275 (Abor Hills), preoccupied by *R. flabellifera kempi* Mathews & Iredale, 1913 (July)
Baker, FBI No. 703 (part), Vol. 2: 279

LOCAL NAMES. None recorded.

SIZE. Bulbul —; length c. 17 cm (6½ in.).

FIELD CHARACTERS. As in 1454, q.v.

FLYCATCHERS

215

SIZE. Sparrow with a long tail; length c. 17 cm (6½ in.).

FIELD CHARACTERS. As in 1454 but entire belly buff; a slaty breast-band spotted with white. Tail sooty brown with the lateral feathers only diffusing to narrow whitish tips (v. broadly tipped with pure white).

R. aureola (1451) has a pure white belly and a large amount of white in its tail.

STATUS, DISTRIBUTION and HABITAT. Common resident, unevenly distributed, subject to restricted local movements. The Indian Peninsula (except for the ranges of *vernayi* and *orissae*) from Mt Abu and the Vindhya Range southward to Kerala — coastal plain, central plateau, Western and Eastern Ghats and their associated hills up to c. 2000 m (Nilgiris). Affects well-wooded areas — secondary jungle, groves and gardens, even in cities. Prefers more broken country and more humid facies than *R. aureola*, although both species may often be found in the same area.

GENERAL HABITS and FOOD. As in 1454.

VOICE and CALLS. Song of the same general pattern as those of White-browed and Whitethroated Fantails (1451 and 1454): a lively clear whistling of several tinkling notes rising and falling in scale, constantly warbled as the bird waltzes and pirouettes on low branches and brushwood. Also has the normal harsh *chuck* or *chuck-r* calls.

BREEDING. Season, March to July occasionally extending into September; often two broods. Nest and eggs as in 1454. Average size of 50 eggs 16.2 × 12.7 mm (Baker). Both sexes take part in all the domestic chores. Incubation period 12-13 days.

MUSEUM DIAGNOSIS. For distinction from *vernayi* see 1459.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	72-79	14-15	18-19	86-98 mm
♀♀	69-74	13-14	17-19	86-94 mm

(SA, HW)

Weight 6 ♂♂ 9-10 g (SA).

COLOURS OF BARE PARTS. Iris dark brown. Bill black; mouth pale flesh (mouth and gape yellow in the nestling). Legs and feet slaty brown.

1459. Dandakaranya Whitespotted Fantail Flycatcher. *Rhipidura albicollis vernayi* (Whistler)

Leucocircia pectoralis vernayi Whistler, 1931, Bull. Brit. Orn. Cl. 52: 40 (Jeypore Agency)

Baker, FBI No. 705 (part), Vol. 2: 282

LOCAL NAMES. None recorded.

SIZE. Bulbul —; length c. 17 cm (6½ in.).

FIELD CHARACTERS. As in 1458, q.v.

STATUS, DISTRIBUTION and HABITAT. Common resident. The upper Eastern Ghats (Dandakaranya area) from southern Orissa to the Godavari river. Habitat as in 1458.

GENERAL HABITS, FOOD and VOICE. As in 1454 and 1458.

214

MUSCICAPINAE

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to vertical or local movements. Bhutan and NEFA south through the plains and hills of Assam, Nagaland and Manipur to the Chittagong region of East Pakistan. In the Himalayas breeds up to 2700 m, but most plentiful between 900 and 1500 m; in the Assam hills south of Brahmaputra R. breeds up to 1500 m. Affects various kinds of forest (humid evergreen, deciduous, dry pine, etc.), as well as secondary jungle and gardens.

Extralimital. Burma. The species extends to Szechuan, Vietnam, Sumatra and Borneo.

GENERAL HABITS, FOOD and VOICE. As in 1454.

BREEDING. As in 1454.

MUSEUM DIAGNOSIS. Differs from *albicollis* (1455) in being darker, more slaty.

MEASUREMENTS and COLOURS OF BARE PARTS. As in 1455.

Weight 6 ♂♂ 9-13 g (SDR, SA).

1457. Orissa Whitethroated Fantail Flycatcher. *Rhipidura albicollis orissae* Ripley

Rhipidura albicollis orissae Ripley, 1955, Proc. Biol. Soc. Washington 68: 42 (Toda, Bonai, Orissa)

Baker, FBI No. 703 (part), Vol. 2: 279

LOCAL NAMES. None recorded.

SIZE. Bulbul —; length c. 17 cm (6½ in.).

FIELD CHARACTERS. As in 1454 but with a patch of buff in centre of belly.

STATUS, DISTRIBUTION and HABITAT. Common resident. Southern Bihar, Orissa and eastern Madhya Pradesh. This population is intermediate between *albicollis* and *vernayi*, and intergrades with the latter. Affects forest, groves, gardens and shrubbery.

GENERAL HABITS, FOOD and VOICE. As in 1454.

BREEDING. As in 1454.

MUSEUM DIAGNOSIS. Differs from *albicollis* in being dark olive-brown above, well demarcated from the black crown, and by the buff patch in centre of belly; from *vernayi* in lacking the pectoral spotting and in having a more reduced buff area on abdomen; however, intermediates commonly occur.

MEASUREMENTS and COLOURS OF BARE PARTS. As in 1455.

1458. Whitespotted Fantail Flycatcher. *Rhipidura albicollis albogularis* (Lesson)¹

Muscicapa (Muscylea) albogularis Lesson, 1832, in Bélanger, Voy. Ind.-Orient., Zool.: 264 (le continent de l'Inde et les environs de Pondichéry = Salem district, Madras)

LOCAL NAMES. *Fhāmbāsr* = 'cotton flake' (♂), *Rāngē bālbāl* (♀), *Lābz* (Loish) (Kashmir); *Taklat* (Urdu); Peninsular names as in 1461.

MONARCH FLYCATCHERS

217

SIZE. Bulbul \pm ; male with very long tail-streamers. Length c. 20 cm (8 in.); with streamers up to c. 50 cm (20 in.).

FIELD CHARACTERS. As in 1461, q.v.

STATUS, DISTRIBUTION and HABITAT. Common summer (breeding) visitor. Northern Baluchistan, N.W.F.P. north to Chitral, east through the Salt Range, Kashmir, Punjab, Himachal Pradesh, Uttar Pradesh and Nepal. Breeds in the northern plains (sparingly south to Delhi, Lucknow and

Terpsiphone paradisi

Distributional ranges

leucogaster (1460), breeding only. paradisi (1461).
ceylonensis (1462). saturator (1463).
nicobarica (1464).

Ghazipur), and in the hills up to c. 1800 m (abundantly in Kashmir), occasionally up to 2100 or even 2400 m. A June record at 3100 m in Lahul (HW). Affects open forest, wooded nullahs, bushes, gardens and groves, especially in the neighbourhood of lakes and streams, e.g. Kashmir Valley.

Extralimital. Turkestan and Afghanistan.

MIGRATION. Arrives on its summer grounds usually singly in late March (mostly April in the hills); departs in September-October. Appears to prefer night migration. Winters over most of the Peninsula, from the Gangetic plain and from lower Sind, Kutch and Kathiawar south to Kerala and Tamil Nadu; also the plains of East Pakistan (Rashid). Movements difficult to elucidate because of the presence of the very similar peninsular race. May not be present in the same area every winter especially in the more northern parts. Recorded in Gilgit as a migrant (April, May and August).

GENERAL HABITS, FOOD and VOICE. As in 1461.

MONARCH FLYCATCHERS

219

breast. Intermediate individuals with more or less white in plumage, or white with rusty traces, frequently seen.

Female and first-winter male: crown bluish black with a shorter crest than adult male. Rest of upperparts rufous. Throat, sides of head and nuchal collar ashy. Belly white. No streamers. General effect of a bulbul.

STATUS, DISTRIBUTION and HABITAT. Common but unevenly distributed. The Indian Peninsula from Kathiawar (Gir forest), western Rajasthan, Madhya Pradesh (Neemuch, Jhansi) south to the hills of Kerala and the Chittur range, and east through lower West Bengal and the lowlands of East Pakistan. There are only spring records in Bihar and Orissa but presumably also breeds there. Rare and very sporadic in the Deccan. Southern populations resident, subject to local movements; northern populations mostly migratory but probably replaced in part by wintering Himalayan birds. Breeds mostly in broken foothills country and peninsular hills, up to the highest summits. Affects well-watered and shady forest, bamboo-clad nullahs, plantations and village groves, spreading in winter to gardens and scrub.

MIGRATION and winter movements little understood. It is known to winter in Ceylon from October to May. Large numbers pass through Pt Calimere (Tamil Nadu) en route in October. Two individuals have been recorded on a ship 25 km off the coast of Malabar and the species has been sighted in the Maldives. Northern birds are probably more migratory, and southern birds prone to erratic winter movements. These populations, however, are greatly increased by wintering Himalayan birds.

GENERAL HABITS. Usually seen in pairs, by themselves or with the roving mixed hunting parties. Frequents shady trees, keeping mostly to the higher branches perched upright or flitting gracefully from bough to bough or tree to tree. Makes short aerial sallies after insects, looping back after the capture to the same tree or flying on to another. Occasionally also descends close to the ground to flutter and dislodge insects from the low herbage. Flight swift and undulating, the long streamers of the male floating gracefully behind. In the nimble aerial contortions after insect prey these looping fluttering 'ribbons' present a spectacle of exquisite charm. When perched the male often flirts his tail, opening and shutting the feathers in a scissors-like movement, making play with the long ribbons. Bathes regularly by splashing at the surface of a pool or stream from a bush on the bank, spinning round abruptly on touching the water, raising a spray, then regaining perch to shuffle the plumage and preen. This repeated quickly 3 or 4 times.

Display. During the breeding season, male sings and courts with wings beating, tail raised and streamers arching gracefully. May also be seen singing in flight, 'fluttering his wing pugnaciously' (Dharmakumarsinhji). Nuptial flight is thus described by Baker: the male launches himself very slowly from some high twig, rises and drops every few yards with slowly beating wings, his long tail undulating with each rise and fall as he flies round in small circles before alighting on the perch he just left.

FOOD. Chiefly winged insects. Recorded items include flies and gnats, dragonflies, jassid hoppers, small bugs and beetles. Commonly butterflies and moths; occasionally spiders.

218

MONARCHINAE

BREEDING. Season, April to August. Nest and eggs as in 1461. Average size of 50 eggs 20.1×14.9 mm (Baker) and of 10 eggs 20.8×15.4 mm (Osmaston). Favourite nest-site: in Kashmir are willow and mulberry groves around lakes and inundations, orchards, and chenar (*Platanus*) trees near habitations.

MUSEUM DIAGNOSIS. White males with streamers not distinguishable from nominate *paradisi* but *leucogaster* tends to have a narrower bill.

Rufous males with streamers paler above than nominate *paradisi* (1461); in about 80 per cent of individuals white of lower parts extends right up to black throat contrasting and clear cut, without any intermediate grey area on breast; wings largely but irregularly variegated with white on primaries and secondaries.

Females and immature males also paler on upperparts; dark portions of vanes of primaries and secondaries usually far more extensive; tertiaries usually have a dark shaft-streak.

MEASUREMENTS

		Wing	Bill (from skull)	Tarsus	Tail	Streamers (from base of tail)
White	♂♂	88-101	23-26	16-18	104-125	316-412 mm
Rufous	♂♂	93-100	24-26	16-18	82-116	267-332 mm
	♀♀	82-92	22-25	15-18	88-106	— mm
						(HW)

Weight 3 ♂♂ (Apr.-May, in summer quarters) 18-22; 2 ♀♀ (ditto) 18, 20 g—SA.

COLOURS OF BARE PARTS. Iris dark brown; eye-rim blue of various shades. Bill dark bluish; mouth bright greenish yellow. Legs and feet bluish grey; claws dusky.

1461. Peninsular Indian Paradise Flycatcher. *Terpsiphone paradisi paradisi* (Linnaeus)

Corvus paradisi Linnaeus, 1758, Syst. Nat., ed. 10, 1: 107

(in India = Chandernagor, see Stresemann, 1952, Ibis 94: 517)

Baker, FBI No. 688 (part), Vol. 2: 264

Plate 66, fig. 2

LOCAL NAMES. Rufous plumage: *Shah bulbul*, *Husaini bulbul*. White plumage: *Sultan bulbul* (Hindi); *Dudhrāj*, *Tarwario* ('swordsmen') [Gujarati]; *Toka pigilipittā* ('long-tailed bird', Telugu); *Wāl kōndā lāthi* ('=tail crest shaker'), *Vāl kūrāi* (Tamil, Malayalam).

SIZE. Bulbul \pm ; male with very long tail-streamers. Length c. 20 cm (8 in.); with streamers up to c. 50 cm (20 in.).

FIELD CHARACTERS. Old male (4 years or more): entire head and throat black with a conspicuous crest (at close range a metallic blue-black). Bill and a narrow eye-rim blue. Wings black and white. Rest of plumage silvery white, the tail-feathers with black outer webs and black shaft-streaks.

The black head with upstanding crest, glistening white plumage and extremely elongated central pair of rectrices ('ribbons') render the bird unmistakable.

Young male (up to 3 years): as in adult but back, tail and streamers rufous (these however are not fully assumed until second autumn moult). First-year birds have ashy

x c. 1

MONARCHINAE

220

VOICE and CALLS. Ordinary call-note, a nasal grating *chē* or *chēchwē* (SA) or *quenk* (Nichols), not unlike the *pench* of a snipe, uttered by both sexes. Alarm, a harsh *ist* and some harsh mobbing notes rendered as *weep poor willie weep* — *poor willie* (B. T. Phillips). Song, a low and pleasant warble of six to eight bulbul-like notes descending the scale, then running up at the end, rendered as *peety-to-whit* . . . repeated three or four times in quick succession (Dharmakumarsinhji, Magrath).

BREEDING. Season, March to August, chiefly May and June. Nest, a neat, deep, inverted cone of grasses, fine roots, bast fibre and a few leaves compactly bound together with cobweb and so thickly plastered on the outside with the last mixed with spiders' egg-bags etc. as to appear quite white; lined with rootlets and silky vegetable down. Placed in horizontal, occasionally upright, forks of trees or saplings from one to fifteen metres above the ground, often in a bare fork of a down-sloping branch. Has a predilection for the vicinity of streams, and frequently builds in partly submerged bushes or on branches overhanging water. Eggs, generally 4, often 3, especially in the south, pink to nearly white, marked with reddish brown specks and small spots, usually forming a well-defined ring around the large end, usually with secondary marks of lavender. Average size of 100 eggs 20.2×15.1 mm (Baker). Building, incubation and care of young, by both sexes; even the conspicuous white male may be seen sitting on the nest though most of incubation as well as construction is done by female. Period of incubation 15-16 days; young leave the nest about 12 days after hatching. No second brood if first is successful. Male often breeds in rufous plumage and even before acquiring the streamers. He is very intolerant of intruders and often gives away the position of a nest by his excited calls as he dashes at all comers in his characteristic, wobbly flight.

MUSEUM DIAGNOSIS. White-plumaged and rufous-plumaged males about equal in numbers. For details of plumages see Baker, loc. cit. Young, not spotted but showing obsolete pale centres and dark fringes on breast-feathers. For distinction from *leucogaster* and *saturator* see Key to the Subspecies; also 1460 and 1463 respectively.

MEASUREMENTS

	♀♀	85-92	22-24	16-17	86-110	— mm
						(HW)

Weight 5 ♂♂ 20-22; 5 ♀♀ 16-22; 50 ♂♀ (October, on passage) 16-21 (av. 18.5) g—SA.

COLOURS OF BARE PARTS. Iris brown; bare fleshy eye-rim slaty blue. Bill very dark greyish blue, blackish at tip. Gape slaty blue; mouth sulphur-yellow or bright yellow. Legs and feet greyish blue; claws brown.

MONARCH FLYCATCHERS 221

1462. **Ceylon Paradise Flycatcher.** *Terpsiphone paradisi ceylonensis* (Zarudny & Härmä)
Tchitrea paradisi ceylonensis Zarudny & Härmä, 1912,
Orn. Monatsb. 20: 60 (Ceylon)
Baker, FBI No. 688 (part), Vol. 2: 264

LOCAL NAMES. White-plumaged: *Redi-horā* ('cotton thief'), *Lānu-horā*, *Kadda-horā*. Rufous-plumaged: *Gini-horā* ('fire thief') [Sinhala]; *Pirāmana-kūrūni*, *Vedi-vāt-kūrūni* (Tamil).

SIZE. Bulbul ±; male with very long tail-streamers. Length c. 20 cm (8 in.); with streamers up to c. 35 cm (16 in.).

FIELD CHARACTERS. As in 1461. Males of the Ceylon subspecies never assume white plumage. Breast of Ceylon males paler ashy than in immature Indian males. The white males seen in Ceylon are wintering birds from India.

STATUS, DISTRIBUTION and HABITAT. Plentiful resident, subject to local movements. Ceylon in the low-country Dry zone and lower hills up to c. 900 m. In the northeast monsoon may be seen anywhere in the well-wooded areas of the lowlands including the Wet zone, and in the hills occasionally up to 1500 m. A familiar bird of the country roadsides, gardens, surroundings of irrigation reservoirs, rivers and watercourses.

GENERAL HABITS, FOOD and VOICE. As in 1461.

BREEDING. *Season*, April to July, chiefly May. *Nest*, as in 1461. *Eggs*, normally 3, sometimes 2, exceptionally 5; colour as in 1461. Average size of 10 eggs 20.2 × 15.3 mm (Baker). Nesting behaviour as in 1461.

MUSEUM DIAGNOSIS. Differs from the Indian subspecies only by the fact that males never assume a white plumage, and by slightly paler breast.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail	Streamers (from base of tail)
10 ♂♂	92-96	25-26	16-17	97-115	245-313 mm
1 ♀	92	25	16	116	— mm

1463. **East Himalayan Paradise Flycatcher.** *Terpsiphone paradisi saturator* (Salomonsen)
Tchitrea affinis saturator Salomonsen, 1933, Ibis: 732
(Buxa Duars, Bhutan)
Baker, FBI No. 689, Vol. 2: 267

LOCAL NAME. *Dao-rajah-gophu* (Cachari).

SIZE. Bulbul ±; male with very long tail-streamers. Length c. 20 cm (8 in.); with streamers up to 50 cm (20 in.).

FIELD CHARACTERS. As in 1461 but crest more rounded. Chestnut males and females have greyish throat and breast. White males have feathers of upperparts with fine black shaft-streaks.

LOCAL NAMES. *Kālā kātkātā*, *Kālā mātha kātkātā* (Bengali); *Terpidippān* (Tamil); *Vil-neeli* (Malayalam).

SIZE. Sparrow; length c. 16 cm (6 in.).

FIELD CHARACTERS. Male. A partially fan-tailed azure-blue flycatcher,

222 MONARCHINAE

STATUS, DISTRIBUTION and HABITAT. A partial migrant or resident subject to local movements, locally common. Sikkim, Darjeeling and Jalpaiguri districts, east through Bhutan and NEFA, south through Nagaland, Manipur, the hills of Assam and East Pakistan to the Chittagong region. Most plentiful along the base of the Himalayan foothills, scarce in the plains of the Brahmaputra and in Nagaland and Manipur. Breeds up to c. 800 m, occasionally 1000 m. Affects thin forest, secondary growth, gardens, bamboo and scrub jungle.

Extralimital. Northern Burma. The species in many geographical races extends from Turkestan and Afghanistan, east to the Indochinese countries, north to Mongolia and Manchuria, and south to the Lesser Sunda Islands.

MIGRATION. Unclear. Himalayan population appears to leave the area almost entirely in winter, returning in March-April. Birds of this subspecies are known to winter in Burma from the southern Shan States to Tenasserim, but some may also come from Yunnan. Also winters in the lowlands of East Pakistan.

GENERAL HABITS, FOOD and VOICE. As in 1461.

BREEDING. As in 1461.

MUSEUM DIAGNOSIS. White-plumaged males predominate (80-86 per cent). Rufous males and females have a distinct olive wash on upperparts, giving the back a brownish appearance. Rump, and edges of remiges and rectrices bright cinnamon. Abdomen yellowish; under tail-coverts pale chestnut. Males have a greyish throat and breast, and lack the sharply defined metallic black of other Indian subspecies.

MEASUREMENTS

	Wing	Streamers (White birds)
♂♂	89-96	224-390 mm
♀♀	87-92	— mm

(Salomonsen)

COLOURS OF BARE PARTS. As in 1461.

1464. **Nicobar Paradise Flycatcher.** *Terpsiphone paradisi nicobarica* Oates
Terpsiphone nicobarica Oates, 1890, Fauna Brit. Ind., Bds. 2: 48 (Nicobars)
Baker, FBI No. 691, Vol. 2: 269

LOCAL NAMES. None recorded.

SIZE. Bulbul ±; male with very long tail-streamers. Length c. 20 cm (8 in.); with streamers up to c. 50 cm (20 in.).

FIELD CHARACTERS. As in 1461, q.v.

STATUS, DISTRIBUTION and HABITAT. Common resident (and winter visitor ?) in the Nicobar Islands. Rare in the South Andaman Islands and perhaps only a winter visitor (Abdulali, JBNHS 64: 183-4, and footnote).

GENERAL HABITS, FOOD and VOICE. As in 1461.

BREEDING. Unrecorded.

MUSEUM DIAGNOSIS. Adult males have a glossy bluish black throat (c. greyish in *saturator*), abdomen darker, buff-coloured; under tail-coverts a darker chestnut. Upperparts also darker, the back more olive, the rump brown rather than cinnamon. Size smaller. Abdulali (loc. cit. p. 184) suggests that the resident Nicobar population may not assume a white plumage and that white birds may be winter visitors.

224 MONARCHINAE

duller on the wings, with a velvety black patch on nape and thin black crescent across throat. Belly whitish.

Female. Above, crown blue, rest of upperparts brown; below, ashy blue fading to whitish on belly. No black nape-patch or necklet.

STATUS, DISTRIBUTION and HABITAT. Widespread resident, subject to erratic local and winter movements. India south and east of a line running from the Gulf of Kutch to Gorakhpur (eastern U.P.), south to Kerala and Tamil Nadu (including the Palnis — JBNHS 55: 159); east through East Pakistan, Assam, Nagaland?, and Manipur, and north along the Himalayan foothills west to Dehra Dun (Osmaston, 1935) and east through Nepal,

Sikkim and Bhutan to NEFA including the Sadiya frontier tract. In the hills generally up to c. 900 m, less often 1200 m (Assam), 1300 m (Sikkim) or 1500 m (Kerala, Maharashtra). More widespread in winter and has straggled to Lucknow, Kutch and Karachi. Affects well-wooded country, evergreen or mixed deciduous forest, secondary jungle, cultivation, coffee,

MONARCH FLYCATCHERS

225

cardamom and teak plantations, etc.; partial to bamboo facies. In drier areas prefers heavy foliage, usually along streams.

Extralimital. Ranges east through southern China and the Indochinese countries to Hainan. The species extends to the Philippines and Indonesia.

GENERAL HABITS. Keeps singly or in pairs, often in company with *Muscicapa tickelliae*, *Rhipidura albicollis*, *Hemipus picatus*, etc. As a rule, keeps to taller trees than other flycatchers but also frequents undergrowth. A very active species, always on the move, pivoting on its perch from side to side, prancing and flitting about, wings drooping and tail partly fanned out and cocked, after the manner of *Rhipidura* though to a less degree. Makes agile looping sallies after winged insects, sometimes flutters in front of a sprig to disturb those hiding within and occasionally descends to the ground to pick up one. Under excitement, the black nape-tuft is erected to a point.

FOOD. Winged insects, including butterflies, moths, cicadas, small beetles and bugs. If prey too big to swallow, held under foot and torn piecemeal.

VOICE AND CALLS. On the whole a silent bird but commonly utters a distinctive high-pitched rasping, interrogative *sweech-which?* (*sweech-which-which?* when alarmed) or *chi-chue?* much like that of the Paradise Flycatcher; reminiscent also of *Aethopyga siparaja* or *Parus major* (SA). No song as such.

BREEDING. Season, March to August. *Nest*, a neat, conical cup of *Rhipidura* pattern though a little more massive; sometimes also with an untidy 'tail' of loose material dangling below. Made of grass stems and shreds of bark, lined with finer grass, coated with green moss when available, and so thickly plastered on the outside with cobweb and spiders' egg-cases as to appear quite white; firmly bound into position with cobwebs in a slender fork or elbow of outer branches of trees; also built in saplings, coffee bushes, bamboo clumps, etc., sometimes in fully exposed situations. Usually placed between three and five metres above ground; recorded as low as 60 cm and as high as nine metres. Eggs, normally 3 in southern India and Assam, often 4 in the north; very similar to those of *Terpsiphone* (1461) though smaller, and with the same range of colour variations. Average size of 110 eggs 17.4 × 13.3 mm (Baker). Female does most of the nest-building though male accompanies her closely. Incubation and care of young by both sexes; incubation period c. 12 days.

MUSEUM DIAGNOSIS. See Key to the Subspecies. For chick (in down) see Biswas, JBNS 59: 807.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	64-75	14-17	16-18	65-76 mm
♀♀	66-76	14-17	16-18	65-74 mm

(HW, SA, BB)

Weight 16 ♂♂ 10-14; 16 ♀♀ 9-13 g (SA).

COLOURS OF BARE PARTS. Iris brown; bare eye-rim blue. Bill: adult ♂ dark greyish blue, black at tip; ♀ horny brown; mouth (both sexes) greenish or sulphur-yellow. Legs and feet: ♂ slaty blue; ♀ greyish brown; claws dark brown.

MONARCH FLYCATCHERS

227

BREEDING. Season, April to June. *Nest* and eggs, as in 1465. Clutch size usually 3, sometimes 2. Average size of 54 eggs 18.3 × 16.9 mm (Baker).

MUSEUM DIAGNOSIS. Like the Indian *styani* (1465) but underparts bluer and extending to vent. Axillaries blue.

MEASUREMENTS

	Wing	Tail
3 ♂♂	71-75	70-73 mm
2 ♀♀	71-73	69-72 mm

(Abdulali)

COLOURS OF BARE PARTS. Unrecorded.

1468. Car Nicobar Blacknaped Monarch Flycatcher. *Monarcha azurea idiochroa* (Oberholser)

Hypothymis azurea idiochroa Oberholser, 1911, Proc. U.S. Nat. Mus.

39: 604 (Car Nicobar)

Baker, FBI No. 697, Vol. 2: 274

LOCAL NAME. *Kalong tesa* (Car Nicobar).

SIZE. Sparrow; length c. 16 cm (6 in.).

FIELD CHARACTERS. As in 1465, q.v.

STATUS, DISTRIBUTION AND HABITAT. Restricted to Car Nicobar.

GENERAL HABITS, FOOD AND VOICE. As in 1465.

BREEDING. As in 1467.

MUSEUM DIAGNOSIS. As in the Andaman *tyleri* but belly white. Differs from *styani* (1465) in having the axillaries light blue (v. white).

MEASUREMENTS

	Wing	Tail
1 ♂	76	72 mm
3 ♀♀	72-77	68-70 mm

(Abdulali)

COLOURS OF BARE PARTS. Iris blackish brown. Bill blue, tip blackish. Legs and feet dull blue.

1469. Nicobar Blacknaped Monarch Flycatcher. *Monarcha azurea nicobarica* (Bianchi)

Hypothymis azurea nicobarica Bianchi, 1907, Ann. Mus. Zool. St. Petersburg

12: 76 (Nicobars = Nancowry)

Hypothymis azurea calocera Oberholser, 1911, Proc. U.S. Nat. Mus. 39: 610

(Nankauri I., Nicobar Is.)

Baker, FBI No. 696, Vol. 2: 273

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 16 cm (6 in.).

FIELD CHARACTERS. As in 1465, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident. Nicobar Islands except Car Nicobar.

GENERAL HABITS, FOOD AND VOICE. As in 1465 and other races.

BREEDING. As in 1467.

226

MONARCHINAE

1466. Ceylon Blacknaped Monarch Flycatcher. *Monarcha azurea ceylonensis* (Sharpe)

Hypothymis ceylonensis Sharpe, 1879, Cat. Bds. Brit. Mus. 4: 277

(Cotta, Ceylon)

Baker, FBI No. 694, Vol. 2: 272

LOCAL NAMES. *Nil-kurullā*, *Mārāwā* (Sinhala).

SIZE. Sparrow; length c. 16 cm (6 in.).

FIELD CHARACTERS. As in 1465 but black collar absent and nuchal spot indistinct.

STATUS, DISTRIBUTION AND HABITAT. Resident, moderately plentiful. Ceylon in the lowlands and lower hills to c. 900 m, occasionally to 1600 m in the drier Uva hills. Affects evergreen forests, well-wooded ravines, etc.

GENERAL HABITS, FOOD AND VOICE. As in 1465.

BREEDING. Season, March to May in the hills; also recorded in September in the low-country Wet zone. *Nest*, as in 1465. Eggs, 2 or 3, similar to those of *Terpsiphone* (1461) but smaller. Average size of 13 eggs 17.2 × 13.2 mm (Baker). When sitting on nest, if uneasy or slightly alarmed, has a curious habit of bending back the head and pointing the bill straight up; this habit also noted in the Paradise Flycatcher (Phillips).

MUSEUM DIAGNOSIS. Differs from the Indian race (1465) in lacking the black crescent on throat (sometimes present but obsolete). Nuchal patch reduced; general coloration a little darker, more purplish.

Female differs in having the head, neck and breast a brighter and purer blue; brown of upperparts more leaden brown and more washed with blue. Postnuptial moult about August-September.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
9 ♂♂	70-74	14-16	15-16	67-73 mm
7 ♀♀	67-71	14-15	15-16	65-70 mm

(HW)

Weight 1 ♀ 12 g (SDR).

COLOURS OF BARE PARTS. Iris black. Bill: ♂ light plumbeous blue, inner surface chartreuse green; ♀ dull plumbeous. Legs and feet light plumbeous; soles yellow.

1467. Andaman Blacknaped Monarch Flycatcher. *Monarcha azurea tyleri* (Beavan)

Myiagra tyleri Beavan, 1867, Ibis: 324 (Port Blair, Andamans)

Baker, FBI No. 695, Vol. 2: 273

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 16 cm (6 in.).

FIELD CHARACTERS. As in 1465 but blue on underparts extending to vent.

STATUS, DISTRIBUTION AND HABITAT. Common resident. Andaman Islands including Great and Little Coco Islands. Affects wooded areas.

GENERAL HABITS, FOOD AND VOICE. As in 1465.

228

PACHYCEPHALINAE

MUSEUM DIAGNOSIS. Male, like the Andaman *tyleri* (1467) but slightly smaller, axillaries white, and more white on belly.

Female differs from *idiochroa* of Car Nicobar in being slightly smaller, browner and less grey above; blue of head darker, clear-cut from back and not grading into it.

MEASUREMENTS

	Wing	Tail
15 ♂♂	63-73	56-78 mm
9 ♀♀	65-70	57-67 mm

(Abdulali)

COLOURS OF BARE PARTS. As in 1468.

Subfamily PACHYCEPHALINAE: Thickheads or Shrikebilled Flycatchers

Genus PACHYCEPHALA Vigors

Pachycephala Vigors, 1825, Trans. Linn. Soc. London 14: 444.

Type, by original designation, *Muscicapa pectoralis* Latham

Muscitra Blyth, 1847, Jour. Asiat. Soc. Bengal 16: 121.

Type, by monotypy, *Muscitra cinerea* Blyth

Bill strong, laterally compressed, notched at tip. Three strong rictal bristles, numerous smaller ones overhanging nostril. Wing long. Young not spotted.

1470. Grey Thickhead or Mangrove Whistler. *Pachycephala grisola* (Blyth)

Tephrodornis grisola Blyth, 1843, Jour. Asiat. Soc. Bengal 12: 180. Female described under *Tephrodornis superciliosus* Swainson, v. *Lanius Kroula* Hardwicke & Gray (nom. nud.), 1842, Jour. Asiat. Soc. Bengal 11: 799 (Neighbourhood of Calcutta).

Cf. Mukherjee A. K., 1970, Jour. Bombay nat. Hist. Soc. 67: 112

M. (uscitra) cinerea Blyth, 1847, Jour. Asiat. Soc. Bengal 16: 122

(Island of Ramree, Arracan)

Baker, FBI No. 887, Vol. 2: 484

Plate 81, fig. 1

LOCAL NAMES. None recorded.

SIZE. Sparrow +; length c. 17 cm (6½ in.).

FIELD CHARACTERS. General aspect very like woodshrike (*Tephrodornis pondicerianus*) but lacking whitish supercilium and white in the tail-feathers.

× c. 1

Above, olive-brown, more ashy on crown. Underparts white with a darker, very pale grey-brown pectoral band. Sexes alike.

THICKHEADS

229

STATUS, DISTRIBUTION and HABITAT. Resident. The Sundarbans of West Bengal and East Pakistan eastward from the Calcutta neighbourhood and down the Chittagong coast. Andaman Islands. Confined to a narrow zone fringing the shores. Affects mangroves and other small trees.

Extralimital. Extends along the eastern coast and islands of the Bay of Bengal, east to Vietnam and south through the Malay Peninsula. Other subspecies in Indonesia and the Philippines.

GENERAL HABITS. A quiet and unobtrusive bird usually seen alone or in pairs. Catches insects on the wing as well as on the branches and trunks of trees. May be seen among the roots of mangroves and higher up in trees.

FOOD. Insects.

VOICE and CALLS. Song, a loud and clear whistle, repeated three or four times in a rising scale, or prolonged and drawn out, followed suddenly by a higher or lower note, somewhat reminiscent of the call of *Aegithina tiphia* (Osmaston).

BREEDING. Season, April to July. *Nest*, a thin, flimsy, cup-shaped structure attached by means of cobwebs to the twigs supporting it. Placed in small trees between one and four metres above the ground. *Eggs*, 2, creamy buff or pale *café-au-lait* marked with small spots ranging from sepia to blackish brown, and secondary spots of lavender, forming a zone around the large end, sparse elsewhere. Average size of 26 eggs 21.7 × 15.7 mm (Baker).

MUSEUM DIAGNOSIS. For details of plumages see Baker, loc. cit. Nestling. Back and wings warm reddish brown; breast pure white, spotless (Osmaston, JBNHS 17: 159).

MEASUREMENTS

	Wing	Tarsus	Tail
♂ ♀	81-89	c. 23	55-61 mm (Baker)

Bill from skull c. 18 mm

Weight 1 ♂ 0.75 oz. (21 g); 3 ♀ 0.75+ oz. (21+ g) — Hume.

COLOURS OF BARE PARTS. Iris dark reddish brown. Bill blackish brown. Legs and feet slate or greyish brown.

1471. Yellowbrowed Ground Warbler. *Tesia cyaniventer* Hodgson

Tesia cyaniventer Hodgson, 1837, Jour. Asiat. Soc. Bengal 6: 101 (Nepal)

Baker, FBI No. 475 (part), Vol. 1: 463

Plate 87, fig. 15

LOCAL NAMES. *Tisi* (Nepal); *Samtit-tammong* (Lepcha); *Ting-lirui bermai-ga* (Kacha Naga).

SIZE. Sparrow —; length c. 9 cm (3½ in.).

FIELD CHARACTERS. A tiny, tailless, dark coloured, wren-like terrestrial bird. Above, olive-green; a long yellowish green supercilium. A noticeable black, post-ocular stripe between the yellowish supercilium and the grey sides of head. Below, ashy grey. Sexes alike.

The very similar *T. olivea* has dark slate-coloured underparts, much less prominent post-ocular stripe, and orange-red or deep orange base of lower mandible (v. yellow or orange in this species).

STATUS, DISTRIBUTION AND HABITAT. Fairly common resident subject to seasonal vertical movements; from Garhwal (?) and western Nepal

1472. Slatybellied Ground Warbler. *Tesia olivea* (McClelland)

Saxicola? olivea McClelland, 1839 (1840), in Horsfield,

Proc. Zool. Soc. London: 161 (Assam)

Baker, FBI No. 475 (part), Vol. 1: 463

Plate 87, fig. 16

LOCAL NAMES. *Samtit-tammong* (Lepcha); *Ting-lirui bermai-ga* (Kacha Naga).

SIZE. Sparrow —; length c. 9 cm (3½ in.).

FIELD CHARACTERS. A tiny, tailless, dark-coloured, wren-like bird, very similar to 1471. Above, back dark olive-green, crown yellowish green, but contrast not appreciable except at very close range. A dark post-ocular stripe, hardly noticeable in the field. Below, dark slaty. Sexes alike.

T. cyaniventer (1471) has paler, ashy grey underparts and its black, post-ocular stripe is very distinct; its lower mandible is orange-yellow or yellow (v. bright orange-red or deep orange in *olivea*).

STATUS, DISTRIBUTION AND HABITAT. Fairly common, resident subject to seasonal vertical movements. Darjeeling, Sikkim, Bhutan, Arunachal Pradesh, Nagaland, Khasi Hills (specimen in Koelz Coll.) and Manipur. Altitudinal distribution little known. There are no summer records for our territory; in Burma the species has been recorded at 1500 and 2000 m. It evidently breeds in a lower zone than *T. cyaniventer*. Winters from at least 1000 m down to the foothills, sparingly entering the plains. Affects dense undergrowth of ferns, nettles and weeds in humid, tropical forest.

Extralimital. Extends to Yunnan and Vietnam.

GENERAL HABITS. Solitary. Keeps near the ground, extremely restless, never still. Hops about so lightly among the rootstocks that hardly a leaf stirs to betray its position though its insistent ventriloquistic *chirik-chirik* may proclaim its presence only a few metres away. Has an amusing habit of jumping back and forth along the same branch like a clockwork toy; also of clapping its wings up over its back every now and then.

FOOD. Insects and spiders.

VOICE AND CALLS. A sharp *chirik-chirik* (SDR); distinctive and rather ventriloquial. Specific description of song as compared with that of 1471 very desirable.

BREEDING. Unrecorded or confused with that of *T. cyaniventer*.

MUSEUM DIAGNOSIS. See Field Characters. Young undescribed.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	47-51	13-14	21-24	16-21 mm
♀♀	45-48			

(NBK, SA, MD)

Weight 1 ♂ 6 g (Hume); 2 ♀♀, 1 ♂ 6-9 g (SA).

COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible blackish, lower orange-red or deep orange yellowish towards tip. Legs and feet brown; soles olive-yellow.

2

SYLVIINAE

east through Darjeeling, Sikkim, Bhutan and Arunachal Pradesh, thence south through Nagaland, Manipur, Meghalaya and Bangladesh to the Chittagong Hill Tracts. Breeds between 1500 and 2550 m, mostly above 1800 m, generally in a higher zone than *T. olivea*; winters from c. 1800 m down to the foothills, sparingly entering the plains of the Brahmaputra. In the breeding season affects bamboo and dense shady forest near small streams in wet ravines with tangled undergrowth of ferns and nettles. In winter may be seen in evergreen and secondary jungle, shady deciduous and sal forest.

Extralimital. Southeastern Tibet south of the main range and east to Yunnan and the Indochinese countries. A closely allied species in Java.

GENERAL HABITS. Usually seen singly but sometimes joins mixed itinerant parties of insectivorous birds. Keeps on or near the ground, skulking in dense undergrowth, bamboo, large nettles and ferns up to three metres high. Extremely inquisitive and restless; dances ceaselessly among the stalks, now clambering up one, now hopping to the next or jumping up and down the same stem like some clockwork toy; may occasionally ascend trees up to about six metres.

FOOD. Ants and other insects; spiders.

VOICE AND CALLS. A sharp, characteristic *chirik* identical to that of *T. olivea* (SDR) and a sharp *tsik* or a rapid *tsik tsik tsik tsik*... of alarm (Heinrich). Also a *churr, churr*... (Fleming). Song, a short, clear phrase consisting of a soft, twittering introduction of two or three syllables somewhat hesitatingly linked together, followed by three trilled notes in quick succession and ending on a short lower note: *tsiti-tjütjütjü tjö* (Heinrich), also rendered as a clear rippling whistled 'pip-pip-pip, pippety-pip' (Stanford). The song, surprisingly loud for so tiny a creature, is uttered as the bird hops about close to the ground. Another distinctive utterance consists of three high-pitched descending notes with a pause of one to two seconds between each note (Smythies). Both call and song deceptively ventriloquial. Song period chiefly April and May.

BREEDING. Season, May to July. Nest, a ball of green moss, some 10 to 12 cm in diameter, lined with moss roots or fine moss and with a circular entrance-hole c. 4 cm across, near the top; placed 30 cm or so up in low bushes, in creepers or in long streamers of moss growing against tree-trunks, less often against rocks. Eggs, 3 to 5, usually 4, bright, pale pink profusely stippled with tiny specks of bright brick-red. Average size of 50 eggs 17.4 × 12.9 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters.

Young, above browner, less green than adult. Underparts entirely greyish olive.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	47-54	13-15	22-25	18-20 mm
♀♀	44-50	13-15	22-25	17-19 mm

(BB, SA, NBK, Stres., MD)

Weight 4 ♂♂ 8.6-9.5; 1 ♀ 8.4 g (Hume, Cripps); 3 ♂♀ 10-12 g (SA).

COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible blackish horny, lower yellow to dull orange; inside gape reddish orange. Legs and feet dark olivaceous.

SYLVIINAE

1473. Chestnut-headed Ground Warbler. *Tesia castaneocoronata*

castaneocoronata (Burton)

Sylvia castaneo-coronata Burton, 1836, Proc. Zool. Soc. London: 152

(Himalayas, restricted to Nepal by Ripley, Synopsis: 441)

Tesia castaneocoronata regia Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 11 (Blue Mountain, Lushai Hills)

Baker, FBI No. 476, Vol. 1: 465

Plate 87, fig. 17

LOCAL NAMES. *Tisi* (Nepal); *Samtit-pho* (Lepcha).

SIZE. Sparrow —; length c. 8 cm (3 in.).

FIELD CHARACTERS. A tiny, wren-like bird with bright yellow underparts and extremely short tail. Above, forehead, crown and nape bright chestnut, rest of upperparts olive-green. Below, throat bright lemon-yellow; breast and belly yellow washed with olive; flanks olive. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Fairly common resident, subject to seasonal vertical movements; from Kangra (Kulu and Parbati valleys) east along the Himalayas to the Mishmi Hills, (Nagaland and Manipur?), Meghalaya and Mizo hills (Koelz); also to the Chittagong Hill Tracts of Bangladesh (Rashid). Breeds between 1800 and 3300 m, more commonly above 2400 m and locally up to 3900 m (central Nepal—Polunin, JBNHS 52: 890). Winters from c. 1800 m down to the foothills, entering the adjacent plains in the Brahmaputra Valley. Affects undergrowth in high, rather open forest, whether light brushwood, ferns, nettles, dense bushes or impenetrable dwarf bamboo, especially in dank ravines and in the vicinity of streamlets. In winter (October to March) may be seen in dense scrub along shady nullahs and in secondary forest.

Extralimital. Burma. The species extends to Szechuan and northern Vietnam.

GENERAL HABITS. Solitary or sometimes in company with *T. cyaniventer*; in pairs during the breeding season. Though shy and elusive, it is not quite as difficult to see and not as restless as the latter or *T. olivea*. It is also less of a ground bird though it generally keeps within a metre or so from the ground, hopping about in cover or sometimes among moss-covered boulders or fallen logs.

Display. 'Two birds were in the same bush one keeping mostly to the upper branches where it ran or rather strutted backwards and forwards with wings drooping, bill turned straight upwards, yellow throat puffed out, tiny tail held bolt upright, uttering a continual, rapid *tsik tsik tsik*... The second bird behaved in exactly the same way in the lower part of the bush. Every now and again the two birds would approach each other, the excitement rising to fever pitch, but when about two inches apart they would turn away and resume their initial positions. This was repeated again and again for an hour until I was obliged to leave and never discovered if they were a pair in courtship display or two males challenging each other' (Desirée Proud, JBNHS 55: 349).

WARBLERS

5

FOOD. Insects and spiders.

VOICE AND CALLS. A chattering *chirik-chirik* like that of 1472 (SA). A single, loud and piercing *teeet* sometimes repeated twice in alarm (various authors). A single, distinctive *wee* repeated at intervals of several seconds (SDR). The body is jerked when the call-note is uttered. A very loud song of four shrill notes, not unlike that of *Culicicapa* (Osmaston), reminiscent of that of *Tesia gyariventer* but thinner and more twittering (Heinrich); rendered by Smythies as *sip, sip-it-up*. Song period in Nepal March to June (Proud).

BREEDING. Season, May to July. Nest, a neat but rather flimsy ball of moss lined with rootlets and feathers woven into and suspended from a small branch within a couple of metres of the ground. Eggs, 2, uniform dark terracotta or dull chestnut with a faint cap of mottlings at the large end. Average size of 18 eggs 17.4 × 12.9 mm (Baker). Incubation by both sexes; period undetermined. Brood-parasitism by *Cuculus poliocephalus* reported by Baker (JBNHS 17: 353; locality corrected p. 841).

MUSEUM DIAGNOSIS. See Field Characters.

Young very distinctive: above (including crown), dark olive-green with a brownish tinge; below chestnut.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	47-53	11-12	21-24	26-29 mm
♀♀	45-50	11-12	21-24	22-26 mm

Weight ♂♀ 8-10 g (GD, SDR, SA).

COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible horny brown, lower yellowish to orange at base, brown at tip. Legs and feet olive-brown or greenish yellow.

Genus CETTIA Bonaparte

Cettia Bonaparte, 1834, Icon. Fauna Italica I, text to pl. 29. Type, by original designation, *Sylvia Cetti* Marmora

Bill thin, narrow and pointed; some short and fine rictal bristles. Tail rounded, of ten broad and soft rectrices; laterals shorter than middle pair. Eggs characteristic, dark terracotta.

WARBLERS

7

Cettia pallidipes

edge of sal forest, secondary jungle, and glades in evergreen or in pine forest.

EXTRALIMITAL. Northern Burma. The species extends to Laos, northern Vietnam and southern China. Also Andaman Islands.

GENERAL HABITS. An adept skulker, often heard, rarely seen. When disturbed, will flutter through the grass to the farther edge of a thicket and scuttle to the next cluster just off the ground, scarcely allowing a glimpse of itself.

FOOD. Insects.

VOICE AND CALLS. A most characteristic peculiar song, loud and persistent, rendered as *rip...rip-chick-a-chuck*. Also a fast-repeated *paree-choop* and *riti-jee* (Fleming). Alarm-note *chick-chick* (Osmaston).

BREEDING. Season, May to July. Nest, a rather untidy ball of grass lined with feathers, and placed in bushes overgrown with grass. Eggs, probably 4, deep mahogany-red, not distinguishable from those of *C. f. fortipes* (1478) and *pallidus* (1477). Average size of 40 eggs 17.1 × 13.1 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Species; for details of plumage Baker, loc. cit.

1474. Indian Palefooted Bush Warbler. *Cettia pallidipes pallidipes* (Blanford)

Phylloscopus pallidipes Blanford, 1872, Jour. Asiat. Soc. Bengal 41: 162 (Sikkim)

Baker, FBI No. 913, Vol. 2: 508

Plate 83, fig. 1

LOCAL NAME. *Daotisha gashim* (Cachar).

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. A small warbler of the foothills. Above, brown with a pale supercilium and a noticeable dark stripe through eye. Below, cream-coloured, with pale yellowish legs. Sexes alike. As for most bush warblers, recognized mostly by its song (q.v.), which is characteristic.

STATUS, DISTRIBUTION AND HABITAT. Resident, subject to vertical movements; on the whole scarce and probably often overlooked, but locally common. The Himalayan foothills from Dehra Dun (Osmaston, JBNHS 26: 426) east through Nepal, Darjeeling, Sikkim, Bhutan, Arunachal Pradesh (Ali & Ripley, JBNHS 48: 31) and Meghalaya (Cachar and Khasi hills). No records from Nagaland or Manipur though it occurs in northern Burma. Breeding zone not satisfactorily known, most records lying between December and April. In the west, appears to breed in the duns and has been recorded in the terai until May. Said to breed around Darjeeling and in Sikkim at c. 1200-1500 m (Baker, *Nidification* 2: 461). In Meghalaya, breeds above c. 1000 m (Baker, loc. cit.). May also breed in the Eastern Ghats: a specimen collected at Sankrametta, 1000 m (Vishakhapatnam dist.) on 12 April. Winters in the foothills, terai, duars and adjacent plains (northern Bengal); Rashid (1967) lists it as a winter visitor to the Bangladesh foothills and the Chittagong region. Affects grass-and-bush jungle on the

8

SYLVIINAE

1475. Andaman Palefooted Bush Warbler. *Cettia pallidipes osmastonii* (Hartert)

Horreites pallidipes osmastonii Hartert, 1908, Bull. Brit. Orn. CL 21: 107 (Andaman Is.)

Baker, FBI No. 914, Vol. 2: 509

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in 1474, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident, common but localized. South Andaman Island (Mr Hartert). Affects dense undergrowth in high or secondary forest.

GENERAL HABITS AND FOOD. Probably as in 1474.

VOICE AND CALLS. Described as 'most characteristic and peculiar, of 3 or 4 notes only, loud for the size of the bird, and insistent' (Osmaston, JBNHS 35: 892-3).

BREEDING. Season, May to July. Nest, a deep cup of dry bamboo leaves very loosely put together, lined with fine flowering grass-heads or rootlets and supported by the stems and leaf stalks of a plant, near the ground. Eggs, 4, bright chestnut, mottled all over, especially at the large end with a deeper shade of chestnut. Average size of 8 eggs 17 × 13.6 mm (Baker).

MUSEUM DIAGNOSIS. Differs from the nominate race (1474) in being a darker, richer brown above, more rufous, less olive. Flanks and sides of breast washed with richer, more ochre brown. Centre of abdomen a purer white.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♀	51-53	c. 12	c. 21	36-37 mm (Baker)

COLOURS OF BARE PARTS. Not recorded.

1476. Chinese Bush Warbler. *Cettia diphone canturians* (Swinhoe)

Arundinax canturians Swinhoe, 1860, Ibis: 52 (Amoy in winter, Shanghai in summer)

Baker, FBI No. 916, Vol. 2: 511

Plate 83, fig. 2

LOCAL NAMES. None recorded.

SIZE. Sparrow ±; length ♂ c. 16; ♀ c. 14 cm (5½-6½ in.).

FIELD CHARACTERS. The largest bush warbler, superficially very similar to and confusable with Thickbilled Warbler [*Phragmaticola arda* (1543)]. Above, russet brown, browner on head. A pale supercilium and a dark stripe through eye. Below, dull white washed with fulvous on breast and belly. Flanks fulvous. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Accidental winter visitor. Two records from Cachar (Meghalaya) [Hume, SF 11: 202-4 (1 Jan. 1881) and Baker, FBI 2: 511]. Affects thick brushwood and reeds.

EXTRALIMITAL. Breeds in northern China; winters in Formosa, the Philippines, southern China and the Indochinese countries. The species extends from southeastern Siberia to Japan and the Philippines.

WARBLERS

9

GENERAL HABITS. Skulks in dense bushes like other bush warblers. In winter may be seen in large banyan trees, exploring quite openly the boughs of these trees (La Touche). 'If hard pressed quietly slips out of the other side of the bush and flits to a further cover' (Swinhoe).

FOOD. Insects. Diptera and larvae in gizzard of a specimen collected.

VOICE AND CALLS. Alarm, a harsh *charr*. Call-note, a discreet though fairly loud *chak-chak* (La Touche). The abrupt song not given in winter.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. See Key to the Species.

MEASUREMENTS. (Note the great difference in size of the sexes.)

	Wing	Tarsus	Tail
♂♂	72-79	28-30	68-79 mm
♀♀	59-64	23-25	57-59 mm

(La Touche).

Bill from skull ♂ c. 17-18; ♀ 15-16 mm

COLOURS OF BARE PARTS. Iris dark brown. Bill: upper mandible brown, lower mandible and edge of upper greyish pink. Legs and feet pinkish grey.

CETTIA FORTIPES (Hodgson)¹

Key to the Subspecies

- More rufous above.....*C. f. fortipes*
More olive above.....*C. f. pallidus*

1477. Pale Strongfooted Bush Warbler, *Cettia fortipes pallidus* (Brooks)

Horreites pallidus Brooks, 1872, Jour. Asiat. Soc. Bengal 41: 78 (Kashmir)
Baker, FBI No. 912, Vol. 2: 507

LOCAL NAME. *Defa pich* (Kashmir).

SIZE. Sparrow —; length c. 11 cm (4 in.).

FIELD CHARACTERS. As in 1478. See Museum Diagnosis. Better identified by its striking song (q.v.).

STATUS, DISTRIBUTION AND HABITAT. Common altitudinal migrant. The western Himalayas from the Indus Valley east to western Nepal (Fleming & Traylor, *Fieldiana* 53: 178). Breeds above 1800 m, mostly between 2100 and 3000 m. Winters (end of October to April) from c. 1800 m down to the foothills, seldom venturing into adjacent plains (Peshawar, Campbellpore). Affects bush-covered hillsides, mixed cultivation and bushes or rank herbage, open mixed forest with plenty of undergrowth and bushes along nullahs; noted in winter in *sarpal* grass.

GENERAL HABITS. As in 1478.

FOOD. Insects.

VOICE AND CALLS. A single harsh *pick* or *tehuk* while skulking through shrubbery, reminiscent of *Phylloscopus griseolus* (1581). A peculiar, unmistakable song, remarkably loud and far-carrying, consisting of two phrases, each starting with a high-pitched long-drawn-out whistle of over

¹ For discussion on use of *montana* versus *fortipes*, see JBNHS 65: 223 and 224.

WARBLERS

11

From Nepal (Ilam district, Fleming & Traylor, *Fieldiana* 35: 540) east through Darjeeling, Sikkim, Bhutan and Arunachal Pradesh, thence south through Nagaland, Manipur, Meghalaya, the Mizo Hills and the Chittagong Hill Tracts. Breeds between 2000 and 3300 m (in Meghalaya from 1200 to 2000 m); winters from c. 2100 down to the foothills and, less commonly, the adjacent plains of the Brahmaputra and northern Bengal. Affects bush jungle, tea-gardens, open forest with dense undergrowth, bamboo and bramble thickets, and lush vegetation on swampy ground. Its absence from most of Nepal may be correlated with the lack of temperate dry forest (see map of climatic types, Vol. 1, after p. xlv).
Extralimital. Northern Burma. The species extends east to Formosa and south through the Sunda Islands to Timor and Borneo.

GENERAL HABITS. An arrant skulker often heard but extremely difficult to see although it may sneak around almost within arm's length. Solitary; keeps close to the ground, hopping among bushes in search of food, seldom ascending trees.

FOOD. Insects.

VOICE AND CALLS. A loud, staccato *tyit-tyu-tyu*, a soft churring alarm-note, and a single *trik* or *chuk*. Song, a thin, prolonged and rising whistle *wheteeeee* (c. 1 second) followed by a loud and quickly uttered (explosive), short phrase *chiuiyou*, thus: *wheteeeee . . . chiuiyou* (SA). The phrases, with some variations, are alternately given in high and low pitches. Song period, March to August. See also 1477.

BREEDING. Season, May to July. Nest, rather untidy, varying from a deep cup to a domed or globular structure with a large entrance near the top; made of broad-leaved grasses and copiously lined with feathers. Placed in dense, low bushes within 50 cm from the ground, seldom higher. Eggs, 3 to 5, usually 4, deep chestnut with a cloudy ring of deeper colour at the large end. Average size of 60 eggs 17.3 × 13.4 mm (Baker). Incubation by both sexes; period undetermined.

MUSEUM DIAGNOSIS. Differs from *pallidus* (1477) in being more rufous above, and darker, more brownish below. For details of plumage see Baker, loc. cit.

Wing, × c. 1

MEASUREMENTS

Baker, FBI No. 910, Vol. 2: 506

Plate 83, fig. 3

LOCAL NAME. *Daotisha gashim* (Cachar).

SIZE. Sparrow —; length c. 11 cm (4 in.).

FIELD CHARACTERS. A small, skulking bush warbler better identified (in season) by its distinctive whistled, explosive song (q.v.). Above, dark rufous olive-brown; a narrow buff supercilium to nape; a brown line from lores through eye. Below, dull whitish washed with olive-brown on sides of breast and fulvous on flanks. Sexes alike.

The smaller *C. pallidipes* (1474) may be distinguished by its pale flesh-coloured or yellowish legs (v. brownish in *fortipes*).

STATUS, DISTRIBUTION AND HABITAT. An altitudinal migrant, common except in Nepal where it appears to be mostly replaced by *C. brunifrons*.

SYLVIINAE

CETTIA MAJOR (Moore)

Key to the Subspecies

- Browner, less olive.....*C. m. rafer*
Paler, more olive.....*C. m. major*

1479. Himalayan Large Bush Warbler, *Cettia major major* (Moore)

Horreites major Moore, in Horsfield & Moore, 1854, Cat. Bds. Mus. E.I. Co. 1: 323 (Nepal)

Baker, FBI No. 915, Vol. 2: 510

Plate 83, fig. 6

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. A dark olive-brown bird with chestnut forehead and crown. A long supercilium, rusty on lores, whitish beyond eye. Underparts dull whitish. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Resident, probably subject to vertical movements. Garhwal and Kumaon (Koelz, *Contrib. Inst. Regional Exploration*, No. 1: 18), Nepal (not recorded since Hodgson's days), Sikkim, Bhutan and Arunachal Pradesh (upper Subansiri). The highest-altitude bush warbler; found in summer between 3300 and 4000 m (Ludlow). Winter data entirely lacking; recorded at 3900 and 2400 m in October. Affects dense rhododendron jungle in silver fir forest at timber-line, or dwarf rhododendron thickets beyond.

Extralimital. Extends to southeastern Tibet, Yunnan and Szechuan.

GENERAL HABITS. Nothing recorded except that it is a skulker.

FOOD. Insects.

VOICE AND CALLS. Unrecorded.

BREEDING. Known only from a single nest sent to Baker from Sikkim, said to have been taken on the Singalila Ridge at 'over 16,000 ft' (4880 + m). It was globular, loosely made of grass and bamboo leaves outside, fine grass and roots inside and lined with soft feathers; placed in scrub at the edge of dense forest on a steep hillside. No date given but a bird with a yolk egg has been collected on 10 June. Eggs, similar to those of *C. fortipes*. Size 18.3 × 13.9 mm (Baker). See also 1480, Breeding.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Young. Above, olive-brown. Below, throat greenish white with faint dusky marks; breast greenish grey; belly whitish. Younger birds are more washed with yellowish on underparts.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

13

1480. Assam Large Bush Warbler. *Cettia major vafra* (Koelz)

Homochlamys major vafra Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 18 (Phulbari, Garo Hills)
Not in Baker, FBI

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. As in 1479.

STATUS, DISTRIBUTION and HABITAT. Scarce resident, subject to vertical movements. Nagaland (Dimapur, Koelz, loc. cit.), Meghalaya in the Garo (Koelz) and Cachar hills, 'confined to the highest peaks about Hungrum' (Baker, JBNHS 9: 22). Altitude in summer c. 1800 m; habitat undescribed. See 1479.

GENERAL HABITS, FOOD and VOICE. Unrecorded.

BREEDING. No dates given. Nest, a very deep cup of fine grasses and a few bamboo leaves outside, shreds of fine grass inside, lined with feathers. Of three nests, one contained 3 eggs and two contained 2 each. Eggs similar in colour to those of *C. fortipes* (Baker, JBNHS 9: 22). These records perhaps dubious as not included subsequently in *Nidification*.

MUSEUM DIAGNOSIS. Differs from *major* in being more saturated, browner, less olive on back, crown more chestnut, less ferruginous (Koelz).

MEASUREMENTS. As in 1479.

COLOURS OF BARE PARTS. Iris brown. Bill pale yellowish brown, culmen and tip darker. Legs and feet reddish flesh (Baker).

SYLVIINAE

Bhutan and Arunachal Pradesh in the Pachakshiri area (and probably throughout the State at suitable altitudes). Breeds between 2400 and 3600 m; recorded in winter between c. 700 and 2700 m. Affects long grass and thick scrub, bamboo and ferns. In winter may be seen in dense bushes and undergrowth of forest.

GENERAL HABITS. Usually difficult to see as it skulks in dense cover, but sometimes inquisitive and not shy.

FOOD. Insects.

VOICE and CALLS. A harsh, grating alarm-note and a *tick* call. Song, see 1483.

BREEDING. Season, May to August. Nest, domed with a side entrance, made of grass and bamboo leaves, lined with feathers, usually placed at the base of thick clumps of grass. Eggs, 3 or 4, varying from pink to dark terracotta, with a darker crown at the large end. Average size of 11 eggs 17.2 × 12.6 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Species and Subspecies, and Field Characters; for details of plumage Baker, loc. cit.

Young, like adults but edges of wings and tail darker. Underparts paler yellow, not so buffish.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	53-57	c. 14	22-23	47-57 mm
♀♀	50-60	13-14	21-23	50-59 mm

(BB, Rand & Fleming, SA)

(Bill by Rand & Fleming: 1 ♂ 15; 4 ♀♀ 14-17 mm)

Weight 1 ♂ 9 g (SA).

COLOURS OF BARE PARTS. Iris brown. Bill brown, paler yellowish brown on lower mandible. Legs and feet pale yellowish brown.

1482. Assam Aberrant Bush Warbler. *Cettia flavolivacea stresemanni* (Koelz)

Neornis flavolivaceus stresemanni Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 17 (Mawryngkneng, Khasi Hills)

Neornis flavolivaceus circumspetus Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 18 (Mawphlang, Khasi Hills)
Baker, FBI No. 907 (part), Vol. 2: 503

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. As in 1481, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Resident, subject to vertical movements. Meghalaya in the Garo and Khasi hills, from c. 1200 m to the summits. Reaches the foothills in winter (arriving in December). Affects long grass and scrub, and bushes in pine forest.

GENERAL HABITS, FOOD and VOICE. As in 1481.

BREEDING. As in 1481.

MUSEUM DIAGNOSIS. Differs from *flavolivacea* in being darker above, dark greyish olive instead of brownish olive. Underparts greenish yellow, but flanks washed

16

SYLVIINAE

STATUS, DISTRIBUTION and HABITAT. Uncommon or local resident, subject to vertical movements. The Himalayas from Garhwal through Nepal, Darjeeling, Sikkim, Bhutan and Arunachal Pradesh; from 2400 to 3300 m (up to 3750 m in SE. Tibet). Recorded in winter at 1350 m (Garhwal) and c. 2100 m (Tibet), and in October at 2700 m (Tibet). Affects mostly dense ringal bamboo (*Arundinaria*) in pure stands or in open forest.

Extralimital. The species extends east through southern China to Formosa.

GENERAL HABITS. A warbler of the dense ringal bamboo on hillsides. A great skulker, very difficult to observe.

FOOD. Insects.

VOICE and CALLS. Song described by observers variously as 'most amazing', 'extraordinary', 'striking', and 'peculiar': a series of three or four long-drawn-out, thin whistles each lasting about two seconds, uttered slowly and deliberately in ascending scale, followed by several quick-repeated up and down *chee* notes resembling call of Upland Pipit (*Anthus sylvanus*, 1873) (Ludlow, Osmaston). Alarm-note a quick *birr*. *Cw* note *tik, tik, tik* (Ludlow).

BREEDING. Season, May and June. Nest, a domed structure of grass and bamboo leaves, copiously lined with feathers, the entrance near the top; placed low down in bushes in thick ringal undergrowth, c. 50 cm from the ground. Eggs, 2 or 3, deep terracotta with a ring or cap of darker tint at the large end. Average size of 20 eggs 17 × 12.8 mm (Baker).

MUSEUM DIAGNOSIS. Exposed portions of wings and tail brighter rufous than rest of upperparts; lores and behind eye dark brown; cheeks and ear-coverts mottled brown and yellowish. Underparts greyish buff, browner on flanks.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	52-56	12-13	21-22	40-49 mm
♀♀	47-50	11-12	—	— mm

(NBK, Baker)

COLOURS OF BARE PARTS. Iris brown. Bill brown, lower mandible fleshy brown. Legs and feet fleshy or yellowish brown.

1485. Western Rufouscapped Bush Warbler. *Cettia brunifrons whistleri* (Ticehurst)

Horreus brunifrons whistleri Ticehurst, 1923, Bull. Brit. Orn. Cl. 44: 28 (Simla)
Baker, FBI No. 918, Vol. 2: 513

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in 1486, q.v.

STATUS, DISTRIBUTION and HABITAT. Common vertical migrant. The western Himalayas from the Pir Panjal range east to Mussooree (where it intergrades with *brunifrons*). Breeds between 3000 and 3600 m; winters between 1000 and 2100 m, probably reaching the foothills locally. Movements take place in April and October. Affects stunted juniper and furze on stony hillsides at or above tree-line, and bushes around open margs. In winter frequents bush-clad hillsides and undergrowth in open forest.

GENERAL HABITS, FOOD and VOICE. As in 1486.

BREEDING. As in 1486.

MUSEUM DIAGNOSIS. Differs from *brunifrons* (1486) in being paler on head, paler and less rufous on back and edges of wings, and in having paler under tail-coverts and thighs.

MEASUREMENTS and COLOURS OF BARE PARTS. As in 1486.

1486. Eastern Rufouscapped Bush Warbler. *Cettia brunifrons brunifrons* (Hodgson)

Prinia brunifrons Hodgson, 1845, Proc. Zool. Soc. London: 29 (Northern region of hills near snows, Nepal)
Baker, FBI No. 917 (part), Vol. 2: 512
Plate 83, fig. 5

LOCAL NAME. *Lik-lik-pha* (Lepcha).

SIZE. Sparrow — ; length c. 10 cm (4 in.).

FIELD CHARACTERS. *Above*, rufous olive-brown with a rufous-chestnut crown, long buff supercilium and dark stripe from lores through eye, all noticeable in the field. *Below*, throat and belly white; breast and sides grey; flanks and vent olive-brown. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Common vertical migrant. The Himalayas from Mussooree, east through Nepal, Darjeeling, Sikkim and Bhutan. Breeds between c. 2700 and 4000 m; winters from c. 2200 m down to the foothills. Affects dwarf rhododendron, *Barberis*, bamboo clumps and other bushes in forest clearings and margins, and thickets in open coniferous forest up to the limit of bracken growth. In winter frequents dense undergrowth in open forest, tea-gardens, bushes and high grass in shady areas.

GENERAL HABITS. Generally a skulker difficult to observe, but at times very inquisitive and forthcoming. Will perch on the top of a bush or rock to utter its song within a few metres of the observer. Usually feeds among the bushes but has been observed creeping on the ground in and out of crevices. When forced to break cover, seldom rises much above the ground or flies far, promptly diving into the nearest shrubbery, hardly giving a glimpse of itself.

FOOD. Insects.

WARBLERS

19

1488. Cetti's Warbler. *Cettia cetti albiventris* Severtzov

Cettia albiventris Severtzov, 1872, Vertik. Turkest. Zhivotn.: 131 (Kara Tau)
Cettia Cettioides Hume, 1873, Stray Feathers 1: 194 (Sind)
Baker, FBI No. 920, Vol. 2: 514
Plate 83, fig. 11

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 12 cm (5 in.).

FIELD CHARACTERS. *Above*, entirely rufous brown. A short supercilium and eye-ring whitish. *Below*, centre of throat, breast and belly nearly white, flanks and vent greyish brown. Sexes alike. The ruddy brown colour and longish round tail are diagnostic.

STATUS, DISTRIBUTION and HABITAT. Winter visitor to the plains of the Indus (Peshawar, Bahawalpur and Sind); possibly Baluchistan, though reported occurrence at Quetta and Sibi not yet confirmed (CBT). Very local. Affects partially submerged bulrushes, reeds, high grass and tamarisks, in *dhand*s and at the edge of inundated tamarisk jungle.

Extralimital. Breeds from Iran and the Caspian east to Russian Turkestan; winters south to southern Iran and Afghanistan. The species ranges west through the Mediterranean countries to the Iberian Peninsula and Morocco. For details see Vaurie, 1959, 1: 227.

Migration. Arrives in its winter quarters in October, leaves in March. Recorded as common on migration (March) in Kohat. At this time may be seen in reed-beds, gardens and dense cover near water.

GENERAL HABITS. A great skulker, usually detected only by its loud clicking note. Creeps about in very dense cover, seldom if at all showing itself or flying.

FOOD. Insects.

VOICE and CALLS. A rather loud *click* or *chey* repeated at intervals. Bursts of its loud, clear song may be heard before spring departure.

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS

18

SYLVIINAE

VOICE and CALLS. Alarm-note, a shrill piercing whistle and a rasping scolding note (Ludlow). Call-note a soft *trik* . . . *trik*. Song, very characteristic and peculiar: a loud *sip-ti-ti-sip* uttered continuously, often followed by an extraordinary sound, rather like that produced by somebody blowing through a comb (Proud); 'a curious grating mouse-like sound, twice repeated and of a ventriloquial nature' (Osmaston). Song period mid April to early August with a resumption in September-October.

BREEDING. Season, May to early July. Nest, domed, made of grass, lined with feathers and placed in low shrubs about 50 cm from the ground. Eggs, usually 4, sometimes 3 or 5, varying from pale to dark terracotta with a cap of deeper colour at the large end. Average size of 30 eggs 17.9 × 13 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Subspecies.

Young, head same colour as back which is slightly duller than that of adult. Underparts greenish brown not grey, with a tinge of yellow. Supercilium light brown not whitish.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	42-51	11-12	18-20	43-45 mm
♀♀	43-47	11-12	18-19	41-47 mm

(BB, Stevens, Stresemann, SA)

Weight 6 ♂♂ 8.9; 2 ♀♀ 8.9 g (May-Oct.) — GD. 8 ♂♂ 6-8 g (Oct.-March) — SA.

COLOURS OF BARE PARTS. Iris hazel. Bill: upper mandible dark brown, lower pale yellowish, darker at tip. Legs and feet pale brownish or greyish brown.

1487. Arunachal Rufouscapped Bush Warbler. *Cettia brunifrons murivides* (Koelz)

Horreus brunifrons murivides Koelz, 1934, Contrib. Inst. Regional Exploration, No. 1: 18 (Bamanigaon, Assam)
Baker, FBI No. 917 (part), Vol. 2: 512

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in 1486, q.v.

STATUS, DISTRIBUTION and HABITAT. Resident, subject to vertical movements: Arunachal Pradesh and adjacent Tibet from 3000 to 4000 m. Habitat as in 1486. Winters from at least 1200 m down to the foothills and over the plains of the Brahmaputra, arriving in September; in the latter area frequents bracken and grass, especially along rivers. Not known to breed south of the Brahmaputra but recorded at the edge of the Garo-Khasi foothills in winter (Koelz, loc. cit.). Obtained in the Chin Hills of Burma (season ?).

Extralimital. The species extends to northern Yunnan.

GENERAL HABITS, FOOD and VOICE. As in 1486.

BREEDING. As in 1486.

MUSEUM DIAGNOSIS. Differs from *brunifrons* (1486) in being darker and richer coloured above.

MEASUREMENTS and COLOURS OF BARE PARTS. As in 1486.

20

Dumeticola thoracica kaschmirensis Sushkin, 1925, Proc. Boston Soc. Nat. Hist. 38: 42 (northwestern Himalaya)

Baker, FBI No. 810 (part), Vol. 2: 405

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 13 cm (5 in.).

FIELD CHARACTERS. As in 1490, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Fairly common vertical migrant. The western Himalayas in Kashmir (specimens in Brit. Mus.), Garhwal and Kumaon. Breeds between 3000 and 4000 m mainly around 3600 m. There are no winter records for this race; the eastern race is known to descend to the foothills in the cold season. Affects open grassy places, especially rank grass and *Rumex* growing on well-manured soil where cattle are temporarily quartered; occasionally also low shrubs and dwarf junipers.

Extralimital. 'Shensi (Tungling Range) westward through Kansu and Szechuan to eastern Tsinghai north to eastern Nan Shan, south through eastern and central Sikang to northern Yunnan, and possibly northern Burma' (Vaurie).

GENERAL HABITS and FOOD. As in 1490.

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. A skulking plain brown bird of scrub and shrubbery. Above, dark rufous-brown. Sides of head and supercilium grey. Below, chin white; throat ashy spotted with blackish brown. Breast grey; centre of belly

WARBLERS

23

FIELD CHARACTERS. Above, olive-brown. A short pale supercilium and a pale eye-ring. Below, chin and throat white, the latter spotted with brown, more heavily so at base. Breast and under tail-coverts fulvous; sides of breast and flanks olive-brown; centre of belly white. Sexes alike.

Doubtfully distinguishable from 1489 unless in the hand. See Key to the Species.

STATUS, DISTRIBUTION and HABITAT. Fairly common vertical migrant. The extreme western Himalayas from Gilgit and the Indus Valley (Kagan) east through Ladakh (to Upshi) and Kashmir (to the Suru Valley). Breeds between 2400 and 3600 m, arriving on its summer grounds in early June. Winters down to c. 1200 m. Affects low thorny scrub (*Lonicera*, *Hippophae*) interspersed with rank grass, bracken and tangled herbage fringing the forest, and irrigated crops (barley etc.).

This species and *B. thoracicus* are presumably allopatric and have the same habits; study of their distribution between Kashmir and Garhwal is desirable.

Extralimital. The species extends to the Kun Lun range and western Astin Tagh.

GENERAL HABITS. A skulker, scuttling off like a mouse at amazing speed through the rootstocks of the grasses and difficult to flush; when forced to fly will drop again into cover after a few hurried metres. When alarmed flicks its tail and wings.

FOOD. Insects.

VOICE and CALLS. Alarm-note, a grating *irr*. Song said to be 'strictly that of a *Locustella*' (Brooks); described as a series of strident monotonous clicks (up to 200 without a break) at a rate of about three per second, rendered as *chipi-chipi-chipi*... or *clipper-clipper-clipper*... (Whistler, Osmaston). Usually uttered from the topmost twig of a bush.

BREEDING. Season, June and July. Nest, a deep cup of grass lined with finer stems and a few hairs, resembling that of *Locustella*; placed very near the ground at the base of some low shrub. Very difficult to find as the owner usually runs through the grass on leaving the nest. Eggs, 3, or more often 4, pinkish, spotted all over but especially at the broad end with bright terracotta, with a few underlying markings and occasionally very thin black lines. Average size of 34 eggs 18.9 × 14.3 mm (Osmaston).

MUSEUM DIAGNOSIS. See Field Characters and Key to the Species.

Young, like adult but upperparts browner; underparts pale yellow, throat spots indistinct and cloudy; flanks washed with ochraceous-olive.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♀	55-65	c. 18	21-22	59-63 mm (Hartert)

COLOURS of BARE PARTS. Iris pale brown. Bill: upper mandible brownish black, lower brownish flesh. Legs and feet pale brownish flesh.

22

SYLVIINAE

white; flanks olive-brown. Under tail-coverts olive-brown barred with white. Sexes alike.

The boldly spotted throat, grey breast and barred under tail-coverts are diagnostic.

STATUS, DISTRIBUTION and HABITAT. Fairly common vertical migrant. Nepal, Sikkim, Bhutan and Arunachal Pradesh from 3300 to 4350 m (old summer records at '5000 feet' and '400 feet' are certainly erroneous). Recorded in winter in the terai, duars and the plains of Jalpaiguri district; south to Sylhet (Godwin-Austen) and Calcutta (Holmes, 1968, JBNHS 65: 779). A specimen of juvenile male from 'Shillong' in the British Museum is dated 30 August. Affects shrubbery on the edge of open grassy places and pastures, dwarf junipers and rhododendrons near timber-line, low scrub above timber-line, and bracken, rank grass and bushes between patches of forest. In winter may be seen in heavy grass jungle and reed-beds (*Phragmites*).

Extralimital. 'Neighbouring parts of southern Tibet and southwestern Sikkim to Pome...' (Vaurie). Southeastern Tibet. The species ranges north to Amurland, Transbaikalia and Altai.

GENERAL HABITS. Apparently not such an arant skulker as other bush warblers, showing itself somewhat more freely as it weaves its way through the shrubbery.

FOOD. Insects.

VOICE and CALLS. As in 1489.

BREEDING. Season, May to July. Nest, domed or deep cup-shaped, loosely made of rather coarse grass outside, finer inside, without true lining but often with a feather or two; placed in tufts of grass or in low scrub, usually within c. 50 cm from the ground, well concealed. Eggs, 3 or 4, white, lightly freckled with pinky red or brick-red, with a tendency to form a ring or cap at the large end. Average size of 50 eggs 18.4 × 13.9 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters and Key to the Subspecies. For details of plumages see Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♂	50-58	10-11	18-19	46-53 mm
♀ ♀	52-55			

(Wing NBK, Ludlow; rest Baker)

Bill from skull c. 15 mm

Weight 1 ♂ 10 g (SDR).

COLOURS of BARE PARTS. Iris brown. Bill dark brown to black. Legs and feet fleshy yellow to pale brown.

1491. Largebilled Bush Warbler. *Bradypterus major major* (Brooks)

Dumeticola major Brooks, 1871, Proc. Asiat. Soc. Bengal: 210 (Cashmir)

Baker, FBI No. 808, Vol. 2: 403

LOCAL NAMES. Tiktik pitta (Kagan Valley); Chibi marta (Ladakh).

SIZE. Sparrow —; length c. 13 cm (5 in.).

SYLVIINAE

24

1492. Chinese Bush Warbler. *Bradypterus taczanowskii taczanowskii* (Swinhoe)

Locustella taczanowskia Swinhoe, 1871, Proc. Zool. Soc. London: 355 (Transbaikalia)

Baker, FBI No. 809, Vol. 2: 404

Plate 83, fig. 15

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 14 cm (5½ in.).

FIELD CHARACTERS. Above, russet olive-brown; a short, narrow whitish supercilium. Below, chin and throat whitish, the latter with a few brown specks. Rest of underparts buffish suffused with pale brown on breast and flanks. Sexes alike.

Difficult to identify unless in the hand.

STATUS, DISTRIBUTION and HABITAT. Winter visitor. Three records: 'Bhutan duars' (Mandelli) and eastern Nepal terai (Biswas, JBNHS 65: 783-4; Fleming & Traylor, *Feldiana* 35: 541). In view of its skulking and silent habits, may be more frequent than the records indicate. Affects stubble

Bradypterus t. taczanowskii

Breeding

Winter

fields, grass and bushes, standing rice until cut, and reed-beds, apparently in the plains only. May be expected between October and March. In summer frequents shrubs, undergrowth and grassy glades in open Altai forest from c. 2800 to 3600 m.

Extralimital. Breeds in southern Siberia from the Yenisey to Ussurland and adjacent parts of northern China and Mongolia; also from northern Szechuan and eastern Tsinghai south to southeastern Tibet (Ludlow, *ibid*

WARBLERS

25

1951: 563) and northern Yunnan (Likiang Mts, specimens collected by J. F. Rock). The subspecies *chui* (Yen) 1933 was described on specimens collected on Yao Shan, Kwangsi, in June. Winters in southern China, northern Indochinese countries and southern Burma.

GENERAL HABITS. Very skulking, restless and difficult to observe. Escapes by creeping on the ground among grass roots and under small bushes. On being flushed, rises a little but settles again almost at once to resume the creeping.

FOOD. Insects.

VOICE and CALLS. A call-note similar to but recognizable from that of *Locustella lanceolata* (1544) which frequents the same grounds. In the breeding season has a strident song reminiscent of that of *Locustella nana* (1545) but shorter.

MUSEUM DIAGNOSIS. See Field Characters and Key to the Species. Tail obsoletely cross-rayed above, with white shafts to the feathers below.

Young, yellowish buff below, and slightly paler than adult above.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♀	52-56	c. 14	c. 20	53-58 mm (MD, Baker)

COLOURS OF BARE PARTS. Iris pale brown. Bill: upper mandible dark brown, lower yellowish, brown at tip. Legs and feet flesh colour.

1493. **Brown Bush Warbler.** *Bradypterus luteoventris luteoventris* (Hodgson)

Tribuna luteoventris Hodgson, 1845, Proc. Zool. Soc. London: 30 (Nepal)

Baker, FBI No. 811, Vol. 2: 406

Plate 83, fig. 8

LOCAL NAME. *Daotisha-tchik* (Cachari).

SIZE. Sparrow — ; length c. 13 cm (5 in.).

FIELD CHARACTERS. Above, rufous-brown; a short pale supercilium and a pale eye-ring. Below, chin, throat and belly white tinged with buff on sides; throat sometimes with fine dark specks. Upper breast, flanks and under tail-coverts rufous-brown. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. A vertical migrant, locally common. Nepal (probably extreme east and not recorded since Hodgson), Sikkim, Bhutan, Arunachal Pradesh (Lhalung, Pachakshiri area, and probably throughout the State); also Meghalaya in the Khasi and Cachar hills, Nagaland, Manipur (?) south to the Chin Hills of Burma. Breeds between 2100 and 3300 m, in a lower zone than *B. thoracicus*, but the two species may occur on the same grounds. In the Khasi Hills breeds between 1200 and 1600 m and on Mt Victoria from 2500 m to the summit. Affects grassy downs, high grass- and bracken-covered hillsides in treeless regions, but in the Khasi Hills frequents undergrowth of bushes, bracken and grass in pine forest. Winters in the foothills.

Extralimital. Extends to central China, Fukien and northern Vietnam.

Other subspecies in Vietnam, southeastern China, Formosa and Luzon.

GENERAL HABITS. Skulking; similar to those of other bush warblers.

WARBLERS

27

FOOD. Grubs, worms, green grasshoppers and other insects.

VOICE and CALLS. Usually very silent, the only note being a low, single, explosive *quizee* or *qiz* (Betts)—sometimes sounding more like *queek* (Henry). This also uttered on alarm, e.g. when nest is approached. In the breeding season, a queer, rather squeaky song of a few scattered notes given from a commanding position on a stem (Betts, Henry).

BREEDING. Season, March to May, occasionally (second brood ?) in August-September. Nest, a deep, substantial cup of moss, dead leaves and rootlets, lined with skeleton leaves; occasionally nests may be made of bamboo leaves and lined with fine grass as is usual in other bush warblers; usually placed in a low shrub or clump of bamboo within a metre or so from the ground, often near a forest path. Eggs, usually 2, pale pink, covered with fine purple-brown specks often coalescing at the larger end; also numerous underlying grey freckles. Average size of 5 eggs 21.7 × 16.1 mm (Phillips). A close sitter; when disturbed the birds scuttle about under cover in the immediate vicinity continually uttering their alarm-notes. Feeding of young by both sexes. Share in other duties not determined.

MUSEUM DIAGNOSIS. See Field Characters.

Young, like adult but rufous throat replaced by whitish, the feathers tipped with olive-grey; rest of underparts more yellow.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
4 ♂♂	61-64	18-19	25-28	65-70 mm
2 ♀♀	60, 61	18	24, 26	65 mm (HW)

Weight 1 ♂ 9 g (SDR).

COLOURS OF BARE PARTS. Iris red-brown to bright red (♂), pale buff (♀). Bill: upper mandible black, lower paler and greyer. Legs and feet purplish brown or mauve-grey.

Genus LUSCINIOLA Gray

Lusciniola Gray, 1841, List Gen. Bds., 2nd ed., 28. Type, by monotypy.

Sylvia melanopogon (Temminck)

1st primary (as.) less than half length of 2nd, which reaches almost to tip of wing. Tail with 12 rectrices, rounded, nearly as long as wing. Bill thin and pointed. Rectal bristles small, not obvious.

Baker, FBI No. 821, Vol. 2: 418

Plate 85, fig. 10

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 15 cm (6 in.).

26

SYLVIINAE

FOOD. Insects.

VOICE and CALLS. Alarm-notes *tek . . . tek*. Song, a very peculiar grating trill deceptively like that of a grasshopper (Heinrich). Described as a rapid repetition of two notes, a sort of screech followed by a sharp short note, at the rate of two or three pairs of notes per second, *creet-ul-creet-ul . . .*; very slight pauses are made every few seconds (Smythies). Sings from a concealed perch near the ground.

BREEDING. Season, April to July. Nest, usually a deep cup, sometimes domed, made of grass blades with finer material inside; placed in bushes or

Wing, x c. 1

clumps of grass, generally within a metre from the ground, sometimes a little higher; rarely on the ground, under a tuft of grass. Eggs, normally 4, often 3, rarely 5, white to pale pink, marked with reddish brown freckles or sometimes blotches, in some eggs coalescing to form a crown around the large end. Average size of 200 eggs 18.2 × 14.3 mm (Baker). Building and incubation by both sexes but mostly by female; period 12 or 13 days.

MUSEUM DIAGNOSIS. See Field Characters and Key to the Species. First primary (as.) about half the length of second.

Young, like adult but underparts tinged with yellow.

MEASUREMENTS

♂♂	51-54	c. 14	c. 19	55-56 mm
♀♀	49-52			

(Stresemann, Ludlow, Baker)

COLOURS OF BARE PARTS. Iris pale brown. Bill: upper mandible dark brown or blackish, lower fleshy yellow. Legs and feet flesh colour, fleshy yellow to fleshy brown.

1494. **Ceylon Bush Warbler.** *Bradypterus palliseri* (Blyth)

Brachypteryx palliseri Blyth, 1852, Jour. Asiat. Soc. Bengal 20: 178 (Ceylon)

Baker, FBI No. 812, Vol. 2: 408

Plate 83, fig. 9

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 14 cm (5½ in.).

FIELD CHARACTERS. Above, brown. A pale grey supercilium and a pale eye-ring. Below, throat ochraceous buff, a diagnostic character. Rest of underparts olive-grey, centre of belly pale yellowish. Sexes alike, except that male has red iris and female pale buff.

STATUS, DISTRIBUTION and HABITAT. Endemic to Ceylon. Common resident in the hills above 900 m, more common above c. 1300 m. Affects undergrowth of *Strobilanthes* and dwarf bamboo in damp forest, occasionally venturing into tea-plantation where it borders the jungle.

GENERAL HABITS. Skulks in dense cover, creeping about the stems, seldom ascending more than a metre or two above the ground; continually flicks its tail. In the non-breeding season may be seen in small family parties.

28

SYLVIINAE

FIELD CHARACTERS. Above, rufous-brown streaked with dark brown.

x c. 1

Crown and nape black, the feathers edged with rufous-brown. A conspicuous white supercilium. Below, throat and upper breast white; rest of underparts cream-buff. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Fairly common winter visitor; partly resident and breeding very locally but often overlooked; thus distribution imperfectly known. Baluchistan, Sind, the flood plains of the Indus R. system in Punjab, and western Gangetic Plain south through eastern Rajasthan (Bharatpur) to Madhya Pradesh (Schore) and Gujarat (Kathiawar, Kutch). Breeds in Baluchistan (around c.

Lusciniola melanopogon mimica

Winter range

Breeding records

30°N.—Meinertzhagen *epud* Ticehurst, JBNHS 31: 697); circumstantially also in Punjab (Gurdaspur dist., Currie, *ibid.* 24: 603) and Kumaon terai (Lalkua, Smythies, *ibid.* 44: 295). Affects reed-beds and partially submerged rush and tamarisk thickets around jheels (or *dhaads*) and rivers.

Extralimital. Breeds from the Caspian Sea to Russian Turkestan and south to Iraq, southern Iran and Afghanistan. The species extends west through the Mediterranean countries to Spain and Tunisia.

Migration. Arrives on its winter grounds in August-September, leaves in March, some individuals being still seen in April. Movements take place mostly in March and September. Noted on passage in Chagai (Baluchistan) and Kohat (NW. Frontier Province) up to 1400 m.

GENERAL HABITS. Creeps about among partially submerged reeds and bushes in search of food, frequently exposing itself on reed tops on misty

1498. Streaked Fantail Warbler. *Cisticola juncidis curritans* (Franklin)

Prinia curritans Franklin, 1831, Proc. Zool. Soc. London: 118

(between Calcutta and Benares)

Baker, FBI No. 825 (part), Vol. 2: 422

Plate 85, fig. 20

LOCAL NAMES. *Ghāski-phūtki*, *Ghāski-pitpiti* (Hindi); *Khergusa* (Bhagalpur); *Tūntūnia* (Monghyr); *Tedru-jitta* (Telugu).

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. A tiny rufous-brown warbler boldly streaked with black above, with a prominently white-tipped fan-shaped tail. Underparts whitish buff, darker on flanks. Sexes alike. Absence of nuchal collar, and broader whitish tips to rectrices, distinguish it from *C. exilis* (1496-7).

STATUS, DISTRIBUTION AND HABITAT. A common and widespread resident, subject to local movements. Pakistan, Nepal, Bangladesh and India from the Himalayan foothills south to Kanyakumari (except for the range of *salimalii*), and Ceylon in the low-country Dry zone (Phillips, 1958, SZ 28: 191).

Intergrades with *malaya* in Manipur and adjacent regions. Absent from desert tracts; scarce in Tamil Nadu. Ascends the hills up to c. 1400 m, locally to 1900 m (Himalayas) and 1800 m (Meghalaya and southern India). Affects tall grass and reed-beds, especially along the margins of tanks, lagoons, tidal creeks, wet paddyfields, and also open, dry grasslands and crops of cereals, lucerne, sugarcane, etc. Paddyfields have probably attracted this species into the Himalayan valleys where they are its almost exclusive habitat.

Extralimital. The species ranges from Africa and southern Europe through southern Asia to China, Japan and south to northern Australia.

x c. 1

WARBLERS

35

VOICE AND CALLS. One alarm-call is an excited, rapid *zit-zit-zit* (Lynes). Song: see Display, above. Very silent outside the breeding season.

BREEDING. Season, correlated with the rains and availability of suitable ground vegetation. Over most of peninsular India breeding starts in May, in Assam in March and in Sind in April or even as early as February, and generally lasts till October; in Ceylon breeds most of the year with a peak period about June. Two or three broods may be reared. Nest, of two types: the more common is a small, cylindrical, narrow purse of fine grass-stems drawn together, fastened with cobweb and vegetable down. The other type is a deepish oval pouch, the small end up with a large entrance at the top; felted inside with vegetable down. It is fastened to several stems of grass which are incorporated with the nest materials, thus reinforcing the otherwise flimsy structure; usually hidden in the base of grass tufts and seldom more than half a metre or so above the ground — sometimes in clumps of rushes standing in water. Often several nests in a restricted patch, in a scattered colony. Eggs, in most of the Peninsula generally 5, sometimes 4 or 6, in Assam normally 4, often 5, in Ceylon mostly 3 or 4; ground colour usually white, sometimes pale blue, speckled or sometimes blotched with pale red or red-brown. Average size of 400 eggs 15 × 11.5 mm (Baker). Building of nest and incubation by both sexes though more by female; period ten days. Often brood-parasitized by cuckoo (*C. canorus*) in Assam — Baker, JBNHS 17: 792, 876.

MUSEUM DIAGNOSIS. See keys to the Species and Subspecies; for details of plumage Baker, loc. cit. Winter plumage rather lighter in colour, supercilium more clearly defined. Complete moult in May (Sind).

Young (juvenile) resembles adult in winter plumage but underparts yellowish and upperparts more streaked with ochraceous, especially on head.

For differences from *salimalii*, *omalura* and *malaya*, see 1499, 1500 and 1500a respectively.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

Tail, summer: 36-40; winter 41-47 mm (Ticehurst)

Weight 1 ♂ (June) 8 g — GD; 2 ♂♂ (March) 6, 7 g — SA.

COLOURS OF BARE PARTS. Iris hazel-brown, olive-brown or straw-coloured. Bill: upper mandible brown, lower flesh; mouth black in summer, fleshy pink in winter. Legs and feet flesh-coloured.

1499. Kerala Streaked Fantail Warbler. *Cisticola juncidis salimalii* Whistler

Cisticola juncidis salimalii Whistler, 1936, Jour. Bombay nat. Hist. Soc. 38: 487 (Peermade, Travancore)

Baker, FBI No. 825 (part), Vol. 2: 422

LOCAL NAME. *Potappottas* (Malayalam).

SIZE. Sparrow —; length c. 10 cm (4 in.).

34

SYLVIINAE

Cisticola juncidis

Distributional ranges

	<i>curritans</i> (1498).		<i>salimalii</i> (1499).
	<i>omalura</i> (1500).		<i>malaya</i> (1500a).

MIGRATION AND MOVEMENTS. Mostly a summer visitor to N.W.F.P., northern Punjab and Nepal Valley (March or April to September). In other parts of its range it is subject to local, somewhat unpredictable and erratic movements with seasonal conditions, mainly rainfall or drought, affecting its habitat. In some areas may be a winter visitor only (e.g. Khandesh) while in others (Ghazipur, Mhow) it is a summer visitor, sometimes disappearing without visible reason. Mostly a resident in southern India, Bangladesh and Assam.

GENERAL HABITS. Keeps singly or in loose 'colonies' of 10 to 15 birds. Skulks among grass and herbage, making short low flights when flushed and pitching quickly into the stems again. Feeds on or near the ground, seldom flitting about or on to tops of bushes or grass clumps in the manner of wren-warblers. Flight jerky, undulating — similar to that of *Prinias*.

Display. Has a rambling, mounting flight, in which the white-tipped fanned tail is conspicuous — each upward motion accompanied by a sharp characteristic *zit* or *chip*, sounding in the distance remarkably like the snip of a barber's scissors. This also uttered from a grass tip at the rate of c. 3 *chips* in 2 seconds. Sometimes skims over the vegetation, at other times rises high in the air in erratic zigzags, flying in wide circles and suddenly nose-diving after a while to alight gently on a grass blade.

FOOD. Insects: small grasshoppers, weevils, tenebrionid beetles, ants, aphids and caterpillars identified among stomach contents (Mason & Lefroy, 1912). Also takes spiders and, rarely, some green tender seeds.

36

SYLVIINAE

FIELD CHARACTERS. As in 1498, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident in Kerala from the low country to 2100 m. Affects paddyfields, tall grass especially where moist or waterlogged, and swampy depressions among the hilltops.

GENERAL HABITS, FOOD AND VOICE. As in 1498.

BREEDING. Season, August to March. Nest and eggs as in 1498.

MUSEUM DIAGNOSIS. Differs from *curritans* in being darker, more richly coloured. Rump bright reddish brown (v. rufous) and flanks washed with bright rufous.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
5 ♂ ♂ (summer)	51-56	11	19	33-34 mm

4 ♀ ♀ (winter)	46-49	11	17-18	35-40 mm (HW)

COLOURS OF BARE PARTS. Iris pale hazel-brown or pale olive-brown. Bill: upper mandible and tip of lower pale horny brown; commissure and rest of lower mandible pinkish flesh; mouth pink, brownish pink or pale yellowish flesh, in some individuals streaked or blotched with brown (seasonal variations? See 1498). Legs and feet pale brownish flesh; claws dusky.

1500. Ceylon Streaked Fantail Warbler. *Cisticola juncidis omalura* Blyth

Cisticola omalura Blyth, 1851, Jour. Asiat. Soc. Bengal 20: 176 (Ceylon)

Baker, FBI No. 826, Vol. 2: 424

LOCAL NAMES. *Tanacoli-kurullā* (Sinhala); *Tinu-kūrūri*, *Yalālān* (Tamil).

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in 1498, q.v.

STATUS, DISTRIBUTION AND HABITAT. Subspecies endemic to Ceylon. Common resident in the low-country Wet zone and Hill zone up to over 2100 m. Affects paddyfields, swamps and tall grassland. Very common in *Salicornia* and other salt-marsh herbage in northern coastal areas (Jaffna district).

GENERAL HABITS, FOOD AND VOICE. As in 1498.

BREEDING. Season, most of the year but with two peak periods: March-April and July to September. Nest, as in 1498. Eggs, 3 or 4, sometimes 5, similar to those of *curritans*. Average size of 50 eggs 15.7 × 11.9 mm (Phillips).

MUSEUM DIAGNOSIS. As richly coloured as *salimalii* but distinguished by its much larger bill. Complete moult takes place in October.

MEASUREMENTS

WARBLERS 39

STATUS, DISTRIBUTION and HABITAT. Common resident. Nepal (one Hodgson specimen), Sikkim, Bhutan, Arunachal Pradesh (?), the Patkai Range, Nagaland, Manipur, Meghalaya and Mizoram; Bangladesh south to the Chittagong Hill Tracts. Also northeastern Orissa in the Simlipal hills (Mukherjee, *Rec. Indian Mus.* 50: 166). Breeds in the foothills up to

Prinia r. rufescens

Distributional range

c. 1200 m (Sikkim) and up to 1800 m, mostly 500-1200 m in the eastern hills. Affects long grassland or patches of light grass under groves of deciduous trees, and low *Eupatorium* and other weeds and scrub on openly forested hillsides, terraced cultivation, fringes of forest and secondary growth. More of a forest bird than *P. hodgsonii*, though it seldom nests inside forest.

Extralimital. Extends east to Vietnam. Other subspecies in southern Thailand and Malaya.

GENERAL HABITS. Keeps singly, in pairs or small parties. Seldom shows itself except for momentary glimpses as it makes short, jerky flights of a few metres to dive into cover again. Thereafter its presence is revealed only by the slight movement of herbage which marks its progress through the stems. Occasionally found in hunting parties with *Stachytis* or other skulking babblers. Habits very similar to those of *Prinia hodgsonii* (1503), q.v.

FOOD. Insects.

VOICE and CALLS. 'A feeble seep (or sip), seep, seep... confusable with notes of *Rhipidura hypoxantha* or *Scircus burkii*' (SA). Described also as rather harsh grating or churring trills, and a continual monotonous chip, and a double chip-wee chip-wee. Song said to be similar to that of *P. hodgsonii*, but no comparable description available.

1501. **Rufous Wren-Warbler.** *Prinia rufescens rufescens* Blyth

Pr. (inia) rufescens Blyth, 1847, Jour. Asiat. Soc. Bengal 16: 456 (Arracan)

Franklinia rufescens austeni Baker, 1924, Bull. Brit. Orn. Cl. 44: 39 (Lhota, Naga Hills)

Franklinia rufescens assamensis Baker, 1924, Fauna Brit. Ind., Bds. 2: 427. *Nom. nud.*

Baker, FBI No. 829, Vol. 2: 427
Plate 84, fig. 16

LOCAL NAME. *Daousta gajao* (Cachari).
SIZE. Sparrow — ; length c. 11 cm (4 in.).

FIELD CHARACTERS. A slim, skulking wren-warbler with a long graduated black-and-white-tipped tail carried almost erect and incessantly shaken up and down.

Above (including tail), rufous brown; crown and nape ashy brown in summer, almost concolorous with back in winter. Lores and supercilium buff. A pale eye-rim. Below, pale buff, more ochraceous on flanks and lower belly. Sexes alike.

Recognized by its rufous back and tail. The very similar *P. hodgsonii* (1503) has a grey tail (also black-and-white-tipped), a shorter supercilium and, in summer, a diffuse grey band across the breast. *P. subflava* (1511) is sand-coloured above (including tail which lacks the white terminal spots), nearly white below. *P. sylvatica* (1521) is darker above and has a brown tail. *P. socialis* (1517) has a grey crown, white lores but no supercilium. *P. cinerocapilla* (1507) has a grey crown, blackish lores and a narrow rufous supercilium.

40 SYLVIINAE

BREEDING. Season, April to September, chiefly May and June. Nest, similar to that of *P. hodgsonii*. Eggs also similar, but larger, and as a series somewhat bluer. Average size of 200 eggs 16.1 x 11.8 mm (Baker). Building and incubation by both sexes.

MUSEUM DIAGNOSIS. For details of plumages see Deignan, loc. cit., p. 2. Distinguished from *P. hodgsonii* as follows:

<i>P. hodgsonii</i>	<i>P. rufescens</i>
Upperparts duller, more olive; tail grey-brown	Upperparts brighter, more fulvous, tail bright fulvous
Summer plumage	
Upperparts and tail uniform leaden grey, wings washed with dull chestnut. Underparts pale fulvous white, a leaden grey band across breast.	Upperparts fulvous brown, crown and nape leaden grey, wings washed with dull chestnut. Underparts fulvous white, warmer on sides of breast and flanks.

P. rufescens generally has a heavier bill.
Young, like adult in fresh winter plumage but paler above and more or less washed with yellow on belly.

MEASUREMENTS	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	43-47	c. 11	c. 20	summer 30-47 winter 48-67 mm (Baker)

Bill from skull 12-13 mm (SA)
Weight 8 ♂ ♀ 6-7 g (SDR).
COLOURS OF BARE PARTS. Iris pale brown. Bill black, edges of lower mandible paler. Legs and feet flesh-colour.

1502. **Northern Ashy-grey Wren-Warbler.** *Prinia hodgsonii rufula* Godwin-Austen

Prinia rufula Godwin-Austen, 1874, Proc. Zool. Soc. London: 47 (Naga Hills)

Baker, FBI No. 827 (part), Vol. 2: 425

LOCAL NAMES. *Dao pitti*, *Daotih-pitti* (Cachari).
SIZE. Sparrow — ; length c. 11 cm (4½ in.).

FIELD CHARACTERS. As in 1503. Distinguished from *P. rufescens* by the grey (v. rufous) tail, and in summer by the cloudy grey band across breast. For distinction from other species, see 1501, Field Characters.

WARBLERS

41

STATUS, DISTRIBUTION and HABITAT. Common resident, locally subject to slight downward movements during cold weather. The Himalayan foothills from the Indus river east to Arunachal Pradesh including the Sadiya

Prinia hodgsonii

Distributional ranges

rufula (1502)

hodgsonii (1503).

albogularis (1504).

pectoralis (1505).

Frontier tract; Nagaland, Manipur, Meghalaya, Assam and most of Bangladesh south to the Chittagong region; from the plains generally to c. 1200 m, locally up to 1600 m (Simla, Nepal) or 1800 m (Meghalaya); also breeds in the plains of Bangladesh and Assam. Affects scrub and grass jungle, forest clearings, cultivation and bushes in and around villages. A bird of bushes rather than grass.

Extralimital. Burma. The species extends to Yunnan and Vietnam.

GENERAL HABITS and FOOD. As in 1503.

VOICE and CALLS. A distinctive *cheu-cheu-cheu* and a rapid, trilling *tut-tut-tut* (Smythies). For description of song see 1503.

BREEDING. *Season*, correlated with the rains: mostly from mid June to September, but sometimes as early as April, especially in Assam. Two or three broods may be reared. *Nest*, a rough cup of grass and fibres built inside a broad, pendent leaf, rarely two or three, the edges of which are sewn together to form a cone. The nest and method of supporting it closely resemble the Tailor Bird's, except that the structure is more globular and the cup usually not lined with felted flower-heads of grasses; normally placed less than half a metre or so from the ground. *Eggs*, 3 or 4, very variable: white or pale blue, sometimes unspotted, more often marked with pale reddish to reddish brown specks and spots distributed fairly evenly over the

WARBLERS

43

FIELD CHARACTERS. A small, rufous brown wren-warbler recognized mainly by its longish grey tail tipped with black and white. Sexes alike.

x c. 1

P. buchanani has a rufous forehead, very dark brown tail (similarly black-and-white-tipped) and white underparts, and is more terrestrial. *P. socialis* has grey crown and sides of head. For distinction from other unstreaked species, see 1501, Field Characters.

STATUS, DISTRIBUTION and HABITAT. Common resident. The Indian Peninsula between Pakistan and Bangladesh, and between the ranges of *rufula* (Himalayan foothills etc.) and *albogularis* (southwestern India); in the plains and hills up to at least 1000 m. May be subject to local movements: occurs commonly in the plains of Madhya Pradesh during winter but has been noted as absent during the rains. Affects scrub jungle with coarse grass and thorn bushes, mango groves and deciduous forest with rank undergrowth, gardens, bushes and hedgerows in cultivation, and to some extent bamboo jungle, mangrove swamps and reeds.

GENERAL HABITS. Keeps singly or in pairs during the breeding season, otherwise in roving parties of five to ten, sometimes up to twenty or more individuals. More gregarious than *P. subflava* but otherwise very similar to it in habits. Works its way through undergrowth, hunts among twigs and foliage of small trees, and flits jerkily from bush to bush with a constant flicking of the tail, the birds loosely following one another. Rather noisy and conspicuous in the breeding season when the males sing vehemently from exposed situations. Pairs form between March and May according to local weather conditions.

Display. A lively and spirited performance. The male mounts to a prominent perch on a bare tree- or bush-top and excitedly warbles his loud, squeaky song (see below). Another turn in the display consists of some spectacular aerobatics when the bird springs up in the air and executes a series of vertical wave-crests and steep nose-dives in quick succession, to the accompaniment of the song (SA).

FOOD. Chiefly insects: ants, tiny beetles, caterpillars, etc. Also takes nectar from blossoms of *Butea*, *Erythrina*, *Bombax*, *Woodfordia*, etc. and often carries pollen adhering to forehead feathers.

VOICE and CALLS. Conversational call-notes, an incessant tinkling *zee-zee-zee* or *pree-dee-dee* as the birds move along. During the breeding season the male pours forth a vehement, squeaky song from a bush-top: *chizwee-chizwee-chip-chip-chip* (or *yousre-yousre-yousre-which-which-which-which*). The *chizwee* portion starts low and feebly and is quickly repeated three or four times. It rises in pitch at each successive note and ends loudly and abruptly after the third or fourth *chip* (SA). Reminiscent of the song of *P. socialis* in overall pattern yet distinct enough to be unmistakable.

BREEDING. *Season*, from the middle of June to October, chiefly July and August, during the height of the monsoon. Also in February-March (Gujarat — Dharmakumarsinhji). *Nest* (of Tailor Bird type), and eggs, as in 1502.

MUSEUM DIAGNOSIS. For details of plumage see 1502.

Differs from *rufula* in being more greyish and pale olive-brown above and on the

42

SYLVIINAE

whole surface. Unspotted eggs are much more common in the early part of the year than later. Out of 178 eggs laid in April-June, 60 were plain blue and 12 plain white; of 266 eggs seen in July-September, only 9 were unspotted blue and 2 white (Baker). Average size of 400 eggs 14.7 × 11.7 mm (Baker). Building and incubation by both sexes; construction takes four to eight days; eggs deposited before completion of nest. Incubation period ten or eleven days, generally the latter.

MUSEUM DIAGNOSIS. Summer plumage: Upperparts, hair brown tinged rufescent on mantle, rump and upper tail-coverts. Supraloral region concolorous with crown. Swollen edges of eyelid orange, tiny feathers of both eyelids slaty. Underparts, white with a broad pectoral band and flanks deep ashy grey, the throat and centre of abdomen washed with cream.

Winter plumage: Upperparts, dark olivaceous brown suffused with rufescent, faintly on forehead, crown and nape, more strongly on mantle, conspicuously on rump and upper tail-coverts. Supraloral streak ashy white. Edges of eyelids neither swollen nor brightly coloured, the tiny feathers of the upper eyelid mixed ashy, grey and white, those of the lower eyelid white. Underparts, white (more or less sullied with ashy grey on breast and upper flanks) washed with cream which posteriorly changes to light rufous cream (Deignan).

Differs from the peninsular *hodgsonii* (1503) in being a warmer rufous olive-brown above and on edges of wing; flanks washed with rusty cream. According to Ticehurst & Whistler (*Ibis* 1939: 762) birds from the Himalayan foothills have no pectoral band.

For details on moults see 1503. Tail shorter in summer, longer in winter (data not available but see 1504 for comparative measurements).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail (March to June)

SYLVIINAE

edges of wing. Flanks suffused with cream. *Albogularis* is slate-brown above, almost pure white below, and also has a grey pectoral band in summer. For distinction from *P. rufescens* see 1501, Museum Diagnosis.

This species usually has two or three filoplumes projecting behind nape. Tail with 12 rectrices.

Young resembles adult in winter plumage but upperparts, edges of wing and tail more rufous; underparts pale yellow, buffish on flanks and thighs.

Postjuvinal moult to winter dress complete. Prenuptial moult complete and takes place about the end of February to beginning of April. Postnuptial moult complete and takes place in October, November and December (Ticehurst & Whistler, 1939, *Ibis*: 761-3).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
10 ♂♂	44-51	11-13	18-20	46-58 mm

Weight 8 ♂♂ 5-9 (av. 6.4) g — SA.

COLOURS OF BARE PARTS. Iris yellow to orange-brown; eye-rim brownish yellow. Bill black, commissures and tip paler; mouth black or dark brown (pale flesh with brown blotches in juvenile). Legs and feet pale yellow, brownish fleshy or yellowish fleshy.

1504. Southern Ashy-grey Wren-Warbler. *Prinia hodgsonii albogularis* Walden

Prinia albogularis Walden, 1870, Ann. Mag. Nat. Hist. 5: 219 (Coorg)

Baker, FBI No. 827 (part), Vol. 2: 425

LOCAL NAMES. *Telikkurēri* (Malayalam); *Kosa ketai*, *Nenni chirai* (Tamil).

SIZE. Sparrow —; length c. 11 cm (4½ in.).

FIELD CHARACTERS. As in 1503, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to some seasonal local movements. The southern Indian Peninsula including Kerala, western Tamil Nadu, southern Mysore and the Eastern Ghats north to the Vishakhapatnam district; in the plains and hills up to c. 1500 m but mostly under 1000 m. Affects thorn scrub, lantana brakes and deciduous jungle with tall grass and bushes and, to some extent, coffee plantations.

GENERAL HABITS, FOOD and VOICE. As in 1503.

BREEDING. *Season*, April to August, chiefly July and August during the height of the monsoon. *Nest*, built in large-leaved herbaceous plants growing in the open among long grass, of two types: one is a cup of fine grass flower-heads, lined with still finer grass stems, slung by threads of cobweb round the rim to the underside of a broad leaf which forms a lid, leaving a small entrance where the leaf-stalk joins the stem of a plant. The other type is similar to that of the Tailor Bird: the two sides and the end of a large leaf are sewn into a bag and the nest proper built inside (Betts). *Eggs*, normally

WARBLERS

45

3, similar to those of *rufula* (1502), q.v.; breeding biology as of that subspecies.

MUSEUM DIAGNOSIS. For details of plumage see 1502. Differs from *hodgsonii* in being more slate-brown above; edges of wings brown; flanks and underparts almost pure white, without a cream wash. Differs from *pectoralis* of Ceylon in having the grey pectoral band less marked.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail	
♂♂	45-52	12-13	17-19	summer	winter
♀♀	42-48	12	17-19	45-50	55-57 mm
				39-50	55 (one) mm (SA)

COLOURS OF BARE PARTS. Adult: Iris straw colour. Bill black; horny at base of lower mandible; mouth slaty brown and pink or pinkish brown. Legs and feet brownish flesh; claws horny brown. Immature: Iris orange-straw. Bill dark horny brown, paler at commissures and gape; mouth pale yellowish cream with slaty blotches. Legs and feet yellowish flesh; claws horny brown.

1505. Ceylon Ashy-grey Wren-Warbler. *Prinia hodgsonii pectoralis* Legge

Prinia pectoralis Legge, 1874, Ceylon Blue Book: 9
(Hambantota District, Ceylon)

Baker, FBI No. 827 (part), Vol. 2: 425

LOCAL NAMES. Hambu-kurulla (Sinhala); Timu-kürini (Tamil).

SIZE. Sparrow —; length c. 11 cm (4½ in.).

FIELD CHARACTERS. As in 1503 but with a grey breast-band throughout the year. Female differs in having this band incomplete in the middle. The pectoral band identifies this bird in Ceylon.

STATUS, DISTRIBUTION AND HABITAT. Resident, moderately plentiful. The eastern and southeastern part of Ceylon from Mankulam in the Northern Province (*Spolia Zeylanica* 28: 190) south to Tangalla, and inland to the foothills of the Uva and Central provinces; in the low-country Dry zone and Hill zone up to 900 m or a little higher. Affects scrub country and parkland, preferring bushes and small trees to grass.

GENERAL HABITS AND FOOD. As in 1503.

VOICE AND CALLS. A rapid chatter of three to five notes *chechecheh*, less loud and less musical than a very similar note produced by *P. socialis* (Henry). See also 1503.

BREEDING. Season, March to June, perhaps extending till October. Nest and eggs, as in 1504.

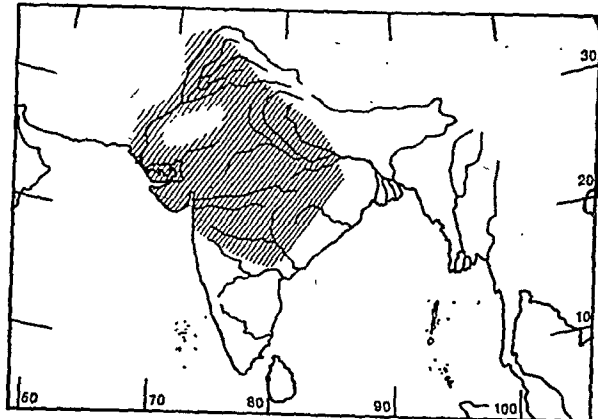

MUSEUM DIAGNOSIS. Differs from peninsular races in having winter and summer plumages alike, both of the summer type, i.e. with the grey pectoral band present the year round. This band is also better marked.

Young, dark brown with an olive tinge above, becoming almost greenish on crown. Wings and tail as in adults. Underparts white, washed with fulvous brown on flanks and greyish olive on sides of breast. No pectoral band.

Moult sequence unclear. Some birds collected in May, August and October were in complete moult while others were in fresh plumage.

WARBLERS

47

Prinia buchanani

▨ Distributional range

but is more terrestrial-feeding than either. Hops on the ground among grass tussocks and thorn scrub, tail slightly cocked, looking very much like *Scotocerca*; also creeps about in bushes, loosely switching the tail — then suggesting a miniature Common Babbler (*T. caudatus*, 1254).

FOOD. Insects and larvae.

VOICE AND CALLS. A lively reeling, twittering song consisting of 'a trill followed by a triple note like *sirigel-sirigel-sirigel*' (Basil-Edwardes), given vehemently from an exposed twig or a bush-top, tail spread out and partially cocked, showing off the white tips prominently; reminiscent of the song of *P. socialis* but distinct enough to be quite unmistakable. May be heard from February onward. Call-note, a shrill *chirrup* constantly uttered while foraging.

BREEDING. Season, mainly during the monsoon, i.e. end of June to September; breeds earlier in the western part of its range (Gujarat, Rajasthan and Pakistan) where nesting has been recorded from March to August. Nests also found in October and December. Nest varies from a cup-shaped to a domed, oblong purse-like structure with entrance near top (the latter type more common) made of fine grass and silky fibres and lined with finer grass and vegetable down; placed in a grass tussock or thorn bush, usually within a metre from the ground. Eggs 4 or 5, white, faintly tinged with pink or bluish, profusely speckled and spotted with reddish brown or deep chestnut. Average size of 100 eggs 15.9 × 12 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters. This species has twelve rectrices. A complete moult takes place in May and June, and again in October-November.

46

SYLVIINAE

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	45-48	13-14	18-20	42-47 mm
♀♀	43-46	c. 13	17-18	(summer) 40-44 mm (summer) (HW)

It is not known whether there is a seasonal variation in the length of tail.

COLOURS OF BARE PARTS. Iris reddish. Bill blackish. Legs and feet fleshy yellow.

1506. Rufous-fronted Wren-Warbler. *Prinia buchanani* Blyth

P. (Prinia) buchanani Blyth, 1844, Jour. Asiat. Soc. Bengal 13: 376, new name for *Prinia rufifrons* Jerdon, 1840, *see Prinia rufifrons* Rüppell, 1835

(neighbourhood of Jalna, northwestern Hyderabad)

F. (ranklinia) eleghorniae Blyth, 1867, Ibis: 24 (northwest of Delhi)

Baker, FBI No. 831, Vol. 2: 429

Plate 85, fig. 8

LOCAL NAMES. *Chihio* (Sind); *Lālbhālāi fūdkī* (Gujarati).

SIZE. Sparrow —; length c. 12 cm (5 in.).

FIELD CHARACTERS. Above, forehead and crown rufous; lores and a narrow supercilium whitish. Back grey-brown. Tail dark brown with broad white tips (except on central pair of rectrices) showing up as a conspicuous white fringe when tail fanned while bird alighting. Below, whitish, tinged with fulvous on flanks and vent. Sexes alike.

In worn plumage the white tips of rectrices become abraded and the bird looks confusingly like *P. subflava*; the rufous forehead provides a clue to its identity but is sometimes very faint; tail darker. *P. sylvatica* is larger, lacks the white tips to tail-feathers and has buff underparts. *P. hodgsonii* is olive-brown above and has a buff belly. For other species see 1501, Field Characters.

STATUS, DISTRIBUTION AND HABITAT. Common resident, locally subject to some seasonal movements. Pakistan in the plains of the upper Indus river system from Peshawar and Bannu (summer only) north to the Himalayan foothills, south at least to Bahawalpur; the southern part of Pakistan from the Hab river valley in Baluchistan east through Sind (northern extension not known), and India from Punjab: Rajasthan (Jodhpur dist.), N. Gujarat (including Kathiawar and Kutch) east to Bihar (Palamau) and south through the central tableland to Andhra Pradesh (common around Secunderabad — R. Sparrow in *epist.* to HW) and central Maharashtra (Ahmednagar). Affects arid scrub jungle mixed with coarse grass, babool scrub in ravines, and stony semi-desert studded with *Capparis*, *Prosopis* and *Zizyphus* bushes, occasionally entering nearby high crops (paddy, wheat, mustard). Prefers a drier biotope than *P. hodgsonii*.

GENERAL HABITS. Keeps in pairs or in small parties according to the season, frequently in company with *Prinia hodgsonii* and *Chrysomma sinense*.

SYLVIINAE

48

Young, like adult but paler above; crown concolorous with back, supercilium whiter. Postjuvénal moult complete.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail	
♂♂	51-55	12-14	18-19	summer	winter
♀♀	47-51	12-14	17-19	53-56	61-70 mm
				51-60	68 (one) mm (SA)

Weight 3 oo? 5-9 g (SA).

COLOURS OF BARE PARTS. Iris yellow-brown. Bill brown, flesh-colour at base, darker in summer. Nestlings have two black spots on tongue. Legs and feet pale flesh.

1507. Hodgson's Wren-Warbler. *Prinia cinereocapilla* Hodgson

Prinia cinereocapilla Hodgson, 1854, in Horsfield & Moore, Cat. Bds.

Mus. E.I. Co. 1: 322 (Nepal)

Baker, FBI No. 830, Vol. 2: 428

Plate 84, fig. 15

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 11 cm (4½ in.).

FIELD CHARACTERS. Above, forehead and a narrow supercilium rufous, this colour sometimes reduced or completely absent; lores blackish. Crown, nape and sides of neck dark grey; rest of upperparts dark rufous. Tail rufous-brown with a subterminal dark brown patch on rectrices. Below, fulvous, darker on lower flanks and vent. Sexes alike.

The dark grey cap and very rufous back and wings identify this species.

STATUS, DISTRIBUTION AND HABITAT. A little known, yet fairly common resident species within its very restricted range. The Himalayan foothills, duns and bhabar from Kumaon through Nepal, Darjeeling, Sikkim and Bhutan. Also North Cachar, where it is very rare (Baker, JBNHS 9: 15); from the edge of the plains to c. 1350 m. Affects dense jungle, secondary growth and trees.

GENERAL HABITS. Little known except that it is more arboreal than other wren-warblers; also found in company with *P. hodgsonii*.

FOOD. Insects; flower-nectar.

VOICE AND CALLS. 'A trilled note with a rising inflection (like an *iors*), then a loud drawn out *swe-e-e-e-chor*' (Fleming & Traylor). Song said to be 'quite different from that of any other *Prinia*, better and more varied' (Brooks, SF 3: 242).

BREEDING. Season, about June. Nest, very similar to that of *P. hodgsonii*, made of fine grass and enclosed in a single broad leaf, the edges of which are stitched with cobweb and the feathery ends of grasses forming the container. Eggs, pale blue, spotless; clutch size unrecorded. Average size of 10 eggs from North Cachar 15 × 10.7 mm (Baker, JBNHS 9: 15). Two eggs from Bhutan measured 16.1 × 11.7 and 16 × 11.6 mm (Baker, 1933).

MUSEUM DIAGNOSIS. See Field Characters. Tail with 12 rectrices. For discussion on variation of amount of rufous on head, see Biswas, JBNHS 59: 427. Young undescribed.

Baker, FBI No. 931, Vol. 2: 526

Plate 85, fig. 7

LOCAL NAMES. *Pitāk* (Brahui); *Door* (Sind); *Khār phūtki* (Hindi); *Vid fūtki* (Gujarati).

SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. Above, pale drab brown, crown and back with dark streaks. Lores and round the eye whitish. Tail long, graduated, faintly cross-barred, the rectrices tipped whitish with a subterminal dusky spot. Below, whitish, washed with buff on lower belly. Sexes alike. Superficially a tiny miniature of Common Babbler (*Turdoides caudatus*) except for tail tip.

Small size and paleness distinguish it from the other two streaked wren-warblers (1527, 1531, qq.v.).

STATUS, DISTRIBUTION AND HABITAT. Common resident. Pakistan from Kohat and the Himalayan foothills south through the plains of the Indus and Quetta, and west through Baluchistan to Iran; India in Gujarat (Kutch, Kathiawar and east to Cambay), western Rajasthan, Punjab and the Gangetic Plain east through Bihar; in the foothills of Pakistan up to c. 1000 m. Affects tamarisk jungle, rank herbage, sarkhan grass (*Saccharum*) and scrub, particularly along rivers, canals, jheels and on river islands; also more sparingly in sandy, semi-desert country with scrub and coarse grass tussocks.

Extremal. Extends westward through SW. Afghanistan and Iran. The species ranges to Egypt and Somalia.

GENERAL HABITS. Lives in pairs or small loose parties according to the season. Flies from bush to bush in search of food, just above the ground, occasionally up to c. 4 metres. On the ground, hops about energetically and will make a long spring if necessary to secure an insect. All the while flicks the wings like a *Phylloscopus* and loosely switches its tail from side to side with a slight upward flick. Slips smoothly through grass, clinging sideways

¹ The observation by Proud attributed to this species by Biswas (JBNHS 59: 427), pertains to *Fredericia gracilis* (= *Prinia hodgsonii*). However, see next subspecies.

51

snatches may be heard in October, December and January. Call-note, a drawn out *breep* or *izeep* uttered by both sexes to keep in touch. Alarm-note a few *trrt-trrt-trrt* with a slight inflection at the end of each note, which may develop into a reeling succession of notes slurred together in a fast, ticking stream. Also a flat *jit* of threat (Simmons). A bill-snapping noise, noted by some observers in India, is not mentioned by Simmons who describes (p. 268) wing-snapping flight and display. (See also p. 292 of same paper for wing-snapping in the Sylviidae.)

BREEDING. Season, February to October with two peak periods: March-April, particularly in the western part of its range where suitable vegetation is found along rivers, and, for the majority, July-August, especially in the east where suitable vegetation is governed by the monsoon; the same peculiarity is apparent in *Cisticola juncidis cuscatus*, *Prinia h. hodgsonii* and *Prinia buchanani*. Nest, a domed structure or upright oval pouch, very like that of *P. s. inornata* (1511), with the entrance-hole about two-thirds of the way up; woven mostly of dry grass bound with vegetable down or cobweb, and lined with downy vegetable matter. It is placed in bushes or clumps of grass, usually within a metre from the ground. Nest-site selected by male. Construction almost entirely by male, helped by female mainly with the lining. Eggs, 3 to 5, normally 4, pale greenish profusely covered with small, light to dark reddish blotches. Average size of 100 eggs 13.8 × 10.7 mm (Baker). Incubation by both sexes, share not determined; period 12 days ± 1 day. Brooding, feeding young, and nest sanitation by both sexes, chiefly by female; male takes over feeding of juveniles, presumably while female prepares for another brood. Two broods are reared in one peak period. For further details of breeding biology see Simmons, loc. cit.

MUSEUM DIAGNOSIS. See Field Characters and keys to the Species and Subspecies. Tail graduated, of ten rectrices.

Young, like adult, but streaks on upperparts broader and more shadowy; a distinct yellow tinge on the sides of neck and upper breast.

Two moults a year, before and after reproductive activity.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail summer winter
♂♂	43-46	c. 12	17-18	59-61 68-72 mm
♀♀	40-45	11-12	17-18	54-55 68-71 mm

(SA, HW)

COLOURS OF BARE PARTS. Iris yellow to brown. Bill: winter, brown above, yellowish brown below; summer, black; inside of mouth black during the breeding season, this colour being lost during the postnuptial moult and regained during the spring one. Legs and feet pale flesh.

1509. Eastern Streaked Wren-Warbler. *Prinia gracilis steerei* Hartert

Prinia gracilis steerei Hartert, 1923, Bull. Brit. Orn. Cl. 18: 132

(N. Lakhimpur)

Baker, FBI No. 932, Vol. 2: 527

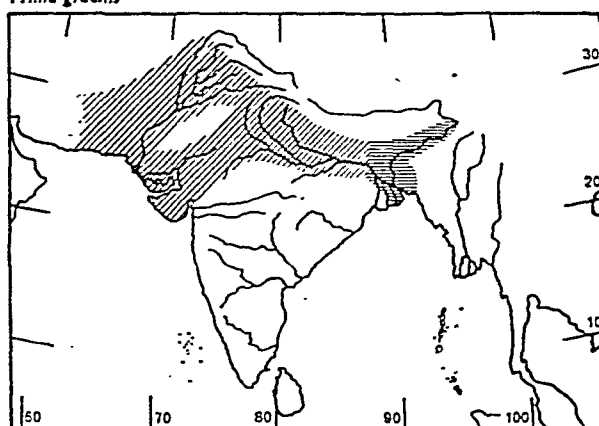

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 13 cm (5 in.).

Prinia gracilis

Distributional ranges

▨ *lepida* (1508).

▨ *steerei* (1509).

to stems and slipping down like a reed warbler. Occasionally catches an insect in flight or hovers to pick a caterpillar off a leaf. Flight jerky, undulating, characteristic of the genus.

Display. 'The male shoots almost vertically upwards for a few feet with very rapid movements in which the wings are used extremely quickly and the tail cocked up repeatedly, giving the whole display a jerky nature. When the peak of the ascent is reached the bird may either flit about erratically before perching again, or dive straight down to its original post before repeating the performance. All the while, a triple wing-snapping is heard, sounding like a quick, crackling *brmp-brmp-brmp*. Wing-snapping is essentially a reaction to other individuals of the same species and is confined to the reproductive cycle. Female does a less intense snapping and jerky flight as predator reactions, but in threat and not in sexual circumstances.' For other forms of display (bowing, flicking and wing-fanning) as well as an excellent study of the behaviour and biology of this species in Egypt, see K. E. L. Simmons, 1954, *Ibis* 96: 262-92.

FOOD. Grasshoppers, small beetles, caterpillars and other insects; spiders. Also a small amount of vegetable matter.

VOICE AND CALLS. Song, a wheezy, reeling warble, of similar pattern to that of *P. s. inornata* (1511) and often indistinguishable from it. A hard, thin, somewhat slurred and disyllabic note delivered in phrases of from one to fifteen, sometimes up to thirty, sung persistently and monotonously in fast, non-stop succession — *ze(r)uitze(r)uitze(r)uit*... Sings from a vantage point, the black gape very conspicuous. Song also given during wing-snapping display; uttered regularly from February to September but

SYLVIINAE

FIELD CHARACTERS. As in 1509, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident, locally common. The plains of the Brahmaputra and Ganges rivers. Recorded from the Subansiri river, Dibong, Tezpur, Dacca, and the Morang district of southeastern Nepal. Affects tall grass in sandy areas along the margins and on islands of big rivers.

GENERAL HABITS, FOOD AND VOICE. As in 1508.

BREEDING. Nests found in April. Season, probably as in 1508. Nest, and eggs as in 1508. Average size of seven eggs 13.7 × 10.9 mm (Baker).

MUSEUM DIAGNOSIS. Like *lepida* but darker above, and underparts tinged with brown rather than fulvous.

MEASUREMENTS AND COLOURS OF BARE PARTS. As in 1508.

Dryocopus territorial Hume, 1874, Nests and Eggs of Indian Birds: 349
(N.-W. India = Oudh, Agra)

Baker, FBI No. 940 (part), Vol. 2: 534

LOCAL NAME. *Phūtki* (Hindi).

SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. As in 1511, q.v. See Key to the Subspecies and Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. The commonest and most widespread wren-warbler; locally subject to short-range seasonal movements, especially in the north. The plains of Pakistan from N.W.F.P. (Peshawar, Thal, Bannu) and eastern Baluchistan (Hab valley and probably the Sibi plain) east to northwestern India in Punjab, Rajasthan and Gujarat. Eastern limit roughly a line from Baroda to the extreme western Nepal terai, east of which it intergrades with the adjacent subspecies (1511, 1512). In the Himalayan foothills up to c. 800 m, in smaller numbers up to c. 1200 m. Affects tamarisk and thorn scrub jungle mixed with tall grass (*Saccharum* etc.) and cultivation, especially wheatfields. Commoner near water, but more tolerant of arid conditions than *P. socialis*, being met with also in sandy or stony semi-desert. Often found in same flocks as *P. gracilis*.

GENERAL HABITS, FOOD AND VOICE. As in 1511.

Prinia subflava

- terricolor (1510).
- inornata (1511).
- insularis (1514).

- fusca (1512).
- franklinii (1513).

BREEDING. Season, overall March to October but chiefly during the monsoon (June–September). Nest, as in 1511: purse-shaped type more common. Eggs, as in 1511.

MUSEUM DIAGNOSIS. Like *inornata* but paler. Colour of tail more uniform; dark subterminal bar obsolete. Tail of ten rectrices; longer in winter.

MEASUREMENTS

1511. Central India Plain Wren-Warbler. *Prinia subflava inornata* Sykes

Prinia inornata Sykes, 1832, Proc. Zool. Soc. London: 89 (Dukhun)
Baker, FBI No. 940 (part), Vol. 2: 534
Plate 85, fig. 12

LOCAL NAMES. *Phūtki* (Hindi); *Lota-kun-jitta* (Telugu); *Chitakul* (Saugor, M.P.).

SIZE. Sparrow; length c. 13 cm (5 in.).

FIELD CHARACTERS. A plain, sand-coloured wren-warbler with a longish, graduated tail; in the peculiar jerky switchback flight it gives the impression of being too heavy for the bird. Above, sandy brown; lores, narrow

MUSEUM DIAGNOSIS. See Key to the Subspecies.

As in the species *P. gracilis*, *P. socialis* and *P. sylvatica*, *P. subflava* also has a summer and winter plumage, both alike in the south but markedly different in colour and in length of tail in the north.

Winter: Upperparts strongly rufescent; lower parts warm buff; wings hair-brown, margined with dull ferruginous. Tail long, deeply graduated, rufescent brown with an imperfect subterminal dark bar and a pale tip. Bill brown, with the greater part of the lower mandible yellowish horny.

Summer: Upperparts dull earthy grey-brown; lower parts white with a faint yellowish tinge; wings earthy brown, margined albescent. Tail shorter and less graduated than in winter, the lateral rectrices growing paler towards the outermost pair which is almost white. Subterminal dark bar and pale tip usually absent from central rectrices. Bill black, yellowish at the extreme base of the lower mandible.

Summer and winter plumages are each preceded by a complete moult from March to May and July to November. Many individuals breed during the moult, contrary to the normal procedure in birds.

Young, somewhat between winter and summer dress of adult: upperparts more rufescent than summer but less rufescent than winter; tail length about as in summer. Postjuvénal moult complete.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail	
				summer	winter
♂♂	46–54	12–14	18–20	48–57	53–80 mm

COLOURS OF BARE PARTS. Iris orange-yellow or brownish orange. Bill black (summer), brown (winter), yellowish at base of lower mandible; inside of mouth blackish brown (summer); pinkish, pale pink or pale yellowish flesh streaked with brown (winter). Legs and feet brownish yellow; claws brown.

1512. Eastern Plain Wren-Warbler. *Prinia subflava fusca* (Hodgson)

Drymocha fusca Hodgson, 1845, Proc. Zool. Soc. London: 29 (Nepal)
Baker, FBI Nos. 940 (part) and 942 (part), Vol. 2: 534, 536

LOCAL NAME. *Niongho* (Lepcha).

SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. As in 1511, q.v.

STATUS, DISTRIBUTION and HABITAT. Common resident. From the extreme western Nepal terai east through northern Bengal (Darjeeling and Jalpaiguri districts), Sikkim, Bhutan and Arunachal foothills, Assam, Nagaland (?), Manipur and Bangladesh to the Chittagong region; intergrades with *inornata* in lower Bengal and presumably along the northern Gangetic Plain. Ascends the hills to c. 1200 m. Affects high grass in open fields, reeds along streams, secondary growth and mixed bamboo and scrub jungle.

Extralimital. The species extends east to Vietnam and south to Java.

GENERAL HABITS, FOOD and VOICE. As in 1511.

BREEDING. Season, March to October, chiefly May to July. Nest and eggs, as in 1511. Average size of 200 eggs 15.5 × 11.4 mm (Baker).

supercilium and sides of head creamy white. Outer rectrices whitish. Below, entirely cream-coloured, more yellow in fresh nuptial plumage. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Common resident. Central India east of the range of *terricolor* (1510, q.v.) and from the Gangetic Plain in Uttar Pradesh, Bihar and lower Bengal, south through Tamil Nadu, but exclusive of the range of *franklinii* (1513). Affects scrub and boulder country, rank grassland, thorn thickets mixed with high grass, wild cane and tall grass in damp situations, and open cultivation with suitable high crops; also mangroves and salt-marsh vegetation in coastal areas. As a rule frequents a less dry facies than typical of *P. sylvatica* and less wet than that of *P. socialis*.

GENERAL HABITS. Found in pairs or small parties according to the season. Flits, clambers and creeps about among grass and bushes in the erratic, jerky manner of most wren-warblers, tail erect and loosely flicked up and down and sideways.

FOOD. Insects: caterpillars, ants, small beetles, etc. Flower-nectar: *Salmalia*, *Erythrina* and other species.

VOICE and CALLS. Call-notes, a rather plaintive *tee-tee-tee* (SA); other notes recorded as *kink*, *kink*... or *chi-up* rapidly repeated many times. Alarm-note (or wing-snapping ?) rendered as *creak*, *creak*, *creak* like sharply striking the point of a quill across a comb (cf. Ashy Wren-Warbler, 1517). Song, reminiscent of a grasshopper, more wheezy and insect-like than that of the Ashy Wren-Warbler: a rapid *tick-tick-tick*... sustained sometimes for ten seconds or more without a pause; given lustily from a prominent perch, on a reed or bush-top, with the body flattened down, head thrown back, tail fanned out, and an excited opening and shutting of wings; sometimes in jerky switchback flight. A wing-snapping is heard when the bird is disturbed from the nest. (See 1508, General Habits, for details and putative meaning of wing-snapping.)

BREEDING. Season, chiefly June to October (monsoon). Nest, variable in shape and structure. Commonest type a deepish, oval or pear-shaped pouch of loosely interwoven thin grass strips (loofah-like) with a lateral entrance-hole at or near the top, the material sometimes forming a dome and partially concealing the orifice. At other times it is more or less open at the top and has cobweb and vegetable down woven into the texture, thus recalling the nest of *Cisticola juncidis* (1498); attached to several upright grass stems or lentil stalks up to a metre or so from the ground. A less common type of nest is of the Tailor Bird pattern, supported between two or more broad leaves stitched together along the edges with fine grass or fibres. Nests usually devoid of lining; sited in a *Lantana*, *Zizyphus* or suchlike bush or grass tussock, commonly growing on bunds separating cultivated fields, especially inundated paddyfields. Eggs, generally 4 or 5, sometimes 3 or 6, variable in colour: usually pale blue with bold, deep reddish, blackish brown or purple spots, blotches and an intricate pattern of fine hairlines especially at the large end. For further details see Baker, *Nidification* 2: 488. Average size of 200 eggs 15.6 × 11.5 mm (Baker). Building and incubation by both sexes; incubation period 11 or 12 days. One pair under observation reared three successive broods and built but deserted a fourth nest.

MUSEUM DIAGNOSIS. Darker and more saturated than *inornata* with a more pronounced fulvous wash below.

MEASUREMENTS

FIELD CHARACTERS. As in 1517, q.v.

STATUS, DISTRIBUTION and HABITAT. Common resident. Pakistan in the plains of the upper Indus river system, and northern India from the Himalayan foothills [Jammu, Kangra, Kumaon bhabar and Nepal terai (*vide* Birwas, JBNHS 59: 425)] south through the Gangetic Plain, northern Madhya Pradesh and eastern Rajasthan to the Kathiawar peninsula, the

Prinia socialis

Distributional ranges

 <i>stewarti</i> (1515).	 <i>inglisii</i> (1516).
 <i>socialis</i> (1517).	 <i>breviceauda</i> (1518).

Narmada river and southern Bihar, intergrading along this limit with the nominate race. Ascends the hills to c. 1200 m. Affects *sarpat* grass, reeds on the margins of streams and ponds, scrub and grass near cultivation, grain fields and bracken-covered slopes in the foothills. Generally prefers a better-watered facies than *P. subflava*.

GENERAL HABITS, FOOD and VOICE. As in 1517.

BREEDING. *Season*, chiefly June to September (monsoon), but locally with a first period in April–May. *Nest and eggs*, as in 1517. Average size of 100 eggs 15.6 × 11.9 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *socialis* (1517) in having the rump and upper tail-coverts rufous-brown.

There is a marked difference between summer and winter plumage. In summer the back is uniform slaty grey; rump and upper tail-coverts rufous-brown; tail shorter. In winter the entire upperparts are dark rufous-brown washed with slaty on crown and nape; tail longer.

SYLVIINAE

60

fulvous tips and blackish subterminal spots. Below, throat whitish buff; rest of underparts strongly washed with ochraceous, especially on flanks and lower belly. Sexes alike.

The longish tail carried partially erect or cocked and loosely flicked up and down, together with slaty head and back and rufous underparts identifies this species.

STATUS, DISTRIBUTION and HABITAT. Resident, but unevenly distributed; locally common. The entire Indian Peninsula south of the Narmada river and southern Bihar; plains and hills up to the highest summits. Affects grassland and scrub on the banks of streams in deciduous facies, open scrub jungle, outskirts of cultivation, shrubbery in gardens, reed-beds in water-logged depressions, and grassy hillsides; mangroves in coastal areas.

GENERAL HABITS. Found singly or in pairs, hopping restlessly among grass stems and bushes, tail erect and constantly flicked about. When suddenly flushed on disturbance, as from nest, will fly from one clump of grass to the next in a curious jerky fashion, emitting with the mandibles (presumably) a peculiar crackling noise *kit, kit, kit* as of electric sparks. Will sometimes descend to the ground to take insects, hopping about with cocked tail.

FOOD. Insects, larvae, spiders, etc.; also flower-nectar (*Bombax*, *Erythrina*, and other species).

VOICE and CALLS. Call-note, a sharp, rather nasal *tee-tee-tee* uttered from time to time while hopping among the bushes. Song rather wheezy and chipping: a loud, sprightly *jinny-jinny-jinny* quickly repeated five or six times, usually delivered from the top of a grass stem or bush; sometimes also given while the bird flits about in erratic rising and falling courtship display, jerking its tail up and down and often fluttering its wings to the accompaniment of a peculiar clapping sound *frap, frap*.

BREEDING. *Season*, overall March to November but varying locally with incidence of rains: in central India mostly July–September; in Andhra chiefly during the latter part of the monsoon (September–November); in Kerala and Tamil Nadu, mainly April to July. *Nest*, more often of two types, both of which may be built by the same pair. One is a flimsily built cup placed in several broad leaves sewn together. A second type is an oblong purse of woven grass and fibres and vegetable felt with the supporting grass stems incorporated into the structure (Lowther). A third, but less frequent, type is a flimsy ball of grass, supported by grass and weeds (Bates). It is generally placed in bushes (*Lantana*, *Lecy*, etc.) within two feet (60 cm) from the ground and frequently near a stream. *Eggs*, 3 to 5, not distinguishable from those of *P. fusciventris*: a glossy uniform reddish brown or mahogany-red with often a darker ring around the large end. Average size of 60 eggs 16.2 × 12 mm (Baker). Building, incubation and care of young by both sexes. Incubation period about 12 days. Frequently brood-parasitized by Plaintive Cuckoo (*Cacomantis merulinus*, 584). Nesting subject to inordinately heavy depredation by snakes, lizards, crow-pheasants, mongooses, and other marauders.

MUSEUM DIAGNOSIS. There is little difference between summer and winter plumage, the latter only differing in the presence of a faint olive wash on the back, not always noticeable in worn plumage. Difference in tail length not so great as in northern birds. Summer plumage differs from that of the northern subspecies

WARBLERS

61

(1515) in the slate colour extending to the rump and upper tail-coverts. See also Key to the Subspecies.

The species undergoes a complete spring moult about April-May and a complete autumn moult about October-November.

COLOURS OF BARE PARTS. Iris and eye-rim rich orange-brown. Bill black; inside of mouth black in summer, brown, blackish brown or slaty pink in winter; mouth of nestlings bright orange-yellow. Legs and feet brownish yellow or brownish flesh; claws dusky.

1518. Ceylon Ashy Wren-Warbler. *Prinia socialis brevicauda* Legge

Prinia brevicauda Legge, 1879, Bds. Ceylon: 521 (Ceylon)
Baker, FBI No. 935 (part), Vol. 2: 530

LOCAL NAMES. *Hambu-kurullis* (Sinhala); *Tinu-kürüvi* (Tamil).

SIZE. Sparrow —; length c. 12 cm (4½ in.).

FIELD CHARACTERS. As in 1517, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident. Ceylon in all zones — lowland and hills up to c. 1600 m. Affects long grass and scrub, paddyfields, and occasionally tea-plantations.

GENERAL HABITS AND FOOD. As in 1517.

VOICE AND CALLS. Song, a loud, unmusical chirruping which sounds like a ringing *thrip, thrip, thrip*. . . Alarm-note, a nasal *cher, cher, cher* or *teuteuteu* rapidly uttered and suggestive of a sewing-machine; scolding-note, a peevish *mee . . . mee* (Henry).

BREEDING. Season, ill-defined; breeds throughout the year, with a peak period about March in the hills, and mainly December to March (north-east monsoon) in the Dry zone. A second peak occurs in August-October. Nest, as in 1517. Eggs, generally 3, sometimes 4 or 2, similar to those of 1517.

MUSEUM DIAGNOSIS. Summer and winter plumages alike. Differs from nominate *socialis* (1517) in having a shorter, more plumbeous tail, paler underparts and more earth-brown on wings.

Young (juvenile), greyish olive above with a buffy yellow loreal streak; underparts paler than in adult.

MEASUREMENTS

♂♀	43-51	—	—	42-54 mm
				(SDR)

WARBLERS

63

Prinia sylvatica

Distributional ranges

	<i>gangetica</i> (1519).		<i>insignis</i> (1520).
	<i>sylvatica</i> (1521).		<i>mahendrar</i> (1522).
	<i>valida</i> (1523).		

FOOD. Insects — green grasshoppers, small beetles, caterpillars, ants, etc.; spiders. A small quantity of vegetable matter has also been found in stomachs.

VOICE AND CALLS. Song, a loud triple note rapidly reiterated for two or three minutes at a stretch, and repeated frequently: *pit-pretty, pit-pretty, pit-pretty* . . ., the *pit* subdued, rather ventriloquistic, and heard only at close range (see Display, above). When alarmed, the bird hops about agitatedly with a loud, quick-repeated *pit, pit, pit*, etc.

BREEDING. Season, overall March to October, mostly June to September (monsoon). Nest, a round or oval ball of grass rather loosely put together, strengthened on the outside by cobweb and vegetable down, and lined with fine grass; entrance on the side. Built in a low bush or in clumps of grass, the blades of which are drawn down and woven into the nest; placed within a metre or so above the ground, usually quite low down. Eggs, usually 4, often 3, sometimes 5, very variable: dull grey-green, sometimes buffy or pink, faintly speckled with light reddish to deep reddish brown, usually forming a ring around the broad end. Eggs of abnormal clutches may be pale blue or white, completely unspotted. Average size of 100 eggs 17.5 × 12.8 mm (Baker). Building, incubation and care of young by both sexes. Incubation period undetermined.

MUSEUM DIAGNOSIS. Differs from *insignis* (1520) in being browner above. Post-nuptial moult takes place from October to December. Both postnuptial and pre-nuptial moults are complete.

62

SYLVIINAE

Weight 1 ♂ c. 11 g (SDR).

COLOURS OF BARE PARTS. Iris brown. Bill black (all year). Legs and feet flesh-colour.

1519. Gangetic Jungle Wren-Warbler. *Prinia sylvatica gangetica* (Blyth)

Suya gangetica Blyth, 1867, Ibis: 23 (Upper Ganges)
Baker, FBI No. 937 (part), Vol. 2: 532

LOCAL NAME. *Tot-rungi* (Hindi).

SIZE. Sparrow —; length c. 15 cm (6 in.).

FIELD CHARACTERS. A large brown wren-warbler with the characteristic longish graduated 'loosely inserted' tail.

Above (summer), earthy brown. Lores and a narrow supercilium whitish. Tail (except central rectrices) tipped whitish, sub-tipped darker; outermost pair almost entirely white on inner web. Below, entirely cream-colour. In winter the upperparts are more ruddy and the tail lacks the white tips. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Common resident. From Kangra district (Himachal Pradesh) and Punjab eastward through Uttar Pradesh and northern Madhya Pradesh, Nepal (terai and foothills) and Bihar to northern Bengal (Jalpaiguri district) and northwestern Bangladesh, in the foothills up to c. 1000 m. Affects low bush jungle mixed with coarse grass, especially in eroded ravines and broken stony country — drier facies than characteristic of *P. socialis*.

GENERAL HABITS. Keeps in pairs or small parties of three to five birds, according to the season, often in company with *Dumetia*, *Chrysomma* and *Prinia hodgsonii*. Hops and flits about jerkily in grass and thorn scrub in the characteristic manner of the genus, switching the tail loosely up and down, clambering to the top now and again and diving into the thicket on alarm.

Display. The male sings excitedly from a bush-top or boulder, or during the vehement aerial courtship display. This consists of a succession of quick-repeated nose-dives, the bird tumbling headlong downwards, then rising steeply again for the next dive, and so on, with occasional snapping of the wings as in *P. socialis* (1517), till it finally alights on a nearby bush. While the song is uttered, whether from a perch or in the air, the tail is spread to show off the white outer feathers and tips prominently. The black inside of mouth is conspicuous while singing.

64

SYLVIINAE

Young, like summer adult but with a distinct yellow wash on underparts. Tail earth-brown with pale tips. First primary shorter and rounded, outer web broader. Postjuvénal moult complete.

MEASUREMENTS AND COLOURS OF BARE PARTS. As in *insignis*.

1520. Northwestern Jungle Wren-Warbler. *Prinia sylvatica insignis* (Hume)

Dryomys Insignis Hume, 1872, Stray Feathers 1: 10 (Mount Abo)
Baker, FBI No. 939, Vol. 2: 533 (= *P. s. rufescens*)

LOCAL NAME. *Tot-rungi* (Hindi).

SIZE. Sparrow —; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 1519, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident. Gujarat (including Kutch and Kathiawar) and western Rajasthan. Affects stony, semi-desert grass-and-euphorbia scrub country, cut up by erosion ravines.

GENERAL HABITS, FOOD AND VOICE. As in 1519.

BREEDING. As in 1519.

MUSEUM DIAGNOSIS. Differs from *gangetica* in being grey above and having more white in tail (summer plumage).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail (winter)
♂♂	59-67	15-17	23-25	73-95 mm
♀♀	53-61	c. 15	22-25	71-77 mm (SA)

Weight 11 ♂♀ 10-21 (av. 16) g — SA.

COLOURS OF BARE PARTS. Iris light brown. Bill: upper mandible black, lower flesh-colour or yellowish; mouth of breeding males black. Legs and feet flesh to brownish flesh.

1521. Peninsular Jungle Wren-Warbler. *Prinia sylvatica sylvatica* Jerdon

Prinia sylvatica Jerdon, 1840, Madras Jour. Lit. Sci. 11: 4
(Seegore Ghat, Nilgiris)

Prinia sylvatica palniensis Koelz, 1939, Proc. Biol. Soc. Washington 52: 72
(Kodaikanal, Palni Hills)

Baker, FBI No. 937 (part), Vol. 2: 532

LOCAL NAMES. *Tot-rungi* (Hindi); *Kenda-lotakun-jilla* (Telugu); *Chettikūrū* (Malayalam).

SIZE. Sparrow —; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 1519, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident. The Indian Peninsula from Maharashtra and northern Madhya Pradesh (intergrading hereabouts with *gangetica*) south to Kanyakumari; plains and hills up to c. 1500 m. Affects sparsely scrubbed, stony, hummocky country — boulder-strewn hillsides with rank grass and scattered thorn bushes etc.

GENERAL HABITS, FOOD AND VOICE. As in 1519.

WARBLERS

65

BREEDING. Season, overall April to September with apparently two peak periods: April-May, especially in the south, and June to September (monsoon) in the north. Once December (Mysore). *Nest* and *eggs*, as in 1519.

MUSEUM DIAGNOSIS. Intermediate in colour between the darker *valida* of Ceylon and the greyer *insignis* of Gujarat etc. Summer and winter plumages show little variation and agree with summer plumage of the northern subspecies. Only some summer birds develop white lateral rectrices.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail	
				summer	winter
♂♂	52-65	14-16	21-24	65-72	67-79 mm

(HW, SA, Koelz)

Weight 6 ♂♀ (July-August) 14-18 (av. 16.3) g—SA.

COLOURS OF BARE PARTS. Iris orange (♂), orange-straw, straw or drab (♀), olive-brown (juv.). Bill: summer male black; in other stages horny brown, lower mandible fleshy; in juvenile lower mandible bright yellow, gape yellow; mouth: summer male black; in other stages brownish pink, or pink with brownish streaks. Legs and feet fleshy or pale fleshy brown; claws similar or darker.

1522. Orissa Jungle Wren-Warbler. *Prinia sylvatica mahendras* Koelz*Prinia sylvatica mahendras* Koelz, 1939, Proc. Biol. Soc. Washington 52: 72

(Mahendra Giri, Orissa)

Baker, FBI No. 937 (part), Vol. 2: 532

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 1519, q.v.

STATUS, DISTRIBUTION AND HABITAT. Region of the type locality (Mahendra Giri, Orissa).

GENERAL HABITS, FOOD AND VOICE. As in 1519.

BREEDING. As in 1519.

MUSEUM DIAGNOSIS. Differs from other races in the winter plumage being dark cinnamon rather than grey-brown or fulvous; underparts, especially sides, much greyer (Koelz).

MEASUREMENTS. Said to have a longer tail than *sylvatica*, but this is a clinal character from south to north: cf. measurements of *insignis*.

(Karong, Manipur)

Baker, FBI No. 933, Vol. 2: 528

Plate 85, fig. 15

SIZE. Sparrow —; length c. 13 cm (5 in.).

SYLVIINAE

66

FIELD CHARACTERS. As in 1519, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident. Ceylon in all zones up to c. 1800 m. Affects scrub-and-grass jungle; low scrub, tea plantations, fernlands and undergrowth around ricefields.

GENERAL HABITS AND FOOD. As in 1519.

VOICE AND CALLS. A loud and monotonous song beginning 'with a slow *titter* . . . *titter* which soon becomes a loud, ringing *titter*, *titter* . . . and this again changes to *thirrip*, *thirrip*, *thirrip* . . . Yet another note is very like the *terik terik terik* . . . of the tailor bird, but less musical' (Henry).

BREEDING. Season, ill-defined: breeds the year round with a peak period from March to May and again from July to September. Several broods are reared. *Nest*, usually a rather untidy ball of grass, but sometimes purse-shaped or even deep cup-shaped. Other details as in 1519. *Eggs*, either 8 or 4, similar to those of 1519. Average size of 12 eggs 17.9 × 12.9 mm (Phillips).

MUSEUM DIAGNOSIS. Differs from *sylvatica* in being darker above. Bill longer and stronger (12 ♂♂ *valida* 15.5-17 mm, 12 ♂♂ *sylvatica* 13-15 mm — HW). Lacks all trace of the pale supercilium sometimes present in peninsular races. Summer and winter plumages alike, of the summer type. Birds in complete moult have been collected in January and in July.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

(Sukkur, Sind)

Baker, FBI No. 934, Vol. 2: 529

Plate 82, fig. 14

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. As in 1525, q.v.

STATUS, DISTRIBUTION AND HABITAT. Resident, common but locally distributed. Pakistan and Punjab in the plains of the Indus river system, from Bannu and Ambala south through Sind. Affects riverain tamarisk and *sarkhan* grass jungle, or reed-beds.

SYLVIINAE

68

FIELD CHARACTERS. A typical wren-warbler with, longish, graduated, loosely inserted tail and bright yellow underparts. Above, forehead and sides of head dark grey; a short supercilium (not always present) and a pale eye-ring. Rest of upperparts and tail olive-green, the latter tipped whitish, and faintly subtyped brown. Below, throat and breast whitish cream. Belly bright lemon-yellow, a distinctive character. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Resident, locally common. Nepal (Rapti Dun, Diesselhorst 1968: 266, sole post-Hodgsonian record), Bengal in the Jalpaiguri district and near Calcutta, Bangladesh south to the Chittagong Hill Tracts, Assam, Nagaland and Manipur. Range disjunct from that of *sindiana*. In the plains and foothills, generally up to c. 800 m, locally to 1200 m. Affects humid grasslands mixed with bushes, elephant grass and reeds near paddyfields, tanks, lakes and swamps, occasionally in thin secondary growth.

Extralimital. Burma. The species extends east to Vietnam and south to Sumatra.

GENERAL HABITS. A sprightly restless little bird, keeping singly, or 3 or 4 loosely together, hopping and climbing about in grasses where it finds its food, sometimes descending to the ground. As a rule difficult to see.

FOOD. Insects.

VOICE AND CALLS. Song consists of a sharp chirp followed by a little trill of about five notes, uttered from the top of a tall grass stem or bush. Call-note, an incessant *chink, chink* . . . Alarm-note, a plaintive *tree*. Also snaps wings.

BREEDING. Season, April to October, mostly June-September (monsoon). *Nest*, oval with the entrance near the top, made of fine grass, grass roots and vegetable down, strengthened by cobwebs and lined with finer grass; fixed to upright grass stems or placed in bushes often on pendent twigs, at heights varying from c. 50 to 150 cm above the ground. *Eggs*, usually 4, glossy mahogany-red, indistinguishable from those of *Prinia socialis* (1517). Average size of 60 eggs 15.2 × 11.7 mm (Baker). Building and incubation by both sexes; incubation period undetermined.

MUSEUM DIAGNOSIS. See Field Characters. Differs from *sindiana* (1524) in having a more saturated olive-green back and rump and a deeper yellow belly.

In summer the tail is shorter with obscure subterminal brown patches; in winter, tail longer without brown patches.

Young, upperparts and sides of neck yellowish olive-brown. Edges of wings rufous brown. Tail brown tinged with olive on outer webs, tips whitish. Underparts pale yellow. Postjuvénal moult complete.

MEASUREMENTS

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length, including long tail, c. 16 cm (6 in.).

FIELD CHARACTERS. As in 1527, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. The foothills of Pakistan from the Salt Range and Kohat south through the Suleiman and Sind ranges nearly to the coast and west to

Prinia criniger

striatula (1526).

criniger (1527).

catharia (1528).

the Hingol Valley; from c. 900 to 2200 m, drifting down to the foothills in winter. Affects grass-and-scrub jungle and open pine forest on hillsides.

Extralimital. Recorded from Nuristan, N.E. Afghanistan (Paludan).

(Lister), of same pattern as Jungle Wren-Warbler's (1519), q.v.; uttered from some vantage point or as the bird dive-bombs at the female or in the vicinity of the nest, this performance accompanied by a loud flutter. See also Display, above. Regular song period, beginning of March till end of October, but song may also be heard sporadically throughout the winter (Proud, Nepal).

BREEDING. Season, May to October, chiefly July and August. Nest, an oval structure with the entrance near the top, made of grass, thickly matted with vegetable down and lined with finer grass. Usually placed in grass within a half-metre of the ground, sometimes in bushes overgrown with grass, up to c. 120 cm above the ground. Eggs, normally 4, sometimes 3, rarely 5; clutches of more than four may include an egg of the Plaintive Cuckoo (*Cacomantis merulinus*) closely resembling those of the host. Colour, white to pale pink marked with tiny reddish blotches and specks forming a ring near the extremity of the large end (not around the broadest part). Average size of 100 eggs 17.6 × 12.6 mm (Baker). Building, incubation and care of young by both sexes; incubation period ten or eleven days. Frequently brood-parasitized by *Cuculus canorus* and *Cacomantis merulinus*.

MUSEUM DIAGNOSIS. See Key to the Subspecies; for details of plumages Baker, loc. cit.

Baker, FBI No. 925, Vol. 2: 520

LOCAL NAME. *Daotisha dldao* (Gachari)

SIZE. Sparrow —, with a long tail; length c. 16 cm (6 in.).

FIELD CHARACTERS. As in 1527, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident. The hills of Assam, Nagaland, Manipur and Bangladesh south to the Chittagong Hill Tracts; from c. 800 m to the highest summits, optimum zone 1200-1600 m. Affects coarse grass and scrub-and-grass jungle.

GENERAL HABITS, FOOD AND VOICE. As in 1527.

BREEDING. Season, May to August. Nest and eggs, as in 1527.

MUSEUM DIAGNOSIS. Differs from *criniger* in the winter plumage being paler above, less warm brown; light streaks also paler; edges of wing less deep rufous; under tail-coverts and flanks paler. Summer plumage also paler.

MEASUREMENTS AND COLOURS OF BARE PARTS. As in 1527.

Weight 1 ♂ (Dec.) 12.4; 1 o? (Dec.) 13 g — Paynter; 1 ♂ (March) 12 g — Paludan.

1527. Himalayan Brown Hill Warbler. *Prinia criniger criniger* Hodgson

Prinia? *Suya criniger* Hodgson, 1836, *Asiat. Res.* 19: 183 (Nepal)

Baker, FBI No. 923, Vol. 2: 518

Plate 85, fig. 19

LOCAL NAMES. *Phitta* (Kashmir); *Suya* (Nepal); *Dang-prim-pho* (Lepcha); *Stik-shillik* (Bhutan).

SIZE. Sparrow —, with a long tail; length c. 16 cm (6 in.).

FIELD CHARACTERS. A long-tailed, brown warbler dark-streaked above, strongly reminiscent of the wren-warblers of the plains. A passable miniature of the Common Babbler (*Turdoides caudatus*).

Above, brown, distinctly streaked on head and back. Tail very long, strongly graduated, each rectrix tipped with buff and a subterminal dusky spot; tail narrowly cross-barred but this character only visible at very close range. Below, pale fulvous (summer), marked with dusky spots or mottling on sides of throat and breast (winter); flanks olive-brown. Sexes alike.

The similar *P. burnesii* (1531) is a bird of the plains only. It is distinguished by its whitish underparts (v. warm fulvous).

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to small vertical movements. The Himalayan foothills from Murree and Kashmir east to Arunachal Pradesh. Breeds from c. 1200 m (in the western Himalayas down to c. 600 m) up to 2100 m, locally up to 2800 m, exceptionally 3100 m (Simla, Nepal). Winters from c. 2100 m down to c. 300 m. Affects low bushes on grassy slopes and in stony ravines, terrace-cultivated hillsides, and open pine forest.

GENERAL HABITS. Found singly or in pairs, skulking among low scrub and grass tussocks. Flight feeble and jerky. When disturbed, seldom flies far before tumbling headlong into another bush; or it shoots almost vertically down a steep hillside, tail doubled over the back and wings pulled in at the sides.

Display. In the breeding season males frequently mount to the top of a bush or tree to utter their reeling creaky song. For this, very partial to telegraph wires where available. From time to time one will jump up and perform curious aerial evolutions consisting of a series of steep wave-crests and nose-dives accompanied by a low fluttering sound — antics recalling those of the Ashy Wren-Warbler (1517), q.v.

FOOD. Insects.

VOICE AND CALLS. Song, an exuberant but wheezy, almost scraping double-note, like a knife being sharpened on a grindstone: 't'zeetu-t'zeetu-t'zeetu (or tsee-tsee-tsee-tsee...) usually given in series of three or four

Extralimital. Extends to northern Burma, northwestern Yunnan and Szechuan. The species ranges east through the Indochinese countries and southern China to Formosa.

GENERAL HABITS, FOOD AND VOICE. As in 1527.

BREEDING. Season, chiefly April, May and June, but eggs may be found in almost every month of the year. Nest, as in 1527. Eggs, 3 to 7, normally 4, pale blue to dull green, spotted as in 1527 but ring not so invariably well defined; occasional eggs may be unmarked. Average of 200 eggs 16.7 × 12.8 mm (Baker). Breeding biology as in 1527.

MUSEUM DIAGNOSIS. Summer. Feathers of forehead, crown, nape and mantle blackish brown suffused with chestnut and margined brownish ashy to give a boldly streaked appearance. Winter. Equally boldly streaked, but feathers overlaid with a rich dark rufous wash which masks the light margins and gives the bird a generally darker appearance (Deignan). Differs from 1527 in being darker.

MEASUREMENTS AND COLOURS OF BARE PARTS. As in 1527.

Plate 85, fig. 11

LOCAL NAMES. *Chiburchay* (Pahana); *Shikshillik* (Bhutan).

SIZE. Sparrow —, with a long tail; length c. 17 cm (6½ in.).

FIELD CHARACTERS. A long-tailed warbler. Above, unstreaked dark olive-brown, greyer on head and nape. Wings and tail rufous brown. Tail very long (c. 10 cm), strongly graduated, paler at tip. Below, throat black, bordered with white moustachial stripes. Breast spotted black and white; belly fulvous, more olive on flanks. In winter the throat is fulvous white streaked with black, and there is a more or less distinct white supercilium. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Fairly common resident but locally distributed. Eastern Nepal (Ilam District — Stevens, Fleming & T aylor), Bengal (Darjeeling district), Sikkim, Bhutan and Arunachal Pradesh (Bailey, JBNHS 24: 75). Breeds from c. 1000 to 2500 m; observed in winter as high as 2200 m. Affects open scrub-and-grass jungle on hillsides, bushes among terrace cultivation and long grass in pine forest — much the same type of country as *P. criniger*, but occasionally found in forested areas.

Extralimital. Adjacent southeastern Tibet. The species extends east to

Fukien and Vietnam, and south to Sumatra.

GENERAL HABITS. Very similar to those of Brown Hill Warbler (1527). Keeps singly or in pairs, skulking in tall grass and scrub. A very active bird.

WARBLERS

73

ceaselessly turning this way and that, twitching its tail up and down — occasionally vibrating it up and down very rapidly for a moment. Repeatedly works its way in little spurts to the top of a bush and then flies down into cover (Lister).

FOOD. Insects.

VOICE and CALLS. Alarm, a series of soft, scolding *chrrrr-churr-churr*. Call-notes, a soft *tp-tp-tp*... while foraging; a soft, high-pitched *pri*... *pri*... *pri* and a *tyip*... *tyip* (Lister). For rendition of song see 1530.

BREEDING. Season, chiefly May and June. Nest, globular with a lateral entrance, made of grass stems and flowering grass heads, usually with a small amount of moss incorporated; generally placed in clumps of grass, attached to two or more stems, the materials being loosely wrapped around these. Eggs, 3 to 5, variable: more commonly pale greenish, more or less covered with reddish freckles or small blotches, usually forming a ring around the broadest part; eggs with white or pink ground colour are also found. Different from those of *P. criniger* in the less bold definition of the ring and in the great preponderance of the green type. For further details see Baker, *Nidification* 2: 473. Average size of 100 eggs 16.9 × 12.7 mm (Baker). Building, incubation and care of young by both sexes; incubation period c. 10 days.

MUSEUM DIAGNOSIS. See Key to the Subspecies.

Young, above, brownish with a faint yellowish tinge; below, white with faint yellow tinge on throat and belly; an indistinct yellowish and green-brown band across the breast. Markings less distinct than in adult.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♀	45-56	13-15	20-25 (mostly 21-23)	75-117 mm (Oct.-April) (SA, Stresemann)

Weight 11 ♂ ♀ 8-16 (av. 11.8) g — SA.

COLOURS OF BARE PARTS. Iris greyish brown. Bill brown (winter). Legs and feet brownish flesh; claws horny brown.

1530. Assam Blackthroated Hill Warbler. *Prinia atrogularis khasiana* (Godwin-Austen)

Suya khasiana Godwin-Austen, 1876, Ann. Mag. Nat. Hist. 18: 412 (Khasia Hills)

Baker, FBI No. 929, Vol. 2: 524

LOCAL NAME. *Daolisha ddao* (Cachari).

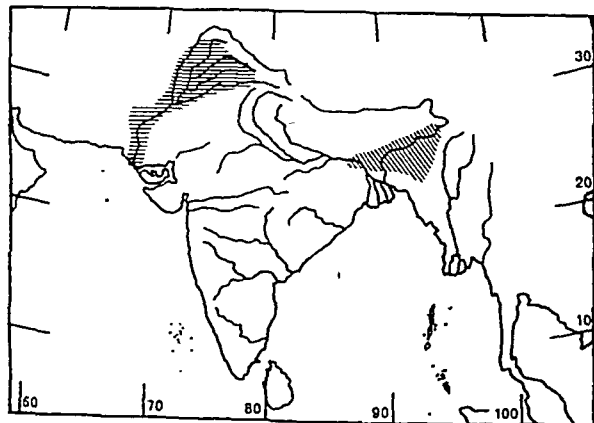

SIZE. Sparrow —, with a long tail; length c. 17 cm (6½ in.).

FIELD CHARACTERS. As in 1529, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Common resident. Nagaland, Manipur and Meghalaya in the Cachar and Khasi hills south to the Chittagong Hill Tracts of Bangladesh; from c. 900 to 1800 m (1400 to 2600 m on Mt Victoria). Affects tall grass or patches of low scrub mixed with grass on steep hillsides, on the edge of cultivation or fringe of forest.

WARBLERS

75

Prinia burnesii

Distributional ranges

■ *burnesii* (1531).

▨ *cinerascens* (1532).

again, being almost impossible to flush a second time. General effect of the bird and its behaviour strangely reminiscent by turns of both Jungle Wren-warbler (1521) and Streaked Laughing Thrush (1314) — a similarity that seems curiously apparent also in their reeling songs. Occasionally feeds on the ground, turning over dead leaves and searching nooks and crannies for insects. During daytime little or nothing is usually seen of the bird; towards evening however it comes out of its retreat, creeps about the outside of a bush, singing cheerily at intervals, only to dive into thick cover again if disturbed.

FOOD. Insects.

VOICE and CALLS. Call-note, a wheezy *fee-z*. Song loud and pleasant, recalling that of *Saxicola caprata*, 'a clear sweet liquid warble of about four seconds' and in a way reminiscent also of the reeling songs of Jungle Wren-warbler and Streaked Laughing Thrush. A chattering alarm-note described as 'a quiet nasal rattle, and when excited a very rapidly repeated *chit* or *szi!*' (Holmes & Wright).

BREEDING. Season, February to September. Nest, cup-shaped, made of coarse grass lined with vegetable down, fine grass and sometimes a feather or two. Well hidden in a grass clump, almost on the ground, often on the edge of a small clearing. The female sits close, skulking off into cover on being disturbed and easily abandons the nest. Eggs 4, white with a very faint tinge of greenish blue, profusely speckled all over with dark brown, slightly more so at the large end. Average size of 20 eggs 17.9 × 14.2 mm (Baker). Share of sexes in domestic duties unknown except that the female alone appears to build the nest.

74

SYLVIINAE

Extralimital. Burma.

GENERAL HABITS and FOOD. As in 1529.

VOICE and CALLS. A loud song rather similar to that of *P. criniger* (1527) rendered as *tulip*... *tulip*... *tulip* (Heinrich). Other calls as in 1529.

BREEDING. As in 1529.

MUSEUM DIAGNOSIS. Male and Female, winter, like *atrogularis* but upperparts, edges of wings and tail bright rufous; flanks more ochraceous. Summer, like *atrogularis* but upperparts, especially crown, bright rufous as are edges of wing and tail. Female like male but chin and throat with white markings making the black less conspicuous. Apparently only has a body moult in spring.

Young, like winter adult but not so rich or so rufous brown. Underparts as adult; there is an indication of the black, white-tipped throat. First primary with broader outer web. Tail shorter and more flimsy. Postjuvénal moult complete.

MEASUREMENTS. As in 1529.

Weight 1 ♀ 11; 1 juv. ♂ 9 g (SDR).

COLOURS OF BARE PARTS. As in 1529.

PRINIA BURNESII (Blyth)

Key to the Subspecies

Under tail-coverts dark ferruginous..... *P. b. burnesii*
Under tail-coverts greyish white..... *P. b. cinerascens*

1531. Western Longtailed Grass Warbler. *Prinia burnesii burnesii* (Blyth)

Eu.(tyercus) Burnesii Blyth, 1844, Jour. Asiat. Soc. Bengal 13: 374

(Indus territories = Sind)

Baker, FBI No. 832, Vol. 2: 430

Plate 85, fig. 17

LOCAL NAMES. *Hedela*, *Chihio* (Sind).

SIZE. Sparrow —, with a long tail; length c. 17 cm (6½ in.).

FIELD CHARACTERS. Above, rufescent grey and rufous-brown with darker streaks. A pale eye-ring. Below, greyish white. Tail olive-brown, very long and graduated, the lateral feathers tipped fulvous. Sexes alike.

Distinguished from *P. criniger* by the whitish underparts. *P. lepbida*, the other streaked *Prinia*, differs by its smaller size and paler plumage.

STATUS, DISTRIBUTION and HABITAT. Resident, locally common. Pakistan in the plains of the Indus. Affects long *sarkhan* grass (*Saccharum*) in pure stands or where mixed with acacias and tamarisks, mainly in the vicinity of large rivers and their tributaries.

GENERAL HABITS. Keeps in pairs or small parties to rootstocks of dense grass clumps, hopping and threading its way through the stems and in and out of cover with the agility of a mouse. Is an inveterate skulker, slipping away silently through the thickest scrub, and flushed only with difficulty. Then flies hurriedly for a few short metres and tumbles headlong into cover

76

SYLVIINAE

MUSEUM DIAGNOSIS. Differs from disjunct *cinerascens* (1532) in being more rufescent above and in having the under tail-coverts deep rufous (v. greyish white). Young, like adult but upperparts more uniform, the dark streaks hardly discernible.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	53-57	10-11	20-21	85-108 mm (Baker)

COLOURS OF BARE PARTS. Iris brown. Bill brown above, straw below. Legs and feet flesh-coloured.

1532. Eastern Longtailed Grass Warbler. *Prinia burnesii cinerascens* (Walden)

Eurtyercus cinerascens Walden, 1874, Ann. Mag. Nat. Hist. 14: 156

(Dhubri, Lower Bengal)

Baker, FBI No. 833, Vol. 2: 431

Plate 85, fig. 16

LOCAL NAMES. None recorded.

SIZE. Sparrow —, with a long tail; length c. 16 cm (6½ in.).

FIELD CHARACTERS. As in 1531, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Resident, locally common. Assam in the plains of the Brahmaputra and Cachar, Bangladesh in the north and in Sylhet; western Bihar (Monghyr, one record). Affects the vast expanses of *ekra* or elephant-grass in the vicinity of large rivers and in swamps.

GENERAL HABITS, FOOD and VOICE. As in 1531.

BREEDING. Season, at least April and May. Nest, as in 1531. Eggs, as in 1531 but ground colour slaty green and speckling almost black. Average size of 7 eggs 16.9 × 13.9 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *burnesii* in being more olive-grey, less rufous above, and in having the under tail-coverts greyish white like the abdomen.

MEASUREMENTS

	Wing	Tarsus	Tail
♂ ♀	51-52	c. 21	68-79 mm (Baker)

Bill from skull c. 15 mm

COLOURS OF BARE PARTS. Iris sienna-brown. Bill horny black, dark above, bluish below. Legs and feet brownish, plumbeous or slaty brown.

Genus SCOTOCERCA Sundevall

Scotocerca Sundevall, 1872, Meth. Av. Disp. Tent.: 7.

Type, by original designation, *Malurus iniquus* Cretzschmar

Much resembles *Prinia* but tarsus longer. Tail slightly graduated, slightly longer than wing. Long hairs overhanging nostrils.

WARBLERS

77

1533. Streaked Scrub Warbler. *Scotocerca inquieta striata* (Brooks)

Melizophilus striatus Brooks, 1872, Ibis: 180 (Naoshera, Punjab)
Baker, FBI No. 905, Vol. 2: 501

Plate 85, fig. 18

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. A small sand-coloured warbler with a dark, erect tail. Above, pale sandy brown, conspicuously streaked on crown with dark brown. A dark line from lores through eye and a broken, pale eye-ring. Supercilium, cheeks and sides of breast pinkish fulvous. Tail dark brown, outer rectrices with pale tips. Below, buffish white, lightly striated with brown on throat; flanks pale buff. Sexes alike.

The dark line through eye, terrestrial habits, and barren stony habitat at once distinguish this species from any streaked *Prinia*.

STATUS, DISTRIBUTION and HABITAT. Fairly common resident. The hills of Pakistan from Peshawar and Kohat east to the Jhelum River, south to the Makran coast and west through Baluchistan (Ticehurst, JBNHS 31: 700,

Scotocerca inquieta striata

▨ Distributional range x Isolated records

1926, Christison, Ibis 1941: 536). Affects arid, rocky hillsides, ravines and valley floors where scrub or a few clumps of grass afford it hunting ground. In summer locally up to c. 3000 m (at least until October) and down to the foothills, but does not enter the plains.

Extralimital. The species extends through the Middle East countries and North Africa to Morocco.

WARBLERS

79

FIELD CHARACTERS. A rufous-brown grass warbler with a broad, graduated, white-tipped tail. Above, head and back streaked with black and rufous; sides of neck and lower nape streaked black and white. A white supercilium. Wings and rump rufous. Tail dark brown, strongly graduated, conspicuously tipped with white. Below, throat, breast and belly white, flanks rufous. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Resident, locally common. From the western Nepal terai (Rand & Fleming 1957, Fleming & Traylor 1968) east through northern Bengal (Jalpaiguri duars) and the flood-plains of the Brahmaputra, south through the plains of Assam, Manipur and Bangladesh to the Ganges. Affects tall grass and reeds.

Graminicola bengalensis and *Schoenicola platyura*

▨ *G. b. bengalensis* (1534). ▨ *S. platyura* (1546).

Extralimital. The species ranges through the Indochinese countries to Hainan.

GENERAL HABITS. Little known except that it is difficult to observe in the dense grass in which it skulks. With close beating and walking up the bird flushes readily but it dives into cover almost instantaneously; and if fired at and missed it vanishes for ever! (Hume).

FOOD. Insects.

VOICE and CALLS. Said to be very noisy in the breeding season, soaring into the air and singing a harsh and loud song, also from the tops of reeds. Call-note similar to that of the American Catbird — 'a mewling call' (Fleming).

78

SYLVIINAE

GENERAL HABITS. Keeps in pairs or in small parties. 'A most attractive bird racing about like a mouse, its tail never quiet, and working itself into an ecstasy of excitement, flicking its little wings, bouncing this way and that, under one stone, over another, round another, reappearing in most unexpected places' (Meinertzhagen). It is a typical wren-warbler, aside from its more terrestrial habit. Feeds a great deal on the ground under the shelter of bushes and coarse grass, or hops about restlessly among the rootstocks and low branches of stunted thorn scrub, constantly jerking its cocked tail over its head and from side to side.

FOOD. Insects, minute snails and seeds.

VOICE and CALLS. 'Has a variety of notes of three main types: A cheerful and sweet song. A melodious, rather loud trill of about five notes descending in tone, uttered when the bird is at ease. A dull but rather loud pit, pit of alarm, much like a dull version of the familiar call of the Tailor Bird' (Whistler MS.). 'Like the squeaking of mice' (Williams).

BREEDING. Season, end of February to August. Nest, globular, made of dry grass stems, rather untidy but well lined with silky fibres, some felt-like vegetable matter and a few feathers. Placed in low bushes from a few centimetres above the ground up to c. 1.5 m, usually rather low down. Eggs, 5 or 6, white marked with minute specks of reddish pink to reddish brown, numerous at the large end where they form an ill-defined cap or zone. Average size of 40 eggs 15.8 × 11.9 mm (Baker). Apparently frequently brood-parasitized by *Cuculus canorus*.

MUSEUM DIAGNOSIS. See Field Characters.

Young, like adult but wing and tail browner and dark markings on upperparts not so sharply defined.

The species has two moults, the spring moult only partial.

MEASUREMENTS

	Wing	Tarsus	Tail
♂ ♀	49-52	c. 18	43-50 mm (Baker)

Bill from skull 12 mm

Weight 1 ♂ 8, 1 ♀ 8 g (subsp.?, Afghanistan) — Paludan.

COLOURS OF BARE PARTS. Iris hazel. Bill brown, lower mandible yellowish. Legs and feet yellowish brown.

Genus GRAMINIGOLA Jerdon

Graminicola Jerdon, 1863, Bds. India 2: 177.

Type, by monotypy, *Graminicola bengalensis* Jerdon

Bill rather stout, about half the length of the head. Four stiff rictal bristles. Crest feathers distinctly spinous.

1534. Large Grass Warbler. *Graminicola bengalensis bengalensis* Jerdon

Graminicola Bengalensis Jerdon, 1863, Bds. India 2: 177

(Cachar — see Baker, Nidif. 2: 393; also Biswas, JBNHS 65: 224)

Baker, FBI No. 834, Vol. 2: 433

Plate 85, fig. 21

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 16 cm (6½ in.).

80

SYLVIINAE

BREEDING. Season, at least July and August (monsoon). Nest, a deep cup of sedges and vegetable fibres, lined with fine grass roots and fixed between a few reeds in the manner of reed warblers. It is placed in dense *chra* grass or reeds standing in deep water during the rains, thus extremely difficult to find. Eggs, apparently 4, white, thickly covered with purple-red and deep brown specks and spots, especially at the large end. Two eggs measured 17.2 × 14.5 and 17.2 × 14.1 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	58-63	13-15	c. 24	73-90 mm (Baker)

Weight 5 ♂ 3, 1 ♀ 0.46–0.58 oz. (c. 13–16.5 g) — Hume.

COLOURS OF BARE PARTS. Iris reddish brown. Bill brown, fleshy at base of lower mandible. Legs and feet pale fleshy brown.

Genus ORTHOTOMUS Horsfield

Orthotomus Horsfield, 1821, Trans. Linn. Soc. London 13: 165.

Type, by monotypy, *Orthotomus sepium* Horsfield

Phyllergates Sharpe, 1883, Cat. Bds. Brit. Mus. 7: 176, 229.

Type, by original designation, *Phyllergates cucullatus* Temminck

Bill as long as head, broad and rather flat. A few rictal bristles. Forehead very smooth and flat. A few long soft hairs springing from nape. Wing very short and rounded; first primary (as.) large, fourth and fifth longest. Tail with 12 rectrices, graduated. Tarsus long and strong.

WARBLERS

83

built near houses or in pot plants in a veranda, as is often the case, all sorts of unusual materials such as bits of string, wool or cotton may be used. In semi-desert country where large-leaved plants are absent, the nest is of the *Cisticola* type. A number of small narrow leaves, e.g. of *Salvadora oleoides* or maybe a garden rosebush, are loosely sewn together with vegetable floss and the nest-cup within stitched to them for support.

The site chosen is usually under a metre from the ground on account of the bird's partiality for broad-leaved plants — occasionally in a leaf almost trailing the ground — but sometimes up to 4 to 5 metres. Nests usually well concealed. For further nesting details, see *Nidification* 2: 370. Eggs, 3 to 5, usually 3, very variable in ground colour but of two main types: 1) white to cream or pale pink, 2) white with a faint tinge of green or blue to a bright blue or pale sea-green. In both types the markings are fairly large blotches, spots and specks of pinkish red to red-brown about the large end where they may form an ill-defined ring, and smaller marks scattered about scantily elsewhere. Average size of 100 eggs 16.4 × 11.6 mm (Baker). Both sexes help in construction though share of male appears mostly to be bringing the material. Stitching of leaf apparently by female alone. In one case the building took four days; an egg was laid on each of the following days. Incubation by both sexes; period 12 days. Often brood-parasitized by the Plaintive Cuckoo, *Cacomantis merulinus*. When disturbed, the incubating bird slips off quietly until it is at a safe distance, when it demonstrates noisily. Male feeds his mate when she is incubating at intervals of c. 10 minutes. Feeding of young by both parents. Nestlings may be heard calling inside the nest but alarm-notes from the parents produce instant silence. The birds remain paired after breeding and may often be seen roosting cuddled together on a twig, sometimes in a potted plant in a veranda and hardly 50 cm from the ground.

Nesting subject to heavy mortality at all stages from rodents, cats, mongooses, crow-pheasants, lizards, snakes, etc.

MUSEUM DIAGNOSIS. Rufous cap confined to forehead and anterior crown; a broad grey area separating the cap from the yellowish green mantle. Central pair of rectrices much longer in winter than in summer. Premautal moult of body, tertials and tail.

Young, similar to adult female. Postjuvénal moult of body, lesser and median coverts.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	47-55	15-17	17-21	37 (summer) to 110 (winter) mm
♀♀	43-49	14-17	18-21	34-39 mm (HW, SA)

Weight 10 ♂♂ 6-10 (av. 7.5) g — SA.

COLOURS OF BARE PARTS. Iris ochre to orange. Bill: upper mandible brown, lower dark flesh; mouth pale flesh. Legs and feet brownish flesh; claws dusky.

82

SYLVIINAE

compounds even where separated maybe by several kilometres of un-cultivated semi-desert.

GENERAL HABITS. Found singly or in pairs. Normally quiet and skulking, but tame and confiding near human dwellings. Usually keeps low down in herbage and undergrowth, hopping about energetically, tail erect and constantly flicked from side to side, uttering its loud, familiar call. Seldom flies more than a metre or two from cover to cover, the long tail jerked over the back in a very characteristic manner. Commonly seen hunting for insects attracted to mango blossoms, and will also feed on flower nectar; occasionally hops about to feed on the ground.

FOOD. Mainly small insects and their larvae: identified among stomach contents are tenebrionid and curculionid beetles, hemipterous bugs, ants, and jassid flies. Has been observed to take butterflies and moths. Also feeds on the flower nectar of *Salmalia*, *Bombax*, *Erythrina*, *Butea*, and many other species (pollen transported on frontal and throat feathers).

VOICE AND CALLS. Alarm-note (as when nest approached) a loud, quick repeated *pit-pit-pit-pit*... while hopping agitatedly in the bushes around the intruder. While foraging often utters a quick *cheep-cheep*... in runs of 5 or 6 *cheeps* each. Song surprisingly loud for such a small bird. Rendered as *pit-pit-pit-pit-pit-pit*... or *chubit*, *chubit*, *chubit* uttered intermittently all day long during the breeding season in series of 3 or 4 *pit-pits* with hardly any pause between the runs. When excited, the male 'climbs to an out-standing twig and pours out this song, his whole body vibrating with the effort, his tail cocked till it nearly touches his back, and the feathers of the throat parting to show their dark bases which give him the appearance of having a black gorget' (Betts).¹

BREEDING. Season, overall March to December, but mainly during the monsoon when herbaceous growth required for nesting is at its maximum, i.e. June to August. Broad-leaved seedlings and grafts of mango and fig, young teak in nurseries, and *cannas*, *crotons* and *suchlike* ornamental plants in gardens afford favourite sites. The nest may be built into one large drooping leaf or several smaller ones sewn along the edges to form a cone or bag with threads of vegetable down. One thread may serve for several stitches. The ends do not always appear to be knotted, but flock out naturally and hold themselves in place. The upper portion of the leaf nearest the stem arches over and protects the aperture which faces into the interior of the plant. Sometimes the tension of the leaf is too great for the strand to hold the edges in place, and the bird returning with more material finds that the leaf has sprung back to its original position with numerous strands floating. At other times the knots, not being large enough, pull through, thereby ruining the labour of perhaps a whole day; but the bird's patience is inexhaustible and as often as a strand snaps, so often is it renewed and strengthened.

The nest itself, built when the sewing is completed, is placed within the leaf cone and consists of a soft cup of fibres (coir etc.), spiders' egg bags and vegetable floss. The rim is strongly reinforced with bark fibre. When

¹ The dark [crescent-shaped] spots on each side of the Tailor Bird's throat are found in both sexes and are primarily due to the absence of feathers on an area of darkly pigmented skin. Its nature and purpose require investigation.

LOCAL NAMES. *Pātia* (Nepal); *Tētāni* (Bengali); *Tētes srai* (Assam); *Noni dao* *terter* (Cachari).

SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. As in 1535, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Common resident. The Nepal terai, northeastern Uttar Pradesh, northern Bihar and Bengal east through Bangladesh, Bhutan foothills and Assam (except for the range of *luteus*). Affects gardens, hedgerows, orchards, edges of forest and thin scrub; plains and hills up to c. 1800 m.

EXTRALIMITAL. Burma. The species extends east through the Indochinese countries, southern China and south to Java.

GENERAL HABITS AND FOOD. As in 1535.

VOICE AND CALLS. Generally as in 1535. Song also rendered as *titawet* or *toet* repeated several times while foraging. A loud, clear *tyra* given in quick succession with barely any pause between.

BREEDING. Season, overall March to October, chiefly May to July. Nest as in 1535. Eggs, 3 to 6, generally 4, similar to those of 1535. Average size of 200 eggs 15.9 × 11.3 mm (Baker).

MUSEUM DIAGNOSIS. More richly coloured than *guzeratus*. Upperparts more saturated olive-green; buff wash of lower parts more pronounced; rufous cap still more reduced; bill somewhat shorter.

MEASUREMENTS

(Teru, Mishmi Hills, NE. Assam)

Not in Baker, FBI

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. As in 1535, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Common resident. From the Mishmi Hills south through Margherita and Nagaland to northern Manipur. Habitat as in 1536.

GENERAL HABITS AND FOOD. As in 1535.

VOICE AND CALLS. Noted as of same pattern but strikingly different from *guzuratus* of the Bombay area — a distinct 'regional dialect' (SA).

BREEDING. As in 1535.

MUSEUM DIAGNOSIS. More rufous-buff below than *patia*; crown and nape darker, forehead richer rufous.

MEASUREMENTS. As in 1536.

Weight 2 ♀ 7.5 (Nov.), 8.5 (Oct.) g — SDR.

COLOURS OF BARE PARTS. Iris pale brown. Bill dark brown. Legs and feet flesh coloured.

1538. Ceylon Tailor Bird. *Orthotomus sutorius sutorius* (Pennant)
Motacilla sutoria Pennant, 1769, Ind. Zool. pl. 7 (Ceylon)
Baker, FBI No. 813 (part), Vol. 2: 410

LOCAL NAMES. *Battichehā, Tawilā* (Sinhala); *Thayarkāran-kirūci, Koddia-pakkān* (Tamil).

SIZE. Sparrow — ; length c. 13 cm (5 in.).

FIELD CHARACTERS. As in 1535, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Common and widespread resident. Ceylon, in all zones from sea level to c. 1500 m. Affects gardens, jungle, scrub.

GENERAL HABITS AND FOOD. As in 1535.

VOICE AND CALLS. Generally as in 1535; described as a loud, rather monotonous call with many variants, something like *tiwer tiwer tiwer*... sometimes speeded up to *twik twik twik*... When a pair has become separated, it becomes a loud *twike, twike, twike* (Henry). Alarm-note, a rapid chatter.

BREEDING. Season, ill-defined: nearly all year but with a peak in March to May and again in August-September. Nest and eggs, as in 1535. Clutch size usually 2, sometimes 3.

MUSEUM DIAGNOSIS. Differs from *guzuratus* in being darker green above, more uniformly washed with buff below. Rufous cap more extensive, practically absorbing all the grey of the nape. Bill longer and heavier. Not yet clear whether length of tail a seasonal or a seasonal characteristic (see Whistler, JBNHS 41: 96).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	47-50	16-17	18-20	40-64 mm
♀♀	42-46	16-17	18-20	29-33 mm (HW)

Weight 1 ♀ 9 g (SDR).

COLOURS OF BARE PARTS. As in 1535.

up to 1400 m, rarely 1800 m. Affects heavy scrub and edges of evergreen forest.

Extralimital. The species extends east through the Indochinese countries and south to Sumatra and Borneo.

GENERAL HABITS. A retiring species frequenting low undergrowth in dense jungle. It is more often heard than seen and, unlike the Indian Tailor Bird, confines itself to forest, not being found in open surroundings. Works its way through the bushes, tail cocked often well over the head.

FOOD. Insects.

VOICE AND CALLS. A loud trill 'kri-kri-kri... repeated a varying number of times' (Smythies); quite distinctive and easily recognized when once heard.

BREEDING. Season, March to August, chiefly May and June. Nest, very similar to that of Indian Tailor Bird, usually built within a single broad leaf and quite close to the ground (within one metre). Eggs, 3 to 5, generally 4, indistinguishable from those of *sutorius*. Average size of 100 eggs 15.4 × 11.4 mm (Baker). Both sexes share incubation.

MUSEUM DIAGNOSIS. See Field Characters. 'Black bases of throat feathers of female can always be seen if turned back with the finger' (Baker).

Young, similar to adult female but lacks rufous cap.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♀	42-48	14-15	c. 19-20	31-36 mm (Baker)

Bill from skull 16 mm

Weight 2 ♂♂ 6.8 (Feb.), 7.5 (May) g — Paynter.

COLOURS OF BARE PARTS. Iris orange-brown. Bill brown, lower mandible pale fleshy brown. Legs and feet flesh-colour.

1541. Goldenheaded Tailor Bird. *Orthotomus cucullatus coronatus* Blyth
Orthotomus coronatus Blyth, 1861, Proc. Zool. Soc. London: 200 (Sikkim)
Baker, FBI No. 922, Vol. 2: 516
Plate 87, fig. 12

LOCAL NAME. *Inhamui* (Kacha Naga).

SIZE. Sparrow — ; length c. 12 cm (4½ in.).

FIELD CHARACTERS. Above, forehead and crown rufous; a short yellow supercilium. Lores, sides of head and a nuchal collar dark grey. Back and wings olive-green; lower rump yellow. Below, throat and breast greyish white. Rest of underparts bright yellow. Tail brown; inner web of outer rectrices white. Sexes alike.

Easily distinguished from other tailor birds by its bright yellow belly.

STATUS, DISTRIBUTION AND HABITAT. Resident, locally common. Eastern Nepal (not recorded since Hodgson), Sikkim, Darjeeling and Jalpaiguri districts (duars), Bhutan and Arunachal foothills to the Mishmis, Nagaland, Manipur and the hills of Assam and Bangladesh

1539. Ceylon Highland Tailor Bird. *Orthotomus sutorius fernandensis* Whistler
Orthotomus sutorius fernandensis Whistler, 1939, Bull. Brit. Orn. Cl. 60: 15 (Ohiya)
Not in Baker, FBI

LOCAL NAMES. As in 1538.

SIZE. Sparrow — ; length c. 13 cm (5 in.).

FIELD CHARACTERS. As in 1535, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Common resident. The hills of Ceylon from c. 1500 m to the highest summits. Habitat as in 1538.

GENERAL HABITS, FOOD AND VOICE. As in 1538.

BREEDING. Season, March to October with a peak in April-May and August-September. Nest and eggs, as in 1535.

MUSEUM DIAGNOSIS. Differs from *sutorius* (1538) in being darker more saturated green on upperparts. Grey of throat-feather bases more extensive; flanks dark slaty grey.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
3 ♂♂	49-50	16-17	19-21	52-64 mm
1 ♀	47	16	20	33 mm (HW)

COLOURS OF BARE PARTS. As in 1535.

1540. Blacknecked Tailor Bird. *Orthotomus atrigularis nitidus* Hume
Orthotomus nitidus Hume, 1874, Stray Feathers 2: 478, 507 (Pahpoon, Tenasserim)
Orthotomus atrigularis [sic] *latebricola* Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 16 (Dimapur, Naga Hills)
Baker, FBI No. 818, Vol. 2: 415
Plate 87, fig. 14

LOCAL NAMES. *Junglā teete sorūi* (Assam); *Hagra das teete* (Cachari).

SIZE. Sparrow — ; length c. 13 cm (5 in.).

FIELD CHARACTERS. Male. Above, olive-green with a rufous or chestnut crown. Below, cheeks and chin whitish grey; throat black; sides of breast grey; belly whitish; lower flanks greenish yellow; under tail-coverts yellow.

Female, like male but lacks the black on throat. Distinguished from Indian Tailor Bird (1535) by its bright yellow bend of wing and under tail-coverts (both whitish buff in the species *sutorius*). The rufous of crown is more extensive and reaches the green of back, lacking the grey area of *sutorius*. Best distinguished by voice, q.v.

STATUS, DISTRIBUTION AND HABITAT. Resident, locally common. Sikkim, northern Bengal (Jalpaiguri dist.), the hills of Bangladesh and Assam south of the Brahmaputra, and south to the Chittagong region, Nagaland and (?) Manipur, from the base of the hills and adjoining plains

to the Chittagong region; up to c. 1800 m (2200 m on Mt Victoria). Affects evergreen biotope — scrub, grass and bamboo jungle, climax forest and secondary growth.

Extralimital. The species extends east through southern China, the Indochinese countries, and south to Borneo and Bali.

GENERAL HABITS. Very similar to the Indian Tailor Bird (1535) but is exclusively forest-dwelling. Usually found in pairs or small parties, hunting in low thickets, elusive and difficult to observe. Occasionally climbs up to six or nine metres in a tall bamboo when foraging, or makes short excursions into the air after insects.

FOOD. Insects.

VOICE AND CALLS. Alarm-note, a low buzz sounding like *kiz-kiz-kiz* (Davison). Song, a loud four-noted whistle, the first two on the same pitch, the third a trill (three or four notes uttered very rapidly) and the fourth either higher or lower than the first two. It is repeated in a remarkable number of keys, high and low, rendered as *pee-pi-pi-pee* (Smythies). Also described as a very thin and high phrase of three notes, *tū-tā-tū*, the second note only a short introduction to the last higher and emphasized note. This song is usually repeated three times at intervals of a few seconds, each time higher than the preceding (Heinrich).

BREEDING. Season, May to July. Nest, made of fine grass stems, dry moss, lined with vegetable down and built within sewn-up leaves in the characteristic manner of *O. sutorius*. It is placed within a metre from the ground. Eggs, 3 or 4, pale blue marked with fine reddish specks. Average size of 12 eggs 15.5 × 11.3 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
7 ♂♂	46-48	16-18	c. 20	34-41 mm
5 ♀♀	45-46	16-18	19-20	c. 42 mm (Stresemann, Baker, SA)

Weight 4 ♂♂ 0.20-0.25 oz. (5.6-7.1 g) — Hume; 1 ♀ 5.5 g (SA); 1 ♂ 6 g (SDR).

COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible black, lower basally orange, distally horn. Legs and feet brownish flesh.

Genus LOCUSTELLA Kaup

Locustella Kaup, 1829, Skizz. Entw. Nat. Syst. 115.
Type, by tautonymy, *Sylvia Locustella* Latham

Cf. Williamson, K., 1963, The Genera *Cettia*, *Locustella*, *Acrocephalus* and *Hippolais*. British Trust for Ornithology, Identification Guide No. 1.

Dementiev, G. P., et al., 1954, *Birds of the Soviet Union* (English translation), 6: 233. Smithsonian Institution, Washington.

Bill slender, about half as long as the head. Rictal bristles very weak and hardly noticeable. Plumage soft. First primary (as.) very short; 2nd reaching nearly to tip of wing. Tail graduated, very much rounded at tip, the rectrices slightly pointed; under tail-coverts very long.

SIZE. Sparrow — ; length c. 13 cm (5 in.).

WARBLERS

91

breast and flanks with dark brown, this character distinguishing it from the other two species which occur in India (viz. *certhiola* and *naevia*). Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Winter visitor. Bangladesh (all parts *vide* Rashid), probably Assam, eastern Nepal (Biswas, 1968, JBNHS 65: 783), and northern India (where very scarce): Etawah (U.P.), Delhi and Kutch (in both places one record—Donahue, JBNHS 64: 425). Also the Andaman and Nicobar Islands (Abdulali, JBNHS 64: 185). Affects dense bush-and-grass; in the Nicobars open grassland and sugarcane; in Burma also low herbage in paddy stubbles.

Extralimital. Breeds mainly in southern Siberia from the Ob river to Sakhalin island. Winters in the Indochinese countries and south to Sumatra and Borneo.

MIGRATION. Arrives in its winter quarters in October. Migration takes place mostly in September (Dementiev); the Delhi record, August 17, is exceptionally early. Leaves in April. One taken at sea in the Gulf of Martaban on April 29 (on passage from Andamans?)—SF 6: 340.

GENERAL HABITS. Those of the genus; one of the greatest skulkers, hard to flush and usually seen only by chance. Makes its way rapidly through tangled weeds and grass stems and runs along the ground among the rootstocks of the herbage in a truly astonishing manner. When flushed, flies low and jerkily for a few short metres and dives into cover, running on immediately upon alighting.

VOICE and CALLS. Alarm-note, *chirr-chirr* louder than that of *L. certhiola*.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS

	Wing	Tail
6 ♂♂	53-59	44-47 mm
4 ♀♀	52-58	— mm
		(Dementiev)
1 ♂, 2 oo?	50-55	32-42 mm

Bill from skull c. 14 mm. Tarsus c. 19 mm

Weight (on summer grounds) ♂♂ 14-15; ♀♀ 13-14 g (Dementiev).

COLOURS OF BARE PARTS. Iris brown. Bill dark brown, yellowish at base of lower mandible. Legs and feet pale flesh.

1545. Eastern Grasshopper Warbler. *Locustella naevia straminea* Seebohm

Locustella straminea Seebohm, 1881, Cat. Bds. Brit.
Mus. 5: 117, ex Severtzov, 1872, *nom. nud.* (Turkestan)
Baker, FBI No. 807, Vol. 2: 402
Plate 85, fig. 3

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 13 cm (5 in.).

FIELD CHARACTERS. Above, pale olive-brown with broad, dark brown streaks. A pale, narrow supercilium. Below, whitish or pale yellowish washed

90

SYLVIINAE

FIELD CHARACTERS.

Above, crown streaked grey and dark brown. A pale but conspicuous supercilium from lores to nape. Rest of upperparts olive-brown, the back streaked with dark brown. Tail rounded, tipped with whitish. Below, whitish suffused with pale brown on breast and flanks. Under tail-coverts buff. Under surface of tail blackish broadly tipped with whitish. Sexes alike.

x c. 1

Young bird similar to adult but underparts strongly suffused with yellow.

The white-tipped tail and more rufous rump distinguish it from *L. naevia*. STATUS, DISTRIBUTION and HABITAT. Winter visitor, locally common. Lower Bengal, Assam, Bangladesh, 'Central India' (Blyth, 1851), eastern Nepal (Biswas, 1968, JBNHS 65: 783), Andaman Islands, Ceylon (not recorded since 1877—Legge). A specimen netted in May 1963 in Kerala (P. V. George, JBNHS 62: 304). Affects swamps, *Phragmites* reed-beds and standing paddy fields.

Extralimital. Breeds in Siberia between the Yenisey and the Sea of Okhotsk, south to the Lake Baikal region. Winters in Burma, the Indochinese countries, Malaysia and Indonesia.

MIGRATION. Arrives in its winter quarters in October, remains till April or early May. Arrives on its breeding grounds in late May and early June. GENERAL HABITS. Very quiet and secretive in winter when it skulks in reeds and grass; rises almost from under an advancing observer's feet and hurriedly tumbles into cover again.

FOOD. Insects.

VOICE and CALLS. In winter only an occasional *chi-chirr* is uttered.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. See Key to the Subspecies.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

92

SYLVIINAE

with buff on breast and flanks, lower throat often speckled. Under tail-coverts very long, whitish with broad brown shaft-streaks. Sexes alike.

The plain brown tail without white tips, and lack of streaking on flanks and breast, distinguish this species from our other two *Locustellas*.

STATUS, DISTRIBUTION and HABITAT. Widespread winter visitor. The Indian subcontinent from Sind (Manchar Lake), Kutch and the Gangetic Plain south to Tamil Nadu and Kerala, and east through the Bengal duars (Jalpaiguri dist.), Bangladesh (all parts *vide* Rashid), and Assam. In the southern hills up to c. 1800 m. Affects flattened-down sedges (Cyperaceae) and low matted herbage on the moist edges of drying-up tanks and in swampy depressions, grass and tamarisk jungle, ricefields, rushes and reeds; *Andropogon* grass intermixed with sparse date scrub on hillsides, especially on the fringe of sholas, in the south.

Extralimital. The species breeds in temperate Eurasia from Turkestan to western Europe; winters in the Mediterranean countries, southern Iran and Afghanistan, east to Burma.

MIGRATION. Arrives in its winter quarters in September, remains till April and early May. Spring passage takes place from the last week of March till the middle of May (Simla 2100 m, Dharmasala, Kohat). A specimen from Sikkim taken in June (Brit. Mus.). On autumn migration recorded in Gilgit (September) and Simla (August).

GENERAL HABITS. Very similar to 1544, q.v., almost invariably met singly. A great skulker usually flushed when almost trodden on, diving headlong into cover again after a short jerky flight low over the herbage and threading its way swiftly through the rootstocks. Almost impossible to flush a second time.

FOOD. Insects.

VOICE and CALLS. Very silent in winter. Normal call when foraging and well-hidden a subdued *chek-chek* or *churr-churr* reminiscent of Blyth's Reed Warbler. Alarm-note (as when mobbing a snake) an agitated *cht-cht-cht* recalling *Dumetia hyperythra*, 1222.

Has an almost incessant, unmusical cicada-like 'song' in breeding season, whence the name Grasshopper Warbler.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. See Field Characters.

Young (immature). Underparts washed with bright yellow.

MEASUREMENTS

	Wing	Tarsus	Tail
♂♂	53-62	18-19	48-61 mm
♀♀	50-57		48-55 mm
			(Dementiev)

COLOURS OF BARE PARTS. Iris brown. Bill dark brown, lower mandible pale yellowish brown. Legs and feet pink.

Genus SCHOENICOLA Blyth

Schoenicola Blyth, 1844, Jour. Asiat. Soc. Bengal 13: 374.

Type, by monotypy, *Thimalia platyura* Jerdon

Bill about half as long as head. Two strong rictal bristles. Wing rather long, third primary (as) longest. Tail long, broad and graduated. Feet powerful.

1546. **Broadtailed Grass Warbler.** *Schoenicola platyura* (Jerdon)*Thimalia platyura* Jerdon, 1844, Madras Jour. Lit. Sci. 13: 170

(Goodaloor, foot of the Neilgherries)

Baker, FBI No. 837, Vol. 2: 437

Plate 85, fig. 2

LOCAL NAME. *Potakkili* (Malayalam).

SIZE. Sparrow; length c. 18 cm (6½ in.).

FIELD CHARACTERS. *Above*, plain rufous-brown. An indistinct pale supercilium. Tail broad, rounded blackish brown, faintly cross-rayed. *Below*, whitish, washed with ochraceous on breast and flanks. Under surface of tail nearly black, the rectrices tipped with whitish. Sexes alike.

× c. 1

The plain, unstreaked appearance and broad, rounded tail distinguish this species.

STATUS, DISTRIBUTION AND HABITAT. Resident; on the whole rather scarce, common in southern Kerala. The hills of the southern Western Ghats complex from Belgaum south to the Ashambu Hills and east to the Madurai district; from c. 900 m to 2000 m (see map, p. 79). Occurrence in Ceylon known only from a single very old and insufficiently documented specimen and by two unconfirmed sight records by W. W. A. Phillips in 1939 (Gammaduwa, East Matale Hills, and Waitalawa, Nugatenne in the Rangala Hills, altitude 750 m). Affects steep grass- and bracken-covered hillsides, matted reeds and grass in marshy depressions among the hilltops, and stretches of *Andropogon* grass and stunted date clothing the opener slopes of the Nilgiris and associated hills.

GENERAL HABITS. Keeps singly or in widely scattered pairs. Habits very similar to *Chaetornis* (1547). An inveterate skulker like grasshopper warblers. Seldom seen except in the early mornings and late afternoons (around sunset) when single birds will clamber up to the tops of grass stems, drawing attention by their feeble pink, pink calls, rather reminiscent of the Red Munia (*Estrilda amandava*, 1964) but louder. Flight indirect and top-heavy like that of *Prinia*, the broad graduated tail conspicuous on the wing. Like *Locustella*, flushes with difficulty only when almost trodden on and dives into cover again after a short jerky flight, threading its way swiftly through the rootstocks and vanishing mysteriously!

Display. In the breeding season rises constantly into the air, soaring 4 or 5 metres up with tail fanned out, chirruping like *Chaetornis* and descending afterwards in the same way on to some low bush or grass tussock, sometimes even on to telegraph wires.

FOOD. Insects.

VOICE AND CALLS. See General Habits and Display. Song delivered on wing as well as from a perch, 'A shrill and sweet trill, ending with a few warbling notes and *chacks*. It is the best song of any of our warblers' (Nichols, Kodaikanal, JBNHS 39: 819).

BREEDING. *Season*, (from the state of the gonads) March to May. *Nests* with eggs or young have actually been found only between the first week of July and September, so perhaps double-brooded. *Nest*, a good-sized ball of

On a fleeting glimpse could be confused with Common Babbler (*Turdoides caudatus*, 1254), rather similar to it in appearance and behaviour.

Graminicola has a nearly black crown (v. pale brown) and some white on sides of neck. *Megalurus* is much larger and has streaked breast and flanks.

STATUS, DISTRIBUTION AND HABITAT. Resident subject to local movements. Distributed over most of the Indian subcontinent but very local; noted as fairly common in Gujarat, Andhra Pradesh and lower Bengal. Range: Pakistan in Punjab and perhaps Sind, east and south through the Indian Peninsula to Tamil Nadu, the Bengal duars (Jalpaiguri dist.) and the plains of Bangladesh and Assam. Does not occur outside our limits. Affects coarse grassland intermixed with low thorny bushes of *Lixyphus* etc., *Imperata* and other tall grasses especially in swampy areas, and also standing rice fields.

GENERAL HABITS. Similar to those of *Schoenicola* and *Megalurus*. Keeps singly or in pairs skulking swiftly through the grass, occasionally exposing itself at the top, tumbling headlong into cover on disturbance and difficult to flush again.

Display. Male soars in the air a metre or two above the grass every now and again, flying about aimlessly — up and down and in zigzags — for a short distance while singing loudly, and then parachuting back or diving into cover. These antics may be observed the year round though the bird is more noisy and demonstrative during the breeding season.

FOOD. Insects.

VOICE AND CALLS. A pleasant, musical *chwee-chew* (rising-falling) uttered from an exposed position on tall marsh grass or bush (Donahue) and during display flight.

BREEDING. *Season*, May to September. *Nest*, a ball of dry grass with an entrance near the top, placed in grass or scrub on or near the ground. *Eggs*, 4 or 5, similar to those of *Schoenicola* (1546). Average size of 22 eggs 20.4 × 15.2 mm (Baker). Incubation apparently by female only; period undetermined.

MUSEUM DIAGNOSIS. See Field Characters. Some individuals have dark shafts on breast-feathers forming a 'necklace' (Donahue, JBNHS 64: 425); this character has not been mentioned in published descriptions.

♀ ♀	63-67	13-15	21-22	61-66 mm

(HW)

COLOURS OF BARE PARTS. Iris brownish grey, greyish olive or olive-brown. Bill: upper mandible horn brown, lower horn grey or flesh-colour; mouth yellowish pink, stippled with brown in some individuals; gape yellowish cream, yellow or black (it is not known whether these variations are seasonal). Legs, feet and claws greyish brown; soles fleshy.

Genus CHAETORNIS Gray

Chaetornis Gray, 1848, Gen. Bds. 1, pl. 48, fig. 9: 161.Type, by original designation, *Megalurus? striatus* Jerdon

Characterized by having unfeathered lores with five very strong rictal bristles arranged in a vertical row in front of the eye.¹ Feathers of breast stiff-shafted.

1547. **Bristled Grass Warbler.** *Chaetornis striatus* (Jerdon)*Megalurus? striatus* Jerdon, 1841, Suppl. Cat. Bds.: 88

(Nilgiris)

Baker, FBI No. 838, Vol. 2: 438

Plate 85, fig. 6

LOCAL NAMES. *Grenla pitta* (Telugu); *Kāñāḍālī khāḍ-jūḍī* (Gujarati).

SIZE. Sparrow +; length c. 20 cm (8 in.).

FIELD CHARACTERS. A large brown warbler of wet grasslands. *Above*, fulvous brown boldly streaked with dark brown on back. Visible part of wing fulvous brown. A pale supercilium. Tail graduated, tipped with whitish, sub-tipped black; edges of rectrices pale brown with a broad dark brown stripe along the shaft having a saw-like design on each side giving the tail a barred appearance. *Below*, cream-buff, sometimes with a necklace formed by the dark shafts of breast-feathers. Sexes alike.

× c. 2

¹ These five bristles are set in a loose moveable flap of skin so that they move backwards and forwards as on a hinge. When pressed back they cover the eyes completely with a grating and afford adequate protection to them while the bird is moving through heavy rough-edged grass (Whistler, JBNHS 33: 783).

Bill from skull c. 16; tarsus c. 30 mm

COLOURS OF BARE PARTS. Iris light brown. Bill: upper mandible greenish black, lower bluish grey darker at base and on edges. Legs flesh-pink; toes light brown; claws dark brown; soles flesh-white (Donahue).

Genus MEGALURUS Horsfield

Megalurus Horsfield, 1821, Trans. Linn. Soc. London 13: 158.Type, by monotypy, Gray, 1849, *Megalurus palustris* Horsfield

Bill strong; rictal bristles strong. Wing less rounded than in most sedentary warblers. Tail much longer than wing, greatly graduated. Foot deeply cleft between middle and inner toe, the latter partially reversible. Legs and feet powerful.

1548. **Striated Marsh Warbler.** *Megalurus palustris toklas* (Blyth)*Turdus toklas* Blyth, 1843, Jour. Asiat. Soc. Bengal 12: 179

(Calcutta), ex 1842, Jour. Asiat. Soc. Bengal 11: 603, and 1843,

Ann. Mag. Nat. Hist. 12: 99; *ibid.* Blyth, 1844, J.A.S.B. 13: 372*Megalurus palustris andrewsi* Bangs, 1921 Bull. Amer. Mus. Nat. Hist. 44: 592

(Malipa, Burma = Mengting, Yunnan)

Baker, FBI No. 836, Vol. 2: 435

Plate 85, fig. 5

LOCAL NAMES. *Takko, Jāl-aggin* (Hindi); *Nul chaypee* (Assam).

SIZE. Bulbul +; length c. 25 cm (10 in.).

FIELD CHARACTERS. A very large striated warbler with a long pointed and graduated tail. *Above*, fulvous brown with fine streaks on head and broad black stripes on back and wings. A pale supercilium. Tail fulvous brown. *Below*, whitish, tinged with fulvous and finely brown-streaked on breast, flanks and under tail-coverts. In fresh plumage, underparts dull primrose-yellow, quite bright in patches. Sexes alike.

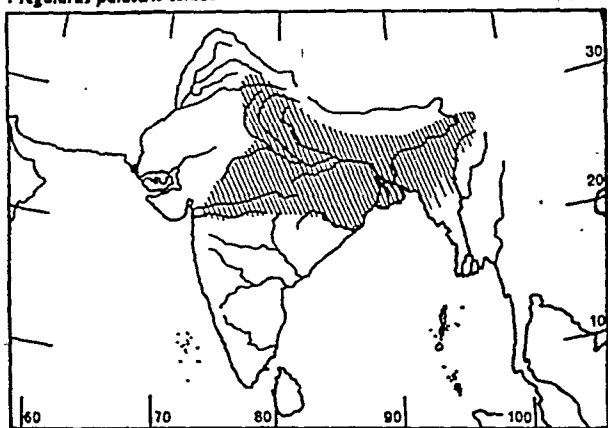

× c. 1

May be confused with two very similar grass-haunting babblers: *Turdoides earlei* which has a rufous throat and *Turdoides caudatus* which lacks any streaking on breast. Both have a narrowly barred tail. *Megalurus* is also much more boldly striped with black on back and wings. The warblers *Chaetornis* and *Graminicola* are smaller and have white-tipped rectrices.

STATUS, DISTRIBUTION AND HABITAT. Resident, locally common. From Pakistan in the Punjab east through the plains of northern India, Nepal terai, Bengal duars (Jalpaiguri dist.), Bhutan and Arunachal foothills, Assam, Nagaland, Manipur and Bangladesh to the Chittagong region. South in the Peninsula to western Khandesh, the Tapi and Mahanadi

WARBLERS

97

Megalurus palustris tokio

▨ Distributional range

river. Affects grass and reeds in swamps and around ponds, tall grass and scrub on overgrown cultivation clearings, and tamarisk-covered islands in large rivers; in Assam frequents grasslands near cultivation and villages, and in Manipur even enters gardens of the suburbs.

Extralimital. The species ranges east through Burma, Thailand, southern China and the Indochinese countries to the Philippines, and south to Java and Bali.

GENERAL HABITS. Usually found singly or in pairs according to the season. Behaves very much like *Turdoides caudatus* and *T. earlei* with which it may easily be confused, but unlike them is seldom seen in flocks. Not such a skulker as other grass warblers, and may commonly be seen perched on bush-tops and reeds, especially in the early morning, when reminiscent in the distance of Brown Shrike (*Lanius cristatus*). While perched flicks tail loosely up and down from time to time like bush chat (*Saxicola*). On alighting on a reed often observed to flick wings nervously like a *Phylloscopus*, fluttering one half-open wing for 2 or 3 seconds followed by the other, and so on alternately—an action comically suggestive of a person scratching his armpits! (Presumably agonistic or threat behaviour.) Searches for food in dense cover, climbing about rapidly among reeds and grass, and threading its way through the stems and brushwood. Occasionally descends to the ground, walking about and feeding like a pipit (not hopping).

Display. Male soars in the air up to thirty metres or so while giving his song, hovering over the vegetation and parachuting down after a short flight with outspread wings.

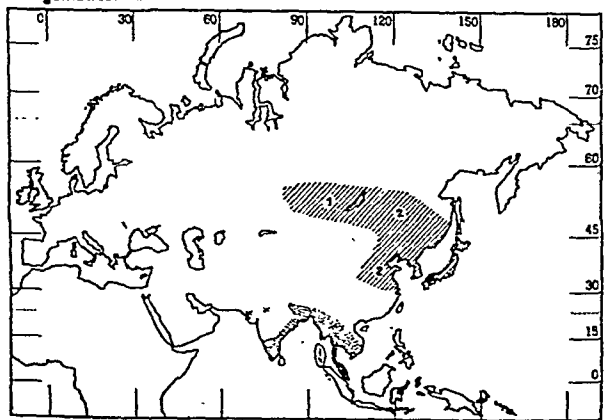

WARBLERS

99

FIELD CHARACTERS. Above, plain fulvous olive-brown. Below, whitish buff more or less tinged with ochraceous, especially on breast, flanks and under tail-coverts. Sexes alike.

The relatively shorter bill and absence of supercilium distinguishes this species from the superficially similar Great Reed warblers with which easily confusable on a fleeting glimpse, as also with Brown Shrike. Best identified by its distinctive calls (qq.v.).

STATUS, DISTRIBUTION and HABITAT. Winter visitor locally common; apparently more widespread than hitherto believed as disclosed by recent mist-netting. Assam, northern Bengal and Bangladesh (fairly common), west to central Nepal (Kathmandu Valley, 1500 m—Fleming & Traylor, Diesselhorst), lower Bengal, Orissa, Andhra Pradesh, southwestern Maharashtra, Goa (?), Mysore, Tamil Nadu and Kerala (uncommon except in

Phragmatocola aedon

▨ Breeding

(After Dementiev)

the latter state); specimens netted in Kutch (Gujarat) and at Bharatpur (Rajasthan) between September and March (SA). Also winters in Andaman and Nicobar islands. Affects marshy places covered with reeds and bushes, patches of tall grass and weeds overrunning abandoned forest clearings, grass tussocks and bracken bushes on waterlogged ground, undergrowth in light forest, even tea and coffee plantations.

SYLVIINAE

98

FOOD. Insects.

VOICE and CALLS. Song recalls nuptial song of *Melanocorypha maxima* lark (893—SA); rather loud and harsh but pleasant, rendered as *oh, where are you going* with variations (Roseveare), uttered from a prominent perch or during the display flight. One call is a clear, drawn-out, rather subdued whistle ending in a short explosive *whetchoo*, of a pattern resembling Bush Warbler's (*Cettia*, 1478—SA). Call-note a loud, harsh *chat*.

BREEDING. Season, April to June. *Nest*, a rough ball of coarse grass lined with finer grasses; placed low down in reeds or grass clumps close above the swampy ground. *Eggs*, normally 4, pale dull pink marked with numerous blackish brown and purple-brown specks with secondary freckles of lilac grey. Average size of 40 eggs 22.7 × 16.7 mm (Baker). Share of the sexes in the domestic chores, and incubation period, unknown. Brood-parasitism by *Cuculus canorus* recorded in Burma by Osmaston and Mackenzie (JBNHS 24: 359; 25: 743).

MUSEUM DIAGNOSIS. See Field Characters.

LOCAL NAME. Chundanbheri (Malayalam).

SIZE. Bulbul; length c. 20 cm (8 in.).

SYLVIINAE

100

Extralimital. The species breeds in southern Siberia from the Ob river to northeastern China and Japan. Winters in the Indochinese countries south through the Malay Peninsula.

MIGRATION. Arrives in its winter quarters in September, leaves by end of April.

GENERAL HABITS. Solitary. Rather secretive; hops about in the undergrowth and reeds close to the ground, seldom showing itself but occasionally makes short sallies after flying insects.

FOOD. Insects.

VOICE and CALLS. A loud harsh, quick-repeated *tchuk, tchuk*, and *chr-r* while hopping among the thickets (SA). A sharp *click, click* (BBO). A distinctive harsh alarm-call *chok-chok* (by which name the bird is known in Transbaikalia), sometimes running into a rattle *chok-chok-cherre-rrek-chok* (Dementiev). A secondary song given in winter quarters described as weak and monotonous but pleasing.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. Distinguished from *Acrocephalus arundinaceus*, *A. stentoreus* and *A. orientalis* by its first primary being longer than the primary coverts. Feathers of forehead rough and disintegrated; rectrices narrow and steeply graduated.

	Wing	Bill (from skull)	Tarsus	Tail

Plate 83, fig. 19

LOCAL NAMES. Kārkaī, Korkuch (Kashmir); Pān tiktiki (Gujarati); Bora-jitti (Telugu); Kaitakkallan (Malayalam); Kosu kattai, Nanni chirai (Tamil).

SIZE. Bulbul; length c. 19 cm (7½ in.).

FIELD CHARACTERS. A large plain olive-brown warbler with a conspicuous whitish supercilium. Below, throat whitish; rest of underparts buff. Sexes alike.

× c. 1

In appropriate facies may be mistaken for Brown or Isabelline Shrike when darting from bush to bush. The superficially similar Thickbilled Warbler (1549) has no supercilium; the Eastern Great Reed Warbler (1554) has a faintly streaked throat, though not readily noticeable in the field.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor, passage migrant and breeder. Breeds mostly in northwestern India and Pakistan — Kashmir (very common in Srinagar valley), Punjab, Uttar Pradesh (Oudh, Bahraich), N.W.F.P. (Kagan and Kurram valleys), the northern Indus plains (West

WARBLERS

103

Pandanus brakes along the backwaters. On passage may be seen in dry situations (acacia jungle, cultivation, etc.).

Extralimital. Extends northwest to the Aral Sea where it overlaps the range of *A. arundinaceus*, and west to western Iran. The nominate race is found as an isolated population from the Nile delta and the Huleh swamp at the head of the Jordan valley where it is sympatric with *A. arundinaceus*, the latter being restricted to reeds, and *stentoreus* to papyrus swamps (Zahavi, A., 1957, *Ibis* 99: 606-7).

MIGRATION. Widespread during migration in northern India and Pakistan, on passage to and from Transcaspiia in March-May and September-November. In southern India (Madurai) it is found as a winter visitor from September to May. Kerala breeding population is probably sedentary. On its breeding grounds in Kashmir and Baluchistan from April to September. A bird ringed near Calcutta (22°34'N, 88°22'E.) in April 1965 was recovered 3 years and 5 months later (Sept. 1968) in Uzbek S.S.R. near Samarkand, 39°41'N, 66°58'E. — c. 2600 km NW. (JBNHS 66: 174).

GENERAL HABITS. Keeps singly or in pairs according to the season. Moves about in reeds close to water. Is a great skulker and might easily be overlooked but for its loud harsh single *ke* (reminiscent of Jungle Babbler's) or *chur-r*, *chur-r* uttered every few seconds, and occasional snatches of its very distinctive rasping song, q.v. When warbling, throat swells out revealing a patch of dark feather-bases.

FOOD. Grasshoppers and other insects.

VOICE AND CALLS. Song spirited, very loud and harsh but quite pleasant; a typical refrain of it well rendered as *karra-karra-kareet-kareet-kareet* or *prii-prii-prii* with many variations, suddenly bursting out of a reed-bed; often of peculiar ventriloquial quality. Described as louder and harsher than that of *arundinaceus* (Witherby). It is a good mimic, and according to Meinertzhagen, in certain cases it might be possible to tell with accuracy from the imitations interlarded in the song where a bird had spent the winter. In Afghanistan in spring he was able to recognize the calls of the Peacock and the Bulbul. The song may be heard sporadically all through the winter.

BREEDING. Season, overall May to August; in Kashmir chiefly June and July. Nest, a neat, deep and massive cup of dry reed leaves and strips of reed bark, lined with softer shreds of the same material. It is firmly slung between several reed or rush stems (*Phragmites*, *Typha*) standing partially submerged, from 30 to 100 cm above water level, more often under c. 50 cm and vulnerable to swamping by flash floods. Eggs 3 to 6, normally 4 (3 in Kerala, 5 or 6 in Baluchistan). Ground colour varies from greyish white to pale sea-green or pale brown, with numerous blackish brown specks and spots and secondary markings of lavender-grey. Average size of 60 eggs 22.7 × 15.9 (Baker), of 29 eggs 22.6 × 15.8 mm (Osmaston). Share of the sexes in nest-building and incubation unrecorded; both parents feed the young and attend to nest sanitation; incubation period undetermined. Nests frequently brood-parasitized by Cuckoo (*Cuculus canorus*).

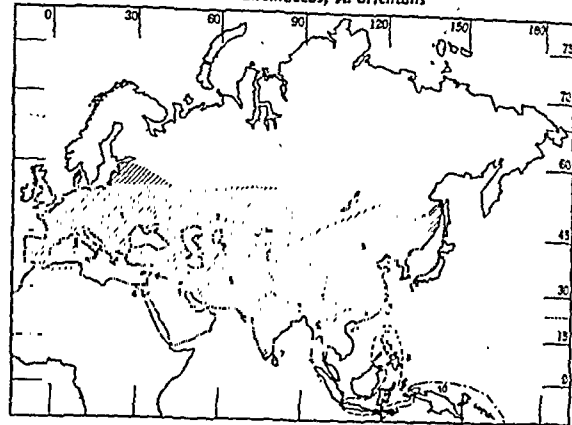

MUSEUM DIAGNOSIS. See Key to the Species. *A. s. amayae* is darker, less rufous. A complete postnuptial moult takes place from September to November; apparently no spring moult. In fresh autumn plumage distinctly washed with grey

Acrocephalus stentoreus amayae Baker, 1922, Bull. Brit. Orn. Cl. 43: 17 (Hessamara, Assam)

Baker, FBI No. 796, Vol. 2: 390

LOCAL NAMES. None recorded.

SIZE. Bulbul; length c. 19 cm (7½ in.).

FIELD CHARACTERS. As in 1550, q.v.

WARBLERS

105

STATUS, DISTRIBUTION and HABITAT. Resident or short-range migrant; Assam in North Lakhimpur and probably other parts of the Brahmaputra plains. Recorded in winter from the Andamans (Abdulali, JBNHS 61: 562). Affects reed-beds and elephant grass.

Extralimital. Extends east to southern China.

GENERAL HABITS, FOOD and VOICE. As in 1550.

BREEDING. As in 1550. Eggs, 3 or 4, duller, browner and smaller than those of *brunescens*. Average size of 30 eggs 20.6 × 15 mm (Baker).

MUSEUM DIAGNOSIS. Like *brunescens* (1550) but darker on upperparts; fulvous underparts somewhat richer and darker.¹

MEASUREMENTS

	Wing	Bill (from skull)	Tail
2 ♂♂	88-91	25-26	79-84 mm
4 ♀♀	86-89	25-26	79-80 mm (HW)

Tarsus c. 28 mm (Baker)

COLOURS OF BARE PARTS. Iris olive-brown. Bill horny black above, paler on edges; lower mandible pinkish, darker at tip. Legs and feet bluish horn.

1553. Eurasian Great Reed Warbler. *Acrocephalus arundinaceus zarudnyi* Hartert

Acrocephalus arundinaceus zarudnyi Hartert, 1907, Bull. Brit. Orn. Cl. 21: 26 (Djarkent, Turkestan)
Not in Baker, FBI

LOCAL NAMES. None recorded.

SIZE. Bulbul; length c. 19 cm (7½ in.).

FIELD CHARACTERS. Indistinguishable in the field from *A. stentoreus*, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Accidental or rare passage migrant. One record in Kalat, northern Baluchistan, in October (Laubmann, 1913. 'Birds collected by Zugmayer in Makran in 1911', *Abh. I. Kon. Bayer. Ak. der Wissensch. Math.-Physik. Klasse XXVI*, Band 9). Affects reed-beds.

Extralimital. Western Palaeartic (see map on p. 102).

GENERAL HABITS and FOOD. As in 1550.

VOICE and CALLS. Apparently identical with those of *stentoreus*.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. Distinguished from *A. stentoreus* in having the first primary shorter than primary coverts. Wing more pointed: second primary longer than fourth (v. shorter in *stentoreus*). General colour much paler. Throat often streaked with brown. An entirely misleading wing-formula could arise in August-November when many birds are completing the moult; shortness of first primary however is diagnostic. For distinction from *A. orientalis* see 1554.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	91-102	20-24	28-32	72-84 mm
♀♀	90-100			71-85 mm (Williamson)

¹ Not always borne out by specimens. Tenability of the subspecies dubious.

106

SYLVIINAE

COLOURS OF BARE PARTS. Unrecorded. 'Iris yellowish sepia. Bill; upper mandible and tip of lower dark brown, rest of lower pinkish flesh. Legs and feet pale brownish grey' (Witherby, for the extralimital nominate race).

1554. Eastern Great Reed Warbler. *Acrocephalus orientalis* (Temminck & Schlegel)

Salicaria turdina orientalis Temminck & Schlegel, 1847, in Siebold, Fauna Japon., Aves: 50-51, pl. 21 B [= 20B] (Japan)
Baker, FBI No. 797, Vol. 2: 391

LOCAL NAMES. Not recorded.

SIZE. Bulbul; length c. 19 cm (7½ in.).

FIELD CHARACTERS. Probably not distinguishable in the field from *A. stentoreus* although throat distinctly streaked: See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Winter visitor, possibly less uncommon than records suggest. Bengal (specimens mist-netted near Calcutta by Biswas); Assam in Cachar and the Dibrugarh area, and Manipur. Andaman Islands (Abdulali, JBNHS 61: 562; also a specimen in Brit. Mus. collected by Wimberly) (see map p. 102). Affects reed-beds.

Extralimital. The species breeds in China and southeastern Siberia and winters in the Indochinese countries, Malaysia and Indonesia.

MIGRATION. Found in its winter quarters from October to April.

GENERAL HABITS, FOOD and VOICE. As in 1550.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. Similar to *A. arundinaceus zarudnyi* (1553) but darker above; throat more streaked, wing shorter and rounder. See Key to the Species.

108

SYLVIINAE

1555a. Asian Reed Warbler. *Acrocephalus scirpaceus fuscus* (Hemprich & Ehrenberg)

Curruca fusca Hemprich & Ehrenberg, 1833, Symb. Phys. Avium, fol. cc (northern Arabia)
Not in Baker, FBI
Plate 83, fig. 18

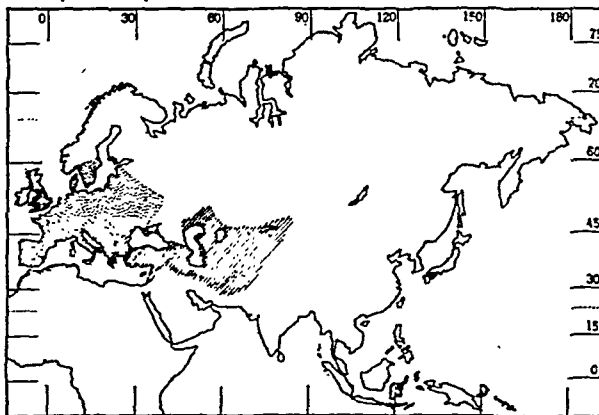

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 13 cm (5 in.).

FIELD CHARACTERS. A plain olive-brown reed warbler with buff underparts. Sexes alike. See Key to the Species.

Very like *A. agricola* (1557) but without the reddish (russet) tinge.

STATUS, DISTRIBUTION and HABITAT. Probably breeds in the Malezai Lora, northern Baluchistan (see JBNHS 43: 480). May also winter on the

Acrocephalus scirpaceus

Distributional ranges

■ *A. s. scirpaceus* (RE).

▨ *A. s. fuscus* (1555a).

Makran coast as the species is said to be a resident in Persian Baluchistan (Dementiev). Affects reed-beds around lakes and ponds.

Extralimital. Ranges from Turkestan and Afghanistan to Turkey. The species extends to England and Morocco.

GENERAL HABITS. Those of the genus.

FOOD. Insects.

VOICE and CALLS. Usual call-note a low *churr*. Song of the same type as *A. stentoreus* but not so loud and harsh, delivered in a more subdued and continuous manner.

BREEDING. Season, about June. Nest, a small version of that of *A. stentoreus* (1550).

MUSEUM DIAGNOSIS. See Key to the Species.

WARBLERS

107

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	75-88	20-24	27-31	67-77 mm
♀♀	75-83			67-71 mm (Williamson)

Weight 13 ♂♀ 22-29 (av. 25.5) g — BB.

COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible and tip of lower nearly black, rest of lower pinkish to yellowish flesh; mouth orange. Legs and feet lead-grey.

1555. Blackbrowed Reed Warbler. *Acrocephalus bistrigiceps bistrigiceps* Swinhoe

Acrocephalus bistrigiceps Swinhoe, 1860, Ibis: 51 (Amoy)
Baker, FBI No. 798, Vol. 2: 392
Plate 83, fig. 12

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 13 cm (5 in.).

FIELD CHARACTERS. A russet olive-brown reed warbler with a conspicuous pale supercilium and a blackish brown stripe above it. Underparts pale fulvous buff, whitish on throat. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Winter visitor. Recorded in Bengal (24-Parganas dist., 'regular in small numbers'—Biswas), eastern Assam and Manipur. Possibly also occurs in Bangladesh. Affects dense cover near *bheels*, high grass and paddyfields.

Extralimital. Breeds in the Ussuri region; winters in Burma, Thailand, the Indochinese countries and southern China.

MIGRATION. Arrives in its winter quarters in November, leaves in April.

GENERAL HABITS. Typical of reed warblers; very skulking and difficult to see.

FOOD. Insects.

VOICE and CALLS. A *churr* of alarm.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. See Key to the Species.

Two subspecies may be encountered in India, the nominate and *tangorum* (see K. Williamson, 1963).

MEASUREMENTS

♂♂	50-58	12-15	19-23	44-52 mm
♀♀	50-56			42-51 mm (Williamson)

Weight 16 ♂♂ 8-11 (av. 9.4) g; 8 ♀♀ 7-10 (av. 8) g (Williamson); 1 ♂? (winter) 8 g (BB).

COLOURS OF BARE PARTS. Iris dark brown. Bill: upper mandible and tip of lower dusky brown; rest of lower mandible and gape fleshy yellow. Legs yellowish brown with a fleshy tinge, yellower on toes and soles, browner on claws (Hume).

WARBLERS

109

A. Asian Reed Warbler (*A. scirpaceus*, 1555a)
B. Marsh Warbler (*A. palustris*, SE)
C. Blyth's Reed Warbler (*A. dumetorum*, 1556)
D. Paddyfield Warbler (*A. agricola*, 1557)

Showing differences in relative lengths of second primary and position of notch on inner web of this primary

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	59-71	15-18	22-25	50-58 mm
♀♀	59-68			48-55 mm

(Williamson)

Weight 1 ♂ 9 g (Paludan, Afghanistan).

COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible brown, lower flesh. Legs greenish horn; feet greenish.

1556. Blyth's Reed Warbler. *Acrocephalus dumetorum* Blyth

Acrocephalus dumetorum Blyth, 1849, Jour. Asiat. Soc. Bengal 18: 815
(No locality = Calcutta, see Biswas, 1962, JBNHS 59: 410)
Baker, FBI No. 799, Vol. 2: 393

Plate 83, fig. 16

LOCAL NAMES. Pēdnā, Tikitiki (Hindi); Pān tikitiki (Gujarati); Tikra (Bengali); Kumpa jitta (Telugu); Etelapoppān (Malayalam).

SIZE. Sparrow —; length c. 14 cm (5½ in.).

FIELD CHARACTERS. A smaller replica of Great Reed Warbler (1550). Above, olive-brown; a pale supercilium. Below, throat white, rest of underparts buffish. Sexes alike.

Confusable with Tree Warbler (1562-3), but somewhat larger size, longer and heavier bill, brighter olive-brown plumage and prominent buff supercilium will usually distinguish it; also its bush- rather than tree-haunting habit.

WARBLERS

111

through bushes and undergrowth, seldom affording a glimpse of itself, its presence within the shrubbery betrayed only by the distinctive loud chuck notes.

FOOD. Insects.

VOICE AND CALLS. A harsh, single chuck given every few seconds while foraging — 'reproduced exactly by placing the tongue against the teeth and drawing it back rapidly' (Davison). Alarm-note churr-r-r. Song, a chattering warble with 'a good deal of the spitting, sputtering noise so peculiar to the genus' (Magrath). A subdued melodious warbling, recalling the breeding song of Rufous-backed Shrike (*Lanius schach*) thus: chek-chek-chek-che-chwee-chek-chek rapidly repeated, punctuated by the usual chur-rs and chucks (SA). May occasionally be heard in winter quarters, particularly from mid March on, when migrating.

BREEDING. Within our limits authentically recorded only in N. Baluchistan, but without details. Elsewhere season, June and July. Nest, a compact cup of long leaves and grass-stalks interwoven with cobweb and vegetable down, lined with fine grass stalks and sometimes horse hair. Hangs from stems and twigs, from a few centimetres to about one metre above the ground, in dense shrubs and thickets. Eggs 4 to 6, of very variable colour, generally falling into three types: (1) pale pink with reddish brown spots and secondary violet-grey blotches, (2) milk-white with olive-brown spots and secondary violet-grey blotches, (3) dingy white, covered to a large extent with cinnamon-brown spots. Average size of 24 eggs 17.5 × 13.8 mm (Pleske in Dementiev).

MUSEUM DIAGNOSIS. See Key to the Species. Distinguished from *Hippolais caligata* (1562, 1563) by its minute, pointed 1st primary (as) equal to or shorter than primary-coverts; tail slightly, graduated (rounded) with narrow rather pointed central rectrices; absence of white edging on inner tip of outer rectrices.

Arrives in India in worn breeding plumage. A usually complete moult takes place from August to November (HW). However, moulting appears to vary according to latitude, and may take place on the breeding grounds as birds from the southern Urals moult from mid July through August while more northern individuals have not begun moulting by the end of July (Dementiev). Spring moult, apparently confined to chin, throat and breast, takes place in April-May. The upper plumage becomes much browner and duller by wear. Postjuvénal moult usually completed on summer grounds but sometimes after arrival in winter quarters. Young birds recognized by being more rusty brown above.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	60-66	15-18	21-23	50-55 mm
♀♀	59-66	15-18	21-23	48-55 mm

(BB, HW, SA)

Weight 4 ♂♂ (April) 10.8-13.5; 2 ♀♀ (April) 10.2, 10.7 g — Paynter. 20 ♂♂ (Sept.-Nov.) 8-13 (av. 10.6); 5 ♂♂ (May) 12-16 (av. 13.8) g — SA.

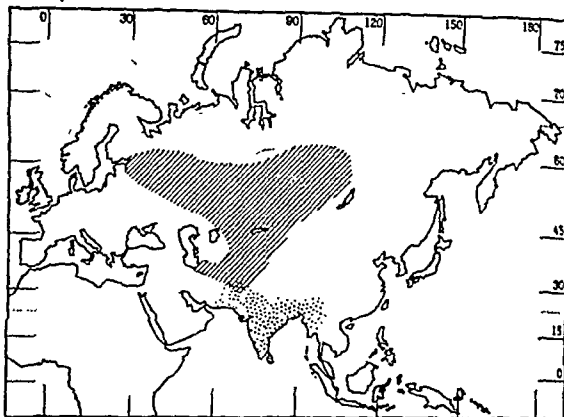

COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible grey-black, lower light brown, pale flesh at base; mouth orange-yellow or pale pinkish yellow. Legs, feet and claws greyish flesh.

110

SYLVIINAE

STATUS, DISTRIBUTION and HABITAT. Common and abundant winter visitor. Madhya Pradesh, Bihar, the Nepal Valley (Diesselhorst) and the eastern Nepal terai south through the Peninsula to Kanyakumari (Cape Comorin) and Ceylon; east through the Jalpaiguri duars, Bhutan foothills, lower Bengal, Assam, Nagaland, Manipur and Bangladesh to Burma; plains and hills up to 2100 m. Very common on passage in Pakistan (Sind, Punjab), north-western India (including eastern Rajasthan, Kutch and Kathiawar),

Acrocephalus dumetorum

Breeding

Winter

the western Himalayas and Nepal, up to over 3300 m. Breeds in the Naleyai Lora, 60 km north of Quetta, according to Christison (*Ibis* 1941: 535). Affects bushes, hedges, orchards, gardens, bamboo clumps and grain fields both near and away from water; in winter, mostly found in deciduous biotope.

Extratropical. Winters also in lower Burma. Breeds in central Eurasia from Lake Baikal west to southern Finland and south to Iran.

MIGRATION. Spring migration takes place from March to May when the species is very common in northwestern India; a few individuals may still be seen in the Peninsula till mid May and in the western Himalayas till early June. Autumn passage already begins in August and lasts till October. Large numbers pass through Pt Calimere (Tamil Nadu) to and from Ceylon in autumn and spring. Main wintering season: September to April.

GENERAL HABITS. Although a reed warbler by name, this species is more commonly seen in bushes, sometimes quite far from water. Habits very similar to those of *Hippolais*. Keeps singly, hopping about and creeping

(neighbourhood of Nellore)
Baker, FBI No. 800 (part), Vol. 2: 394

Plate 83, fig. 17

LOCAL NAMES. Terra-kumpa-jitta (Telugu); Pāḍikkūrūci (Malayalam).
SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. Above, rufous brown, rump a little paler and brighter; an indistinct pale supercilium. Below, throat whitish, rest of underparts ochraceous buff. Sexes alike.

Not distinguishable from *A. concinens* (1559). *A. dumetorum* is olive-brown above and less warm olive-buff below. *Luscinola melanopogon* (1495) has a brighter, white supercilium.

STATUS, DISTRIBUTION and HABITAT. Widespread winter visitor. The whole Indian Peninsula, Pakistan, Bangladesh and Assam. Breeds in the Malesai Lora, northern Baluchistan (Christison, JBNHS 43: 480). In winter affects standing rice, reed-beds, sugarcane and elephant grass, almost

WARBLERS

113

always above water or on wet ground; breeds in reeds, cat's-tail and neighbouring bushes.

Extralimital. Probably breeds in parts of Afghanistan and Turkestan (cf. Ludlow, *Ibis* 1933: 468). The species ranges north to Mongolia and west to the Danube delta. Winters west to southern Iran and east to Burma.

MIGRATION. Spring migration takes place from March to May (latest date: 27 May); autumn passage from August to October. Common on passage through Pakistan (N.W.F. Province, Baluchistan, Sind), north-western India and the western Himalayas.

GENERAL HABITS. Keeps singly within thick cover, hopping from stem to stem close to the ground or to water, clinging sideways and often lunging to snap up tiny insects from the surface. When flushed, the bird skins over the vegetation in a jerky, hurried flight, spreading the tail as it dives into the reeds a few metres further, the rufous rump then showing up prominently.

FOOD. Insects (small beetles, ants, etc.).

VOICE and CALLS. A characteristic harsh *chr. chuck* constantly uttered. Song said to be very imitative and to resemble that of *Hippolais caligata*. Also sings in flight.

BREEDING. So far authenticated only in Baluchistan. *Season*, May to July. *Nest*, a deep cup woven around three or four reed stalks or other stems; 30 to 90 cm above water. Made of rough grass, lined with fine grass or reed fibres, wool, goat's hair, feathers and downy inflorescence of reeds. Of 25 nests found in Baluchistan, 18 had 5 eggs and 7 had 4. Colour varies from whitish to greenish stone, blotched, streaked and spotted with dark olive, brown, dark grey and black, the markings denser at the large end where they tend to form a zone, sometimes a cap. Average size 16.8 × 12.9 mm (largest 17.2 × 13.1, smallest 16.4 × 12.8 mm) [Christison].

MUSEUM DIAGNOSIS. See Key to the Species. More richly coloured and darker than *capistrata* (1558) in corresponding plumage, more rufous above, less dull and olivaceous, more rusty, less whitish below (Vaurie).

A complete moult takes place immediately after arrival in winter quarters. A body moult begins in early March.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	56-61	14-15	20-23	53-59 mm
♀♀	56-60	14-15	21-23	53-57 mm

Weight 1 ♂ (April) 10.5 g — GD. 10 ♂♀ 8-11 (av. 9.5) g — SA.

COLOURS OF BARE PARTS. Iris olive-brown (once pale straw). Bill: upper mandible dark brown, lower pale flesh; mouth pale greyish yellow. Legs, feet and claws pale greyish brown.

1558. Northern Paddyfield Warbler. *Acrocephalus agricola capistrata* (Severtzov)

Salicaria capistrata Severtzov, 1872, Vertik. Turkest. Zhivotn.: 127 (Turkestan), *nee Salicaria brevipennis* Severtzov, 1872, loc. cit., preoccupied (vide G. E. Watson & B. J. Gray, 1969, Bull. Brit. Orn. Cl. 89: 8) Baker, FBI No. 800 (part), Vol. 2: 394

LOCAL NAMES. As in 1557.

WARBLERS

115

MUSEUM DIAGNOSIS. See Key to the Species. Differs from *stevensi* in being paler and slightly greyer above, especially on head.

MEASUREMENTS (all subspecies)

1560. Assam Bluntwinged Paddyfield Warbler. *Acrocephalus concinens stenseni* Baker

Acrocephalus concinens stenseni Baker, 1922, Bull. Brit. Orn. Cl. 43: 16 (Hesamara, N. Lakhimpur, Assam) Baker, FBI No. 803, Vol. 2: 397

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 13 cm (5 in.).

FIELD CHARACTERS. As in 1557, q.v. See Key to the Species and Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Resident, subject to some winter movements. Assam in the plains of the Brahmaputra. Recorded in winter in the Bengal duars (Jalpaiguri dist.), Bangladesh and lower Burma. Affects high grass on wet ground close to rivers or swamps.

Extralimital. Probably breeds also in Burma (Pegu); nominate *concinens* breeds in eastern China and has been recorded in winter in Kwangtung and northern Thailand.

GENERAL HABITS and FOOD. As in 1557.

VOICE and CALLS. As in 1559.

BREEDING. *Season*, end of April to June. *Nest*, as in 1559. *Eggs*, apparently 3, pale buffy brown to sepia brown with dark brown to black blotches, bolder and larger than in *haringtoni*. Average size of 13 eggs 15.9 × 12.1 mm (Baker).

MUSEUM DIAGNOSIS. Like *haringtoni* but darker.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♀	49-53	11-12	c. 20	46-50 mm

COLOURS OF BARE PARTS. Iris olive-brown. Bill: upper mandible horny black, paler on edge of commissure; lower mandible horny, darker at tip. Legs and feet fleshy brown.

1561. Largebilled Reed Warbler. *Acrocephalus (stentoreus) orinus* Oberholser

Acrocephalus orinus Oberholser, 1905, Proc. U.S. Nat. Mus. 28: 899, new name for *Acrocephalus macrothrychus* Hume, 1871, *Ibis*: 31 (not far from Rampoor), *ex Phylloscopus macrothrychus* Hume, 1869, *Ibis*: 357, nom. *nov.*, *nee Celamophorus macrothrychus* Müller, 1853

SYLVIINAE

SIZE. Sparrow — ; length c. 13 cm (5 in.).

FIELD CHARACTERS. As in 1557, q.v.

STATUS, DISTRIBUTION and HABITAT. Winter visitor. Recorded in Baluchistan, Sind, Uttar Pradesh, Madhya Pradesh and the Nepal terai. Noted in Kathmandu Valley on spring passage. Habitat as in 1557.

Extralimital. Breeds in northern Transcaspia and in the northwestern Black Sea region.

MIGRATION. As in 1557.

GENERAL HABITS, FOOD and VOICE. As in 1557.

MUSEUM DIAGNOSIS. For subspecific distinction see 1557 under Museum Diagnosis.

MEASUREMENTS and COLOURS OF BARE PARTS. As in 1557.

ACROCEPHALUS CONCINENS (Swinhoe)

Key to the Subspecies

Paler	<i>A. c. haringtoni</i>
Darker	<i>A. c. stenseni</i>

1559. Kashmir Bluntwinged Paddyfield Warbler. *Acrocephalus concinens haringtoni* Witherby

Acrocephalus agricola haringtoni Witherby, 1920, Bull. Brit. Orn. Cl. 41: 26 (Buttakundi, Khagan)

Acrocephalus concinens hokrae Whistler, 1930, Bull. Brit. Orn. Cl. 50: 71 (Hokra jheel, Kashmir)

Baker, FBI No. 802, Vol. 2: 396

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 13 cm (5 in.).

FIELD CHARACTERS. As in *A. a. agricola* (1557); not distinguishable from it in the field.

STATUS, DISTRIBUTION and HABITAT. A summer (breeding) visitor to the northwestern Himalayas in the Kagan Valley, Gagai Pass, Wardwan Valley, upper Kishtwar, and the Vale of Kashmir. An example mist-netted in Nepal (northern Jhapa dist.), February (Fleming, JBNHS 65: 332 — subspecies?). Breeds in reeds, rushes and long grass around lakes and swamps, and in rank vegetation, either on flat ground or at the base of hillsides; in the higher rainy valleys up to c. 3000 m, frequently away from water. Winter quarters unknown.

Extralimital. Adjacent parts of northern Afghanistan.

MIGRATION. Noted on its breeding grounds from May to August.

GENERAL HABITS and FOOD. Not different from those of *agricola*.

VOICE and CALLS. Song described as pleasant, vigorous and varied. Probably not different from that of *agricola*.

BREEDING. *Season*, June and July. *Nest*, a neat cup of grass, reed fibre, rush leaves, occasionally some moss, lined with wool, vegetable down, and sometimes a few feathers. Attached to or suspended between several upright plant stems within 90 cm from the ground. *Eggs*, normally 4, very pale green, almost white, stippled and blotched with yellowish brown, purplish grey and black, more or less all over but chiefly at the large end. Average size of 47 eggs 17.1 × 12.7 mm (Osmaston).

116

SYLVIINAE

SIZE. Sparrow — ; length c. 13 cm (5 in.).

FIELD CHARACTERS. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Known only from the type obtained near Rampur (c. 31°26'N., 77°37'E.), Sutlej Valley, Himachal Pradesh. Habitat unknown.

GENERAL HABITS, FOOD, VOICE and BREEDING. Unknown.

MUSEUM DIAGNOSIS. This species is known from a unique specimen in the collection of the British Museum which Hume had collected near Rampur on 13 November 1867. G. Vaurie (*Amer. Mus. Novitates*, No. 1753, p. 9, 1955) discusses the specimen describing the wing formula in detail — 5th primary [as.] longest, 2nd 10 mm shorter and 3rd-4th intermediate — but this is unhelpful since it is in moult. Primaries 3rd-5th are emarginated, and there is a notch on inner web of 2nd, 16 mm from tip.

The bill is long and strongly made, and akin to that of a small *A. stentoreus* (such as *toxopei* of the Moluccas). It measures 19 mm from skull, instead of about 15 mm in *A. concinens* and *A. agricola*. The plumage is almost identical with *A. concinens* (or with *A. stentoreus toxopei*), being slightly darker olive-brown above, and buffish white below, heavily washed with fulvous on sides of breast and flanks. Its status as a full species whose breeding range is still unknown may be doubted. Perhaps the best guess is that it represents a rare and isolated form of the widely but very patchily distributed *A. stentoreus* (Williamson, 1963).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
1 ♂?	61	19	23	54 mm
		(from nostrils)		15 mm

Width of bill at gape 6 mm

COLOURS OF BARE PARTS. Unknown.

Genus HIPPOLAIS Baldestein

Hippolais Baldestein, 1827, Neue Alpina 2: 77.

Type, by monotypy, *Sylvia polyglotta* Vieillot

Close to *Acrocephalus* but tail square or nearly so. Bill flattened and wide. Three weak rectal bristles.

WARBLERS

117

1562. Siberian Booted Tree Warbler. *Hippolais caligata caligata* (Lichtenstein)

Sylvia caligata Lichtenstein, 1823, in Eversmann's Reise Orenburg Buchar: 128 (Ilek River, near Orenburg)
Sylvia scita Eversmann, 1843, Add. Pallas Zoogr. Rosso-Asiat., fasc. 3: 12 (Ural Mts)
Baker, FBI No. 842, Vol. 2: 444
Plate 86, fig. 3

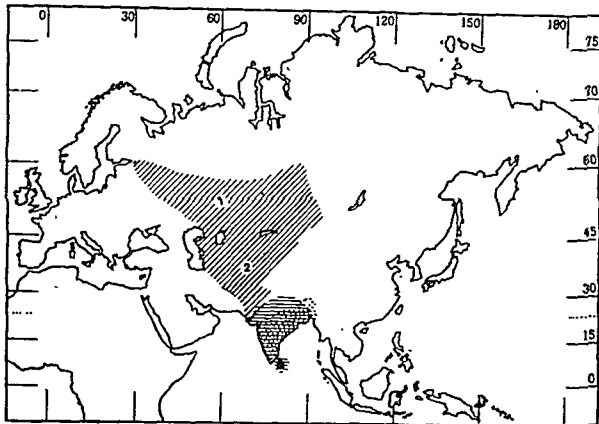

LOCAL NAME. *Chinnambhəri* (Malayalam).

SIZE. Sparrow — ; 12 cm (4½ in.).

FIELD CHARACTERS. As in 1563, q.v.

STATUS, DISTRIBUTION AND HABITAT. Widespread and fairly common winter visitor. The Indian Peninsula from Madhya Pradesh and the Ganges south to Kanyakumari (Cape Comorin); east through the Bengal duars,

Hippolais caligata

▨ Breeding range 1, 2 ▨ Winter, 1 ▨ Winter, 2
1 *caligata* (1562). 2 *rama* (1563).

Assam and Bangladesh (fide Rashid). Also Ceylon (one record — Phillips). On passage throughout the western Himalayas and Pakistan (including northern Baluchistan), northern and northwestern India, Nepal (not recorded since Hodgson) and Sikkim. Affects deciduous scrub jungle, isolated shrubs in dry cultivated land, clumps of grass, and occasionally reeds.

Extralimital. Breeds in southern Siberia from the Yenisey to the Lenin-grad region.

WARBLERS

119

MIGRATION. As a winter visitor may be found from September (August in the north) to April. On its summer grounds from April to August. Common on passage through northern India, Pakistan, the Makran coast and the western Himalayas.

GENERAL HABITS. Usually seen singly, sometimes loose 'flocks' of up to 10 birds or so, restlessly hunting insects among leaves and blossoms such as *Acacia* and *Prosopis*; often flies out from the extremity of a twig to take insects on the wing. Closely resembles leaf warblers in behaviour and movements.

FOOD. Insects.

VOICE AND CALLS. A harsh chuck . . . chuck or churr-r . . . chur-r recalling the notes of the Lesser Whitethroat (*Sylvia curruca*). Song, a soft, sweet and spirited creaky jingle reminiscent of song of Lesser Whitethroat as well as of Swallow (*Hirundo rustica*) uttered more or less incessantly throughout the day from shortly before spring departure. A quieter warbling in the nature of sub-song given now and again in winter while foraging.

BREEDING. Season, May to July. Nest, a cup of twigs, grass roots and stems, lined with fine grass, wool, vegetable down and hair. Well hidden in dense undergrowth especially tamarisk and rose bushes, sometimes in grass clumps, within a couple of metres from the ground. Eggs, normally 3 or 4, occasionally 5, very variable: pinkish white to pale grey with grey, purple or black spots and specks, sometimes lines, scrawls or blotches (for further details see Baker, *Nidification* 2: 402). Average size of 200 eggs 15.8 × 12.3 mm (Baker). Appears to breed in loose colonies; many nests may be found in a small area and sometimes a couple of nests even in the same bush. Share of the sexes in nest-building and incubation, and incubation period, unrecorded.

MUSEUM DIAGNOSIS. In fresh winter plumage differs from *caligata* (1562) by its uniform mouse-grey upperparts with slight olive tinge, as against darker, more fulvous brown. Tail longer, usually over 50 mm.

Best differentiated from *Acrocephalus dumetorum* by the rudimentary first primary being longer than primary coverts by 4–10 mm. In *A. dumetorum* the first primary is narrow and pin-like, shorter than or equal to primary coverts, never exceeding them by more than c. 3 mm.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	60–65	14–16	19–22	50–57 mm
♀♀	58–62	15–16	20–21	49–57 mm
			(HW, SA, CBT)	

Weight 14 ♂♀ 8–11 (av. 9.3) g — SA (possibly both subspecies).

COLOURS OF BARE PARTS. Iris hazel-brown or olive-brown. Bill: upper mandible brown, lower pale flesh; mouth pale lemon-yellow or bright yellow; gape yellowish buff. Legs and feet greyish brown; claws dusky; soles pale lemon-yellow.

1564. Upcher's Tree Warbler. *Hippolais languida* (Hemprich & Ehrenberg)

Curruca languida Hemprich & Ehrenberg, 1833, Symb. Phys. Avium, fol. cc (Syria)
Baker, FBI No. 844, Vol. 2: 445
Plate 86, fig. 1

LOCAL NAMES. None recorded.

118

SYLVIINAE

(After Hartert), × c. 1

MIGRATION. Spring passage from April to May; autumn passage August to September. On its winter grounds from August to April.

GENERAL HABITS, FOOD AND VOICE. As in 1563.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. Like *rama* but upperparts darker, more fulvous brown. Tail shorter.

Young (immature) paler, more sandy grey above, whiter below. Often migrates in this plumage.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	59–65	13–15	19–22	47–51 mm
♀♀	58–65			46–52 mm
				(HW, SA)

COLOURS OF BARE PARTS. As in 1563.

1563. Indian Booted Tree Warbler. *Hippolais caligata rama* (Sykes)

Sylvia Rama Sykes, 1832, Proc. Zool. Soc. London: 89 (Dukhun)
Baker, FBI No. 840, Vol. 2: 442

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 12 cm (4½ in.).

FIELD CHARACTERS. Above, pale olive-brown; a short, whitish supercilium. Below, buffish white. Sexes alike.

May be easily confused with the very similar Paddyfield and Blyth's warblers which are darker brown. The latter is slightly larger, has a sensibly longer bill and a more rounded (v. square-ended) tail. May also be confused with some *Phylloscopi* but calls different.

STATUS, DISTRIBUTION AND HABITAT. Common and widespread winter visitor. From Sind, Delhi and Calcutta south to Kanyakumari (Cape Comorin) and Ceylon. Breeds in Sind, northern Baluchistan, Peshawar dist. and western Punjab. In winter affects almost any country where acacias, bushes or scrub abound. More a bird of semi-desert country whereas *caligata* prefers less arid parts. In the breeding season frequents tamarisks and bushes along river beds and canals; also gardens and hedges.

Extralimital. Breeds also in Afghanistan, northern Iran, southern Turkey and Transcaucasia.

SYLVIINAE

120

SIZE. Sparrow — ; length c. 14 cm (5 in.).

FIELD CHARACTERS. Above, pale grey-brown. Loes whitish. Below, buffish white, flanks washed with pale brown. Outer rectrices tipped white. Sexes alike.

The conspicuous white-tipped rectrices identify this species.

STATUS, DISTRIBUTION AND HABITAT. Summer visitor. Breeds in small numbers in the hills of Quetta at c. 2300–2400 m. Affects stunted bush-covered, stony hillsides. Recorded on migration in southern Baluchistan.

Hippolais languida

▨ Breeding ▨ Winter

Extralimital. Extends to the Aral Sea and eastern Mediterranean. Winters in southwestern Arabia, Ethiopia, Sudan and Kenya.

MIGRATION. Arrives on its summer grounds in April. Autumn passage noted in September and spring passage in April (Baluchistan).

GENERAL HABITS. Undescribed. Said to be rather silent and thus easily overlooked.

FOOD. Insects.

VOICE AND CALLS. Song undescribed. Call-note a sharp chick chick.

BREEDING. Season, May and June. Nest, a neat cup of grass well plastered with cobweb on the outside and lined with fine grass-stems. Generally placed in stunted, thorny bushes some 30 to 50 cm from the ground. Eggs, clutch size not recorded with certainty (c/4–5 in more northern latitudes); colour, pale pinkish purple, sparsely marked with fairly bold black blotches and dots. Average size of 28 eggs 18.9 × 13.6 mm (Baker).

MUSEUM DIAGNOSIS. The white-tipped rectrices distinguish this species.

WARBLERS

1564a. Barred Warbler. *Sylvia nisoria* (Bechstein)

Motacilla nisoria Bechstein, Orn. Monatsb. 15: 3

(Kachka Su, central Tien Shan)

Not in Baker, FBI

Plate 84, fig. 1

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 16 cm (6½ in.).

FIELD CHARACTERS. A large warbler resembling whitethroats in shape and actions.

Male (adult). Above, grey, flecked with white on sides of crown; wing-coverts, tertials and upper tail-coverts tipped with white. Outer rectrices partly white. Below, white scalloped with grey (except on centre of belly).

Female similar but scalloping much less prominent.

Young birds have plain whitish buff underparts.

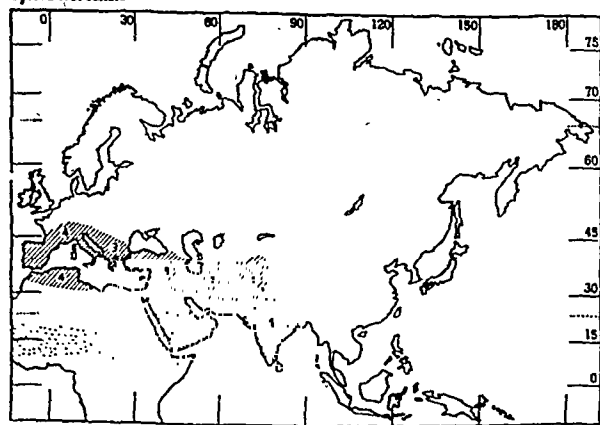

The finely barred appearance of underparts is diagnostic. The yellow eye is also a distinctive character in both sexes (juveniles have a brown iris).

STATUS, DISTRIBUTION and HABITAT. Scarce passage migrant. Two records: Gilgit, 1500 m (Biddulph, vide N. B. Kinnear, *Ibis* 1931: 575) and Shyok Valley, Ladakh, 4150 m (J. A. Sillem, 1934, *Orgaan der Cl. Nederland. Vogelk.* 7: 29). Affects bushes:

WARBLERS

123

ibid. 44: 400). Winters irregularly in the more northern parts (Sind, Punjab); appears to be scarcer in dry years when trees are not in good leaf. A common passage migrant in northwestern India, Pakistan and the western Himalayas. Affects semi-desert, stony country and ravines with a

Sylvia hortensis

■ Winter

1 jerdoni (1565). 2 balchanica (RE). 3 crassirostris (RE).

4 hortensis (RE).

sparse vegetation of *Capparis*, *Prosopis* and leafy babool trees and scrub. In summer, appears to be confined to localities where there is a fair amount of shrubbery, not too far from water, though it is sometimes met with also in arid regions.

Extralimital. Turkestan, Afghanistan and eastern Iran. The species extends west to Spain and Morocco. Winters in Arabia and in Africa from Ethiopia to Guinea.

MIGRATION. Found on its summer grounds from April to August and in its winter quarters from August to March, in the north till the end of April. A bird ringed in Kathiawar on 27.ix.1960 was recaptured and released at the same place on 21.ix.1961; it was captured again in the identical spot a year later, on 18.ix.1962. A second bird ringed here on 19.ix.1960 was also recaptured in the same locality two years later, on 24.ix.1962 (Shivraj-kumar, JBNHS 59: 963).

GENERAL HABITS. Very skulking. Hunts in bushes and lower branches of trees; sometimes descends to the ground to pick up a morsel. Extremely discreet in its breeding territory and easily overlooked even when searched for.

122

SYLVIINAE

Extralimital. Breeds in the western Palearctic from Turkestan to Germany. Winters in eastern Africa from Egypt to South Africa.

MIGRATION. The specimen from Ladakh (a juvenile) was taken on 2 July, that from Gilgit on 6 September.

GENERAL HABITS. Those of the genus. Very skulking.

FOOD. Insects in summer and also berries in autumn.

VOICE and CALLS. A *chak, chak* and a churring note as common to most members of the genus. Alarm, a harsh chatter *trr-trr-trr*. Said to be a magnificent songster.

MUSEUM DIAGNOSIS. See Field Characters. Unbarred juvenile distinguished from young or female *S. hortensis* by having first primary shorter than primary-coverts.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♀	83-90	16-18	24-26	64-79 mm (Williamson)

Weight 50 ♂ ♀ (first-winter) 18.8-31 (av. 22.8) g — Williamson.

COLOURS OF BARE PARTS. Iris pale to bright yellow in adults, dark brown in juveniles becoming grey-brown in first winter. Bill dark brown, base of lower mandible yellow or yellowish brown. Legs and feet dull yellowish flesh to brownish grey.

1565. Eastern Orphean Warbler. *Sylvia hortensis jerdoni* (Blyth)

G. (urruca) Jerdoni Blyth, 1847, Jour. Asiat. Soc. Bengal 16: 439

(Southern India)

Baker, FBI No. 846, Vol. 2: 448

Plate 84, fig. 3

LOCAL NAMES. *Gaz burruck* (Brahui); *Moto shveta kántha* (Gujarati); *Pedda nalla kampa jitta* (Telugu).

SIZE. Sparrow ±; length c. 15 cm (6 in.).

FIELD CHARACTERS. A large grey warbler with a white throat, dark crown and cheeks, and pale eyes.

Male (adult). Above, head black; rest of upperparts grey. Tail blackish, outer rectrices white. Below, throat white, rest buffish white.

Female. Above, head grey, darker on cheeks and contrasting with white throat.

Back and wings pale brownish grey. Tail grey, outer rectrices white. Below, as in male.

STATUS, DISTRIBUTION and HABITAT. As a summer (breeding) visitor, locally common. Northern Baluchistan and N.W.F.P., between 2100 and 3000 m, in Kohat apparently as low as 750 m. A specimen collected in Gilgit on 11 June. As a winter visitor, widely distributed and locally common from Sind, the Indus Valley, Punjab, Uttar Pradesh (Oudh), and southern Bihar (Manbhum), south through the Deccan to Mysore (Satnur — Sálím Ali, JBNHS 43: 575) and Tamil Nadu, c. 10°N. (Madurai dist. — Nichols,

124

SYLVIINAE

FOOD. Mainly insects; flower nectar (e.g. of *Capparis aphylla*) and berries are taken in autumn and winter; also determined are seeds and a snail (SA).

VOICE and CALLS. Song, short vehement phrases of almost blackbird-like quality. Sings very sporadically, even during courtship season when one may be within its territory without hearing a sound for several hours. Call-note *chuck* . . . *chuck* like that of a whitethroat but louder and deeper. Alarm, a hard, rattling *trrr*. Other notes, a *chichirichich* given while hopping among bushes.

BREEDING. Season, end of April to July. Nest, a cup of grass stems, twigs and dead leaves lined with fine grass and some hair. Placed near the top of a small, often isolated bush some 60 to 150 cm above the ground, often ill-concealed. Eggs, 4 or 5, very pale greenish

white, marked with blackish brown specks or small blotches and secondary ones of pale grey, fairly numerous at the large end, scanty elsewhere. Average size of 31 eggs 20.6 × 15.5 mm (Baker). Other details of breeding biology not recorded within our limits.

MUSEUM DIAGNOSIS. See Field Characters. Postjuvénal moult of body, lesser and median coverts.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	79-86	19-21	23-25	66-72 mm
♀♀	77-83	19-21	23-25	67-71 mm (HW, SA)

Weight 9 ♂ ♀ 22-24 (av. 22.2) g — SA.

COLOURS OF BARE PARTS. Iris grey-white to pale straw. Bill dark brown, base of lower mandible pale lead. Legs and feet olive-brown to slate-grey.

1566. Indian Whitethroat. *Sylvia communis icterops* Ménétries

Sylvia icterops Ménétries, 1832, Cat. Rais. Caucase: 34

(Talych, eastern Transcaucasia)

Sylvia communis rubicola Stresemann, 1928, Jour. f. Orn. 76: 378

(Kuldja, Chinese Turkestan)

Baker, FBI No. 845, Vol. 2: 447

Plate 84, fig. 2

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 14 cm (5½ in.).

FIELD CHARACTERS. Above, brownish grey; edges of secondaries rufous-brown. Outer rectrices white. Below, throat white, rest of underparts with a pinkish flush. Sexes practically alike.

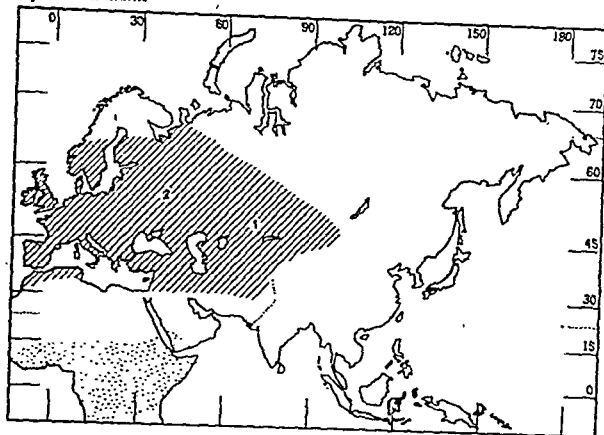

The Lesser Whitethroat is smaller, lacks the rufous wing-patch and has distinctive dark cheeks which contrast sharply with the glistening white throat.

STATUS, DISTRIBUTION and HABITAT. As a summer (breeding) visitor recorded only from northern Baluchistan at 2100-2300 m (Meinertzhagen,

WARBLERS

125

JBNHS 31: 698). Obtained once in Ladakh (Chang Chenmo, 4500 m) on 1 June (Meinertzhagen, Ibis 1927: 421). An abundant autumn migrant west of a line Spiti-Mt Abu-Kutch and western Kathiawar (Amreli), only occasionally straying farther east (Kanpur, U.P., once). Said to be also a

Sylvia communis

Breeding

Winter

1 *icterops* (1566). 2 *communis* (RE).

Dotted line: eastern limit of migrants.

spring migrant on the Makran coast (CBT). Affects *Capparis* and other scrub in stony and sandy semi-desert, and bushes and hedges amidst cultivation, often by roadsides. Breeds in low thorn bushes on hillsides.

Extralimital. The western Palearctic from Turkestan to the Urals and Turkey (*icterops*) and westward to Scandinavia and Morocco (nominat). Winters in Yemen and tropical Africa.

MIGRATION. One of the species (cf. Ind. Hb. 1: xxxv) that pass through NW. India on autumn migration to take the Arabian route to their winter quarters in Africa. Earliest autumn migrants reach India in the second half of August, the bulk arriving in early September often literally swarming. Passage lasts till about the middle of October. Return (spring) passage apparently largely extralimital. On breeding grounds from May to September.

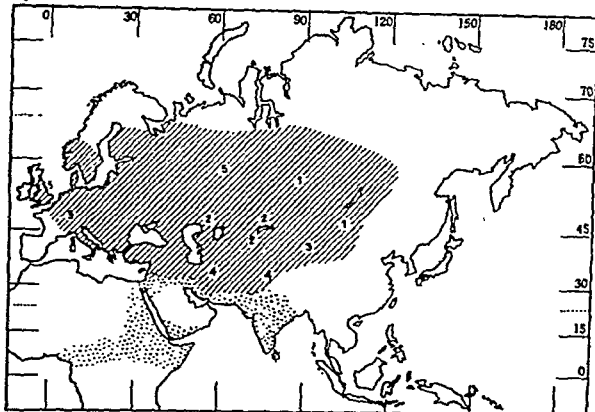

GENERAL HABITS. Less secretive than most warblers. Moves about in low scrub, frequently showing itself outside. Unlike the Lesser Whitethroat, seldom ascends trees.

FOOD. Chiefly insects, occasionally berries.

VOICE AND CALLS. Very silent during migration. A hoarse *churr-r* and a sharp *tak, tak*. Also a *che-wee che-wit-whit-whit-whit*. Song, (not recorded in India)

WARBLERS

Sylvia curruca blythi Ticehurst & Whistler, 1933, Ibis: 556

(Cawnpore)

Baker, FBI No. 849, Vol. 2: 45 (See footnote 2, p. 129, under *S. c. althara*)

Plate 84, fig. 6

LOCAL NAME. Chinna nalla kampa jitta (Telugu).

SIZE. Sparrow —; length c. 12 cm (5 in.).

FIELD CHARACTERS. As in 1570, q.v., but back browner.

STATUS, DISTRIBUTION AND HABITAT. Common and widespread winter visitor. Pakistan and India from the western Himalayan foothills, Uttar Pradesh and lower Bengal south through the Peninsula to Tamil Nadu. One record from Ceylon (Phillips, 1953, p. 97). In the hills up to at least 900 m. Noted on passage in Spiti at over 3300 m and in northern Baluchistan. One record from Nepal (Ripley, JBNHS 59: 290). Affects scrub jungle and undergrowth; in semi-desert especially partial to *kerdi* bushes (*Capparis aphylla*), babool (*Acacia nilotica*) and *kandi* (*Prosopis spiciogera*) trees.

128

SYLVIINAE

1568. Kirghiz Lesser Whitethroat. *Sylvia curruca halimodendri* Sushkin

Sylvia minula Hume, 1873, Stray Feathers 1: 198

(Bhawulpore)

Baker, FBI No. 850, Vol. 2: 451

Plate 84, fig. 4

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 12 cm (5 in.).

FIELD CHARACTERS. Above, pale sandy brown, more ashy on crown. Dark cheeks contrasting with white throat distinctive. Tail dark brown, outer rectrices white. Below, throat white, rest pale buff. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Common winter visitor. North-western India in Haryana and Pakistan from Peshawar and Punjab south through the Indus Valley to the Makran coast in the west and Kutch (JBNHS 61: 184) in the east. On passage through the western Himalayas and northern Baluchistan. Affects thorn scrub in semi-desert country, frequently far out in sand-dune desert among sparse *Capparis* bushes. As a breeder, also frequents semi-desert.

Extralimital. Breeds from Transcaspiia to the Gobi desert.

MIGRATION. Spring passage in March-April; autumn passage September to mid November. In its winter quarters from September to April.

One of the Kutch specimens (W. 68 mm) identified by Dr C. Vaurie as perhaps *S. minula marginata* Stollmann.

WARBLERS

129

GENERAL HABITS, FOOD and VOICE. As in 1570. Perhaps more terrestrial than other whitethroats, commonly seen running on ground in and out of rootstocks of bushes like *S. nana* (1571).

MUSEUM DIAGNOSIS. A pale sandy brown desert form, the palest of all whitethroats. Brown ashy grey. White part of outer rectrices purer than in other races, 2nd primary (as.) usually between 7th and 8th, occasionally equal to 7th or 8th. Moults as in 1570.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♀	58-65	11-12	20-23 (CBT, Williamson)	50-58 mm

COLOURS OF BARE PARTS. Iris pale yellowish brown. Bill bluish grey, tip black; mouth whitish flesh. Legs and feet brown to plumbeous-slate.

1570. Hume's Lesser Whitethroat. *Sylvia curruca althaea* Hume¹

Sylvia althaea Hume, 1878, *Stray Feathers* 7: 60, 62 (Kashmir)

C. (curruca) affinis Blyth, 1845, *Jour. Asiat. Soc. Bengal* 14: 564 (S. India)²

Cf. Watson, G. E., 1969, *Bull. Zool. Nomencl.* 26: 39-41

Baker, FBI No. 848, Vol. 2: 450

Plate 84, fig. 5

LOCAL NAME. *Chat lyot* (Kashmir).

SIZE. Sparrow —; length c. 12 cm (5 in.).

FIELD CHARACTERS. Above, dark grey, back and wings tinged with brown. Ear-coverts a darker grey contrasting with glistening white throat. Tail blackish brown, outer rectrices white. Below, white tinged with buff on breast and belly. Sexes alike.

The dark ear-coverts, darker than crown and contrasting with white of throat, are characteristic of all Lesser Whitethroats. The very similar female of the Orphean Warbler (1565) is much larger.

STATUS, DISTRIBUTION and HABITAT. Summer (breeding) visitor to the western Himalayas; winter visitor to the Peninsula, locally common. Breeds in Kashmir from 1500 to 2700 m, in Astor, Gilgit and Ladakh between 2100 and 3700 m, and from Murree west through N.W.F.P. and south through the high ranges to northern Baluchistan. Affects stony, bush-covered hillsides, often along streams, *Berberis*, *Rubus*, *Coloneaster* and briar in Kashmir, *Lonicera*, willows and fruit trees in Ladakh, buckthorn bushes and juniper in Baluchistan. Winters from the western Himalayan foothills south to Sind and southeast to the Eastern Ghats and Tamil Nadu. Also fairly common in northern Ceylon. In this season affects bushes and scrub of babool etc.

EXTRALIMITAL. Ranges north to Turkestan and west to the southern Caspian and Zagros mountains of Iran, these populations probably wintering in southern Iran and Iraq.

MIGRATION. Arrives on its summer grounds in April. First autumn migrants appear in Punjab at the end of July. Recorded in Ceylon from October to April.

¹ Subsequent information on habits, distribution and intergradation show that *althaea* and *minula* are better treated as subspecies of *curruca*.

² Although this name is synonymized with *althaea*, most of the notes published under the name '*S. affinis*' pertain to *S. curruca blythi*, *fide* Whistler & Ticehurst, *Ibis* 1933: 554-6.

WARBLERS

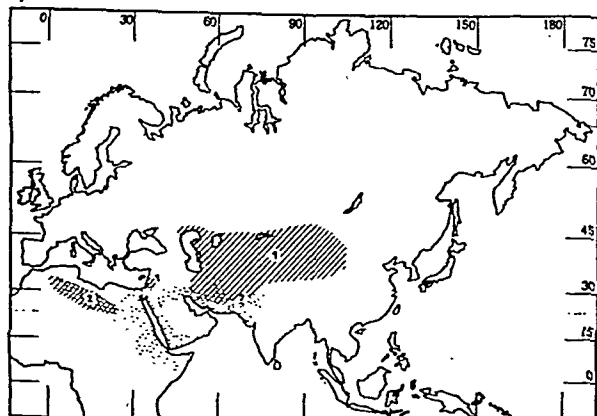

131

SIZE. Sparrow —; length c. 11 cm (4½ in.).

FIELD CHARACTERS. Above, pale greyish brown; a white ring round eye. Tail pale rufous, showing when expanded dark brown inner rectrices (some with white tips) and pure white outer rectrices. Below, creamy white. Sexes alike.

Superficially a passable miniature of Rufous Chat (1641), especially when tail cocked and fanned out.

STATUS, DISTRIBUTION and HABITAT. Winter visitor, locally common. Pakistan from N.W.F.P. and Punjab south through Sind, Baluchistan (Chagai, Makran coast) and northwestern India in Haryana, Rajasthan and Kutch. Affects scattered *Capparis* and suchlike bushes often far out in

Sylvia nana

■ Breeding ranges

□ Winter

1 *nana* (1571). 2 *deserti* (RE).

sandy or boulder-strewn desert, stony hillsides, and even *Salsola* and *Suaeda* vegetation on salty mudflats. May breed in Baluchistan (Dicean hills near the Sind border) whence Baker (*Nidification* 2: 407) received a nest and eggs, but confirmation required. The nest was found in 'barren, rocky mountains'.

EXTRALIMITAL. Breeds from Mongolia to the Caspian Sea and Iran (south to Zagros Mts, Afghanistan and Baluchistan?). Another subspecies in the northern Sahara. Winters in southern Iran, Arabia and northeastern Africa south to Ethiopia.

MIGRATION. Arrives in its winter quarters towards the end of September, leaves in March.

GENERAL HABITS. Usually seen singly hopping among low scrub or running briskly on the ground in among the bases of bushes like a desert

130

SYLVIINAE

GENERAL HABITS. Quiet and unobtrusive. Frequents bushes singly, creeping and hopping about restlessly amongst the tangles of twigs and foliage searching for caterpillars etc. Unlike the Indian Whitethroat (*S. communis*), freely ascends trees. Along with tree- and leaf warblers all whitethroats have a comical habit, when hunting, of lunging out with the bill to seize an insect just out of reach, nearly toppling over in the attempt then quickly steadying themselves with the wings.

FOOD. Insects. Commonly visits the blossoms of babool (*Acacia*), *Capparis* and *Prosopis* for nectar, perhaps also insects, often getting the forehead thickly coated with yellow pollen.

VOICE and CALLS. Ordinary note, a subdued, hard *tek . . . tek* like the clicking of two stones together or of one's tongue against the palate. This note is distinct from the *chuck* or *chur-r* of the Booted Warbler. Song, a varied soft warbling audible only at close range and followed by a rapid and far-carrying descending rattle. The latter has been rendered as *chuychirri chuychirri* (Magrath). The song is occasionally uttered before its departure in spring and often while on migration.

BREEDING. Season, end of April to August. Nest, a thin cup of dry grass and rootlets bound together with a little wool and scantily lined with finer grass and hair. Usually placed in low bushes some 60 to 150 cm above the ground, less often in the lower branches of trees up to 3 metres. However, where low vegetation has been burnt out the birds may nest again in the outer branches of pines 4 to 6 metres up (Davidson). Eggs, usually 4, sometimes 3, pale grey, white or creamy marked with light or dark brown spots and blotches with secondary markings of lavender. Average size of 41 eggs from Ladakh 18.5 × 13.7 mm; of 86 from Kashmir 17.5 × 13 mm (Osmaston).

MUSEUM DIAGNOSIS. Differs from other subspecies by larger size, dark grey upperparts and larger bill. 2nd primary (as.) usually between 6th and 8th.

Spring moult takes place in February and March and includes body-feathers, central rectrices, inner secondaries and their coverts, sometimes all rectrices and remiges. Postnuptial moult complete, July to September.

MEASUREMENTS

	Wing	Tarsus	Tail
♂ ♀	63-71	19-22	52-61 mm (Williamson)

Bill from skull 14-15 mm (HW)

COLOURS OF BARE PARTS. Iris brown or hazel brown. Bill horny brown, lower mandible paler; mouth fleshy pink. Legs and feet horny black or bluish slate; claws brown.

1571. Desert Warbler. *Sylvia nana nana* (Hemprich & Ehrenberg)

(Rohri, Sind)

Baker, FBI No. 847, Vol. 2: 449

Plate 84, fig. 7

LOCAL NAMES. None recorded.

SYLVIINAE

132

mouse. Tail often spread out and partly cocked, the bird then reminiscent of a *Scotocerca* (1533) or *Erythropgyia* (1641) but otherwise is a typical *Sylvia* in habits. Generally shy and retiring but at times will allow a close approach when perched on the top of a bush, bowing and eying the intruder before flying off low over the ground. Has a curious habit of often following other birds such as wheatears from bush to bush, maybe for sociability rather than with malice aforethought!

FOOD. Insects.

VOICE and CALLS. Call-notes unrecorded. Snatches of a pleasant, rather feeble reeling song may be heard in its winter quarters. Song rendered as *tiri-tityu-tyu-tyu-tyu* and likened to the jingle of a tiny bell. When singing often spreads and partly erects tail, displaying the white outer rectrices and tips. Song also given in flight.

BREEDING. Mainly extralimital. Season, end of April to July. Nest, a small cup of grass bents and rootlets lined with some vegetable down; placed in dense scrub within a metre from the ground. Eggs, 4 or 5 (in U.S.S.R.), white marked with dark brown and pale brown blotches fairly numerous at the larger end, with secondary markings of pale grey. Average size of 16 eggs 17.5 × 13.1 mm (Baker); of 61 eggs 15.7 × 12.1 mm (Zarudny).

MUSEUM DIAGNOSIS. See Field Characters. Young like adult but upperparts creamy grey, no fawn tinge. Postjuvenile moult of body-feathers. Spring moult includes body-feathers, tertials and at least part of tail.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♂	57-60	11-12	c. 18	46-51 mm
♀ ♀	54-58			c. 47 mm (CBT, SA)

Weight 12 ♂♂ 7-10.5 (av. 8.8); 2 ♀♀ 7, 9 g (Paludan, Afghanistan).

COLOURS OF BARE PARTS. Iris yellow or pale gold. Bill yellowish straw, dusky on culmen and tip. Legs and feet straw-yellow.

Genus PHYLLOSCOPUS Boie

♀♀	62-66			44-51 mm (Williamson)

COLOURS OF BARE PARTS. Iris hazel. Bill brown, base of lower mandible paler. Legs and feet pale brown.

1573. Siberian Leaf Warbler. *Phylloscopus trochilus yakutensis* Ticehurst

Phylloscopus trochilus yakutensis Ticehurst, 1935, Bull. Brit. Orn. Cl. 55: 178 (Verkhoyansk District, Yakut Land)
 Not in Baker, FBI

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in 1572, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Perhaps an accidental winter visitor: specimens taken in January 1952 at Kohima, Nagaland (Meinertzhagen coll.). May be expected as a passage migrant. Affects bushes.

Extralimital. Breeds in Siberia from the Yenisey to Verkhoyansk (c. 133°E.). Winters in eastern Africa, at distances of over 11,000 km from its breeding range.

MIGRATION. As in 1572.

GENERAL HABITS, FOOD and VOICE. As in 1572.

MUSEUM DIAGNOSIS. See Key to the Species. Above, grey-brown with only a trace of olive on rump and edges of wing and rectrices. Below, dull white, clouded grey on breast and without yellow except at bend of wing and on thighs.

MEASUREMENTS

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. No wing-bar. Above, olive-brown with a yellowish tinge. A short yellowish supercilium. Below, dull whitish more or less streaked with yellow. Sexes alike.

First-winter birds have yellow underparts and supercilium.

STATUS, DISTRIBUTION and HABITAT. Rare or accidental vagrant or passage migrant. One record, Gujarat (Sálim Ali, JBNS 52: 760). Affects bushes, particularly near water.

Extralimital. Breeds from western Siberia to Scandinavia. Winters in central and southern Africa.

MIGRATION. The Gujarat specimen was taken on 29 March. Migration takes place from March to May. Autumn migration takes place mostly in September.

GENERAL HABITS. Those of the genus.

FOOD. Insects.

VOICE and CALLS. Call-note *wheet* hardly distinguishable from that of *collybita*. Song, an unmistakable, beautiful liquid warble, usually faint at

COLOURS OF BARE PARTS. Iris brown. Bill dark brown, yellowish brown at base of lower mandible. Legs and feet dark brown.

1575. **Brown Chiffchaff.** *Phylloscopus collybita tristis* Blyth

P. (Phylloscopus) tristis Blyth, 1843, Jour. Asiat. Soc. Bengal 12: 966 (Calcutta)
Baker, FBI No. 854, Vol. 2: 456

LOCAL NAME. *Viri tiris* (Kashmir).

SIZE. Sparrow — ; length c. 10 cm (4 in.).

FIELD CHARACTERS. No wing-bar. *Above*, pale olive-brown; a short, whitish supercilium. *Below*, dull whitish washed with buff on breast and flanks. Sexes alike.

Distinctly and unmistakably 'whiter' than nominate *collybita* (H. G. Alexander). Songs of the two similar but the latter's said to be more musical. The tail-wagging easily differentiates this species from *P. trochilus*.

STATUS, DISTRIBUTION AND HABITAT. Abundant winter visitor. The lower Himalayas (from c. 2100 m downwards) from N.W.F.P. in Pakistan east through Nepal, Sikkim, northern Bengal and the Bhutan foothills, south through the western half of Bangladesh, southern Bengal, Bihar, Madhya Pradesh, western Maharashtra south to north Kanara, Gujarat, Sind and the Makran coast. On passage through the western Himalayas and northern Baluchistan. Affects bushes (especially *Acacia*, *Zizyphus* and suchlike, and waterside vegetation); also hedges, gardens, babool groves, scrub jungle, reed-beds and standing crops.

Extralimital. Breeds in Siberia from the Ural Mts to the Kolyma river. Winters west through southern Iran and Iraq.

MIGRATION. Arrives in its winter quarters in September, remains till the end of April. Autumn passage lasts till November.

GENERAL HABITS. Found singly or in parties of 8 to 10 birds (once 50+ — SA) flitting restlessly from bush to bush or hopping on the ground flicking wings and tail nervously as characteristic of the genus, springing up a half-metre or so now and again to snatch a midge in flycatcher fashion. Feeds also in standing crops of cotton, wheat, etc., in stubble fields, or among partially submerged bushes. Commonly observed picking insects off the water surface, clinging sideways to reed-stems, reaching down and lunging out for them and deftly transferring itself to an adjacent stem when the perch bends over into the water with its weight.

FOOD. Insects. Identified among stomach contents are weevils and other small beetles (Coleoptera), aphids, dipterons and geometrid larvae (Mason & Lefroy, 1912).

¹ i.e. with no appreciable yellow or buff in plumage except on axillaries.

WARBLERS

139

given with less vigour and with intervals between notes longer and less regular (BBO). Other observers have noted no difference. Song may be heard in spring before departure. Call-note given by Brooks as *ti-yip*, different from that of *tristis*, but also *too-wit* similar to that of *occipitalis* (1606).

BREEDING. Season, May to July. Nest, domed, made of fine grass and weed stems, lined with very fine vegetable down and feathers; similar to that of *affinis* but latter lacks the layer of vegetable down. Usually placed in low thorny scrub within half a metre from the ground; sometimes in large tamarisks up to three metres, more rarely in willows up to c. 4 metres. Also built in the cut thorns that are placed on top of piled stone boundary walls or buildings in Ladakhi villages (BBO). Eggs, normally 4, sometimes 3, rarely 5, white marked chiefly at the large end with chestnut spots and specks. Average size of 140 eggs 15.8 × 12 mm (BBO).

MUSEUM DIAGNOSIS. See Key to the Species. Similar to *tristis* (1575) but with hardly any olive cast and generally paler underwing (white or yellowish white).

Spring moult (end of January to mid March) involves body plumage, innermost secondaries and their coverts, and usually central rectrices. Postnuptial moult complete in September and October, some later.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	57-65	11-13	19-20	47-56 mm
♀♀	51-62			43-52 mm

(HW, CBT)

COLOURS OF BARE PARTS. Iris dark brown. Bill: upper mandible blackish brown, lower yellowish brown; mouth yellow. Legs and feet very dark brown or black; soles yellowish.

1577. **Plain Leaf Warbler.** *Phylloscopus neglectus* Hume

Phylloscopus neglectus Hume, 1870, Ibis: 143 (Punjab and Doab)
Baker, FBI No. 856, Vol. 2: 458
Plate 86, fig. 2

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 10 cm (4 in.).

FIELD CHARACTERS. No wing-bar. *Above*, greyish olive-brown; a pale supercilium. *Below*, whitish tinged with buff especially on flanks. Sexes alike. Distinguished by earthy grey colour, small size and short tail, the last a diagnostic character (Alexander).

STATUS, DISTRIBUTION AND HABITAT. Summer (breeding) visitor, locally common. Northern Baluchistan (Ziarat, Koh-i-Pusht), N.W.F.P. (Safed Koh), Kashmir in the Liddar Valley (Alexander, 1950, JBNHS 49: 11) and perhaps also Ladakh but records not well authenticated (cf. Ticehurst, 1938, p. 61). Affects juniper forest and low bushes between 2000 and 3000 m. Winters in Pakistan from the Himalayan foothills south through Sind and southern Baluchistan. In this season affects tamarisks, acacias and sheesham (*Dalbergia*) plantations, especially on damp ground along irrigation canals.

Extralimital. Breeds in eastern Iran north to the Kopet Dagh, Afghanistan and Tadzhikistan. Winters in southern Iran and Oman.

138

SYLVIINAE

VOICE AND CALLS. Call-note a plaintive-sounding *tweet* or *wheel*. Song, often uttered during spring migration, occasionally in autumn, the well known *chiff-chaff*... (*chip-chalp-chalp-chip-chip* — SA) casually indistinguishable from that of nominate *collybita*. However, according to H. G. Alexander, who made a special field study of leaf warblers in India, the call as well as song of *tristis* are quite distinct. He gives the song as a rapid repetition of the call-note *chi-nit chi-nit* run together by the introduction of a few more musical notes, as originally described by Seebohm.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. See keys to the Species and Subspecies. *Above*, brownish to greyish brown without olive except on the edges of wing, rectrices, wing-coverts and rump. No yellow in supercilium, eye-ring and cheeks, this being replaced by buff. *Below*, sides of breast and flanks buff; bend of wing and under surface of wing yellow.

MEASUREMENTS

Phylloscopus sindianus Brooks, 1879, Stray Feathers 8: 476 (Sukkur, Sind)
Baker, FBI No. 855, Vol. 2: 457

LOCAL NAMES. *Chip-chip*, *Viri tiris* (Kashmir).

SIZE. Sparrow — ; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in 1575, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Summer (breeding) visitor: Baltistan, Gilgit, Ladakh, Rupshu, Lahul and Spiti, from c. 2500 to 4400 m. Winters in Pakistan from the Himalayan foothills (and probably Jammu) and Haryana south to Sind (vide H. W. Waite, JBNHS 59: 962). On migration through Kashmir. In summer affects willow and poplar groves, tamarisks along streams, gardens, orchards and *Hippophae* scrub. In winter frequents tamarisk and open scrub and babool jungle.

Extralimital. Breeds in Tadzhikistan and western Kun Lun range. Obtained in winter from Helmand, south Afghan border and Persian Baluchistan.

MIGRATION. Noted on passage through Kashmir and the Indus Valley in March–April and October–November. Arrives on its breeding grounds in early May.

GENERAL HABITS. Not different from those of *tristis* (CBT).

FOOD. Small insects.

VOICE AND CALLS. Song described as more 'tinny' and not nearly as loud as that of the European Chiffchaff (H. G. Alexander); also said to be

140

SYLVIINAE

Phylloscopus neglectus

■ Breeding

▨ Winter

MIGRATION. Spring passage takes place from the end of February to April, autumn passage from mid August to October. May be seen commonly on the breeding grounds as late as October.

GENERAL HABITS. Typical of leaf warblers. Forages in low undergrowth, from time to time showing itself on top of bushes.

FOOD. Insects.

VOICE AND CALLS. Call-note, a sharp *chip* and occasionally a double *chi-ip* (Alexander); also described as a harsh, rather grating single *chit* or *chut* not unlike that of *Sylvia curruca* and very different from the call of most leaf warblers (CBT). Song, a three-note *ti-wish-i* (Alexander).

BREEDING. Known only from one record in Iran. Season, April to June. Nest, domed, neatly made of grass and well lined with feathers; placed in a small, dense bush within a metre from the ground. Eggs, 4, white, unspotted. Four eggs measured each 15 × 10.1 mm (Witherby).

MUSEUM DIAGNOSIS. See Key to the Species; for details of plumage Ticehurst, 1938, or Williamson, 1962.

Pre-nuptial moult of body-feathers, lesser wing-coverts and central rectrices during March. Complete postnuptial moult in August.

MEASUREMENTS

1578. **Tytlér's Leaf Warbler.** *Phylloscopus tytléri* Brooks*Phylloscopus tytléri* Brooks, 1872, Ibis: 23 (Kashmir and Simla)

Baker, FBI No. 853, Vol. 2: 455

Plate 86, fig. 5

LOCAL NAME. *Viri tirio* (Kashmir).

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. No wing-bar. *Above*, olive, looking dull brown in the field. A well-marked yellowish white supercilium; cheeks and ear-coverts yellowish white with dusky mottling. *Below*, yellowish white streaked with brighter yellow on throat, breast and belly. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Summer (breeding) visitor. Gilgit, Hazara and Kashmir (especially common on Pir Panjal range), from c. 2400 m to timber-line (c. 3600 m). Chiefly a bird of coniferous forest (blue

Phylloscopus tytléri

Breeding range

Isolated records

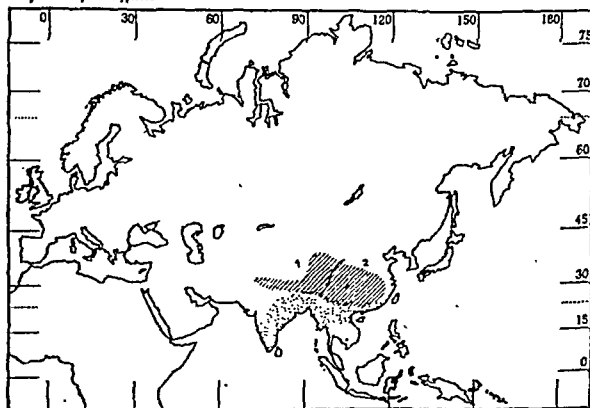

pine, silver fir); also seen in dwarf willows and birches near tree-line. Winter range little known, records very scanty: western Maharashtra in Khandala (one specimen — Fairbanks), and Londa (occasionally seen January–March — Koelz), and the Nilgiris (2 records, January and March — Davison). Records from Khandesh, M.P. and U.P. (Etawah) are of passage migrants. Passage recorded also in Kangra, Simla, Almora (Brooks) and extreme western Nepal (Fleming & Traylor, 1968). Winter habitat not described.

MIGRATION. Passage in northern India takes place in April and in September–October.

WARBLERS

143

zone 3500–4500 m. Affects scrub of *Barberis*, willow, juniper, rhododendron, *Hippophae* and *Caragana*; in Nepal also dwarf bamboo, edges of forest and bushes among upland cultivation. Winters from the Himalayan foothills (Nepal eastwards) south through the Peninsula to the southernmost hills

Phylloscopus affinis

Breeding

Winter

1 *affinis* (1579). 2 *subaffinis* (RE).

(Mysore, Kerala), east through Bangladesh, Assam and Manipur; keeps to the hills, from their base to at least 2100 m. In this season frequents scrub and secondary jungle, and well-wooded country.

EXTRALIMITAL. Breeds in eastern Tibet and western Szechuan north to Kansu. Winters east to northwestern Thailand.

MIGRATION. Found on its summer grounds from April to October and in its winter quarters from November to April (southern India). Abundant in the Himalayas at medium elevations during spring migration (March–April). Autumn passage mostly in October.

GENERAL HABITS. Found singly or in pairs in summer. Often in loose parties in winter, feeding in low bushes close to the ground, sometimes clinging upside down to sprigs and leaves or making short sallies into the air for insects.

FOOD. Weevils, small beetles, midges and other insects.

VOICE and CALLS. Song, given constantly from bush-tops in breeding season, a single note rapidly repeated five or six times, preceded by one or two higher-pitched notes; rendered as *pick-pick whi whi whi whi* (BBO) or *ze zizizizi* (GD). Very similar to that of *P. griseolus* (1581) but for the single (sometimes double) note that precedes it; for further renderings of song see Diesselhorst, 1968: 271. Song period April to end of July; a light

142

SYLVIINAE

GENERAL HABITS. An unobtrusive leaf warbler searching for food in low bushes and undergrowth, chiefly in clearings and along margins of forest. FOOD. Insects.

VOICE and CALLS. Song of 4 or 5 notes rendered as *whittle-di-wee-yea* (Alexander) and *let's kiss him*, or sometimes *superstition* (BBO), repeated at frequent intervals. Call, a squeaky single note.

BREEDING. Season, May to July. *Nest*, a small, globular structure of grass mixed with feathers, lichen, moss, birch bark and hair, lined with feathers. Well concealed in a leafy bough of fir, sometimes in the fork of a pollarded tree, at a considerable height above the ground, generally above 6 metres and up to c. 9 m. Eggs, normally 4, occasionally 5, white, sometimes faintly speckled with reddish. Average size of 36 eggs 16×12.2 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Species. Bill rather long and narrow, shaped like tailor bird's (*Orthotomus*). For details of plumage see Ticehurst, 1938 or Williamson, 1962. First-winter birds are rather yellower below and greener above than adults. Postnuptial moult complete, mid July to mid September.

MEASUREMENTS

Plate 86, fig. 6

LOCAL NAMES. *Viri tirio* (Kashmir); *Foochi* (Manbhum); *Ani chin* (Tibet); *Dastika gabi* (Cachari).

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. No wing-bar. *Above*, dark olive-brown. A prominent long, yellow supercilium. *Below*, almost canary yellow. Sexes alike.

Combination of uniform olive upperparts and bright yellow underparts serves easily to identify this species.

STATUS, DISTRIBUTION and HABITAT. Abundant summer (breeding) visitor to the Himalayas: from Gilgit and Hazara east through Sikkim and southeastern Tibet (not recorded in Bhutan in the breeding season). A bird of very high altitudes breeding above 2700 m in Nepal, 3300 m in Kashmir and up to the limit of scrub growth c. 4800 m in Tibetan facies; optimum

SYLVIINAE

144

autumn resumption in September. Call-note a feeble sparrow-like *chip* or *tisp* uttered as it flicks wings nervously and hops about.

BREEDING. Season, May to August, chiefly June and July. *Nest*, a ball of grass or sometimes juniper fibre, copiously lined with feathers, the entrance near the top; placed in a low *Caragana* or suchlike bush, often rather conspicuously in its outer rim, some 30 or 60 cm above the ground. Eggs, normally 4, sometimes 3 or 5, either unpigmented white, or white sparsely stippled with rusty red especially at the large end; both types may be found in the same clutch. Average size of 40 eggs 16.2×12.3 (BBO); of 18 eggs 15.2×11.5 mm (Ludlow). Incubation and care of young by both parents. Incubation period undetermined.

MUSEUM DIAGNOSIS. See Key to the Species; for distinction from *arcanus* see 1580. Young, warmer brown above than adult; underparts with a variable amount of yellow. Postjuvinal moult of body-feathers in August. Prenuptial moult of body-feathers in March and April, postnuptial moult complete, on or near breeding grounds in August and September.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	53–63	12–13	18–19	44–51 mm
♀♀	51–61			39–48 mm
				(CBT, BB, HW)

Weight 12 ♂♂ (March–Sept.) 6.3–7.6; 5 ♀♀ (June–Sept.) 6.0–7.7 g (GD).

COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible dark brown, lower yellowish brown (Osmaston) or orange-yellow (SA). Legs and feet yellowish brown; soles yellow.

1580. **Buffbellied Leaf Warbler.** *Phylloscopus affinis arcanus* Ripley*Phylloscopus subaffinis arcanus* Ripley, 1950, Proc. Biol. Soc. Washington 63: 105

(Tikapur, Kailali District, western Nepal)

Not in Baker, FBI

Plate 86, fig. 7

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in 1579, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Winter visitor. Obtained only from the western Nepal terai in January and from the central Kathmandu Valley in April (Ripley, loc. cit. *supra* and JBNHS 49: 400). Affects low bushes.

EXTRALIMITAL. Probably breeds at high elevations (3000–3600 m) in central Szechuan. Breeding range of the very similar race *subaffinis* extends east to Fukien; it winters in northern Burma, southern China and northern Indochinese countries.

GENERAL HABITS and FOOD. As in 1579.

VOICE and CALLS. Call-note recorded as a single tick (SDR) or tick-tick (Schäfer). Song (of *subaffinis*) rendered as *diil-diil-diil-zit-zit-zit*. Both song and call-note probably not different from those of *affinis*.

BREEDING. Unrecorded.

MUSEUM DIAGNOSIS. Differs from *affinis* in having the underparts paler yellow strongly tinged with buff.

COLOURS OF BARE PARTS. Iris brown. Bill brownish horn, base of lower mandible flesh-coloured. Legs and feet pale brown.

1581. Olivaceous Leaf Warbler. *Phylloscopus griseolus* Blyth

Ph.(ylloscopus) griseolus Blyth, 1847, Jour. Asiat. Soc. Bengal 16: 443
(banks of the Hoogly River, near Calcutta)
- Baker, FBI No. 858, Vol. 2: 459
Plate 86, fig. 8

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 10 cm (4 in.).

FIELD CHARACTERS. No wing-bar. *Above*, grey-brown. A conspicuous yellow supercilium, pale eye-ring and dark streak through eye. *Below*, oil-yellow tinged with dusky on breast and flanks. Sexes alike.

One of the easiest leaf warblers to identify; recognized also by its tree-creeper-like climbing habit (q.v., 1842).

STATUS, DISTRIBUTION and HABITAT. Summer (breeding) visitor to the Pakistan and western Himalayan ranges, locally common. Breeds from northern Baluchistan to Chitral, Gilgit, Astor, Baltistan, Ladakh, the Zaskar Mts, Lahul and Spiti, from c. 2400 to 4500 m. Affects rocky or stony hillsides with a few bushes, desolate scree studded with tufts of grass, juniper forest, and willows along river beds. Winters in the northern Peninsula from Lahore (Ahmad, 1965), Rajasthan and Gujarat through Madhya Pradesh to lower Bengal, south to Maharashtra (Mahabaleshwar) and Andhra Pradesh (Nelipaka and Asifabad); in the hills up to at least 1000 m. In this season affects rocky country, steep sides of rocky ravines and deciduous forest. On passage through Pakistan and northwestern India from Chagai to central Nepal (Biswas, 1968, JBNHS 65: 783) and the plains of Uttar Pradesh.

Extralimital. Breeds also in Afghanistan and north to the Altai.

MIGRATION. Passage takes place from August to October and in March-April. Recorded on its breeding grounds from May to September.

GENERAL HABITS. Found singly or in pairs; on migration often in twos and threes. Usually keeps near the ground in low herbage and scrub, clambering over stones and boulders, rock outcrops and scarps, and in its winter quarters commonly on walls of ancient forts, archaeological ruins, etc. Often seen running up trunks of large trees in sideway and zigzag hops like a tree creeper (*Certhia*) or scuttling around and along horizontal branches like a nuthatch (*Sitta*) in search of insects, with a constant flicking of the wings.

FOOD. Insects — weevils, small beetles, larvae, etc.

VOICE and CALLS. A hard, finch-like *pick* or *quit* while foraging. Song similar to that of *fuligiventis*; also recalls song of *affinis* but lacks the single or double introductory note.

WARBLERS

147

winter keeps close to water, coming out freely on to little islets, stones or pieces of driftwood. Often flutters out over water catching insects, hovering momentarily above the surface as it does so (Proud).

FOOD. Insects.

VOICE and CALLS. Song, a monotonous repetition of a single note *tsli-tsli-tsli-tsli-tsli* or sometimes an almost disyllabic *tsli* . . . etc. given five or six times (Desfayes). Call-note *cht* . . . *cht* constantly uttered (Proud).

BREEDING. Unknown.

MUSEUM DIAGNOSIS. See Key to the Species. Differs from *tibetanus* by the greenish yellow underparts (v. grey).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♀	51-61	12-14	19-22	40-50 mm (Williamson)

COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible black, lower brown, yellowish at base. Legs and feet brownish black, dark brown or greenish brown.

1583. Tibetan Smoky Leaf Warbler. *Phylloscopus fuligiventis tibetanus* Ticehurst

Phylloscopus tibetanus Ticehurst, 1937, Bull. Brit. Orn. Cl. 57: 109
(Bombi La, Tsari, S. Tibet)
Not in Baker, FBI

LOCAL NAME. *Chinteh-lok* ('top-of-the-thumb-size bird' - Tibetan).

SIZE. Sparrow — ; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in 1582 but underparts grey with little or no yellow.

STATUS, DISTRIBUTION and HABITAT. Altitudinal migrant. Breeds in southeastern Tibet on the northern slopes of the main range from c. 3900 m to 4500 m, in the scrub zone and scree above timber-line. Winters in the Arunachal foothills and adjacent plains, in same habitat as *fuligiventis*.

Extralimital. Breeds on the ranges on both sides of the Tsangpo river east to Sanga Cho (cf. Williamson, 1962: 48).

GENERAL HABITS and FOOD. As in 1582.

VOICE and CALLS. Alarm-note likened to that of *Troglodytes* (Ludlow). Both call and song probably not different from those of *fuligiventis*.

BREEDING. Unknown.

MUSEUM DIAGNOSIS. See Key to the Species. *Above*, dark sooty brown like *fuligiventis*. *Below*, different shades of grey, usually lacking any yellow. Supercilium greyish white (v. greenish yellow).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
1 ♂	59	13	21	50 mm
1 ♀	57	—	—	46 mm

(CBT, NBN)

COLOURS OF BARE PARTS. Iris brown. Bill nearly black, yellowish at gape. Legs and feet dark brown.

SYLVIINAE

146

BREEDING. Season, chiefly June-July. Nest, a ball of grass or juniper fibre copiously lined with feathers, placed in low bushes, herbage or nettles usually within c. 60 cm from the ground. Eggs, normally 4, white spotted with dull red, mostly in a broad zone around the large end. Average size of 19 eggs 16.7 × 12.5 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Species; for details of plumage Ticehurst, 1938, or Williamson, 1962.

Young, like adult but warmer brown above, less bright yellow below. Post-juvénal moult of body-feathers. Prenuptial moult of body-feathers in February and March. Postnuptial moult complete from July to September.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	65-67	14-15	20-21	49-52 mm
♀♀	63-68			50-53 mm (HW, SA)

Weight 6 ♂♀ 7-9 (av. 7.6) g — SA.

COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible brown, lower yellow. Legs and feet yellowish brown; claws brown; soles yellow.

PHYLLOSCOPUS FULIGIVENTER (Hodgson)

Key to the Subspecies

Underparts greenish yellow.....*P. f. fuligiventis*
Underparts grey.....*P. f. tibetanus*

1582. Smoky Leaf Warbler. *Phylloscopus fuligiventis fuligiventis* (Hodgson)

H.(ormis)? fuligiventis Hodgson, 1845, Proc. Zool. Soc. London: 31 (Nepal).
Baker, FBI No. 859, Vol. 2: 460
Plate 86, fig. 12

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 10 cm (4 in.).

FIELD CHARACTERS. No wing-bar. *Above*, very dark olive-brown; a long, greenish yellow supercilium. *Below*, dull greenish yellow (or dusky oil-green). Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Altitudinal migrant. Breeds from 3600 to over 4300 m in Bhutan, Sikkim and west probably to central Nepal (Desfayes, sight record, Gosainkund 4300 m, 18 June; see also Dieselhorst, 1968: 273 for another sight record near Gokyo north of Namche Bazar at nearly 5000 m). Frequents low scrub above timber-line and boulder-strewn alpine meadows. Winters from the western Nepal terai (Rand & Fleming, 1957) and duns (Proud, JBNHS 58: 277) east through the Sikkim, Bhutan and Arunachal foothills, northern Bengal and Assam in the plains of the Brahmaputra south to Cachar. In this season very partial to proximity of water: frequents dense bushes, grass and sedges along banks of water-courses, both small streams and large slow-flowing rivers.

MIGRATION. Noted on its breeding grounds from June to September.

GENERAL HABITS. Keeps singly or in pairs, on or near the ground in low scrub, or clambering about among large boulders in search of food. In

1584. Szechuan Dusky Leaf Warbler. *Phylloscopus fuscatus weigoldi* Stresemann

Phylloscopus weigoldi Stresemann, 1924, Abh. u. Ber. Mus. f. Tierk. u. Volkerk., Dresden 16: 10 (Dschesiong, near Tatsienlu, SE. Chwanben)
Not in Baker, FBI

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in 1586, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Winter visitor. The Himalayan foothills and adjacent plains, from eastern Nepal (Fleming & Traylor, 1968) east through Arunachal Pradesh. Habitat as in 1586.

Extralimital. Breeds above timber-line in western Szechuan and Tsinghai. MIGRATION. Passage recorded in southeastern Tibet and eastern Bhutan in September and October.

GENERAL HABITS, FOOD and VOICE. As in 1586.

MUSEUM DIAGNOSIS. Like *fuscatus* but darker; supercilium, cheeks and underparts greyish white, but subspecies of winter birds not always easy to assign.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	56-67	12-14	21-23	48-56 mm
♀♀	53-60			42-49 mm (CBT, Williamson)

COLOURS OF BARE PARTS. Bill (except base of lower mandible), legs and feet said to be nearly black. Probably not different from 1585.

1585. Manipur Dusky Leaf Warbler. *Phylloscopus fuscatus mariae* Ripley

Phylloscopus fuscatus mariae Ripley, 1951, Postilla, Yale Peabody Mus., No. 6: 5 (Moirang, Manipur)
Baker, FBI No. 860 (part), Vol. 2: 461

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 10 cm (4 in.).

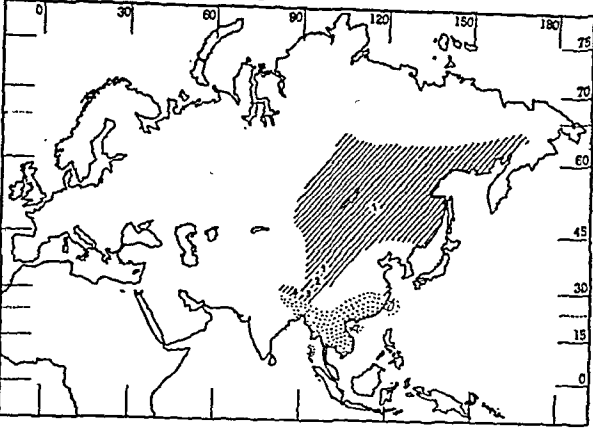

FIELD CHARACTERS. As in 1586, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Winter visitor to Manipur (whence described) and the Andaman Islands (Abdullahi, JBNHS 61: 562). Affects low bushes and long grass in swampy areas, often near cultivation.

Baker, FBI No. 865, Vol. 2: 465

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in 1589, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Altitudinal migrant, common.

Breeds in the western Himalayas from Kishtwar and Zaskar to Garhwal

Phylloscopus pulcher

Distributional ranges

■ *kangrae* (1587). ● *pulcher* (1589).

and Kumaon, between 2800 and 3900 m, optimum zone 3000-3600 m. Winters (October to March) between 1000 and at least 2100 m, east to western Nepal. In summer affects birch and mixed conifer-rhododendron forest; in winter forest of oak, *Ilex*, etc.

GENERAL HABITS, FOOD and VOICE. As in 1589.

BREEDING. Season, mainly June and July. Nest, a ball of green moss, grass, lichen and strips of birch bark copiously lined with feathers. Placed in the outer branches of a conifer, in dense bushes or against trunks of trees, some 60 cm to four metres above the ground. Eggs, normally 4, white with reddish brown blotches and specks, mostly at the large end, sometimes forming a well-defined ring. Average size of 16 eggs 14.9 × 11.4 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Species. Differs from the nominate race (1589) in being more yellowish olive above; head not so dark; underparts paler and purer yellow; grey suffusion on breast reduced.

MEASUREMENTS and COLOURS OF BARE PARTS. As in 1589.

150

SYLVIINAE

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. No wing-bar. Above, dusky olive-brown. A pale, prominent supercilium, pale semi-eyering, and dark streak through eye. Below, whitish with a grey wash on breast; flanks and under tail-coverts fulvous. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Winter visitor, locally common. From the Himalayan foothills (up to c. 1400 m in central Nepal) south through Uttar Pradesh, Bangladesh and Assam; also Andaman Is. Affects reed and scrub jungle, low bushes and long grass around pools, and hedges and standing crops in damp areas.

Extralimital. Breeds in northern China and southeastern Siberia; winters also in southern China and the Indochinese countries.

MIGRATION. Recorded on passage in southeastern Tibet and eastern Bhutan in September and October. Remains on winter grounds till April or early May.

GENERAL HABITS. Forages in low bushes or on the ground, usually singly, incessantly flicking wings and tail.

FOOD. Insects. Stomach contents showed weevils and other small beetles (Coleoptera), geometrid, pyralid and lepidopterous larvae; also some vegetable matter and *Ficus* and weed seeds (Mason & Lefroy, 1912).

VOICE and CALLS. A single *chuck* or *tek* like Lesser Whitethroat's but softer, and a soft *chi-chi-ree*. 'A sharp clicking note' (Osmaston).

MUSEUM DIAGNOSIS. See Key to the Species. Differs from *weigoldi* in being paler and having the cheeks and supercilium behind eye fulvous.

SYLVIINAE

1588, 1589. **Eastern Orangebarred Leaf Warbler.** *Phylloscopus pulcher pulcher* Blyth

Ph. (ylloscopus) pulcher Blyth, 1845, Jour. Asiatic Soc. Bengal 14: 592

(Nepal, restricted to Nepal Valley by Biswas, 1962, JBNHS 59: 413; cf. also 414)

Phylloscopus erichsoni Gray, 1846, Cat. Mammals. Bds. Nepal: 66, 152

(Nepal, restricted to Chandragiri Pass, central Nepal Valley,

by Ripley, 1950, JBNHS 49: 401)

Phylloscopus pulcher pernix Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 16

(Blue Mountain, Lushai Hills)

Baker, FBI No. 864, Vol. 2: 464

Plate 86, fig. 14

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. Two orange-yellow wing-bars, lower very prominent. Above, olive; crown sooty olive with an indistinct median stripe and a prominent yellow supercilium extending to nape. Rump pale yellow. Inner webs of outer rectrices white. Below, pale yellow suffused with grey on breast. Sexes alike.

One of the most easily identified leaf warblers. Orange double wing-bar and white in tail very noticeable in the field, the latter particularly in flight.

STATUS, DISTRIBUTION and HABITAT. Altitudinal migrant, common. From western Nepal (where intergrading with *kangrae*) east through Darjeeling, Sikkim, Bhutan and Arunachal Pradesh, thence south through Nagaland and Manipur to the Khasi, Garo and Mizo hills (Koelz, loc. cit. *supra*). In the Himalayas breeds between 3000 and 4300 m, optimum zone 3800-4100 m. Altitudinal distribution and status unknown south of the Brahmaputra (on Mt Victoria, Heinrich found it common between 2400 and 2800 m, but the birds disappeared after 10 May; nest found in the Chin Hills at c. 1800 m). In the breeding season affects mixed conifer, rhododendron and birch forest, and also dwarf juniper, rhododendron or other scrub above tree-line. Winters (October to March) between 500 and 2800 m, its movements then influenced by weather conditions. At this season frequents oaks and other dense forest.

Extralimital. Extends through the mountains of western China to Kansu.

MIGRATION. Moves to higher altitudes at the end of March and first week of April but does not appear to start breeding until mid June.

GENERAL HABITS. More arboreal than other leaf warblers, especially in winter when it often keeps with the itinerant hunting parties of small insectivorous birds high up in the canopy foliage of trees.

FOOD. Insects. Observed drinking sap of oak (*Quercus*)—Proud.

VOICE and CALLS. Song said by several observers (Proud, Heinrich, Schäfer) to be reminiscent of song of *P. sibilatrix* but much slower and shorter; a very thin and high twitter preceded by, or ending with, a long-drawn high-pitched trill increasing in depth of tone and loudness. Song period: end of February till end of June (Proud). Call-note, a high-pitched *trip* or *trick* constantly repeated, sometimes quickly run together, sounding like the twitter of a flowerpecker (*Dicaeum*).

WARBLERS

153

BREEDING. As in 1587. This and several other leaf warblers commonly brood-parasitized by *Cuculus poliocephalus* and other cuckoos.

MUSEUM DIAGNOSIS. See Key to the Species. Young. *Above*, slightly browner, less olive than adult; *below*, duller and greyer. Postjuvénal moult of body-feathers, August to October. Prenuptial moult of body-feathers, mid February to mid April. Postnuptial moult complete, July to August.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	53-62	12-13	18-21	40-45 mm
♀♀	52-63			37-42 mm
(BB, CBT, Rand & Fleming)				

Weight 10 ♂♂ (June-July) 6.6-7.2; 3 ♀♀ (June-July) 5.4-6 g — GD. 3 ♂♂ (July) 6.8-8.1; 2 ♂♂ (December) 7.1, 7.4; 4 ♀♀ (December) 6.2-7 g — RAP.

COLOURS OF BARE PARTS. Iris dark brown. Bill: upper mandible black; lower mandible dark horny, yellowish on base, gape and sides. Legs, feet and claws brown; soles dull yellow.

PHYLLOSCOPUS INORNATUS (Blyth)

Key to the Subspecies

Page

A	Head pattern well-marked.....	<i>P. i. humei</i>	153
B	Head pattern very faint		
1	Wing-bars and supercilium yellow.....	<i>P. i. inornatus</i>	156
2	Wing-bars and supercilium buffish white.....	<i>P. i. mandellii</i>	155

1590. Hume's Yellowbrowed Leaf Warbler. *Phylloscopus inornatus humei* (Brooks)

Reguloides humei Brooks, 1878, Stray Feathers 7: 131 (Northwest India)
Baker, FBI No. 870, Vol. 2: 469

LOCAL NAMES. *Viri tiris* (Kashmir); *Fochi* (Manbhum).

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. Two wing-bars, upper usually less clear cut. *Above*, greenish olive; faint coronal bands, prominent pale yellowish supercilium and eye-ring. *Below*, whitish more or less tinged with yellow. Sexes alike.

Combination of whitish supercilium, double wing-bar, faint coronal bands and absence of white in the relatively short tail identifies this species.

STATUS, DISTRIBUTION AND HABITAT. Common summer (breeding) visitor to the western Himalayas from N.W.F.P. east through Gilgit, Astor, Hazara and Kashmir to Garhwal, from c. 2100 to 3600 m, optimum zone 2700-3000 m. Winters from c. 1400 m downwards and in the plains of northern Pakistan and peninsular India south to Belgaum, Hyderabad and Anantagiri (doubtfully south to Nellore); east through Nepal terai and lower hills of Sikkim and Bangladesh to the Brahmaputra-Ganges. In summer affects glades in mixed or coniferous forest, and birch forest above the conifer zone. In winter haunts gardens, orchards and dry-deciduous forest.

WARBLERS

155

MUSEUM DIAGNOSIS. See keys to the Species and Subspecies. Differs from the nominate race (1592) in having the upperparts and edges of wing and rectrices duller, more greyish olive, giving a mealy appearance; yellow of head, underparts and wing-bars replaced by buffish white.

Postnuptial moult complete from August to November, either on breeding grounds or after arrival in winter quarters. Prenuptial moult of body-feathers in March-April.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	51-61	10-12	17-19	38-45 mm
♀♀	51-60			37-43 mm
(BB, HW)				

Weight 15 ♂♂ (November to January) 5.3-7.1; 2 ♀♀ (January) 5.8, 6; 1 ♂ (March) 7 g — RAP. 2 ♂♂ (October) 6.2, 7.2; 1 ♀ (October) 6.2 g — GD.

COLOURS OF BARE PARTS. Iris dark brown. Bill: upper mandible very dark horny, lower mandible fleshy or light brown with dark horny tip. ('It is the only *Phylloscopus* with a dark tip to the lower mandible' — H. G. Alexander.) Legs horny to dark horny; feet and claws horny to pale horny; soles yellowish white (BB).

1591. Mandelli's Yellowbrowed Leaf Warbler. *Phylloscopus inornatus mandellii* (Brooks)

Reguloides Mandellii Brooks, 1879, Stray Feathers 8: 389 (Sikkim)
Baker, FBI No. 871 (part), Vol. 2: 470

LOCAL NAME. *Dastisha koro* (Cachari).

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in 1590, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor. From the Himalayan foothills east of Sikkim, south through Assam, Nagaland, Manipur and Bangladesh; in the hills up to c. 1880 m. Summer visitor to southeastern Tibet (Ludlow, *Ibis* 1944: 200 and 1951: 563) and probably the ranges of Arunachal Pradesh from 2800 m up. Breeding recorded by Baker (JBNHS 9: 17, 1894) on a peak above Hungrum, North Cachar. In summer affects mixed coniferous and scrub forest. Winter habitat as in 1592.

Extralimital. Breeds in the mountains of Western China. Winters east to northern Burma.

MIGRATION. Spring passage recorded in southeastern Tibet in April, autumn passage in September.

GENERAL HABITS AND FOOD. As in 1590.

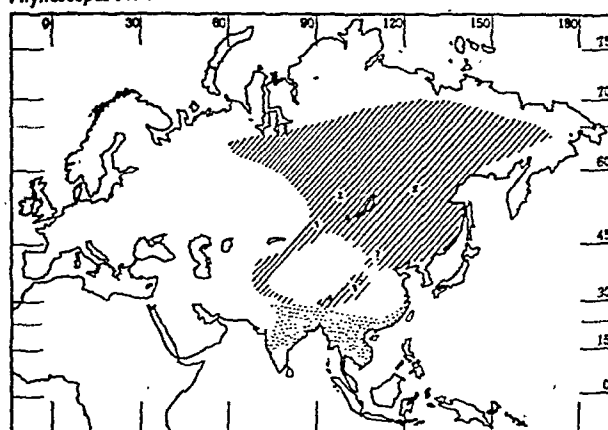

VOICE AND CALLS. A sparrow-like chirp *ch-chip* and a pipit-like *tripp tripp* (Schäfer). Song rendered by the same as *ch-chip* mixed with trills. See 1592.

BREEDING. Probably as in 1592. A nest reported by Baker (JBNHS 9: 17) at the end of March was a ball of moss lined with a little grass and rootlets; it was said to have been wedged between some stones on a steep mossy bank (this situation often recorded for *inornatus*). The three eggs were white with numerous freckles and spots of bright reddish. They measured 15.5 × 10.9, 15.2 × 10.6 and 15.2 × 10.9 mm (Baker).

154

SYLVIINAE

Phylloscopus inornatus

Distributional ranges

1. *humei* (1590). 2. *inornatus* (1592). 3. *mandellii* (1591).

Extralimital. Breeds also in adjacent parts of Afghanistan and north through the Turkestan ranges to the Altai. The nominate race extends from Lake Baikal to the northern Urals, Anadyr and the Ussuri region. *P. i. mandellii* breeds in the ranges of western China.

MIGRATION. Spring passage takes place from March till the middle of May, some birds already showing up on their breeding ground in the last week of March, where they may be seen till October. Autumn migration in September and October. Young birds may start drifting down in August. Recorded in the Peninsula from October to April.

GENERAL HABITS. Forages high up in trees as well as in low bushes. May be seen fluttering against the bark of a tree or even descending to the ground.

FOOD. Insects. Among stomach contents were found blattids and small beetles, ants (*Phidole malini*) and spiders (Mason & Lefroy, 1912).

VOICE AND CALLS. A sharp fairly long double *tis-jip* (Alexander) uttered as a call-note or alarm-note; also rendered as *chilip* or *tiu-lip* (SA) and as *te-hweet*, or *te-we-ul*, in one note (Whistler). Song, not described from the Himalayas, a brief and buzzing *rit-rit-zzhi* (Sushkin). See also 1591.

BREEDING. Season, end of May to July. Nest, a ball of grass and moss lined with finer grass, hair and, occasionally, a few feathers, with entrance on the side. Placed on the ground, on steep slopes or banks among ferns or at the foot of a small bush or tree. Eggs, normally 4, sometimes 5, white spotted with reddish brown, hardly distinguishable from those of *proregulus* (1594). Average size of 100 eggs 14.6 × 11.4 mm (Baker). Brood-parasitized by *Cuculus poliocephalus*.

SYLVIINAE

156

MUSEUM DIAGNOSIS. See keys to the Species and Subspecies. Differs from *inornatus* in having the upperparts darker and browner, except for greenish rump. Dark coronal bands and pale median stripe faintly indicated. Supercilium and underparts dirty yellowish white; centre of belly more yellowish. Upper wing-bar and pale edges to tertials less distinct.

MEASUREMENTS AND COLOURS OF BARE PARTS. As in 1592.

Weight (winter) 4.5-6 g (SDR).

1592. Siberian Yellowbrowed Leaf Warbler. *Phylloscopus inornatus inornatus* (Blyth)

Regulus inornatus Blyth, 1842, Jour. Asiat. Soc. Bengal 11: 191 (Darjeeling)
Phylloscopus humii praemium Mathews & Iredale, 1915, Aust. Av. Rec. 3: 44.
new name for *Motacilla superciliosa* Boddaert, 1783
Baker, FBI No. 871 (part), Vol. 2: 470
Plate 86, fig. 10

LOCAL NAME. *Dastisha koro* (Cachari).

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in 1590, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor. The east Himalayan foothills from c. 1500 m downwards, west to central Nepal (Proud, JBNHS 53: 63) and south through Assam, Nagaland, Manipur and Bangladesh. Affects scrub, gardens, groves and open forest.

Extralimital. Breeds in Siberia, winters in the Indochinese countries, southern China and Formosa.

MIGRATION. Arrives in its winter quarters in October, leaves in April.

GENERAL HABITS AND FOOD. As in 1590.

VOICE AND CALLS. Contrary to what has been repeatedly stated in the literature, this subspecies also utters the disyllabic *tis-jip* recorded for *humei*; variously rendered as *tis-jipp* (Weigold), *tyu-i* (Kozlova) or *chee-wee* (Proud). However, *inornatus* seems to have, in addition to the disyllabic call, a note given as *wheet* (Proud), *west* (SA), *rist* (Portenko), or also a shrill *tree* (Brooks). A call which is probably the same as the latter is recorded by two observers as a pipit-like *biest-biast* (Weigold) or *tripp tripp* (Schäfer, for *mandellii*). Also a *ti-ti* while in family parties. Song poor and feeble, rendered as *sz sz sz szit* or *schuk djuid jid* rising and falling in tone (Weigold) and *ti ti tit zch-zhi* ending in a peculiar buzzing sound (Ivanov).

MUSEUM DIAGNOSIS. See Key to the Species. For details of plumages see Williamson, 1962: 16; for distinction from *humei* and *mandellii* see 1590 and 1591 and Key to the Subspecies. Postnuptial moult complete on breeding ground, late July to August. A moult of body-feathers only during March.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	55-61	10-12	17-18	40-44 mm
♀♀	51-57			36-41 mm
(CBT)				

Weight (winter) 5-7 g (SDR). 6 ♂♂ (Oct.-Nov.) 5-8 g — SA.

COLOURS OF BARE PARTS. Iris hazel. Bill brown, base of lower mandible yellowish flesh. Legs and feet olive-brown; soles yellow.

WARBLERS

157

1593. **Brooks's Leaf Warbler.** *Phylloscopus subviridis* (Brooks)
Reguloides subviridis Brooks, 1872, Proc. Asiat. Soc. Bengal: 148
(Etawah, U.P.)
Baker, FBI No. 869, Vol. 2: 468
Plate 86, fig. 9

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 10 cm (4 in.).

FIELD CHARACTERS. Two yellowish white wing-bars, lower prominent, upper indistinct. Above, yellowish olive, head and cheeks appearing yellowish; a conspicuous yellow supercilium; median coronal stripe yellowish but indistinct; rump yellowish. Below, dull yellowish white. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Summer (breeding) visitor to Murree hills (Rattray, JBNHS 16: 424), Gilgit (Astor, Nulter Valley, Mt Deobani) and N.W.F.P. (Kagan Valley, Byan Khel, Hariab Valley, Safed Koh); from c. 2100 to 3600 m. Winters at lower elevations (c. 1800 m downwards) from Kohat to Simla, south in the plains to Multan (SW. of Lahore), Gwalior, M.P. (Sálim Ali, JBNHS 41: 98) and east to Etawah and Fatehgarh, U.P. Affects coniferous forest in summer; bushes, olive groves and thorny *kikar* (*Acacia*) trees in winter.

Extralimital. Breeds also in adjacent parts of Afghanistan and in Turkestan probably north to Kara-Kul Lake and Fergana Range (Dementiev).

MIGRATION. Arrives on summer grounds at the end of March, leaves in September and early October. In winter quarters from September to March, reaching its peak numbers in early November.

GENERAL HABITS. Little recorded. Appears to haunt trees more than bushes. Usually singly or in pairs; in winter also in mixed parties.

FOOD. Insects.

VOICE AND CALLS. Call-note a distinct *chwey* (Whitehead) or *twee-ut* (Whistler) fairly sharp, almost double but running into one, much flatter than the call of *P. inornatus*, the second half of the note lower than the first (Alexander, in litt.); it is also quite distinct from the slight, single note of *P. proregulus*. Song, shrill and weak, consisting of a series of single notes followed by a reel thus: *wet wet wet whir-r-r-r-r* (Whistler) or *pi-pi-piaz-z-z-z* with some variations (Whitehead). Song begins in March before departure.

BREEDING. Little known. Season, May to July. Nest, a ball of coarse grass lined with fine grass or goats' hair, placed on the ground, on a sloping bank. Eggs, 4, white with reddish spots and speckles. Average size 13.7 × 12.7 mm (Whitehead).

MUSEUM DIAGNOSIS. See Key to the Species. Considered by some authors to be conspecific with *P. inornatus*.

Postnuptial moult probably completed on breeding grounds. Moult of body-feathers in February or later. Upperparts are more olive, less yellow in late winter and spring.

Phylloscopus proregulus

Distributional ranges

▨ Breeding

▤ Winter

1 *proregulus* (RE) 2 *newtoni* (1596) 3 *chloronotus* (1595) 4 *simlaensis* (1594).

(Alexander). Song, a short twittering phrase and a faint shivering sibilant note (Brooks).

BREEDING. Season, May to July. Nest, a neat ball with lateral entrance, of moss, lichen and a few strands of grass or some pine needles, lined with feathers. Usually placed in the outer branches of a conifer between two and fifteen metres, mostly between three and six, above the ground. Eggs, normally 4, rarely 5 or 3, white with numerous reddish blotches and dots, mostly at the large end. Average size of 100 eggs 14.1 × 10.9 mm (Baker). Frequently brood-parasitized by *Cuculus saturatus*.

MUSEUM DIAGNOSIS. See Key to the Species. Brighter above, more yellowish green, than other races; underparts paler yellow than in *chloronotus*.

MEASUREMENTS. As in 1595.

COLOURS OF BARE PARTS. Iris dark brown. Bill: upper mandible black, lower yellow, yellowish or brown; mouth yellow. Legs and feet brown or fleshy brown; soles yellow (Abbott).

Phylloscopus proregulus simlaensis Ticehurst, 1920, Bull. Brit. Orn. Cl. 41: 55
(Simla)
Baker, FBI No. 868, Vol. 2: 467
Plate 86, fig. 15

LOCAL NAME. *Viri tirio* (Kashmir).

SIZE. Sparrow — ; length c. 9 cm (3½ in.).

FIELD CHARACTERS. Two yellow wing-bars. Above, olive-green. A dusky olive coronal band on either side of a prominent pale yellow median stripe. A long conspicuous yellow supercilium and a dark streak through eye. A prominent pale yellow rump-band. Below, dull white tinged with yellow. Sexes alike.

The yellow rump distinguishes it from all but *pulcher* and *maculipennis*, both of which have white in tail.

STATUS, DISTRIBUTION AND HABITAT. Altitudinal migrant, common. Breeds in the western Himalayas from N.W.F.P. to west central Nepal, between 2200 and 3300 m, optimum zone 2700-3000 m. Winters from c. 2000 m down to the foothills (360 m in Kangra, 300 m in Nepal), optimum zone 1200-1800 m. Obtained in winter in Gilgit. In summer affects principally forests of fir, pine, deodar and also mixed conifers and birch, *kharsu* oak (*Quercus semecarpifolia*) and rhododendron. In winter frequents woods and bush-covered hillsides.

Extralimital. The species breeds in southern Siberia from the Russian Altai to Sakhalin Island and in the mountains of western China. Winters in the Indochinese countries and southern China.

MIGRATION. Occurs below c. 2000 m from October to March. Leisurely ascent to breeding grounds takes place from end of March through April.

GENERAL HABITS. Generally keeps high up in trees but occasionally also hunts in undergrowth; usually singly or in pairs, in winter often in mixed foraging parties of tits, tree creepers and other small birds. Exceedingly active and restless. Easily identified from its habit of fluttering and hovering in front of sprigs to pick off insects in the manner of a goldcrest, when the bright yellow rump shows up prominently.

FOOD. Insects and their larvae.

VOICE AND CALLS. Alarm, a twittering note. Call-note, a sharp *tsip* (Bates and others). Also a plaintive *twee* near the nest, and a flat *chi-wee*

160

SYLVIINAE

FIELD CHARACTERS. As in 1594, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Altitudinal migrant, common. Breeds in central and eastern Nepal between c. 2700 and 4200 m. Winters (end of October to mid April) from c. 2000 m down to the foothills. In the breeding season affects chiefly coniferous forest mixed with birch, rhododendron or oak, sometimes either of the preceding in pure stands. In winter frequents woods and jungle-covered hillsides.

GENERAL HABITS AND FOOD. As in 1594.

VOICE AND CALLS. See 1594 and 1596. A frequent call is given as *ut-ut-ut* (GD). Has a feeble but pleasing tinkling song. Period: middle of February (in winter quarters) till end of August (Proud).

MUSEUM DIAGNOSIS. Differs from *simlaensis* in having the underparts a darker yellow, and from *newtoni* in being paler above. Moult of body-feathers noted in March.

MEASUREMENTS

	Wing	Bill (from skull)	Tail
♂♂	48-58	10-11	37-44 mm
♀♀	46-55	—	35-36 mm

Tarsus 17-18 mm (SA)

Weight 5 ♂♂ (May-July) 5.1-6.2; 2 oo? 4.9, 5.3 g (GD). 6 ♂♂ (Nov.-Jan.) 4.8-5.4; 5 ♀♀ (Nov.-Dec.) 4.5-4.9 g (RAP).

COLOURS OF BARE PARTS. Iris dark brown. Bill: upper mandible very dark horny; lower yellowish fleshy with dark horn tip. Legs and feet horny; claws light horny with darker tips; soles light yellow (BB).

1596. **Eastern Pallas's Leaf Warbler.** *Phylloscopus proregulus newtoni* Gätke

Phylloscopus newtoni Gätke, 1889, Ibis: 579 (India = Darjeeling)
Phylloscopus proregulus forresti Rothschild, 1921, Novit. Zool. 26: 45

(Saraj, Punjab Himalaya)

Baker, FBI No. 863 (part), Vol. 2: 463

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 9 cm (3½ in.).

FIELD CHARACTERS. As in 1599, q.v.

STATUS, DISTRIBUTION AND HABITAT. Altitudinal migrant, uncommon and known only from winter quarters. The western Himalayas from Kashmir to Kumaon. Altitudinal distribution and habitat in summer unknown; see 1599 (altitudes given by Ticehurst, 1938, p. 123, are those given by Whistler for the eastern race). Winters from at least 1800 m down to the foothills, chiefly about 1200-1500 m. In this season found mostly in forest.

GENERAL HABITS, FOOD AND VOICE. As in 1599.

BREEDING. Unknown.

MUSEUM DIAGNOSIS. Like *centralis* (1598) but paler, less olive on back. Differs from nominate *maculipennis* (1599) in having the edges of crown paler slate-grey, upperparts brighter, more yellowish olive; underparts paler.

MEASUREMENTS AND COLOURS OF BARE PARTS. As in 1599.

1598. **Central Greyfaced Leaf Warbler.** *Phylloscopus maculipennis centralis* Ripley

COLOURS OF BARE PARTS. Iris brown. Bill black. Legs and feet ♂ brownish yellow, ♀ brownish grey.

1600. **Arctic Leaf Warbler.** *Phylloscopus borealis borealis* (Blasius)

Phylloscopus borealis Blasius, 1853, Naumannia: 313 (Sea of Okhotsk)

Baker, FBI Nos. 872 and 873, Vol. 2: 472

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 12 cm (4½ in.).

FIELD CHARACTERS. A relatively large leaf warbler with a slight single wing-bar, not always present. Above, brownish olive; a yellowish supercilium and a dark streak through eye; sides of head mottled yellowish and dusky. Below, dull white with a little amount of pale yellow, breast often mottled dull grey. Sexes alike.

Distinctive call-note (q.v.) when once learnt is best guide to identification.

STATUS, DISTRIBUTION AND HABITAT. Two winter records from the Andaman Islands. Frequents mangrove swamps and mango groves.

Extralimital. The species breeds in northern Eurasia from Finland and Anadyr and also Alaska, south in the mountains to Mongolia. Winters in the southern Indochinese countries, Malaysia, Indonesia, the Philippines and Formosa.

MIGRATION. Arrives in its winter quarters in September, leaves in April. Performs one of the longest migrations among the phylloscopi, the farthest distance between known points of breeding and wintering being over 10,500 km (CBT).

GENERAL HABITS. Solitary. Usually keeps to trees and high bushes.

FOOD. Insects.

VOICE AND CALLS. A loud *teeet ee* or *de-deet* unlike any other leaf warbler, and a hard *zit* or *chik*.

MUSEUM DIAGNOSIS. See Key to the Species. For details of plumages and wing-formula see Ticehurst (1938) or Williamson (1962).

162

SYLVIINAE

FIELD CHARACTERS. As in 1599, q.v.

STATUS, DISTRIBUTION AND HABITAT. Altitudinal migrant. Western and central Nepal. Vertical distribution and habitat as in 1599.

GENERAL HABITS, FOOD AND VOICE. As in 1599.

BREEDING. Unknown.

MUSEUM DIAGNOSIS. Differs from nominate *maculipennis* in being lighter, more yellowish olive on upperparts with the crown a lighter shade of iron-grey. Underparts paler yellow. Differs from *virens* in being darker, more olive on back (less yellowish olive) and darker, more fuscous on the crown.

MEASUREMENTS AND COLOURS OF BARE PARTS. As in 1599.

Weight (Nov.-Dec.) 5 ♂ ♂ 5-3-5-7; 2 ♀ ♀ 4-7, 4-9 g (RAP).

1599. **Eastern Greyfaced Leaf Warbler.** *Phylloscopus maculipennis maculipennis* (Blyth)

Abornis maculipennis Blyth, 1867, Ibis: 27 (Nepal, restricted to Ilam District, eastern Nepal, by Ripley, 1950, Proc. Biol. Soc. Washington 63: 106)

Phylloscopus maculipennis papilio Koelz, 1952, Jour. Zool. Soc. India 4: 42

(Mawphlang, Khasi Hills)

Baker, FBI No. 863 (part), Vol. 2: 463

Plate 86, fig. 16

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 9 cm (3½ in.).

FIELD CHARACTERS. Two conspicuous yellow wing-bars. Above, head brownish grey with an interrupted whitish median coronal stripe, a long well-defined whitish supercilium, and a dark stripe through eye. Cheeks mottled whitish and grey. Back olive-green, rump yellow. Inner web of outer rectrices white. Below, throat and breast grey; rest of underparts yellow. Sexes alike.

Small size, grey head and throat, yellow rump, double wing-bar, and white in tail make this species unmistakable.

STATUS, DISTRIBUTION AND HABITAT. Resident, subject to vertical movements, rather sparsely distributed. Breeds from eastern Nepal through Darjeeling, Sikkim, Bhutan and Arunachal Pradesh. Probably breeds also in the hills south of the Brahmaputra (recorded as common by Baker) and in Nagaland (Ripley, 1958), since the species breeds in the Chin Hills and south to Mt Victoria. Found in summer between 2500 and 3400 m, optimum zone 2900-3200 m, in open mixed forest of oak and rhododendron or conifers and rhododendron, or mixed deciduous, all with plenty of undergrowth. Winters from c. 2900 m down to the foothills, mostly between c. 1400 and 2300 m, in broad-leaved, chiefly oak forests, and secondary scrub.

Extralimital. Breeds also in the mountains of Szechuan and Yunnan to northern Vietnam. A vertical migrant in its entire range.

GENERAL HABITS. A very active and restless species haunting mostly medium-sized trees though sometimes may ascend to great heights; also frequents bushes in forest, especially in winter. Usually single in summer, often in itinerant hunting parties, mixed or by themselves in winter. Flicks wings and white-margined tail as it hops about or flutters and hovers in front of springs or blossoms for insects.

164

SYLVIINAE

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♀	60-70	13-15	18-21	40-50 mm (Williamson)

Weight 45 ♂ ♂ 9-15 (av. 11); 25 ♀ ♀ 8-13 (av. 10) g — Shaw in Williamson.

COLOURS OF BARE PARTS. Iris hazel to dark brown. Bill: upper mandible dark brown with yellowish tomentum, lower mandible orange-yellow (adult) to pale brown or yellowish flesh, dark on underside towards tip (first winter); mouth orange (adult). Legs and feet pale or yellowish brown, often with greyish tinge in front (Williamson & Davis).

1601. **Largebilled Leaf Warbler.** *Phylloscopus magnirostris* Blyth

Phylloscopus magnirostris Blyth, 1843, Jour. Asiat. Soc. Bengal 12: 966

(Calcutta)

Baker, FBI No. 878, Vol. 2: 476

Plate 86, fig. 22

LOCAL NAMES. *Deru* (Kohat); *Viri tirir* (Kashmir).

SIZE. Sparrow — ; length c. 12 cm (4½ in.).

FIELD CHARACTERS. The largest of all Indian leaf warblers; with a single very faint wing-bar. Above, brownish olive; a prominent yellowish supercilium and a dark streak through eye; cheeks mottled yellowish and dusky. Below, yellowish white sullied with grey on breast and throat. Sexes alike.

Very similar to Arctic Leaf Warbler (1600) but the two not likely to be found together. Very similar also to Greenish and Bright Green leaf warblers (1604, 1605). Best distinguished by their call-notes (qq.v.).

STATUS, DISTRIBUTION AND HABITAT. Fairly common summer (breeding) visitor to the Himalayas from N.W.F.P. (Safed Koh) east through Bhutan, and presumably Arunachal Pradesh. Breeds between 1800 and 3600 m, mostly above 2100 m. Winter range not satisfactorily known: recorded in Kerala (Sálim Ali, JBNHS 38: 493, Ferguson, JBNHS 15: 458; also Bourdillon and Davison), Mysore (Sálim Ali, JBNHS 43: 576), Belgaum (Butler, SF 9: 408), Londa (Koelz, JBNHS 43: 19), Tamil Nadu (Nichols, JBNHS 44: 400, Koelz, JBNHS 47: 135), Nellore (Jerdon), Nagpur (D'Abreu, *Rev. Nagpur Mus.*, No. 3, 1923), Manipur (Hume, SF 11: 218) and Mishmi Hills (Ali & Ripley, JBNHS 48: 31). All other data from the Indian Peninsula and Assam are in September, October, April and May and could be passage records. Said to be rare in all the above-mentioned localities except in the hills of Kerala (up to at least 1200 m) where it has been found to be common locally. Also winters throughout Ceylon where moderately plentiful in all zones (Phillips, 1953) and in the Andaman Islands (North Andaman, Hume collection; South Andaman, Wimberley and Davison & Hume specimens in British Mus.). Recorded commonly on passage in the Himalayan foothills, in the Peninsula (but not west of U.P. and M.P.), and in Bangladesh and Assam. In summer affects birches or other deciduous trees, or mixed rhododendron and firs in ravines or on their

Phylloscopus magnirostris

▨ Breeding
▤ Known winter range
x Isolated winter records

sides, almost invariably in the vicinity of torrential streams. In winter chiefly favours evergreen forest in sholas.

Extralimital. Breeds also in the mountains of western China north to Kansu. Winter range abroad little known. Said to winter at lower altitudes near breeding range; probably in the Indochinese countries as it has been recorded on passage in Tenasserim.

MIGRATION to summer grounds occurs from May to September. Downward movement begins after breeding as large numbers appear in the Nepal Valley in August. Passage in the Peninsula takes place from the end of August to October; recorded in winter quarters from October to May. Spring passage April to mid May.

GENERAL HABITS. Usually keeps singly to the crowns of medium-sized trees and lower canopy of taller ones. Unobtrusive and difficult to observe, but easily detected by its call and song.

FOOD. Insects.

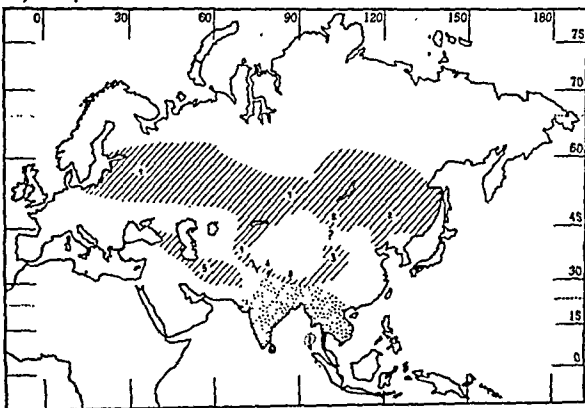

VOICE AND CALLS. Call-note, an unmistakable interrogative *dee-tee?* or *wee-chi?* second note much higher than first (various observers). This, in more agitated tone, is also the alarm-note in summer, e.g. when nest approached by intruder. In winter, a three-noted whistle on an ascending scale *yaw-wee-uee* likened to the song of the Orangebreasted Blue Flycatcher [*Muscicapa tickelliae*, 1443] (Henry, Ceylon). Song, a very distinctive, clear, five-noted silver bell-like *see, si-si, si-si* on three descending tones, with occasional variations (BBO, Alexander); reminiscent of ditty of *Rhipidura*

FIELD CHARACTERS. A single faint wing-bar. *Above*, dull greenish; a well-marked yellowish supercilium and a dark streak through eye; cheeks mottled olive and yellowish. *Below*, sullied yellowish white. Sexes alike.

Indistinguishable in the field from *P. t. nitidus* (1605) which however is greener above and yellower below, and has a better marked yellow wing-bar. *P. magnirostris* has a distinctive song and call-note.

STATUS, DISTRIBUTION AND HABITAT. Common summer (breeding) visitor to the western Himalayas from Gilgit and Kohat east through the Murree hills and Kashmir south of the main range, from 2700 to 3700 m. Winters from the Nepal and Sikkim foothills south throughout the Peninsula east to the Brahmaputra-Ganges rivers in Bangladesh, west to central Uttar Pradesh and western Madhya Pradesh, south to southern Kerala. Also

Phylloscopus trochiloides

▨ Breeding
▤ Winter (all subspecies)
1 *viridanus* (1602). 2 *plumbeitarsus* (RE). 3 *trochiloides* (1604).
4 *ludlowi* (1603). 5 *nitidus* (1605).

Ceylon where rare (Phillips). In Nepal up to c. 1800 m, in Kerala up to the summits of the hills but most common between c. 600 and 900 m. In summer affects willow, tamarisk and poplar groves (Gilgit, Kashmir) and mixed fir and deciduous forest (Turkistan). In winter frequents gardens, orchards, wooded compounds, lowland acacia groves, open deciduous and, to a lesser extent, evergreen jungle.

Extralimital. Breeds in Turkistan north to the Altai, thence west to the Baltic Sea. Other subspecies in eastern Siberia and western China. *P. t. nitidus* breeds in northern Iran and in the Caucasus Mountains. The species winters in India and the Indochinese countries.

albicollis, 1455 (SA). Song period, mid April till end of August (Proud). May also be heard in September while on migration, and occasionally in winter quarters.

BREEDING. Season, June to August. *Nest*, roughly domed, made of grass stems, moss, dead leaves, ferns and lichen, lined with fine grass; placed under a fallen log or rock, in hollows or crevices, under an overhanging bank or among the tangled roots of a fallen tree, often overhanging a stream. *Eggs*, usually 4, sometimes 5 or 3, white, unspotted. Average size of 50 eggs 18.2 × 13.2 mm (Baker); of 9 eggs 18.5 × 13.6 mm (BBO). Sometimes brood-parasitized by *Cuculus saturatus* (Currie, JBNHS 24: 594).

1602. Western Greenish Leaf Warbler. *Phylloscopus trochiloides viridanus* Blyth

Phylloscopus viridanus Blyth, 1843, Jour. Asiat. Soc. Bengal 12: 967 (Calcutta)

Baker, FBI No. 875, Vol. 2: 474

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 10 cm (4 in.).

MIGRATION. Found on its breeding grounds from April to September; on autumn passage from end of August to October. On winter grounds from October to May; spring migration, March to May.

GENERAL HABITS. Usually met with singly, sometimes among mixed foraging parties of small insectivorous birds, feeding mostly in the foliage canopy but also in undergrowth, bustling energetically among leaves and blossoms, clinging to sprigs upside down, nervously flicking wings, and at times launching into the air to seize a midge like a flycatcher.

FOOD. Insects, including small beetles and caterpillars.

VOICE AND CALLS. Call-note while foraging a characteristic squeaky *chiwee* or *si-chiwee* (sometimes *si-si-chiwee*) repeated every few seconds. Identical with call of *P. t. nitidus* (1605) and likewise indistinguishable from that of *P. inornatus humei* (1590). Song, also heard in the winter quarters prior to spring migration and constantly during passage, a lively high-pitched quick-repeated *chi-chi-chiwee*, *chi-chi-chiwee*... (of about 2 seconds duration) or *chi-chirichi-chiwee*... and variants of this theme (SA). Main song period April till end of July.

BREEDING. Very few authentic records in India. Season, May to August. *Nest*, a ball of moss, lichen, dead leaves and root fibres, lined with fine grass, fine moss, a few hairs and feathers, with a lateral entrance. Placed on sloping ground among roots of trees, or in hollows of rotten trunks up to two metres or so from the ground. *Eggs*, 3 or 4, unspotted white. Average size of 36 eggs 15.3 × 11.9 mm (Baker). Incubation by female only, care of nestlings by both sexes (Dementiev).

MUSEUM DIAGNOSIS. See Key to the Species. For details of plumages, wing-formula and moults see Ticehurst (1938) or Williamson (1962).

♀♀	54-65			{ 42-47 mm

(CBT, Rand & Fleming, HW)

Weight ♂♀ (breeding) 6.5-10.5 (av. 7.9); (winter) 7.9-9.3 (av. 7.8) g — CBT. 25 ♂♂ (October, S. India) 8-14 (av. 9.5) g — SA.

Average of 10 autumn migrants 7.4 g (Williamson).

COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible brown, lower pale flesh or pale yellow. Legs and feet greyish or greenish brown; soles lemon-yellow.

1603. Baltistan Greenish Leaf Warbler. *Phylloscopus trochiloides ludlowi* Whistler

Phylloscopus trochiloides ludlowi Whistler, 1931, Bull. Brit. Orn. Cl. 52: 62 (Maran River, near Kishtwar)

Baker, FBI No. 875 (part), Vol. 2: 474

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in 1602, q.v.

WARBLERS

169

STATUS, DISTRIBUTION and HABITAT. Summer (breeding) visitor to Baltistan intergrading with *viridanus* in Gilgit and Kashmir, and with *trochiloides* in Garhwal and Kumaon. Vertical distribution and habitat as in 1602. Winters in the Peninsula: Etawah, Fatehgarh (U.P.), Ahmednagar (Maharashtra), Wynaad (Kerala), the Nilgiris and in the Eastern Ghats (Andhra Pradesh).

GENERAL HABITS, FOOD and VOICE. As in 1602.

BREEDING. As in 1602.

MUSEUM DIAGNOSIS. Like *viridanus* but slightly greyer above and a little larger. Paler and greyer above than *trochiloides* with less greyish wash below.

MEASUREMENTS

Acanthiza trochiloides Sundevall, 1838, Fysiogr. Sällskap. Tidskr. Lund 1: 76 (Calcutta)

Baker, FBI No. 875 (part), Vol. 2: 474

Plate 85, fig. 10

LOCAL NAME. *Inruite* (Kacha Naga).

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in 1602, q.v.

STATUS, DISTRIBUTION and HABITAT. Abundant summer (breeding) visitor to the Himalayas from Garhwal and Kumaon to Arunachal Pradesh, between 2900 and 4200 m, optimum zone 3500-4000 m, wandering up to 4600 m after the breeding season. Also breeds in Nagaland and North Cachar at c. 1800 m (Baker, *Nidification* 2: 425). Winters from the Himalayas (up to c. 2200 m) south to lower Bengal (but apparently not south of the Gangetic Plain) and throughout Bangladesh and Assam. Also Andaman Islands. Has straggled to Wynaad and Ceylon. In summer affects subalpine mixed forest of fir, birch, rhododendron or juniper as well as pure stands of birch or conifers; also haunts bush jungle with isolated trees; occasionally met with in the scrub zone above timber-line, but does not appear to breed in this biotope. In winter frequents various types of mixed forest and open cultivated country.

Extralimital. Breeds also in the mountains of western China and winters east through the Indochinese countries. For range of the species see under 1602.

MIGRATION to breeding ground occurs from April to September; passage at lower elevations mostly in September and April.

GENERAL HABITS, FOOD and VOICE. As in 1602.

WARBLERS

171

MIGRATION. Recorded in winter quarters from October to April. Autumn passage from August through October. Spring migration from end of March till end of May; the last of the migrating leaf warblers to be seen in Kohat (Whitehead, *Ibis* 1909: 125). Abundant during spring migration in the lower Himalayas east to Sikkim, but appears to avoid this region in autumn when passage is chiefly recorded from Punjab to Sind.

GENERAL HABITS and FOOD. As in 1602. In winter quarters reported (this or *magnirostris*?) roosting individually at night under leaves, e.g. of papaya trees (*Carica papaya*)—Pillay, N. G., JBNHS 57: 659.

VOICE and CALLS. Call-note indistinguishable from that of *viridanus* (SA, Proud). A common call in Ceylon is given as *thirrip* (Henry). Song claimed to be recognizable (Proud); for rendition see under 1602.

BREEDING. As in 1602.

MUSEUM DIAGNOSIS. Differs from *viridanus* in being a brighter green above and distinctly yellow below. *Contra* Ticehurst (1938: 155) intergrades do occur (specimens examined U.S. Nat. Mus.). For details of plumages, wing-formula and moults see Ticehurst (1938) or Williamson (1962).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	58-68	12-14	18-20	45-51 mm
♀♀	58-64			43-47 mm
				(BB, HW)

Weight 3 ♂♂ 7.2-7.5; 1 ♀ 6.5 g (Dementiev).

COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible brown, lower yellowish brown. Legs and feet greyish brown (variable).

1605a. Palelegged Leaf Warbler. *Phylloscopus tenellipes* Swinhoe

Phylloscopus tenellipes Swinhoe, 1860, *Ibis*: 53 (Amoy, SE. China)

Baker, FBI No. 879, Vol. 2: 477

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. Two faint wing-bars. *Above*, olive-brown, more rusty on rump, darker on rump and crown. A conspicuous buff supercilium and a dark streak through eye; a broken eye-ring. Sides of head mottled buff and dusky. *Below*, dull white, flanks washed with brownish. Sexes alike. Very similar to *P. fuscatus* (1586) but distinguished by presence of wing-bars and pale-coloured legs.

STATUS, DISTRIBUTION and HABITAT. Possible winter visitor: a migrant was taken on a boat 10 miles east of Great Nicobar (*Proc. U.S. Nat. Mus.* 25: 291; see also JBNHS 64: 186). Affects deciduous forest.

Extralimital. Breeds in Japan, Sakhalin and the Ussuri region. Winters in the Indochinese countries.

GENERAL HABITS. Frequents undergrowth and lower branches of trees.

FOOD. Insects.

VOICE and CALLS. Call-note, a distinct *tik-tik*.

MUSEUM DIAGNOSIS. See Key to the Species and Field Characters. For details of plumage and wing-formula see Ticehurst (1938) or Williamson (1962).

170

SYLVIINAE

BREEDING. As in 1602. Six eggs measure 15.5-15.6 × 11.7-12.5 mm (Baker, Ludlow).

Wing, × c. 1

MUSEUM DIAGNOSIS. Differs from *viridanus* in wing-formula: 2nd primary is usually shorter than 8th, mostly between 9/10 or = 10th, while in *viridanus* it is often longer than 8th, usually between 7/8. For details of plumages and moults see Ticehurst (1938) or Williamson (1962).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	62-68	12-14	18-20	50-57 mm
♀♀	55-62			45-52 mm
				(CBT, BB)

Weight 13 ♂♂ (May-Aug.) 8.8-9.2 ♂♂ (Sept.) 9.4, 9.8 g; 14 ♀♀ (May-Aug.) 7.9-10.3 g (GD). 4 ♂♂ (April) 7.5-8.7, 9 ♀♀ (April) 6.8-7.9 g; 13 ♂♂ (July) 8.9-9.5, 14 ♀♀ (July) 7.3-9.5 g (RAP).

COLOURS OF BARE PARTS. Iris hazel brown. Bill dark brown, yellow to orange at base of lower mandible; mouth yellow. Legs and feet yellowish brown to greenish brown.

1605. Bright Green Leaf Warbler. *Phylloscopus trochiloides nitidus* Blyth

Ph. (ylloscopus) nitidus Blyth, 1843, Jour. Asiat. Soc. Bengal 12: 965 (vicinity of Calcutta)

Baker, FBI No. 874, Vol. 2: 473

Plate 86, fig. 21

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in *viridanus* (1602) but underparts distinctly yellow. Probably not distinguishable in worn winter plumage. Call-notes of the two identical.

STATUS, DISTRIBUTION and HABITAT. Winter visitor to southern India (Kerala, where common, Tamil Nadu and probably the Eastern Ghats) and Ceylon where common in all zones. On passage throughout the Peninsula east to Bengal and in Pakistan (Sind, northern Baluchistan and the western Himalayas) up to at least 2400 m. Probably nests near Quetta (Williams, JBNHS 33: 601; record unsubstantiated but description of nest and eggs clearly applies to either *nitidus* or *viridanus*. The occurrence of *nitidus* at Fort Munro as early as 27 July [Waite, JBNHS 37: 690] may also be an indication of breeding not far away). In winter affects heavy forest as well as gardens, orchards or other cultivation. In summer affects mixed forest at the upper limit of trees.

Extralimital. Breeds in the mountains of northern Afghanistan, central and northern Iran west to the Caucasus Mts.

Under tail-coverts yellow, contrasting with belly.....*P. o. coronatus*

1606. Large Crowned Leaf Warbler. *Phylloscopus occipitalis occipitalis* (Blyth)

Ph. (yllopneuste) occipitalis Blyth, 1845, Jour. Asiat. Soc. Bengal 14: 593 (Southern India)

Baker, FBI No. 881, Vol. 2: 479

Plate 86, fig. 18

LOCAL NAME. *Viri tiriv* (Kashmir).

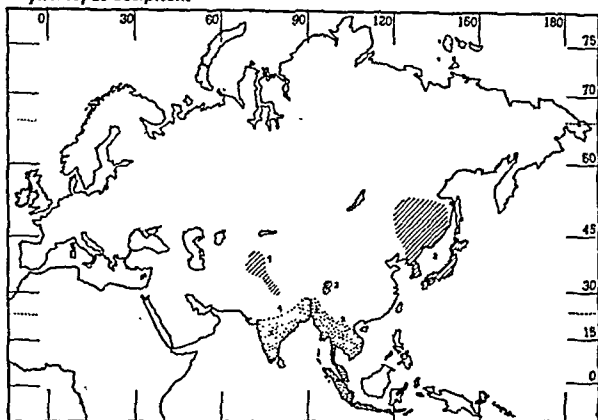

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. Two wing-bars of which only one noticeable. *Above*, light greyish olive; wings more yellowish; shoulders yellow. A pale median coronal stripe with a broad, dusky olive band on either side, blackish on nape. A conspicuous pale yellow supercilium, a dark line through eye. Cheeks pale yellow. *Below*, whitish tinged greyish on breast and flanks, slightly streaked with yellow on breast and belly. Sexes alike. Orange at base of lower mandible is a distinctive character.

STATUS, DISTRIBUTION and HABITAT. Abundant summer (breeding) visitor to the western Himalayas: Kohat dist. (N.W.F.P.) and Baltistan east to Garhwal and Kumaon; from c. 1800 to 3200 m. Breeds abundantly in Kashmir. Winters in the Peninsula from southern Gujarat (Surat Dangs) and northwestern Maharashtra (Dhulia), Madhya Pradesh (Raipur) and the Eastern Ghats (Vishakhapatnam) south to the southernmost hills; more common on the western side of the Peninsula. Appears to keep mostly to the hills, up to at least 2100 m. All records north of a line Dhulia-Raipur (c. 21°N.) are from October to April. Listed as winter visitor to Bangladesh west of the Brahmaputra-Ganges by Rashid, 1967. Recorded on passage at Lahore, and in Rajasthan and Gujarat; east to central Nepal and eastern Bihar (Madhupur). In summer affects willow groves, deciduous or mixed conifer-deciduous forest; in winter mostly moist-deciduous and evergreen biotope.

Extralimital. Breeds also in northwest Afghanistan and north to Uzbekistan. Also Ussuriland (see 1607).

MIGRATION. Found on summer grounds from end of March till September; autumn passage in September and October. May be seen in the Peninsula (M.P.) as early as August. Records from Rajasthan on 22 July

Phylloscopus occipitalis

Distributional ranges

▨ Breeding

▨ Winter

1 *occipitalis* (1606). 2 *coronatus* (1607).

are exceptional. In winter quarters from October to April; spring passage third week of March to early May.

GENERAL HABITS. Keeps singly or in pairs in the breeding season, in parties up to 30 birds in winter, almost invariably in mixed company with flycatchers, titmice, *Zosterops*, *Alcippe poioicephala* and other small birds. A restless leaf warbler, continually flicking its wings and tail as it creeps or flits among branches and shrubs, clinging to twigs to peer under leaves or making short aerial sallies after insects. Hunts mostly in the canopy of moderate-sized trees and higher bushes. Under excitement, as when mobbing a snake or owl, tail spread out and wings drooped at sides.

FOOD. Insects and spiders.

VOICE AND CALLS. Rather noisy. Said to have a wide repertoire of songs. Commonest song is a constantly repeated, cheerful, rapid *chi-wee-chie-wee* etc. (Alexander); also rendered as a squeaky but spirited *chi-chi-chi-chiwee-chiwee-chiwee* (or *ti-ti-tiu-tiu-tiu-tiu*) quickly repeated (SA). A 'monotonous chip-chip-chip-chip' (Magrath) appears to be another rendition of the song rather than a call-note. Song period, third week of March till early August. Alarm-note, *chick-wip* or *chick-weep*; sometimes repeated almost incessantly, maybe for several minutes, at the rate of c. two per second while fussing agitatedly around an intruder near nest (BBO, SA).

BREEDING. Season, May to July. Nest, varying from cup-shaped to completely domed according to situation. Made of moss, leaves and fibres, lined with fur or hair. Usually placed well out of sight, sometimes an arm-length within crevices of walls. Also in holes in trees up to a couple of metres from

WARBLERS

175

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. Resembles *occipitalis* but crown darker, upperparts greener, under tail-coverts yellow contrasting with white belly. For details of plumages, wing-formula and moults see Ticehurst (1938) or Williamson (1962).

MEASUREMENTS

1608. Small Crowned Leaf Warbler. *Phylloscopus reguloides kashmiriensis* Ticehurst

Phylloscopus reguloides kashmiriensis Ticehurst, 1933, Bull. Brit. Orn. Cl. 54: 19 (Simla)

Baker, FBI No. 883 (part), Vol. 2: 481

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 9 cm (3½ in.).

FIELD CHARACTERS. A smaller version of *P. occipitalis* (1606) with the wing-bars better marked, but not readily distinguishable from it in the field. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Uncommon resident and altitudinal migrant. Breeds in the western Himalayas from Murree (Rattray, JBNHS 16: 426) and Kashmir (Brooks, JASB 41: 81; Wilson, JBNHS 12: 636) east to Garhwal, between c. 2400 and 3300 m. Affects rhododendron and oak forest. Winters in the foothills and adjacent plains south and east to Etawah (U.P.), Darbhanga and Dinapore (Bihar). In winter frequents subtropical pine and tal forest.

GENERAL HABITS, FOOD AND VOICE. As in 1609.

BREEDING. Season, May to July. Nest, similar to that of *occipitalis* (1606) but smaller, often placed between stones in walls, sometimes in tree hollows up to a couple of metres above the ground. Eggs, 4 or 5, white, unspotted. Average size of 36 eggs 15.6 × 12.1 mm (Baker). See also 1610.

the ground, hollows in dead stumps, under stones in rocky banks or under roots of trees, in old rat-burrows and sometimes in vertical holes in the forest floor; nests have even been recorded in rafters of cowsheds and in the gable of a bungalow roof. Eggs, normally 4, unspotted white. Average size of 36 eggs 16 × 12.3 mm (BBO), of 50 eggs 16.4 × 12.7 mm (Baker). Both sexes tend the young; share in nest-building and incubation, and period of incubation, not recorded. Often brood-parasitized by *Cuculus saturatus* and *C. poliocephalus* (Rattray).

MUSEUM DIAGNOSIS. See Key to the Species. For details of plumages, wing-formula and moults see Ticehurst (1938) or Williamson (1962).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	59-71	13-15	17-19	45-55 mm
♀♀	56-70			45-55 mm

(Williamson, HW, Koels)

Weight 8 ♂♂ (summer) 8-9 (av. 8.5); 5 ♀♀ (summer) 8-9 (av. 8.4) g — Paludan, Afghanistan.

COLOURS OF BARE PARTS. Iris brown. Bill brown, lower mandible pale orange; mouth pale orange or pale yellow. Legs and feet slaty brown or greyish brown; soles yellow (SA).

1607. Eastern Crowned Leaf Warbler. *Phylloscopus occipitalis coronatus* (Temminck & Schlegel)

Ficedula coronata Temminck & Schlegel, 1847, in Siebold's Fauna Japon., Aves: 48, pl. 18 (Japan)

Phylloscopus occipitalis extimus Koels, 1954, Contrib. Inst. Regional Exploration, No. 1: 16 (Karong, Manipur)

Baker, FBI No. 882, Vol. 2: 480

Plate 86, fig. 19

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in 1606 but has white underparts and bright yellow under tail-coverts. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor to the Sikkim foothills up to c. 2000 m (Meinertzhagen), the Garo, Khasi and Mizo hills, Nagaland and Manipur (Koels, loc. cit.; presumed by collector to be migrants) and the Chittagong ranges of Bangladesh (Rashid). In winter affects deep jungle.

Extralimital. Breeds in Korea, Amurland, Japan and Szechuan (Traylor, M. A., Fieldiana: Zool. 53: 37, 1967). Winters also in the Indochinese countries, Sumatra and Java.

MIGRATION. Arrives in the Malay Peninsula in September, remains till mid April (Robinson).

GENERAL HABITS. In winter very silent and unobtrusive. Keeps to the lower boughs of trees and bushes.

FOOD. Insects.

VOICE AND CALLS. Call-note unrecorded. Song probably not uttered in winter: two repeated short syllables followed by a longer, drawn-out one *djiip-djiip*, *djiip-djiip*, *djee* (Austin & Kuroda).

Phylloscopus reguloides

▨ Breeding ranges

1 *kashmiriensis* (1608). 2 *reguloides* (1609). 3 *assamensis* (1610). 4 *claudiae* (1611). 5 Other races, extralimital.

MUSEUM DIAGNOSIS. Differs from *P. occipitalis* by smaller size, yellowish median coronal stripe, brighter greenish upperparts, broader wing-bars and different wing-formula: 2nd primary usually between 8/9 or equal to 9 while in *occipitalis* it usually falls between 7/8. Differs from *reguloides* (1609) in having the upperparts, edges to wings and coverts a yellowish green; lateral coronal bands less dark, not so conspicuous. Postnuptial moult complete.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♀	57-65	13-14	16-17	42-48 mm

(CUT)

COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible dark brown; lower and edge of gape orange-yellow. Legs and feet bluish green to greenish yellow.

WARBLERS

177

1609. Blyth's Crowned Leaf Warbler. *Phylloscopus reguloides reguloides* (Blyth)*Phylloscopus reguloides* Blyth, 1842, Jour. Asiat. Soc. Bengal 11: 191 (Darjeeling)

Baker, FBI No. 883 (part), Vol. 2: 481

Plate 86, fig. 20

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 9 cm (3½ in.).

FIELD CHARACTERS. Similar to *occipitalis* (1606) but smaller.

STATUS, DISTRIBUTION and HABITAT. Resident and altitudinal migrant, fairly common. Breeds in the Himalayas from Kumaon to eastern Bhutan, between 2000 and 3500 m, optimum zone 2500–3000 m. Affects forests of oak, rhododendron and conifers, mixed or in pure stands. Winters in the foothills from c. 1500 m downwards, and adjacent plains to northern Bangladesh and upper Assam; two records from Burma (Bhamo and northern Tenasserim). In winter frequents bushes in forest, forest edges and bush country with isolated trees.

MIGRATION. Arrives on its summer grounds in early March, leaves in August.

GENERAL HABITS. In the breeding season usually met singly or in pairs: in winter often in the mixed foraging parties of small insectivorous birds. Hunts in tree canopy as well as in bushes.

FOOD. Chiefly insects; berries also recorded (GD).

VOICE and CALLS. Call-note *kee-ku-i* constantly repeated (HGA). Song rendered as *ziwizi wizi wit* and said to recall that of the Coal Tit (*Parus ater*, 1803—GD); also described as a distinctive trill of nine to ten notes *chi-ti-chi-ti-chi-ti-chi-ti-chee* (Proud). No direct comparison with song of *occipitalis* available. See also 1610. Song period mid March till end of August (Proud).

BREEDING. As in 1608. One nest is described as cup-shaped, made of moss and placed in a hole in the ground, 60 cm from the entrance. The three eggs measured 17 × 12, 16 × 12, 17 × 12 mm (Ludlow). See also 1610.

MUSEUM DIAGNOSIS. See 1608. Differs from *assamensis* (1610) by restricted amount of white (2 mm wide) on inner webs of the two outer rectrices (v. 2–4 mm in *assamensis*) and slightly brighter upperparts. Intergrades with *kashmiriensis* in Kumaon and with *assamensis* in Bhutan. For details of plumage see Ticehurst (1938) or Williamson (1962). Postnuptial moult complete from July to early September. Prenuptial moult of body-feathers in February and March.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible dark brown, lower yellow. Legs and feet pale yellowish plumbeous.

WARBLERS

179

STATUS, DISTRIBUTION and HABITAT. Winter visitor to the Khasi Hills and Manipur.

EXTRALIMITAL. Breeds in the mountains of Yunnan and Szechuan. Another subspecies in Fukien. Winters at lower elevations and at short distance from breeding area.

GENERAL HABITS, FOOD and VOICE. Probably those of the species (1609 and 1610).

BREEDING. Probably as in 1610.

MUSEUM DIAGNOSIS. Resembles *assamensis* but upperparts slightly brighter, not so yellowish green. Cheeks and median coronal stripe greyer yellow and paler. Underparts whiter, yellow confined to streaks on breast. Two outer rectrices only very narrowly and sharply edged with white. For wing-formula see Ticehurst, 1938.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	60–67	12–13	17–18	45–49 mm
♀♀	57–62			43–47 mm (CBT)

(Borabhum and Dolbhum)

Baker, FBI No. 895, Vol. 2: 492

Plate 86, fig. 17

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 9 cm (3½ in.).

FIELD CHARACTERS. A double yellow wing-bar, the lower one distinct. Above, olive-green. Two black coronal bands with a yellowish green median stripe, and a conspicuous yellow supercilium; sides of head bright yellow. Below, throat and under tail-coverts bright yellow, belly whitish. Sexes alike.

Combination of above characters identifies the species.

STATUS, DISTRIBUTION and HABITAT. Little recorded. Known to breed in North Cachar between 1200 and 1800 m (Baker, *Ibis* 1906: 262) and probably Manipur (Hume, SF 11: 221, 225). Specimens taken in the Chittagong Hill Tracts, February–March (R. A. Paynter) where, according to Rashid, it is a resident. Collected in Sikkim at c. 1000 m in March (Stevens, JBNHS 29: 1026) and at c. 2000 m in June (Schäfer *vide* Salim Ali, 1962); may be expected in the lower hills of Bhutan and Arunachal Pradesh. More widespread in winter when recorded in all parts of eastern Bengal (Rashid), Assam, the Jalpaiguri duars, Bhutan foothills, extreme eastern Nepal (Fleming & Traylor, *Fieldiana* 53: 181, 1968) and lower Bengal (type locality). In summer affects dense evergreen forest; in winter more open, deciduous and mixed forest.

EXTRALIMITAL. Extends east to Vietnam, Hainan and Fukien (*ricketti*).

GENERAL HABITS. Sociable in winter when often found in the roving mixed foraging parties of small birds. Hunts in the lower branches of trees,

SYLVIINAE

1610. Assam Crowned Leaf Warbler. *Phylloscopus reguloides assamensis* Hartert

Phylloscopus trochiloides assamensis Hartert, 1921, Vög. pal. Fauna (3): 2139, new name for *Acanthopneuste trochiloides harterti* Baker, 1913, Bull. Brit. Orn. Cl. 31: 36 (Peak near Shillong, Khasia Hills) *nee* *Phylloscopus bonelli harterti* Zedlitz, 1912 *Phylloscopus reguloides terpsinus* Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 16 (Blue Mountain, Lushai Hills) Baker, FBI No. 884, Vol. 2: 481

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 9 cm (3½ in.).

FIELD CHARACTERS. As in 1608, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Resident and altitudinal migrant, fairly common. Breeds in Arunachal Pradesh and the hills south of the Brahmaputra (cf. Koelz, loc. cit.), Nagaland and Manipur. In the Himalayas breeds between c. 2400 and 3600 m; for habitat see 1609. In the Khasi Hills above c. 1400 m in evergreen wet forest and mixed broad-leaved and pine forest (on Mt Victoria between 2000 and 3000 m). Winters from c. 2200 m (Nagaland) down to the foothills and adjacent plains west to Sikkim and south to the Chittagong region in Bangladesh. In winter may be seen in light scrub and pastureland with low second growth.

GENERAL HABITS and FOOD. As in 1609.

VOICE and CALLS. Has some 'cheep' call-notes. Alarm-notes *chee-pit* or *zip-ye*. Song rendered as *pit-chew-a-pit-chew-a-pit-chew-a*, the notes slurred into each other to produce a continuous undulating wave of sound (Smythies). Also given as *tschitschui* . . . *tschitschui* — *tschitschui*, recalling the song of *P. trochiloides* (Heinrich).

BREEDING. Season, end of April to June. Nest, a well-built ball of green moss, sometimes a few scraps of dead leaves or lichen being added, lined with soft vegetable down, occasionally with feathers. Placed in hollows on banks covered with moss, weeds and ferns; sometimes in holes in trees or rotten stumps. Eggs, 4 or 5, unspotted white. Average size of 50 eggs 15.3 × 11.9 mm (Baker). Building and incubation by both sexes though female has greater share. Brood-parasitized by *Cuculus saturatus* and *C. poliocephalus*.

MUSEUM DIAGNOSIS. For distinguishing from *reguloides* and *claudiae* see 1609 and 1611.

MEASUREMENTS and COLOURS OF BARE PARTS. As in 1609.

Weight 1 ♂ (March) 7 g (RAP).

1611. Yunnan Crowned Leaf Warbler. *Phylloscopus reguloides claudiae* (La Touche)*Acanthopneuste trochiloides claudiae* La Touche, 1922, Bull. Brit. Orn. Cl. 43: 22

(Mengt, Yunnan)

Baker, FBI No. 886, Vol. 2: 483

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 9 cm (3½ in.).

FIELD CHARACTERS. As in 1603, q.v.

180

SYLVIINAE

in bushes and bamboo clumps. Spreads tail and flicks it upwards. Makes short sallies after winged insects.

FOOD. Insects.

VOICE and CALLS. Call-note, a loud and incessant *pio, pio* . . . (CBT). Song undescribed.

BREEDING. Season, end of April to June. Nest, a little ball of green moss thickly lined with soft vegetable down; placed on the ground, generally at the foot of trees, half buried among fallen leaves, or in hollows in banks, concealed in moss, weeds or other cover. Eggs, 3 or 4, unspotted white. Average size of 50 eggs 14.5 × 11.9 mm (Baker). Building of nest and incubation by both sexes. Incubation period unrecorded.

MUSEUM DIAGNOSIS. See Field Characters; for details of plumage and wing-formula Ticehurst (1938) or Williamson (1962). First-winter birds have duller upperparts, and paler yellowish white underparts. Apparently a complete moult in July.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♀	50–57	12–13	17–18	35–43 mm (Williamson)

Weight 1 ♂ 7; 2 ♀♀ 5, 6 g (SA).

COLOURS OF BARE PARTS. Iris hazel to dark brown. Bill: upper mandible brown, lower yellow. Legs and feet fleshy yellow to pale yellow.

Genus SEICERCUS Swainson

Seicercus Swainson, 1837, Clasif. Bds. 2: 84, 259.Type, by monotypy, *Sylvia Burkii* Burton

Bill broad and blunt, about half the length of the head. Rictal bristles greatly developed, in some cases reaching almost to the tip of the bill. Wing rather rounded, first primary (as) small, second and third graduated.

Plate 87, fig. 5

LOCAL NAME. *Inshush-gat* (Kacha Nag).

SIZE. Sparrow —; length c. 10 cm (4 in.).

WARBLERS

181

FIELD CHARACTERS. A yellow wing-bar. Above, crown striped grey and black; sides of head yellow; a conspicuous but incomplete white eye-ring. Rest of upperparts olive-green; inner webs of outer rectrices white. Below, bright yellow. Sexes alike.

S. burkii has a complete, yellow eye-ring and lacks the wing-bar. Easily confused with *S. poliopterus* but which has the grey of head descending below the eye.

STATUS, DISTRIBUTION and HABITAT. Resident, subject to altitudinal movements. The eastern Himalayas from eastern Nepal (not recorded thence since Hodgson's days), Darjeeling, Sikkim, Bhutan and Arunachal Pradesh from c. 2300 m (summer) to the foothills (winter). Also the hills south of the Brahmaputra, Nagaland and Manipur, breeding above 1400 m, descending to the foothills and adjacent plains in winter. Affects dense, humid evergreen or pine forest.

Extralimital. Extends east to Vietnam and Fukien.

GENERAL HABITS. Very similar to the leaf warblers (*Phylloscopus*). Hunts mostly in the foliage of shrubs and undergrowth in deep forest, often catching insects on the wing. Flits tirelessly, flicking wings nervously, often fluttering and hovering in front of sprigs and blossoms to pick insects. In winter usually met with in the mixed itinerant foraging parties.

Display. Fluffs out feathers and spreads tail and wings while cowering low down on a branch close to the female, then springing erect and bursting into song.

FOOD. Insects.

VOICE and CALLS. Call-note, a sharp *che-wheel* like that of *S. burkii* (Stanford). Song not satisfactorily described.

BREEDING. Season, April to June. Nest, a well-made ball of green moss with rootlets and a few leaves incorporated, with a first inside layer of rootlets, a layer of fine moss compactly woven, and a final lining of soft vegetable down; placed in hollows or in dense moss on steep banks, occasionally in holes in dead trees. Eggs, 4 or 5, unspotted white. Average size of 30 eggs 15.4 × 12.4 mm (Baker). Building and incubation by both sexes; incubation period unrecorded.

MUSEUM DIAGNOSIS. See Field Characters; for details of plumage Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♀	50-58	11-13	17-19	38-49 mm (SA, BB)

Weight 6 ♂♂ (winter) 6-8 g (SDR, SA).

COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible dark brown, lower yellow. Legs and feet yellow.

Baker, FBI No. 889 (part), Vol. 2: 487

Plate 87, fig. 2

LOCAL NAME. *Inshushia-gaaba* (Kacha Naga).

SIZE. Sparrow — ; length c. 10 cm (4 in.).

FIELD CHARACTERS. No wing-bar. Above, olive-green including supercilium and sides of head. Two black stripes on crown. A conspicuous, complete, yellow eye-ring. Below, deep yellow. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Common summer visitor (except in the lower zone where summer and winter ranges overlap). The Himalayas from western Nepal through Darjeeling, Sikkim, Bhutan and Arunachal Pradesh, thence south through the Patkai Range, Meghalaya, Nagaland, Manipur and the Mizo hills. Breeds between c. 2000 and 3700 m, mostly above 2400 m (also on the northern slopes of the Himalayan ranges) and above c. 1000 m in the hills south of the Brahmaputra. Winters (October to April) from c. 2100 m (lower during cold weather) down to the foothills and in the plains south to lower Bengal, Orissa (Koelz, SA) and the Chittagong region.¹ Affects the upper evergreen forest of oak, rhododendron and birch as well as mixed coniferous and deciduous forest.

Extralimital. Extends east through southern China and the northern Indochinese countries.

GENERAL HABITS. Haunts low undergrowth and the middle story in forest, rarely ascending into the canopy. In non-breeding season often met in small parties or among the roving mixed flocks of flycatchers, warblers, minias and other small babblers, etc. Actions and behaviour typically phylloscopine (SA).

FOOD. Insects.

VOICE and CALLS. As in 1614. Song period, end of March till at least end of July (Proud).

BREEDING. Season, early May to July (Himalayas), early April through June (Assam). Nest, a ball of moss, grass, bark fibres, bamboo leaves, dry pine needles or rootlets, neatly lined with fine moss and lichen; placed on sloping ground or among roots of fallen trees, usually well concealed in moss or weeds. Eggs, normally 4, unspotted white. A clutch of 7 found by Ludlow might be the laying of two females. Average size of 40 eggs 16.1 × 12.3 mm

¹ However, see 1615a.

▨ *burkii* (1615).

□ Winter

foothills and in the Peninsula as far as northern Maharashtra (Chikaldia, Kamptee) and northeastern Andhra Pradesh (Sankrametta). Affects dense deciduous or mixed forest.

MIGRATION. Passage at mid-elevations takes place mostly in April-May and in October.

GENERAL HABITS and FOOD. As in 1615.

VOICE and CALLS. Call-notes rendered as *pillip* or *wre-up* and a single sharp *chiw* uttered every few seconds while foraging. A fine song of loud, clear notes resembling the trill of a canary (A. E. Osmaston); leiothrix-like, and recalling also that of *Seicercus xanthochristus* (1617) — SA.

184

SYLVIINAE

(Baker); 4 eggs from Bhutan measure 16.5 × 12.7 mm (Ludlow). Incubation by both sexes; other details of breeding biology not recorded.

MUSEUM DIAGNOSIS. See Key to the Species. For distinction from *whistleri* see 1614; for details of plumage Baker, loc. cit. Postnuptial moult apparently in September.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	55-61	13-14	19-20	43-53 mm
♀♀	51-58			43-49 mm

(BB, Stresemann, SA, Stevens, Rand & Fleming)

Weight 10 ♂♂ (May-Oct.) 6.5-9.3 (av. 7.7); 1 ♀ (Oct.) 6.2 g — GD. 9 ♂♂ (Oct.-Nov.) 4-8 g (BB, SA).

COLOURS OF BARE PARTS. Iris very dark brown. Bill: upper mandible dark brown, paler near tip and yellowish on edges and extreme tip; lower mandible yellow or orange-yellow. Legs, feet and claws yellowish brown.

1615a. Burmese Blackbrowed Flycatcher-Warbler. *Seicercus burkii tephrocephalus* (Anderson)

Culiciveta tephrocephalus Anderson, 1871, Proc. Zool. Soc. London: 213

(Bhamo)

Baker, FBI No. 890, Vol. 2: 488

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in 1615, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Non-breeding specimens collected in Bangladesh (Sundarbans (Burigodini) and Chittagong Hill Tracts (Rangmati and near Manimukh)) in February, March and April (R. A. Paynter).

Extralimital. Burma (Chin Hills) east to northern Yunnan and southern Sikkim. Winters in N. Thailand.

GENERAL HABITS, FOOD, and CALLS. As in 1615.

BREEDING. Not recorded within our limits.

MUSEUM DIAGNOSIS. 'Darker green than nominate *burkii* (1615), coronal bands better indicated, lateral bands darker, dull black, central band ashy, more or less tinged with olive' (Vaurie).

MEASUREMENTS and COLOURS OF BARE PARTS. As in 1615.

flavogularis (1618).

tephrodinus (1619).

zone 1500–2100 m, scarce and local below 1200 and above 2400 m. Winters commonly in the foothills, locally up to c. 2000 m, from October to early April. Affects well-wooded valleys, oak, pine and deodar forest in summer, extending to scrub jungle, gardens and orchards in winter.

GENERAL HABITS, FOOD and VOICE. As in 1617.

BREEDING. Season, March to June. Nest, globular, made of green moss and grass, lined with hair and fur; placed on grassy banks often protected by an overhanging bush. Eggs, normally 4, occasionally 5, unspotted white. Average size of 50 eggs 15.9 × 12.5 mm (Baker). Often brood-parasitized by *Cuculus saturatus*.

WARBLERS

187

COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible dark horny to almost black, paler on tip and on edges; lower mandible brownish yellow. Legs, feet and claws pale horny to horny brown; soles white (BB) or lower mandible orange-yellow; legs and feet brownish flesh with a yellow tinge; claws pale flesh (SA).

1618. Mishmi Greyheaded Flycatcher-Warbler. *Seicercus xanthoschistos flavogularis* (Godwin-Austen)

Baker, FBI Nos. 891 (part) and 903, Vol. 2: 489, 499

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in 1617, q.v.

STATUS, DISTRIBUTION and HABITAT. Resident, subject to seasonal vertical movements. Arunachal Pradesh in the Abor and Mishmi Hills. Altitudinal distribution and habitat, probably as in 1617.

Extralimital. Northern Burma.

GENERAL HABITS and FOOD. As in 1617.

VOICE and CALLS. Call noted to be 'easily distinguishable from that of *albosuperciliaris*' (a local dialect? — SA).

BREEDING. Unrecorded, probably as in 1617.

MUSEUM DIAGNOSIS. Differs from *xanthoschistos* (1617) in being darker, slaty on crown and mantle, and somewhat more washed with olive on flanks.

MEASUREMENTS and COLOURS OF BARE PARTS. As in 1617.

1619. Assam Greyheaded Flycatcher-Warbler. *Seicercus xanthoschistos tephrodinus* Sick

Seicercus xanthoschistos tephrodinus Sick, 1939, Orn. Monatsb. 47: 78 (Mt Victoria, Chin Hills)

Baker, FBI No. 891 (part), Vol. 2: 489

LOCAL NAME. *Inakushia* (Kacha Naga).

SIZE. Sparrow — ; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in 1617, q.v.

STATUS, DISTRIBUTION and HABITAT. Resident, subject to seasonal vertical movements. In the hills south of the Brahmaputra, Nagaland and Manipur. Breeds between c. 900 and 1800 m in the Khasi Hills; probably higher in Nagaland (up to 2400 m on Mt Victoria). Affects open evergreen forest.

Extralimital. The Chin Hills of Burma.

GENERAL HABITS, FOOD and VOICE. As in 1616.

186

SYLVIINAE

MUSEUM DIAGNOSIS. Like the nominate race (1617) but grey and greenish of upperparts, and yellow of underparts, paler. Young, like adult but grey of upperparts washed with brown, green parts not so bright; underparts pale.

MEASUREMENTS and COLOURS OF BARE PARTS. As in 1617.

1617. Nepal Greyheaded Flycatcher-Warbler. *Seicercus xanthoschistos xanthoschistos* (Gray)

Phylloscopus xanthoschistos 'Hodgs.' = Gray, 1846, Cat. Mamms. Bds. Nepal: 65, 151 (Nepal)

Baker, FBI No. 891 (part), Vol. 2: 489

Plate 87, fig. 7

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 10 cm (4 in.).

FIELD CHARACTERS. Above, crown and back grey; a long, white supercilium; rump and wings greenish yellow; inner web of outer rectrices white. Below, bright yellow. Sexes alike.

The white supercilium identifies this species. In flight rapidly opens and shuts tail scissors-wise, flashing the white rectrices which proclaim its identity.

STATUS, DISTRIBUTION and HABITAT. Common resident, subject to summer-winter vertical movements. From western Nepal east through Darjeeling, Sikkim and Bhutan, intergrading in Arunachal Pradesh with *flavogularis* (cf. Baker, 1913, *Rec. Indian Mus.* 8: 270). Breeds between c. 1000 and 2700 m, sparsely as low as 300 m; optimum zone 1200–2300 m. Winters from c. 2000 m down to the foothills. Affects rather open evergreen forest, coniferous or broad-leaved.

GENERAL HABITS. Similar to leaf warblers' and others of the genus *Seicercus*. Frequents mostly higher shrubs and the lower canopy of trees, usually hunting on the top side of branches and among leaves. In winter (October to March) commonly associates with the usual mixed hunting parties of small insectivorous birds. In summer keeps singly or in pairs.

FOOD. Insects, caterpillars and occasionally berries.

VOICE and CALLS. Call-note, a distinctive high-pitched, oft-repeated *pit-pit*. Alarm (?) a plaintive *tyee-tyee*. Has a 'pleasing and lively but monotonous song'. No description available, but noted as resembling that of *Seicercus burkii* (1614, SA). Song may be heard throughout the year with a main period from early March till end of June and a resumption in September and October (Proud).

MUSEUM DIAGNOSIS. See Key to the Species and Field Characters. Postnuptial moult complete in September and early October.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	51–58	11–13	18–20	38–45 mm
♀♀	48–56			39–42 mm (BB, SA)

Weight 12 ♂♂ (May, Oct.) 6.8–5; 8 ♀♀ (May, Oct.) 6.2–7.6 g (GD). 15 ♂♂ (Oct.–Apr.) 6–7; 2 ♀♀ (Feb., Mar.) 6, 7 g (BB, SA).

188

SYLVIINAE

BREEDING. Season, April to August, chiefly May and June. Nest and eggs as in 1616. Average size of 50 eggs 15.7 × 11.9 mm (Baker). Building and incubation by both sexes though female has major share. Incubation period 10 or 11 days.

MUSEUM DIAGNOSIS. Differs from *flavogularis* (1618) in being darker above and in having a dark olive wash on flanks. Differs from *xanthoschistos* (1617) in having a green instead of grey back.

MEASUREMENTS

Wing 14 ♂♂ 51–55; 3 ♀♀ 50–51 mm (Stresemann, SDR)

Weight 6.5–7 g (SDR).

COLOURS OF BARE PARTS. As in 1617.

1620. Greycheeked Flycatcher-Warbler. *Seicercus poliogenys* (Blyth)

C. (ulicipeta) poliogenys Blyth, 1847, Jour. Asiat. Soc. Bengal 16: 441 (Darjeeling)

Baker, FBI No. 893, Vol. 2: 491

Plate 87, fig. 9

LOCAL NAMES. None recorded.

SIZE. Sparrow — ; length c. 10 cm (4 in.).

FIELD CHARACTERS. A yellow wing-bar. Above, head and nape slaty with two black coronal bands and a conspicuous white eye-ring. Rest of upperparts olive-green; inner web of outer rectrices white. Below, chin and lower cheeks pale grey; rest of underparts bright yellow. Sexes alike.

General colour scheme rather similar to Greyheaded Flycatcher (*Culicicapa cydonensis*, 1449) but the darker slaty head and conspicuous white eye-ring, as in White-eye (*Zosterops*), are diagnostic.

STATUS, DISTRIBUTION and HABITAT. Resident in moderate numbers, subject to seasonal vertical movements; from central Nepal (Proud, JBNHS 53: 65) east through Darjeeling, Sikkim, Bhutan, Arunachal Pradesh and the hills south of the Brahmaputra, Nagaland?, Manipur and the Chittagong ranges of Bangladesh. Vertical distribution imperfectly known in the Himalayas: noted at 2400 and 3000 m in spring and from 1800 m down to the foothills in winter. South of the Brahmaputra it breeds from 1200 m to the tops of the hills. Affects open evergreen forest and dense bamboo jungle.

Extralimital. Extends to Yunnan and the northern Indochinese countries.

GENERAL HABITS. Phylloscopine; typical of the flycatcher-warblers. Recorded as moving through the leaves along the sunny surface of vines strung over undergrowth, occasionally clinging to the underside of a small twig like a titmouse (Fleming). Also noted as keeping to the upper branches of trees (Cripps).

FOOD. Insects.

VOICE and CALLS. Unrecorded.

BREEDING. Season, May and June. Nest, a ball of moss and grass, the latter scanty or sometimes wanting, lined with a felt-like pad of matted moss and moss roots; placed on the ground among moss, weeds, bracken, etc., or between moss-covered stones and boulders. Eggs, usually 4, unspotted white. Average size of 40 eggs 15.8 × 12.5 mm (Baker). Incubation by both sexes.

WARBLERS

189

MUSEUM DIAGNOSIS. See Key to the Species and Field Characters. This species has three outer rectrices with white inner web. For details of plumage see Baker, loc. cit.

Bill from skull c. 12 mm

Weight 1 ♂ 7; 2 ♀ 6, 6 g (SDR).

COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible black, lower horny. Legs yellow, feet brownish yellow.

1621. Chestnut-headed Flycatcher-Warbler. *Scircus castaneiceps* (Hodgson)

Abornis castaneiceps Hodgson, 1845, in Blyth, Jour. Asiat. Soc. Bengal 14: 593 (Nepal)

Scircus castaneiceps negensis Kozel, 1951, Jour. Zool. Soc. India 3: 29

(Kohima, Naga Hills, Assam)

Baker, FBI No. 894, Vol. 2: 492

Plate 87, fig. 13

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. Two yellow wing-bars. *Above*, crown chestnut with dark lateral bands becoming black on nape, and white spots on nape on either side and between the black bands. Nape and sides of head grey; a white eye-ring. Back and wings yellowish olive; rump bright yellow; outer rectrices with white inner web. *Below*, throat and upper breast bluish ash; rest of underparts bright yellow. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Resident, subject to seasonal vertical movements, locally distributed. The Himalayas from central Nepal east through Darjeeling, Sikkim, Bhutan and Arunachal Pradesh, and the hills south of the Brahmaputra, Nagaland, Manipur and around Chittagong. In the Himalayas, breeds from c. 1800 and 2400 m, wintering (November to March) from c. 2300 m down to the foothills; in the Khasi Hills breeds between 750 and 1800 m. Affects dense forest of oak etc.

Extralimital. Burma and Yunnan. The species extends east through the Indochinese countries, southern China to Fukien, and south through the Malay Peninsula to Sumatra and Borneo.

GENERAL HABITS. Outside the breeding season usually found in mixed itinerant hunting flocks of leaf warblers, flycatchers, nuthatches and small babblers, etc., usually keeping fairly high up in the substage or canopy foliage. Restless behaviour and habit of flicking wings nervously while hopping about identical with that of *Phylloscopus*.

FOOD. Insects.

VOICE and CALLS. A double call-note, *chi-chi* and a loud, wren-like *tsik* quite distinctive. Song undescribed.

BREEDING. Season, April to June. *Nest*, an oval ball of green moss compactly woven, with a dense lining of felted moss and tiny moss roots. Usually

WARBLERS

191

FIELD CHARACTERS. *Above*, forecrown brownish grey; a broad, white supercilium; sides of head mottled dark and pale grey. Rest of upperparts yellowish olive. *Below*, throat whitish, remainder bright yellow. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Resident, subject to vertical movements; locally common. From central Nepal (Biswas, JBNHS 59: 423) east through Darjeeling, Sikkim, Bhutan and the hills south of the Brahmaputra, Nagaland, Manipur and Bangladesh south to the Chittagong ranges. Breeds at c. 500-900 m (Himalayas) and between 900 and 1800 m in Assam. Wanders into adjacent plains in winter. Affects mixed bamboo forest, secondary and scrub jungle especially where bamboo occurs, and in the vicinity of streams.

Extralimital. Adjacent hills of Burma.

GENERAL HABITS. Typically phylloscopine. Keeps to trees and high bushes; often makes short aerial sallies for insects. In the non-breeding season, usually in the roving mixed parties of 'tinies'.

FOOD. Insects.

VOICE and CALLS. Unrecorded. Song said to be 'short, sweet and clear'.

BREEDING. Season, April to June. *Nest*, a neat cup of fibres, rootlets or moss, resting on a base of a few small bamboo leaves, usually placed in hollows in bamboo stems within a couple of metres from the ground. Eggs, 3 to 5, white more or less tinted with pink, freckled with reddish brown spots, forming a ring or cap at the large end, or sometimes so densely covered with spots as to look uniformly pink, terracotta or rich red. Average size of 36 eggs 15.2 × 11.6 mm (Baker). Building and incubation by both sexes. Sometimes brood-parasitized by *Cuculus canorus*.

MUSEUM DIAGNOSIS. See Key to the Species. For details of plumage see Deignan, 1947, Proc. Biol. Soc. Washington 60: 20; for distinction from *drastius* see 1623.

Young, similar to adult but forecrown ash; green of upperparts a little darker; yellow of underparts duller. Postjuvénal moult complete.

MEASUREMENTS

♂ ♂	50-60	12-13	18-21	39-49 mm
♀ ♀	46-48			36-40 mm (BB)

Weight 3 ♂ 6-7 g (BB).

COLOURS OF BARE PARTS. Iris brown. Bill horny brown, pinky plumbeous at base of lower mandible. Legs and feet brownish flesh.

1623. Arunachal Yellowbellied Flycatcher-Warbler. *Abroscopus superciliosus drastius* Deignan

Abroscopus superciliosus drastius Deignan, 1947, Proc. Biol. Soc. Washington 60: 20 (Margherita, Lakhimpur District, Assam Province, India)

Baker, FBI No. 896 (part), Vol. 2: 494.

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 9 cm (4 in.).

FIELD CHARACTERS. As in 1622, q.v.

190

SYLVIINAE

placed on the ground, well concealed by overhanging moss and creepers, sometimes in hollows at the foot of trees and bushes, or on banks and steep hillsides. Eggs, 4 or 5, unspotted white. Average size of 50 eggs 14.6 × 11.6 mm (Baker). Building, incubation and care of young by both sexes. Frequently brood-parasitized by Emerald Cuckoo (*Chalcites maculatus*, 586).

MUSEUM DIAGNOSIS. See Field Characters. Young undescribed.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♂	48-53	10-11	16-17	40-43 mm
♀ ♀	47-50			35-38 mm (BB, SA, Stres.)

Weight 6 ♂ 4-6 (av. 5.3) g—SA, BB.

COLOURS OF BARE PARTS. Iris dark brown. Bill: upper mandible dark horny, paler on edge and tip; lower mandible yellowish brown. Legs, feet and claws pale greyish horny; soles white to yellowish white.

Genus *ABROSCOPUS* Baker

Abroscopus Baker, 1930, Fauna Brit. India, Bds. 7: 192. Type, by original designation,

Abornis superciliosus Blyth

Tickellia Blyth, 1861, Proc. Zool. Soc. London: 199.

Type, by monotypy, *Abornis? hodgsoni* Moore

Differs from *Scircus* in having ten rectrices instead of twelve.

Plate 87, fig. 6

LOCAL NAME. *Dastisha mini* (Cachari).

SIZE. Sparrow —; length c. 9 cm (4 in.).

192

SYLVIINAE

STATUS, DISTRIBUTION and HABITAT. Resident, subject to vertical movements. Arunachal Pradesh, probably intergrading with *flaviventris* in eastern Bhutan. Breeds from the base of the hills probably up to c. 1500 m. Wanders into the adjacent plains in winter.

Extralimital. Northern Burma. The species extends east to Vietnam and south to Java and Borneo.

GENERAL HABITS, FOOD and VOICE. As in 1622.

BREEDING. As in 1622.

MUSEUM DIAGNOSIS. Similar to *flaviventris* but with the whole crown dark brownish grey, scarcely washed with olive-green, and much more clearly demarcated from the colour of the remaining upperparts (in *flaviventris* the top of crown is more or less washed with olive-green and not clearly demarcated from the olive-green of the hindcrown and nape). Olive-green of mantle more suffused with yellow; yellow of rump and lower underparts more golden.

MEASUREMENTS

Wing 14 ♂ 42-50 mm (Deignan)
COLOURS OF BARE PARTS. Iris brown. Bill black, lower mandible dark grey. Legs and feet whitish flesh to yellowish flesh.

ABROSCOPUS SCHISTICEPS (Gray)

Key to the Subspecies

Yellow restricted to throat.....	<i>A. s. flaviventris</i>
Yellow extending to breast.....	<i>A. s. schisticeps</i>

1624. Nepal Blackfaced Flycatcher-Warbler. *Abroscopus schisticeps schisticeps* (Gray)

Guliciceta schisticeps Gray, 1846, Cat. Mamm. Bds. Nepal: 67: 153 (Nepal)

Baker, FBI No. 899 (part), Vol. 2: 496

Plate 87, fig. 4

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 9 cm (4 in.).

FIELD CHARACTERS. *Above*, crown, nape and ear-coverts slaty grey. Very conspicuous yellow supercilial stripes nearly meeting on forehead. Loins and round the eye black. Rest of upperparts olive. Inner webs of outer rectrices white. *Below*, yellow, tinged with olive on breast and paling to white on belly. Sexes alike.

The striking head pattern is diagnostic. On colour alone, could easily be confused with Yellowbellied Fantail Flycatcher (1450), but open, partially cocked tail and behaviour of latter distinctive.

STATUS, DISTRIBUTION and HABITAT. Resident, uncommon and local. Central Nepal, Darjeeling and Sikkim between 1500 and 2500 m. A withdrawal from the higher zone probably occurs in the cold weather. Affects forest of oak etc., with patches of scrub or bamboo.

GENERAL HABITS. Usually seen in mixed hunting parties, very commonly associated with *Parus modestus* and *Rhipidura hypoxantha*, along with miscellaneous small babblers and warblers. Keeps mostly to bushes but

WARBLERS

193

sometimes parties ascend lofty trees, especially those draped with climbers, soon dropping down into the undergrowth one after the other like a shower of falling leaves.

FOOD. Insects.

VOICE and CALLS. Little recorded. Said to make a continual chattering while feeding.

BREEDING. Season, about May and June. Nest (one described), a loose lining of bamboo leaves placed in the bottom of a cleft in a tree c. 150 cm from the ground. Eggs, 5, dull pinkish white profusely mottled and streaked with red; average size c. 14 × 10.5 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters; for details of plumage Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from skull)	Tail
11 ♂♂	45-49	10-11	42-44 mm
2 ♀♀	46, 47	11, 11	41, 43 mm (BB)

Tarsus 15-17 mm

COLOURS OF BARE PARTS. Iris red-brown. Bill pale brownish horny, 'a somewhat unusual colour for the bill in comparison with its near allies' (Stevens). Legs and feet dusky olivaceous.

1625. Assam Blackfaced Flycatcher-Warbler. *Abrosopus schisticeps flavimentalis* (Baker)

Abrosopus schisticeps flavimentalis Baker, 1924, Bull. Brit. Orn. Cl. 44: 63 (Mt Victoria)

Baker, FBI No. 901, Vol. 2: 497

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 9 cm (4 in.).

FIELD CHARACTERS. As in 1624, q.v.

STATUS, DISTRIBUTION and HABITAT. Resident, locally common. Bhutan, Arunachal Pradesh (?), the Cachar hills of Meghalaya, Nagaland (?), and Manipur, from c. 1500 to 2400 m in the Himalayas, down to c. 600 m in Cachar. Affects glades and banks of streams in deep forest, especially where interspersed with tracts of bamboo, scrub-covered ravines and thin forest or open country near cultivation.

Extralimital. Southeastern Tibet and the adjacent hills of Burma to Mt Victoria (up to 2600 m). The species extends to Yunnan and northern Vietnam.

GENERAL HABITS, FOOD and VOICE. As in 1624.

BREEDING. Season, April, May and probably June; cf. also 1624. Nest (one described), a pad of moss and feathers lined with soft down, placed in a hollow in a burnt-out bamboo a few feet from the ground in bamboo jungle. Eggs, 4, densely freckled with reddish brown, forming a cap at the large end, measuring 15.1 × 11.1 to 15.4 × 11.3 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *schisticeps* (1624) in having the yellow paler and restricted to chin and throat; breast and belly white.

WARBLERS

195

1627. Broadbilled Flycatcher-Warbler. *Abrosopus hodgsoni hodgsoni* (Moore)

Abrosopus hodgsoni Moore, 1854, in Horsfield & Moore, Cat. Bds. Mus. E.I. Co. 1: 412 (Nepal)

Tickellia hodgsoni rupchandii Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 17 (Kohima, Naga Hills)

Baker, FBI No. 904, Vol. 2: 500

Plate 87, fig. 10

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. Above, forehead and crown chestnut; lores and sides of head grey with a short ashy supercilium. Rest of upperparts olive-green tinged with yellow on rump. Inner web of two outermost rectrices white. Below, chin, throat and breast dark grey, becoming whitish on throat. Rest of underparts bright yellow. Sexes alike.

× c. 1

STATUS, DISTRIBUTION and HABITAT. Resident, possibly subject to some vertical movements, uncommon. Nepal (not recorded since Hodgson), Darjeeling, Sikkim, Bhutan, Arunachal Pradesh?, Nagaland (Koelz), Manipur? and south to Mt Victoria. Breeds between c. 1100 and 2700 m (2200-2600 m on Mt Victoria). Affects dense scrub and bamboo especially along forest edges.

Extralimital. Adjacent hills of Burma. The species extends to Yunnan and northern Vietnam.

GENERAL HABITS. Little recorded. Keeps to dense undergrowth, frequently in the mixed hunting parties of small birds.

FOOD. Insects.

VOICE and CALLS. 'Note [song?] a single long-drawn, very shrill whistle followed after an interval of 10 seconds or so by two notes, the second lower' (BBO). Also described as a very thin and sharp twitter or warble (Heinrich).

BREEDING. Season, about May and June. Nest (one described), egg-shaped with an entrance near the top, made of dry leaves, chiefly bamboo, lined with rootlets and a finer layer of soft, dry bamboo leaves. The three eggs were 'pale claret, spotted, streaked and speckled, chiefly at the larger end, with darker claret'. Average size of 3 eggs 16 × 11.9 mm (BBO).

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♀	45-49	12-14	20-21	38-45 mm (Koelz, SA, BB, MD)

Weight 1 ♀ 5 g (SA). 1 ♂? 4 g (BB).

COLOURS OF BARE PARTS. Iris brown. Bill horny brown, paler and more yellow at base. Legs and feet pale yellow or fleshy horn colour.

Genus *REGULUS* Cuvier

Regulus Cuvier, 1800, *Leçons d'Anat. Comp.* 1, tab. 2.

Type, by tautonymy, *Metacilla Regulus* Linnaeus

Very small birds with dense, soft plumage. Bill small, straight, less than half the length of head. Rictal bristles present. Wing short and rounded. Tail shorter than wing. Tarsus relatively long.

194

SYLVIINAE

MEASUREMENTS. As in 1624.

Weight 1 ♂ 6 g (SA). 1 ♀, 1 ♂? 4, 4 g (BB).

COLOURS OF BARE PARTS. Unrecorded, probably as in 1624.

1626. Whitethroated Flycatcher-Warbler. *Abrosopus albogularis* (Horsfield & Moore)

Abrosopus albogularis 'Hodgson' = Horsfield & Moore, 1854, Cat. Bds. Mus. E.I. Co. 1: 340 (Nepal)

Baker, FBI No. 902, Vol. 2: 498

Plate 87, fig. 3

LOCAL NAME. *Destika mini* (Cachar).

SIZE. Sparrow —; length c. 8 cm (3½ in.).

FIELD CHARACTERS. Above, head rufous with two black superciliary bands to nape. Back and wings olive-green; rump yellowish white. No white in tail. Below, throat and belly white; a band across breast, and under tail-coverts yellow. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Resident, locally common. Nepal (ride Biswas, JBNHS 59: 423), Darjeeling, Sikkim, Bhutan, Arunachal Pradesh, the hills of Meghalaya and Mizoram south to the Chittagong Hill Tracts, Nagaland (?) and Manipur; from c. 300 to 1200 m, in Cachar up to 1800 m, optimum zone 600-1200 m. Affects bamboo jungle, secondary scrub, and moist-deciduous forest.

Extralimital. The species extends to Szechuan, southern China, Formosa, Hainan and the Indochinese countries.

GENERAL HABITS. Usually keeps to lower growth in open country but may sometimes be seen high up in trees. 'Moves about in small parties, hovering at the tip of a branch or darting after flies.' At times spreads its tail like *Rhipidura*.

FOOD. Insects.

VOICE and CALLS. Little recorded. Keeps up a shrill twitter while moving about.

BREEDING. Season, early April to June. Nest, a layer of bamboo fibre, roots, bamboo leaves or scraps of grass on which is placed a pad of felted moss with a cup in the centre; built in a hollow in a bamboo 30 cm or so from the ground, almost always in the vicinity of streams. Eggs, 3 to 5, similar to those of *A. superciliosus* (1622, q.v.). Average size of 33 eggs 14.4 × 11.5 mm (Baker). Building and incubation by both sexes; period not recorded.

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♀	43-47	7-8	c. 16	35-40 mm (Baker)

Bill from skull c. 11 mm

COLOURS OF BARE PARTS. Iris brown. Bill: upper mandible brown, lower light greyish flesh. Legs and feet yellowish brown.

Regulus regulus salimalii Deignan, 1954, Bull. Brit. Orn. Cl. 74: 104 (Kotgarh).
 New name for *Regulus Himalayensis* 'Blyth' = Jerdon, 1863
 Baker, FBI No. 944 (part), Vol. 2: 539
 Plate 84, fig. 10

LOCAL NAMES. None recorded.
SIZE. Sparrow — ; length c. 8 cm (3½ in.).
FIELD CHARACTERS. A diminutive *Phylloscopus*-like bird with two yellowish white wing-bars.

Male. Above, greyish olive-green tinged with yellowish on rump; a dark patch on wing. Crown with an orange median stripe bordered by two broad black bands; a large whitish area around eyes. Below, pale greyish fulvous, tinged with olive on flanks.
Female. Similar to ♂ but with coronal stripe yellow *contra* orange.
 May be confused with *Phylloscopus proregulus* but always distinguishable by call-notes (q.v.).
STATUS, DISTRIBUTION AND HABITAT. Resident, subject to vertical movements, uncommon except in N.W.F.P. The Himalayas from the Safed Koh (possibly farther south), Astor, Gilgit and Kashmir east to central Nepal (intergrading here with *sikkimensis*). Breeds from c. 2200 m up to the limit of fir forest, c. 3600 m, locally 3900 m (Nepal). In winter between 1500 and at least 3000 m. Has straggled in winter to Quetta. Affects silver fir and deodar forest; in winter occasionally orchards or deciduous groves.
Extralimital. Adjacent ranges of Afghanistan.
GENERAL HABITS. Outside the breeding season usually seen in mixed parties of tits and leaf warblers. Keeps to the canopy of conifers, from the lowest branches to a fair height, hunting actively among the green foliage often hovering in front of sprigs.

Weight 1 ♂ (June) 5.5; 1 ♀ (Sept.) 6.4; 1 ♂ (June) 5 g (GD). 1 ♂ (Sept.) 6 g (SDR).
COLOURS OF BARE PARTS. Iris brown. Bill blackish brown. Legs, feet and claws pale horny brown.

1631. Yunnan Goldcrest. *Regulus regulus yunnanensis* Rippon
Regulus yunnanensis Rippon, 1906, Bull. Brit. Orn. Cl. 19: 19
 (Yangtze River, W. Yunnan)
 Baker, FBI No. 945, Vol. 2: 541

LOCAL NAMES. None recorded.
SIZE. Sparrow — ; length c. 8 cm (3½ in.).
FIELD CHARACTERS. As in 1629, q.v.
STATUS, DISTRIBUTION AND HABITAT. Resident, subject to vertical movements. Northern Arunachal Pradesh from c. 2200 to at least 3500 m (in Tibet up to 4400 m). Affects dry, temperate conifer forest; in winter also evergreen oak.
Extralimital. Adjacent southeastern Tibet, and Yunnan.
GENERAL HABITS, FOOD AND VOICE. As in 1629.
MUSEUM DIAGNOSIS. Differs from *sikkimensis* (1630) in having the upperparts darker and the underparts paler.
MEASUREMENTS AND COLOURS OF BARE PARTS. As in 1630.

Genus LEPTOPOECILE Severtzov

 Not in Baker, FBI
 Plate 84, fig. 12
LOCAL NAMES. None recorded.
SIZE. Sparrow — ; length c. 10 cm (4 in.).
FIELD CHARACTERS. Male (adult). Above, forehead white becoming pale greyish lilac on crown and crest; lores black; sides of head and hind-collar

FOOD. Insects and their larvae.
VOICE AND CALLS. A distinctive high-pitched mouse-like squeaking *tsi-tsi-tsi-tsi*, oft-repeated, which usually gives the first indication of its presence among a mixed foraging party high up in the tree-tops. Song not described from the Himalayas.
BREEDING. Season, May to July. *Nest*, a pouch of green moss, lichen, spiders' web and cocoons, and rootlets, hanging at the extremity of a branch between 2 and 12 metres above the ground, well concealed and very difficult to find. *Eggs*, 4 to 7, white with large reddish spots, or pale creamy buff speckled with pink-buff around the large end. Average size of 13 eggs 14.3 × 10.7 mm (Baker).
MUSEUM DIAGNOSIS. See Field Characters. Young, like adult but crown lacking dark bands or flame-coloured patch. Upperparts browner; underparts greyer white. Postjuvinal moult of body, lesser and median coverts.

MEASUREMENTS		Wing	Bill	Tarsus	Tail
			(from feathers)		
♂♀		53-58	9-10	c. 17	c. 36 mm (Baker)

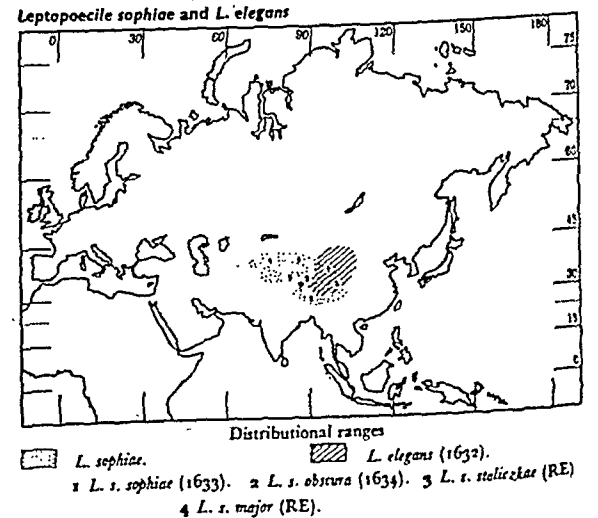

COLOURS OF BARE PARTS. Iris dark brown. Bill black. Legs and feet dark greenish brown; soles paler, more yellowish.

1630. Sikkim Goldcrest. *Regulus regulus sikkimensis* R. & A. Meinertzhagen
Regulus regulus sikkimensis R. & A. Meinertzhagen, 1926, Bull. Brit. Orn. Cl. 46: 97 (Sikkim)
 Baker, FBI No. 944 (part), Vol. 2: 539

LOCAL NAMES. None recorded.
SIZE. Sparrow — ; length c. 8 cm (3½ in.).
FIELD CHARACTERS. As in 1629, q.v.
STATUS, DISTRIBUTION AND HABITAT. Uncommon resident, subject to vertical movements. Eastern Nepal (Stevens, JBNHS 29: 1014; Diesellhorst 1969: 287), Darjeeling, Sikkim, Bhutan and Arunachal Pradesh in the Daffa and Abor hills; from c. 2600 to 3800 m in winter, up to 4000 m (upper limit of fir forest). Affects mainly fir forest in the breeding season; at other times may be seen also in pine, oak or birch forest, even in buckthorn thickets.
GENERAL HABITS, FOOD AND VOICE. As in 1629.
BREEDING. As in 1629.
MUSEUM DIAGNOSIS. Differs from *himalayensis* (1629) in having the coronal stripe more reddish orange in male. Upperparts darker and duller. Underparts suffused more with fulvous brown than buffish yellow.

MEASUREMENTS		Wing	Bill	Tarsus	Tail
			(from skull)		
4 ♂♂	55-58	1 ♂? 10	19	36 mm	(Wing by Ludlow, rest SA)
4 ♀♀	51-53				

rich chestnut. Back dark dull blue becoming bright cerulean blue on rump wings and tail dull greenish blue. Below, throat pale chestnut; breast vinaceous; belly purplish blue; under tail-coverts chestnut.
Female (adult). Above, crown darker than in male, crest shorter. Back dark greenish olive; rump verditer-blue mixed with greenish olive. Cheeks sides of neck and underparts dirty white tinged with vinaceous, lower flanks washed with purple.
 Pointed pale-coloured crest and chestnut collar distinguish this species from *L. sophiae*. Female distinguished by different head pattern and lack of white in tail.
STATUS, DISTRIBUTION AND HABITAT. Resident in the Tsangpo bend area of SE. Tibet, therefore presumably also occurs in adjacent northern Arunachal Pradesh; between c. 3400 and 4300 m in summer, 2800 and 3900 m in winter. Affects fir forest, and juniper scrub above timber-line.

Extralimital. The mountains of western China and eastern Tibet.
GENERAL HABITS. Outside the breeding season, often found in mixed company with tits, goldcrests and *L. sophiae*. May be found high up in tree as well as in shrubs. Behaviour goldcrest-like (Schäfer).
FOOD. Insects.
VOICE AND CALLS. A soft peeping call-note and sometimes a shrill note reminding one of *Troglodytes* (Przevalski).
BREEDING. Unknown.

COLOURS OF BARE PARTS. Iris red. Bill black. Legs and feet brown; claws darker.

LEPTOPOECILE SOPHIAE Severtzov

Key to the Subspecies

Belly pale fulvous.....*L. s. sophiae*
 Whole underparts lilac-purple.....*L. s. obscura*

1633. Turkestan Tit-Warbler. *Leptopoeile sophiae sophiae* Severtzov

Leptopoeile Sophiae Severtzov, 1872, Vertik. Turkest. Zhivotn.: 135, pl. 8
 (pinewoods at Issyk-Kul)

Baker, FBI No. 947, Vol. 2: 542

Plate 84, fig. 8

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. Male (adult). Above, crown chestnut washed with lilac; a broad, whitish supercilium. Back grey; wings pale brownish grey; rump violet-blue. Tail blackish brown tinged with verditer; outer web of external rectrices white. Below, sides of head, throat and flanks violet-blue, the base of feathers rufous; belly pale fulvous. In summer the whole belly is vinous purple without the fulvous area (Biddulph).

Female (adult). Like male but paler and without blue except on rump. Sides of head and underparts pale fulvous. Flanks slightly washed with blue. Broad supercilium, lack of crest and absence of white in outer rectrices distinguish this species from 1632.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to vertical movements. Baltistan, Gilgit and Ladakh. Breeds between 3000 and 3900 m, descending to c. 1800 m in winter, seldom lower. Affects dwarf juniper scrub above timber-line and *Hippophae* thickets along rivers.

Extralimital. Extends to the Pamirs and Tien Shan systems. The species ranges to Kansu and Szechuan.

GENERAL HABITS. Outside the breeding season met in small restless parties, often in company with other small insectivorous species. Keeps to thick undergrowth, ceaselessly hopping or flitting about and difficult to observe. From time to time individuals climb to tops of bushes, call loudly with tails cocked like a Magpie-Robin, and fly down to the base of the next bush (R. L. Fleming, Jr.).

FOOD. Insects.

COLOURS OF BARE PARTS. Iris bright red. Bill black. Legs and feet almost black (W. L. Abbott).

1634. Tibetan Tit-Warbler. *Leptopoeile sophiae obscura* Przevalski

Leptopoeile obscura Przevalski, 1887, Zapiski Imp. Akad. Nauk, St. Petersburg. 55: 80 [mountain forests of northeastern Tibet

(= upper course of the Di Chu)]

Baker, FBI No. 948, Vol. 2: 543

Plate 84, fig. 9

LOCAL NAME. *Chiu-thep-to* (Gyantse).

SIZE. Sparrow —; length c. 10 cm (4 in.).

FIELD CHARACTERS. As in 1633, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident, locally common in Tibet. Found in Tibetan facies north of the main range from the Tsangpo bend west at least to central Nepal, between 2800 and 4000 m at all seasons. One actual record within our territory: Kali Gandak Valley, west-central Nepal, 3600 m in December (Rand & Fleming, *Fieldiana* 41: 173, 1957). May be expected in Arunachal Pradesh on the northern slopes (cf. Ludlow, *Ibis* 1944: 205). Affects juniper, *Lonicera*, *Berberis*, *Caragana* and rhododendron scrub above timber-line, and thickets of *Hippophae* and willows along stream-beds.

Extralimital. The mountains of western China and eastern Tibet north to Kansu.

GENERAL HABITS, FOOD AND VOICE. As in 1633.

BREEDING. Season, April to July. Probably double-brooded. Nest, domed, oval or ball-shaped, made of moss, vegetable down and animal fur, feathers and shreds of grass, strengthened with cobweb, and decorated with bits of lichen and cocoons; lined, but apparently not always, with soft feathers. Placed low down in a bush usually under one metre. Eggs, 4 to 6, white spotted with reddish brown. Average size of 50 eggs 15.1 × 11.6 mm (Baker).

MUSEUM DIAGNOSIS. Differs from *sophiae* in being darker throughout; purple pigment covers the whole of the underparts; rump more bluish, less lavender.

MEASUREMENTS

1635. Gould's Shortwing. *Brachypteryx stellata stellata* Gould*Brachypteryx (Drymochares) stellatus* Gould, 1868, Proc. Zool. Soc. London: 218(Nepal = Sikkim)¹

Baker, FBI No. 486, Vol. 2: 16

Plate 88, fig. 1

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. A stub-tailed, long-legged, slaty grey robin, with bright chestnut upperparts.

Above, chestnut with black lores and a narrow grey supercilium. Lower rump slaty grey flecked with whitish. Below, slaty grey: finely vermiculated on throat and breast with grey and black and flecked with triangular white spots on belly. Flanks and vent tinged with rufous. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Resident, very locally distributed and subject to vertical movements. Kumaon (JBNHS 53: 468), eastern Nepal (Stevens, JBNHS 30: 356, Fleming & Traylor, *Fieldiana* 35: 544), Sikkim, northeastern Bhutan (Ludlow, *Ibis* 1937: 265) and Arunachal Pradesh in the upper Subansiri region where common (Ludlow, *Ibis* 1944: 181); from c. 3300 to 4200 m in summer, and from c. 2000 to at least 3400 m in winter, once as low as 540 m in Sikkim (Schäfer). Affects dense rhododendron and bamboo growth in fir forest, dwarf rhododendron on hillsides; also rocks and boulders in the alpine zone away from all shrub growth 'where undoubtedly breeding' (Ludlow). In winter has been observed in a dark, damp streambed full of ferns and moss.

Extralimital. One record from Burma and one from northern Vietnam.

GENERAL HABITS. Not such a ground-skulker as other shortwings, and often absurdly tame. Will sometimes ascend to the tops of the bushes and stumps to gaze at an intruder in a most confiding manner. Meinertzhagen observed them running on the ground (not hopping) in and out of roots and fallen branches just like a mouse.

FOOD. Larvae, grubs and small coleoptera (Meinertzhagen); also seeds and grit (Stanford).

¹ The specimen is stated as coming from Sikkim by Sharpe, 1883: 31. Vide Bierwies, 1961, JBNHS 58: 653.

THRUSHES AND CHATS

205

VOICE and CALLS. Alarm-note tik-tik. Song unknown.

BREEDING. Unknown. Season, end of May to July (judging from juveniles and state of gonads).

MUSEUM DIAGNOSIS. See Field Characters.

Young, dark blackish brown on head and neck with paler brown shaft-streaks, which on mantle cover nearly the whole feather. Rump as in adult but without freckling. *Below*, throat and breast similar to head; abdomen greyish black with broad whitish, arrow-shaped markings which on flanks and abdomen are suffused with buff. As the bird becomes older the colour of the upperparts fades paler to reddish brown and the white arrow-marks and speckling on the lower parts become more suffused with buff while the dark edges to the breast-feathers fade to a buffy brown. Postjuvinal moult in September.

MEASUREMENTS

COLOURS OF BARE PARTS. Iris dark brown. Bill black; inside of mouth black. Legs and feet fleshy horn.

1636. *Rustybilled Shortwing*. *Brachypteryx hyperythra* Jerdon & Blyth*Brachypteryx hyperythra* Jerdon & Blyth, 1861, Proc. Zool. Soc. London: 201 (Darjheeling)

Baker, FBI No. 487, Vol. 2: 17

Plate 88, fig. 2

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. Male (adult). *Above*, lores and a frontal line black. A short and rather concealed white supercilium. Rest of upperparts deep blue. *Below*, entirely ferruginous.Female. *Above*, olive-brown. *Below*, pale ferruginous; centre of belly whitish.♂ very similar to Blue Chat, *Eritacus brunneus* (1650) but white supercilium less conspicuous. Could be confused also with ♂ Redbreasted Blue Flycatcher, *Muscicapa hyperythra* (1417) but its noticeably long tarsus and more terrestrial habit usually diagnostic.

STATUS, DISTRIBUTION and HABITAT. An endemic species, but rare and little known. Recorded from Sikkim, Arunachal Pradesh (Dafila Hills and Margherita) and Nagaland (Asalu, Godwin-Austen *vide* Hume). Winter records only from: base of Dafila Hills and adjacent plains in December and January, in forest undergrowth, scrub and reeds; Mangpu (Sikkim) at c. 1100 m; a sight record at Tonglo (Sikkim) 2900 m in January in dense *Arundinaria* bamboo (Stevens).

GENERAL HABITS. Frequents dense undergrowth and thickets. Quite fearless.

FOOD. Unrecorded.

VOICE and CALLS. Unrecorded.

BREEDING. Unknown.

THRUSHES AND CHATS

207

FIELD CHARACTERS. As in 1637, slaty blue above but with a pronounced bluish white band above the velvety black frontal line. Rufous brown of underparts replaced by slaty blue; centre of belly, vent and under tail-coverts greyish white. Sexes alike.

In interior of dark sholas may casually be confused with Whitebellied Blue Flycatcher, *Muscicapa pallipes* (1435), q.v.

STATUS, DISTRIBUTION and HABITAT. Fairly common resident. Western Tamil Nadu and southern Kerala from the Palni to the Ashambu hills; from c. 900 m to the highest summits. Haunts sholas and moist, densely wooded ravines in evergreen biotope.

GENERAL HABITS. Shy and retiring. Affects deep shade though not necessarily dense jungle. Mainly terrestrial; keeps singly or in pairs in undergrowth, rarely higher than about three metres above the ground. Most in evidence at dusk when it may be seen sitting on a bank by the roadside or hopping on to jungle paths, tail slightly cocked. On alarm, flies up into trees, soon descending again to resume feeding.

FOOD. Chiefly insects.

VOICE and CALLS. Has a loud chattering, and at times a faint high whistle. Song usually heard at dusk, described as of a few notes, beautiful, sustained, thrush-like in quality but less loud, higher pitched and with a narrower range of variations.

BREEDING. Season, March to June, chiefly in May after the rains have broken. Nest, a large, loose mass of green moss with a shallow cup lined with rootlets; placed in holes in roadside banks in sholas or hollows in trees, usually within a metre or so from the ground. Eggs, almost invariably 2, pale olive-brown, more or less completely covered with minute reddish brown freckling, in some eggs forming a ring or cap at the broad end. Average size of 14 eggs 23.9 × 16.8 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Subspecies. Plumage of young spotted.

MEASUREMENTS

SIZE. Sparrow ±; length c. 15 cm (6 in.).

FIELD CHARACTERS. *Above*, slaty blue; lores and frontal line black; a faint bluish line above this, extending back over eye. *Below*, throat and breast slaty blue; centre of belly white. Rest of lower plumage, including under tail-coverts, pale rufous; sides olive-brown. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Fairly common resident. The hills of southern Mysore (Bababudan, Brahmagiri and Nilgiri hills) from c. 1300 to 2100 m, mostly above 1600 m. Affects well-wooded sholas.

GENERAL HABITS, FOOD and VOICE. As in 1638.

BREEDING. Season, March to June, chiefly in May after the advent of rains. Also July and August (Betts). Nest and eggs as in 1638. Average size of 15 eggs 23.7 × 16.5 mm (Baker).

MUSEUM DIAGNOSIS. See Key to the Subspecies.

LOCAL NAMES. *Sandhyakkili* (Malayalam); *Kuruv jettai kūrūti* (Tamil).

SIZE. Sparrow ±; length c. 15 cm (6 in.).

208

TURDINAE

FIELD CHARACTERS. Male (adult). *Above*, dark slaty blue. A white supercilium, often concealed. *Below*, throat and centre of belly white. A breast band and flanks smoky grey.Female. *Above*, rusty olive-brown. A white, usually concealed supercilium. *Below*, throat and belly white. A breast band and flanks rusty brown.

Many males appear to retain the brown plumage similar to that of the female.

STATUS, DISTRIBUTION and HABITAT. Resident, subject to vertical movements; scarce in the Himalayas, more common south of the Brahmaputra. Eastern Nepal, Darjeeling, Sikkim, Bhutan, Arunachal Pradesh, the hills of Meghalaya south to the Mizo Hills (Koels), Nagaland and Manipur. In the Himalayas from c. 1500 to 3900 m, in Assam from c. 900 m to the highest summits. Reaches the foothills in winter. Affects dense undergrowth in humid forest and secondary growth, especially in the vicinity of streams and in damp, shady glens.

Extralimital. Burma and western Yunnan. The species extends to Szechuan, Fukien, the Indochinese countries, the Malay Peninsula and the Sunda Islands to Timor.

GENERAL HABITS. Mainly terrestrial. Keeps singly or in pairs in low undergrowth, in the same habitat as *Tesia cyaniventer* (1471). Forages on the ground, running about among the dead leaves and decaying tree-trunks, tail carried erect. Quiet and unobtrusive; usually undetected unless singing.

FOOD. Chiefly insects.

VOICE and CALLS. A rather short and pleasant song recalling that of *B. montana* (1640) without the characteristic robin-like ending. Alarm, a loud single piping note ending with a *tek-tek-tek* (Heinrich).

BREEDING. Season, early April to late July. Nest, an oval ball with the entrance high up on one side, compactly built with bamboo and other leaves, and skeleton leaves, bound together with long roots and green moss, lined with a first layer of rootlets or fine fern stems and an inner layer of skeleton leaves mixed with a few scraps of grass, bark and fibre. It is wedged in among orchid clumps, twigs in low thick bushes, or among the moss growing on tree-trunks or rocks — in dense damp forest with plenty of undergrowth. Eggs, 3 or 4, pale olive-green, sea-green or, rarely, pale olive-brown, almost completely covered with tiny, light reddish brown specks and freckles. Average size of 60 eggs 19.5 × 14.6 mm (Baker). Building of nest and incubation by both sexes. Incubation period unrecorded.

THRUSHES AND CHATS

209

MUSEUM DIAGNOSIS. See Field Characters. Males often breed in brown female-like dress and some may possibly never acquire blue plumage; this needs determining.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	58-63	c. 15	c. 26	{ (1) 38 mm
♀♀	55-61			{ (1) 31 mm

Weight (Sept.) 1 ♂ imm. 19; 1 ♀ 22 g—SDR.

COLOURS OF BARE PARTS. Iris brown. Bill dark brown, lower mandible yellowish. Legs and feet fleshy white to purplish fleshy.

1640. Whitebrowed Shortwing. *Brachypteryx montana cruralis* (Blyth)*Calliope? cruralis* Blyth, 1843, Jour. Asiat. Soc. Bengal 12: 929, 933

(Darjeeling)

Cf. Roonwal, M. L. & Nath, B., 1947, *Rec. Indian Mus.* 45: 321-8, Baker, FBI No. 488, Vol. 2: 17

Plate 88, fig. 5

LOCAL NAMES. None recorded.

SIZE. Sparrow —; length c. 13 cm (5 in.).

FIELD CHARACTERS. Male (adult). Entirely dark slaty blue, ashy on belly; lores velvety black; a long white supercilium.

x c. 1

Female. Above, dark olive-brown; lores and eye-ring rusty. Below, paler olive-brown, fulvous on belly, rufescent on under tail-coverts.

Many males breed in brown female-like plumage; they may be told from the female by the white supercilium.

STATUS, DISTRIBUTION AND HABITAT. Resident, subject to vertical movements, fairly common. The Himalayas from Garhwal (JBNHS 11: 471) east through Nepal, Darjeeling, Sikkim, Bhutan and Arunachal Pradesh, the hills of Meghalaya south of the Brahmaputra, Nagaland? and Manipur (*Rec. Indian Mus.* 46: 135). Breeds between 1500 and 3300 m, mostly above 2000 m; recorded in winter between 300 and 2400 m. Affects damp, shady forest of oak and rhododendron with undergrowth of bracken etc., and dense brushwood in ravines or in the vicinity of streams.

Extralimital. Burma, Yunnan and Szechuan. The species ranges east to Fukien, Formosa and the Philippines, south to Borneo and the Sunda Islands to Flores.

GENERAL HABITS. Mainly terrestrial. Solitary, skulking, shy and difficult to observe. Keeps in low bushes or among the heads of saplings and bamboos, or on the ground where it hops rapidly, pausing for a moment, then continuing — behaving much like a robin.

FOOD. Chiefly insects.

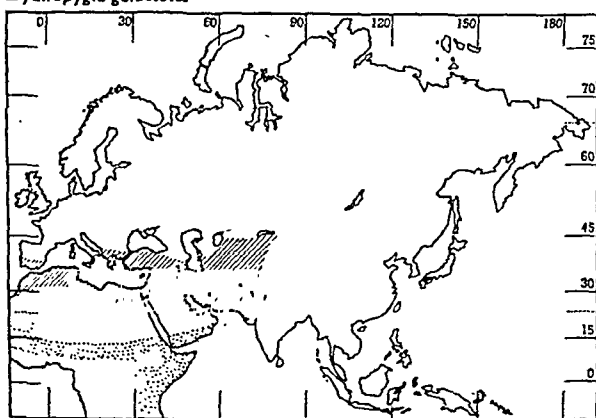

VOICE AND CALLS. Call-note, a quick *tek* accompanied by a flick of the wings. Alarm, a robin-like *tl-tl-tl-tl*. Song, variously described as 'a broken succession of very soft, very high-pitched notes in no recognizable pattern — just a broken, inconsequential rambling *see... see... see-ee* each note

THRUSHES AND CHATS

211

Confusingly like the Pale Brown and Rufous shrikes (*Lanius c. isabellinus*, 943, *L. c. phoeniceoides*, 942) on the wing, but the black-and-white-tipped rufous tail, spread out in flight and cocked upon alighting, are diagnostic.

STATUS, DISTRIBUTION AND HABITAT. Mostly an early autumn passage migrant en route to its winter quarters in Arabia and Africa. Pakistan east to Punjab (Jhang district) and northwestern India to Rajasthan (Jodhpur), N. Gujarat (Mt Abu, Deesa), Kutch and Kathiawar peninsula

Erythropgia galactotes

Distributional ranges

■ Breeding, ■ Winter
 ■ *E. g. familiaris* (1641). Other subspecies unnumbered.
 Dotted line: normal autumn 'extension' (passage) through India and Pakistan.

(Dwarka, Jasdan). Has strayed once to Ceylon in September (*Spolia Zeylanica* 30, pt. 2: 247-9, 1965). April records are restricted to Baluchistan and N.W.F.P. Breeds locally in Baluchistan (Chagai), and N.W.F.P. (Kohat). Affects dry scrub jungle, tamarisks and stony, broken country.

Extralimital. Extends to Lake Balkhash, Aral Sea and the Caucasus Mts. The species ranges west to Spain, Morocco, the Saharan savanna belt, and Ethiopia. Winters in southern Arabia and in the dry savannas of eastern Africa and southern Sahara.

MIGRATION. Recorded on breeding grounds from April to September. Autumn passage takes place mostly in September (first date 28 August, last date 11 October). Post-breeding dispersal may start in July. Spring passage in April and early May evidently by a different route almost entirely bypassing India. There is a record from Nasirabad (Baluchistan) on 1

210

TURDINAE

usually rising' (Lister); 'characterized by its compass of high and low notes, with odd sucking and popping noises thrown in' (Smythies); 'a pretty, short song of a few notes which, however, end up harshly' (Osmaston); 'a gentle merry little warble which might be syllabified as *hey did-dle did-dle the cat an'* (Proud).

BREEDING. Season, May to July. Nest, domed, made of moss and lined with rootlets, usually incorporated into the moss growing on rocks or tree-trunks; in most cases the lateral entrance-hole is parallel to the face of the rock or trunk concealed from view, giving effective camouflage to the nest. Eggs, normally 3, white. Average size of 31 eggs 22.7 × 16 mm (Baker). Sometimes brood-parasitized by *Cuculus poliocephalus*.

MUSEUM DIAGNOSIS. See Field Characters. Many males breed in brown female-like dress and may not acquire a blue plumage. They are, however, recognized by the white supercilium which the females lack. See Biswas, JBNHS 58: 653-4.

Young, head dark brown with pale centres to the feathers; back dark brown, rump tinged with yellowish, upper tail-coverts with a rufous wash. Throat and breast paler, each feather with a yellowish brown centre; belly yellowish brown.

SIZE. Bulbul —; length c. 18 cm (7 in.).

FIELD CHARACTERS. Above, sandy brown; a prominent whitish supercilium and a dark line through eye. Tail rufous with a dark brown sub-terminal band and broad white tips. Below, dull creamy white, breast more or less tinged with pale brown. Sexes alike.

212

TURDINAE

December and one from Quetta on 1 February suggesting that a few individuals may occasionally spend the winter in this area.

GENERAL HABITS. A confiding bird. Usually seen singly, running along the ground, hopping on to stones etc. with tail erect and wings partly drooping; tail fanned out and flicked up from time to time, sometimes almost touching back of head. Often perches on bushes, darting to the ground to take an insect. Resembles Indian Robin in many of its habits and behaviour.

FOOD. Insects (grasshoppers, caterpillars, beetles and butterflies recorded).

VOICE AND CALLS. Alarm-note given as *wutch, wutch* (Whitehead). 'A sweet song' usually uttered from the top of a bush.

BREEDING. Season, April to July. Nest, a rather large, loose, cup-shaped structure made of fine twigs with an inner layer of shredded grass stalks, lined with vegetable down and small feathers; may possibly use old nests of *Pycnonotus leucogenys* and *Turdoides caudatus* (cf. JBNHS 23: 365 and Baker, *Nidification* 2: 351). Nest usually placed in bushes within a metre from the ground. Eggs, 3 to 5, very pale grey profusely covered with greyish brown specks, blotches and spots, generally more numerous at the large end. Average size of 70 eggs 20.9 × 15.4 mm (Baker). Building of nest by both sexes, incubation by female, fed on nest by male (Dementiev). The birds get very excited when an intruder discovers the nest, following him closely while uttering their alarm-note, sometimes hovering in the air within a few feet.

Tail, × c. 1 (After Hartert)

Foot, × c. 1

Wing, × c. 1

MUSEUM DIAGNOSIS. See Field Characters.

Juvenile resembles adult but has broad, pale edges to tertials and wing-coverts, and very thin brownish edges to breast-feathers. Postnuptial moult in July and August.

Baker, FBI No. 542, Vol. 2: 91

Plate 88, fig. 7

LOCAL NAMES. *Gangula* (Nepal); *Gumfigera* (Bengal).

SIZE. Sparrow ±; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male (adult). Above, olive-brown, no white in tail. Lores black; a conspicuous white supercilium. Below, chin and throat scarlet bordered with a black line on sides of chin; a broad white malar stripe. Breast and flanks pale buffish brown; belly whitish.

Female like male, also with white supercilium, but throat white, sometimes faintly tinged with pink, without any black. Belly and under tail-coverts buff.

Male distinguished from Himalayan Rubythroat (1647) by the absence of black on breast. Female very similar to nightingale (1642) distinguished only by white supercilium; female Himalayan Rubythroat has a darker grey, not fulvous brown breast, contrasting with white belly and white-tipped tail.

STATUS, DISTRIBUTION AND HABITAT. Uncommon winter visitor. Assam, Nagaland, Manipur, all parts of Bangladesh and south to the Chittagong region, and eastern India from the Bhutan foothills, Bengal duars, Sikkim and Nepal [to west-central Nepal (Rand & Fleming, 1957)] and up to c. 1500 m (Dieselhorst, 1968) south through Bihar, Bengal, Orissa, eastern Madhya Pradesh and northeastern Andhra Pradesh (Godavari delta). Within this area, recorded as fairly common only in Hailakandi and Vishakhapatnam districts. West of this range, isolated examples recorded only in the Satpuras (date ?, SF 2: 413), Delhi (November, JBNHS 47: 280) and Bharatpur, Rajasthan (September, *Newsletter for Birdwatchers* 8(8): 7, 1967). Since then found to be a scarce but fairly regular visitor (on passage?) to Bharatpur, between September and December. Affects dense scrub in the vicinity of water, hedges near villages, underbrush along sides of country roads, long grass, sugarcane or reeds, and sometimes tea gardens.

Extralimital. Breeds in Siberia from the Ural Mts to Anadyr, Kamchatka and Hokkaido. Winters also through the northern Indochinese countries and southern China to Formosa and the Philippines.

Baker, FBI No. 540, Vol. 2: 87

Plate 88, fig. 6

LOCAL NAMES. *Bulbul* (Iran). The *bulbul* of Persian poetry and song.

SIZE. Bulbul —; length c. 18 cm (7 in.).

FIELD CHARACTERS. Above, uniformly brown, tail more rufous. A pale eye-ring. Below, throat, belly and under tail-coverts whitish. Sides of neck, breast and flanks pale brown. Sexes alike.

Resembles shortwings in carriage and movements.

STATUS, DISTRIBUTION AND HABITAT. Occasional visitor during migration: Western Baluchistan (Kacha and Robat in April — Christison, JBNHS 43: 481). Quetta once in October, once in April; also obtained there in February (JBNHS 31: 709). Has strayed to the Oudh terai in October (SF 4: 500). Affects bushes and gardens.

Extralimital. Breeds in Russian Turkestan, east to the Caspian Sea and south to Afghanistan and Iran. The species ranges west through Asia Minor to England, Spain and Morocco.

MIGRATION takes place mostly in April and early September.

GENERAL HABITS. Very secretive. Haunts low bushes, usually within a couple of metres from the ground. Feeds on the ground, hopping with tail partly erect and flicked from time to time.

FOOD. Chiefly insects.

VOICE AND CALLS. Very silent during migration. On breeding grounds utters a soft but loud *hweet* and a croaking *krrrr* in addition to its magnificent song. For description of the song see Witherby, 2: 188.

216

TURDINAE

Erithacus calliope

Distributional range

■ Breeding

□ Winter

MIGRATION. Noted in winter quarters from 1 October until the last week of April. On migration (?) recorded at Dehra Dun (Seeborn coll.), Sikkim 26 September (JBNHS 1867: 453) and Sikkim, 4500 m on 19 September (Stevens). A strayed bird was recorded on board a ship 'a little south of Bombay' in November (SF 9: 405).

GENERAL HABITS. Usually found singly. Feeds mostly on the ground, but also among low bushes and reeds. Has a habit of flicking its cocked and semi-expanded tail over the back. Carriage and movements — running about rapidly in short spurts — also similar to those of the Himalayan Rubythroat (1647) and the Bluethroat (1645), qq.v.

FOOD. Insects and their larvae.

VOICE AND CALLS. Alarm-note, a loud rattling. Call-note a harsh *klrr* rather like Jungle Babbler's, sometimes followed by pleasant stretches of song. 'A plaintive whistling noise' given by male (JBNHS 1894: 49) may refer to this attempt at song in the winter quarters.

MUSEUM DIAGNOSIS. See Field Characters and Key to the Species. First winter birds are distinguished by ochraceous tips to greater coverts.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor, locally common, scarce south of lat. 20°N. Pakistan and India from the Himalayan foothills

Erithacus svecicusBreeding (*abbotti*) Numerals, winter specimens identified1 *svecicus* (1644), 2 *pallidogularis* (1645), 3 *abbotti* (1646), 4 *saturation* (1646a).

THRUSHES AND CHATS

219

much reduced. First-winter female whiter below with large, dark brown spots and streaks on breast and sides of throat.

In both sexes black-tipped orange-chestnut tail conspicuous in flight and when spread out and cocked.

STATUS, DISTRIBUTION AND HABITAT. Common winter visitor. Pakistan from N.W.F.P. to Sind (where it is the prevailing race), central and coastal Makran, and India south at least to Bombay, Londa (Koelz, JBNHS 43: 14, subspecies not determined) and Nagpur, and east to the Bhutan foothills and Jalpaiguri duars. An abundant passage migrant in the western Himalayas west of Nepal; recorded as high as 4800 m (Henderson, 1873, *Lahore to Yarkand* p. 214, cf. Hellmayr, 1929: 115). Affects reeds, clumps of grass, tamarisk and other bushes near water, bushes around well-watered cultivation, and fields of maize, corn, sugarcane, etc. Also dry tidal mud-flats on the sea coast with salt-marsh vegetation.

Extralimital. Breeds from the southern Urals and Transcaspiia to Kirghizstan and Tadzhikistan. Winters west to Iran.

MIGRATION. First autumn migrants arrive in Baltistan and Himalayan foothills in early September (first dates 4 and 7 Sept.); migrants already noticed in the last week of August in Kohat (ssp.?). In Kashmir Valley passage is at its heaviest in the second part of September and early October. Northward movement begins in early March (Chagai, 4 March) and lasts until mid May (Himalayan foothills, HW) and end of May (Kohat, Whitehead). Most birds however have left the Peninsula by the first week of April. These data certainly include the other subspecies, *svecicus*, *saturation* and *abbotti*, as well.

GENERAL HABITS. Mainly terrestrial; skulking, shy and unobtrusive, thus often escaping observation. Keeps singly, like other robins and chats, feeding on damp ground under bushes with tail cocked and spread out, stopping every now and again to pick up a morsel. When alarmed or suspicious, slinks swiftly to cover with quick mincing steps, head lowered furtively, body dipped forward and tail cocked over back, sometimes nearly doubled over, seeming then as if the bird would topple heels over head; erects itself every couple of metres or so to have another look at the intruder before the next spurt. When flushed, usually dives behind another bush almost immediately, giving no more than a fleeting glimpse of the expanded rufous tail as the only clue to its identity. Roosts with swallows, wagtails, etc. in reed-beds and bushes in or near water.

FOOD. Insects: beetles, ants, caterpillars, cutworms, etc.

VOICE AND CALLS. As in 1646.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. Differs from *svecicus* by paler blue colour of plastron. Upperparts often paler and somewhat greyer. Differs from *abbotti* in being paler above and having less black at lower end of blue plastron.

MEASUREMENTS	Wing	Bill (from skull)	Tarsus	Tail
♂♂	70-75	15-16	25-27	55-58 mm
♀♀	70-74	15-16	—	— mm

south to Ceylon (cf. Phillips, W. W. A., *Spolia Zeylanica* 28: 190) and Andaman Islands (cf. Meinertzhagen, *Ibis* 1927: 591), and east to Assam (Stevens, JBNHS 23: 260). Given for all parts of Bangladesh as *abbotti* by Rashid, but subspecific identification virtually impossible in winter and these are probably *svecicus* or *saturation* since *abbotti* and *pallidogularis* appear to winter farther west. Affects sugarcane, cotton fields, grass jungle, reeds, bushes near water, gardens and fallow fields.

Extralimital. Breeds in northern Eurasia from Scandinavia to Chukotskiy Peninsula and western Alaska. Winters in North Africa, Iraq, Iran, the Indochinese countries and southern China.

MIGRATION. On spring and autumn passage throughout the Himalayas, mostly in April and September.

GENERAL HABITS, FOOD AND VOICE. As in 1645.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. See Key to the Subspecies. For details of plumages see Dementiev, translation Vol. 6, p. 696.

1646. Ladakh Bluethroat. *Erithacus svecicus abbotti* (Richmond)*Cyanecula abbotti* Richmond, 1896, Proc. U.S. Nat. Mus. 18: 484

(Nubra Valley, Ladak)

Baker, FBI No. 539, Vol. 2: 86

LOCAL NAMES. As in 1645.

SIZE. Sparrow \pm ; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 1645, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Summer (breeding) visitor, locally common. Gilgit, Baltistan, Ladakh, northern Kashmir (Fashgam, Zaskar Range, Liddar Valley) and Spiti (Koelz, *Ibis* 1937: 91), from 2600 to 3600 m. Affects bushes on swampy ground, especially patches of *Hippophae* and *Lonicera* in river beds and by streams. Winter range very little known: recorded in winter in Gujarat (Sálim Ali, JBNHS 52: 767), and at Nasirabad (Rajasthan) and Tista Bridge (northern Bengal) [Meinertzhagen, *Ibis* 1927: 591]. Habitat in winter as in 1645.

MIGRATION. Identified on passage through Kashmir in early May.

GENERAL HABITS AND FOOD. As in 1645. For display see below.

VOICE AND CALLS. Normal call-note a harsh *chur-r* or *chuck*, *chuck* like Blyth's Reed Warbler. Alarm-note *tick tick*. Song in breeding season variable, reminiscent of the nightingale's but shorter, less rich; usually uttered from the topmost twig of a bush with tail expanded. Occasionally flies up in the air and sings on the wing while descending, in the manner of a pipit. Song sometimes also heard in winter quarters in April from belated emigrants.

BREEDING. Season, May to August. Nest, a deep cup of grass, rootlets and leaves lined with finer grass and fibres; placed on the ground, well concealed in grass at the base of a bush. Eggs, normally 4, occasionally 3 or 5, pale olive-green, either plain or lightly suffused with pale rufous markings, especially at the broad end. Average size of 22 eggs 19.9 × 14.8 mm and of 20 eggs 19.1 × 14.3 mm (Osmaston); of 36 eggs 19.1 × 14.2 mm (Baker). Other particulars of breeding biology not recorded.

MUSEUM DIAGNOSIS. Differs from *pallidogularis* in being darker brownish above, in having the blue of plastron darker and the star smaller; the latter may vary from white to rufous-and-white or entirely rufous. Birds with white star appear to predominate (Hellmayr, 1929; Osmaston, *Ibis* 1925: 683). Bill averaging longer (17.5 mm — Vaurie) than in other races occurring in our territory (av. 16 mm). For details of plumage see Richmond, 1895, Proc. U.S. Nat. Mus. 18: 484.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

SIZE. Sparrow ±; length c. 15 cm (6 in.).

THRUSHES AND CHATS

223

scrub, hedgerows and cultivation affording sufficient cover; also marshy places.

Extralimital. Breeds also in Russian Turkestan north to Ala Tau, south to the Manasarovar region, W. Tibet (Sálim Ali, JBNHS 46: 299). For an excellent account of the breeding biology in the Tien Shan see Gavrilov, E. I. & Kovshar, A. F., 1970, JBNHS 67: 14-25.

MIGRATION. Recorded on breeding grounds from mid April until the end of September. Passage noted at mid elevations from Chitral to central Nepal Valley from early March till the third week of April, and in late September and October.

GENERAL HABITS. Solitary outside the breeding season. Usually very secretive. Feeds on the ground; ventures into the open but darts to cover on the slightest alarm. In the breeding season commonly perches in exposed situations to sing. Stance while singing upright, with tail loosely depressed (normally not cocked) and wings partly drooped. Otherwise actions and behaviour very similar to Bluethroat and typically robin-like: hops on longish legs or runs swiftly in spurts with tail erect and flicked up from time to time, wings drooping at sides. For display, see 1649.

FOOD. Chiefly insects and caterpillars; also spiders and molluscs. Lizards fed to young recorded.

VOICE and CALLS. A characteristic, loud, shrill but attractive song likened to an accented's or Pied Bushchat's, of three or four seconds' duration; usually given from the top of a shrub or prominent rock. Singing commences at early dawn and continues well into the dusk. Song repeated almost continuously — to point of monotony — for half to one hour at a time, the scarlet throat-patch scintillating with the pulsations and particularly eye-catching in poor light (SA). See also 1648. Call-note, a harsh *ké* like *Turdoides* (SA). Alarm-note near nest, *it... it... it...* similar to Black Redstart's (Desfayes).

BREEDING. Season, end of May to beginning of August. Double-brooded. Nest, usually domed with a large entrance on the side near the top, 'rather like a coconut with a good slice taken diagonally off a top quarter' (Bates & Lowther); sometimes a very deep cup in which the tail of the sitting bird nearly touches its head. The material consists entirely of dry grass with a lining of finer grass. Site: well concealed under shrubs, in a tuft of rank herbage among rocks and grass, or in patches of furze or juniper usually near their outer edge, and generally within c. 60 cm from the ground. Eggs, normally 4, occasionally 3, blue-green with a faint ring of reddish freckles at the large end. Average size of 100 eggs 21.6 × 15.4 mm (Baker); of 9 eggs 21 × 15.3 mm (BBO). Incubation chiefly by female; period undetermined. Both parents feed the young. Commonly brood-parasitized by *Cuculus canorus*.

MUSEUM DIAGNOSIS. Differs from *tschebaiewi* by lack of the white malar stripe. See also 1649. For distinction from *confusus* see 1648. Males in female-like plumage can be told by white base of tail. First-winter birds distinguished by pale tips to greater coverts and tertials, the male further by rusty-tinged tips of rectrices. Young greater coverts and tertials, the male further by rusty-tinged tips of rectrices. Young greater coverts and tertials, the male further by rusty-tinged tips of rectrices. Young greater coverts and tertials, the male further by rusty-tinged tips of rectrices.

222

TURDINAE

FIELD CHARACTERS. Male (adult). Above, brownish slaty; forehead and supercilium white. Wings brown; tail blackish brown with white base and tips. Below, chin and throat scarlet; sides of throat and breast jet black; belly and under tail-coverts white.

Female. Above, grey-brown; a short supercilium and eye-ring whitish. Tail blackish brown with white tips. Below, breast smoky grey fading to whitish lower down. For distinction from the Siberian species *E. callise*, see 1643.

STATUS, DISTRIBUTION and HABITAT. Summer (breeding) visitor, fairly common. Baltistan, Gilgit, Kagan Valley, Kashmir, Pir Panjal to upper Suru Valley, Kishtwar, Zaskar, Rhotang range, east to Simla, Kumaon and central Nepal (Lowndes, JBNHS 53: 32; Desfayes, Thare Pati 3300 m, sight record of breeding bird). Recorded at 4500 m in Nepal in winter by Rand & Fleming. Breeds between 2700 m [Kagan Valley, *vide* Whitehead,

Luscinia pectoralis confusa Hartert, 1909, Vög. pal. Fauna 1: 740 (Sikkim)
Baker, FBI No. 544, Vol. 2: 93

LOCAL NAMES. None recorded.

SIZE. Sparrow ±; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 1647, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Common summer (breeding) visitor. Eastern Nepal (Biswas, 1961; Diesselhorst, 1968) and Sikkim. Ludlow's Bhutan record, *Ibis* 1937: 272, is questioned by the author himself, ibid. 1944: 186. Intergrades with *pectoralis* in central Nepal. Breeds between 3600 and 4900 m. Affects dwarf scrub well above timber-line, especially the bare screes and boulder-strewn slopes in the alpine zone. Winters from the foothills of Darjeeling, Sikkim, Bhutan and Arunachal Pradesh (Hume, SF 11: 199) south through northern Bengal, Meghalaya, Cachar and Manipur (Baker, FBI), and the hills of Bangladesh south to the Chittagong ranges (Rashid). In this season affects dense scrub and long grass jungle.

MIGRATION. Little known. Periods apparently as in 1647.

GENERAL HABITS. As in 1647. Behaviour very Bluethroat-like. For display see 1649, under Voice and Calls.

FOOD. Mostly insects, some caterpillars and (once) grit (GD).

VOICE and CALLS. Song consists of some pure whistled notes mixed with many harsh ones, rather similar to that of the Bluethroat but not so rich, at times reminding one of the European Hedge Sparrow or of *Prunella strophiala* (1782) (Diesselhorst). For other calls see 1647 and 1649.

BREEDING. Season, June to August; in the latter month mostly late broods; fledglings being fed by parents observed in early September. It is not certain if all females have a second brood. Nest and eggs as in 1647. Only females have an incubation patch (Diesselhorst).

MUSEUM DIAGNOSIS. Male, like *pectoralis* but grey of upperparts darker in summer, a deep blackish slate; white on forehead wider. In autumn, fringes of upperparts darker compared with *pectoralis*.

Female, not always certainly distinguishable from *pectoralis*; in summer ear-coverts, sides of throat, and breast darker grey and contrasting more with white of throat and belly.

THRUSHES AND CHATS

225

Juvenile, dark warmer brown above; the spotting below heavier and darker than in *pectoralis*. (For distinction from *tischebaiewi* see 1649.) Juvenal plumage is worn for at least a month after the young has become full-fledged. Postnuptial moult takes place in September.

MEASUREMENTS. As in 1647.

Weight 9 ♂♂ (July-Sept.) 21.5-25.2; 4 ♀♀ (July-Sept.) 21.7-23.7; 8 juv. (Aug.-Sept.) 22-24.7 g (GD).

COLOURS OF BARE PARTS. As in 1647.

1649. **Tibetan Rubythroat.** *Erithacus pectoralis tischebaiewi* (Przevalski)

Calliope tischebaiewi Przevalski, 1876, Mongol. i Str. Tangut 2: 44 (Kansu)
Baker, FBI No. 545, Vol. 2: 94

LOCAL NAME. *Dao gulugajao* (Cachari).

SIZE. Sparrow \pm ; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 1648 but with a conspicuous white moustache in male and an indication of same in female.

STATUS, DISTRIBUTION AND HABITAT. Summer (breeding) visitor, locally common. Breeds in Tibet, south to extreme eastern Ladakh [between Ralma and Tsaka La (Osmaston, JBNHS 31: 984 and *Ibis* 1925: 685)], northern Bhutan and northern Arunachal Pradesh both north and south of the main range (Ludlow, *Ibis* 1937: 272, 1944: 186 and 1951: 560). Breeds between 3900 and 4500 m. Affects juniper and rhododendron scrub and especially Tibetan furze (*Caragana*), often near streams. Winters from the foothills of eastern Nepal (Fleming & Traylor, *Fieldiana* 35: 545), northern Bengal, Bhutan, Arunachal Pradesh to the Mishmi hills, south through Assam and Bangladesh (Rashid). Arrives in September (first date 6 Sept.), leaves in March-April (last date 24 April) [Stevens]. In this season affects marshes and dense scrub.

EXTRALIMITAL. Tibet, Sikang, Kansu, Szechuan and northern Yunnan. Not known to winter in Burma though presumably does so.

MIGRATION takes place mostly in April and October. Recorded on passage in April in Kashmir (Meinertzhagen, *Ibis* 1927: 589), Nepal (Fleming & Traylor, *Fieldiana* 35: 545) and Sikkim (Mandelli).

GENERAL HABITS AND FOOD. As in 1648.

VOICE AND CALLS. Alarm-note given as a long-drawn *süü süü* (Schäfer); see also 1647. Male sings from a prominent twig, shifting its body in every direction when excited and flying in ecstasy from bush-top to bush-top. During display, head is held high, neck and red throat-patch puffed out, wings drooping at sides, tail fanned and held at a 45° angle, thus flashing its white base (Schäfer); cf. 1647.

BREEDING. As in 1648.

MUSEUM DIAGNOSIS. Male distinguished from *pectoralis* and *confusus* by the broad white moustache; white at base of tail less extensive. White over base of bill not wider than supercilium as in *pectoralis*, but less wide than in *confusus*.

Female may also show white moustache, and some have crimson chin; whitish supercilium always present (sometimes almost absent in *confusus*) but not every specimen can be differentiated. Young (juvenile) very distinct: Upperparts

THRUSHES AND CHATS

227

Erithacus brunneus

▨ Breeding

■ Known winter range

MIGRATION. Arrives on breeding grounds in May, leaves in September; downward movement begins in August. Passage in the foothills lasts till the beginning of October; passage in the Peninsula mostly in October. Arrives in winter quarters in southern India and Ceylon in October, remains until April, a few individuals until May. Northward movement chiefly in April. Migration follows mostly in the forest-clad Western Ghats; in the Eastern Ghats recorded only in spring.

GENERAL HABITS. Terrestrial, forest-haunting and unobtrusive. Keeps singly, skulking in heavy undergrowth among the tangled stems and lowest branches, dropping to the ground and hopping along swiftly to snatch an insect, and back again. Flirts its tail like a redstart and spreads and jerks it up from time to time, with occasional flicks of the wings. When disturbed flies up into a low tree but descends almost immediately; otherwise seldom shows itself except in the breeding season when males come up to exposed bush-tops etc. to sing.

FOOD. Insects.

VOICE AND CALLS. Alarm-notes a guttural *tuck-tuck* and a high-pitched *tue* when near nest, punctuated by *chr-r*. Song consists of a few introductory notes, at first soft then growing louder, followed by a rapid trill or jumble of notes; rendered as *jerri-jerri-jerri quick-quick-quick* (Magrath). Also described as commencing with a loud *peep*, slowly and deliberately repeated 3 or 4 times in ascending scale, followed by an explosive trill of 4 or 5 quick-repeated sweet notes ending abruptly. Usually sings in the undergrowth or in the crowns of rhododendrons or pines; often from an exposed

226

TURDINAE

blackish brown, with cream spots and streaks (in *confusus* warm brown, in *pectoralis* greyish brown, with ochraceous spots and streaks); underparts very heavily spangled, as in *confusus*, and darker still (Titchhurst, *Ibis* 1940: 330). Colour of young, however, is variable as noted by Diesselhorst (1968: 289) for *confusus*.

MEASUREMENTS

	Wing	Tarsus	Tail
♂ ♀	73-81	33	58-66 mm (Baker)
♂ ♂	74-83	—	— mm
♀ ♀	68-71	—	— mm (HW)

Bill from skull 15-17 mm

COLOURS OF BARE PARTS. As in 1648.

1650, 1651.¹ **Indian Blue Chat.** *Erithacus brunneus* (Hodgson)

Larvicora brunnea Hodgson, 1837, Jour. Asiat. Soc. Bengal 6: 102 (Nepal)

(Teikhubama, Naga Hills)

Larvicora wickhami Baker, 1916, Novit. Zool. 23: 298 (Chin Hills)

Baker, FBI No. 484, Vol. 2: 14

Plate 88, fig. 11

LOCAL NAME. *Manzhil pho* (Lepcha).

SIZE. Sparrow \pm ; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male (adult). Above, slaty blue. A conspicuous white supercilium; lores and cheeks black. Below, throat, breast and flanks bright chestnut or ochraceous; throat bordered with black. Centre of belly and under tail-coverts white.

Female. Above, olive-brown. Below, whitish washed with ochraceous on breast and flanks. Young dark brown with buff spots.

STATUS, DISTRIBUTION AND HABITAT. Common summer (breeding) visitor, scarce east of Nepal. The Himalayas from N.W.F.P. (Safed Koh) east to Bhutan, Arunachal Pradesh (Tsangpo gorge—Ludlow, *Ibis* 1951: 558), Nagaland (Koelz, loc. cit.), Manipur ?, and in the Cachar and Khasi hills, where very rare (Baker, JBNHS 8: 200 and 17: 788). Breeds between 1600 and 3300 m. Affects dense undergrowth of rhododendron, ringal bamboo, *Berberis* and other bushes in open oak or conifer forest. Winters in Ceylon (especially in the hills up to 2100 m), in the hills of southwestern India (western Mysore from Londa south to the Ashambu hills of Kerala), in the hills of Assam and Bangladesh and, occasionally at least, in the eastern Himalayan foothills [Sikkim, Darjeeling (Stevens, Mackintosh)]. Assam population apparently resident. In winter frequents almost exclusively evergreen forest; partial to *Rubus*, *Pandanus* and *Calamus* brakes along shady forest streams and in dank ravines; also cardamom and coffee plantation.

EXTRALIMITAL. Extends to Burma (Chin Hills), northwestern Yunnan, Szechuan and southwestern Kansu.

¹ *L. wickhami* was described from a single unsexed specimen which could be a male in 'retarded' plumage, or an old female. We follow Suresmann (Mitt. Zool. Mus. Berlin 24: 227, 1940) in considering it a synonym of *brunneus*.

228

TURDINAE

situation such as the top branches of a fir. Song period, mid April till mid July with a resumption in August and September; may sometimes also be heard in winter quarters until December, but bird very silent thereafter.

BREEDING. Season, May to July. Nest, a cup of moss, dry grass, dead leaves and lichen, lined with fur, hair, fine rootlets and often a few feathers; placed on the ground, generally on a bank, well concealed between roots, in a cavity among stones, etc. Eggs, normally 4, occasionally 3 (once 5), blue, unspotted. Average size of 5 eggs 20.4 × 14.8 mm (Osmaston); of 50 eggs 20 × 14.6 mm (Baker). Incubation apparently by female alone; nest-feeding by both sexes. Incubation period undetermined. Often brood-parasitized by *Cuculus micropterus*. For details of breeding in captivity see *Agricultural Magazine* 75: 265-70, 1969.

MUSEUM DIAGNOSIS. See Field Characters; for details of plumages Whistler, JBNHS 38: 283. Postnuptial moult complete, in August and September; summer and winter plumages alike, no spring moult. Young spotted. Postjuvenal moult of body-feathers, presumably about August-September.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♂	72-80	15-17	c. 26	{ 45-53 mm 44-50 mm (BB, HW, Koelz)

(Phulbari, Garo Hills)

Not in Baker, FBI

Plate 88, fig. 10

LOCAL NAMES. None recorded.

SIZE. Sparrow \pm ; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male (adult). Above, bluish slaty. Forehead, lores, round the eye, cheeks and sides of throat black; a whitish patch on sides of neck. Upper tail-coverts black; tail blackish brown, inner rectrices (except central) white at base. Below, chin, throat and breast flame-coloured widely bordered with black on sides. Belly white washed with buff, flanks brownish buff.

Female. Above, olive-brown. Below, throat pale ochraceous. Sides of head, neck, breast and flanks ochraceous brown. Belly white more or less washed with ochraceous; under tail-coverts ochraceous.

THRUSHES AND CHATS

229

Male, first-year. Above, like adult male. Below, like female but paler, less ochraceous; no black.

STATUS, DISTRIBUTION and HABITAT. Rare winter visitor; presumably regular but overlooked. One record: Garo Hills, 18 January 1950 (Koelz, loc. cit.). Affects dense bushes.

Extralimital. Breeds from Chumbi Valley (Brit. Mus. coll.), southeastern Tibet (Ludlow, *Ibis* 1944: 187 and 1951: 560) and northwestern Yunnan north through Szechuan to southwestern Kansu and Shensi, from c. 2800 m (Tibet) to 3700 m (Szechuan). On breeding grounds affects dense thickets of bamboo, rose and barberry in valley bottoms. May be expected to breed in northern Arunachal Pradesh.

GENERAL HABITS. An arant skulker; keeps to the densest thickets. Behaves more like a blue chat than a rubythroat.

FOOD. Probably insects.

VOICE and CALLS. Alarm-note resembles that of *Erithacus cyanurus* [1655] (Ludlow). Song unknown.

BREEDING. Unknown.

MUSEUM DIAGNOSIS. See Field Characters. Young spotted; differs from that of *E. pectoralis* in the more uniform and darker colour of upperparts and absence of white tip to tail. For distinction from *E. obscurus* (extralimital) see Goodwin, D. & Vaurie, C., 1956, *Bull. Brit. Orn. Cl.* 76: 141-3, and Ripley, S. D., 1957, *Poistilla* 37: 1-3.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
12 ♂♂	69-73	16-17	26-28	48-53 mm
10 ♂♂	64-71	15-17	—	53-58 mm

(Dauria, southeastern Transbaikalia)

Baker, *FRI* No. 483, Vol. 2: 12

Plate 88, fig. 12

LOCAL NAMES. None recorded.

SIZE. Sparrow ±; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male (adult). Above, slaty blue. Lores and cheeks black. Below, white bordered with black on sides of throat, bluish slate on flanks. Pale flesh-coloured longish legs noticeable.

Female. Above, olive-brown, tinged with rufous on upper tail-coverts and tail. A pale buff eye-ring. Below, throat and centre of belly white; sides of throat, breast and flanks tinged with buff and scalloped with pale brown.

x c. 1

THRUSHES AND CHATS

231

Female. Above, olive-brown, bluish on rump and tail. A pale eye-ring. Below, as male but sides of throat grey-brown; flanks orange.

First-year male similar to female.

STATUS, DISTRIBUTION and HABITAT. Common altitudinal migrant. The western Himalayas from Safed Koh and Gilgit to Garhwal; very common in Kashmir. Breeds between 2700 and 3600 m; winters between c. 2600 and 1200 m, occasionally down to c. 750 m. Affects undergrowth in open forest of oak, pine, fir, birch or rhododendron, and thickets of barberry, *Viburnum*, etc. along edges of heavy forest. In winter frequently to be seen on roadside wire fences in quiet wooded hill-stations.

Erithacus cyanurus

Distributional ranges

pallidior (1654). rufilatus (1655). Winter

MIGRATION. Vertical movements very leisurely. Downward movement noted in September at 1800-2400 m but arrives at lower elevations (c. 1200 m) only in November. Upward movement begins early in March, few birds being seen at winter levels in April.

GENERAL HABITS. As a rule very shy and secretive. Hunts in shrubbery and low trees as well as on the ground, catching insects while hopping about like a robin or by launching sorties in the air after them. 'Very flycatcher-like in its movements' (Stanford). Strongly reminiscent also of Pied Bush Chat perching fairly upright on a low branch, flying down to the ground momentarily to pick up a morsel and back again to another perch. Constantly twitches wings and flicks tail open and shut, also very like bush chat. Male has been observed to 'freeze' on its perch with beak pointing upwards, and remain so all the time the observer was searching for the nest, although only three or four metres away (HW).

230

TURDINAE

STATUS, DISTRIBUTION and HABITAT. A straggler in winter and during migration. Haldibari duars, Bengal, 18-February 1932 (Ingis coll., Brit. Mus.); Manipur, a party in April (Hume).¹

Extralimital. Breeds in southern Siberia from the Altai to Amurland, Japan and northern China. Winters in Burma, Thailand, the Indochinese countries, southern China, Sumatra, Borneo and the Philippines.

MIGRATION. Recorded in Burma from October to April.

GENERAL HABITS. Mainly terrestrial. Found singly or in pairs, perhaps in small parties when migrating. Very secretive. Hops about on the ground in dense cover, quivering the tail up and down in a peculiar way.

FOOD. Insects.

VOICE and CALLS. Alarm-note a rapid *chuck-chuck-chuck*.

MUSEUM DIAGNOSIS. See Field Characters; for details of moults and plumages. (Dementiev).

MEASUREMENTS

	Wing	Bill (from skull)	Tail
10 ♂♂	70-76		
2 ♀♀	68, 71	16-17	47-50 mm
			(Dementiev)

Tarsus 25 mm

Weight 2 ♂♂ 14, 16 g (Dementiev).

COLOURS OF BARE PARTS. Iris dark brown. Bill: upper mandible blackish horny; gape and lower mandible bluish or livid white, dusky at extreme tip. Legs and feet pale fleshy white (Hume).

Ianthia cyanura pallidiora Baker, 1924, *Fauna Brit. India*, Bds. 2: 101 (Simla) Baker, *FBI* No. 550, Vol. 2: 101

LOCAL NAMES. None recorded.

SIZE. Sparrow ±; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male (adult). Above, dark blue. Forehead, supercilium, shoulder-patch and rump sky blue. Below, centre of throat, breast and belly sullied white. Sides of throat dark blue; flanks orange-ochraceous.

¹ A specimen in the Pinwill coll. (Brit. Mus.) is labelled Simla but 'Simla is written in such a way that it evidently was not written at the time though it is Pinwill's writing' (Hume). It was taken at Hazara in June (JBNHS 18: 197) certainly one from Narkanda, c. 35 km NE. of Simla (von

232

TURDINAE

FOOD. Insects.

VOICE and CALLS. Alarm-notes given as a throaty *prot* or *tok* and a mournful *phoeu* (Whitehead, HW). Agitated notes, as when nest precincts intruded, a sharp *kek*, *kek* sometimes followed by a whistled *traveet* (SA). Song short, of three or four notes, the first and last on the same tone, the middle ones lower (BBO); has been rendered as *pray did he then?* See also 1655.

BREEDING. Season, May to July. Nest, a cup of moss, grass, rootlets and dead leaves lined with soft grass, hair (often musk deer's) or wool; placed in holes in banks or very steep slopes, among roots of fallen trees, or sometimes in hollows in decayed stumps. Eggs, 3 to 5, generally 4, white, usually freckled at the larger end with pink. Average size of 60 eggs 17.8 × 13.5 mm (Baker). Once brood-parasitized by a cuckoo 'apparently *saturatus*' (Davidson, *Ibis* 1898: 24). Incubation by female (only?), fed by male. Period unrecorded. Tending of young by both parents.

MUSEUM DIAGNOSIS. See Field Characters. Differs from *rufilatus* in being paler. Blue of back may vary from cyan to deep purplish blue; amount of white in blue supercilium variable, usually present, sometimes lacking. Males often breed in female dress but differ by darker colour, darker blue upper tail-coverts and more olive-grey, less buffy on sides of throat. In Kashmir blue males noted as being the exception (Davidson, *Ibis* 1898: 24). Plumage of young spotted.

MEASUREMENTS. As in 1655.

Weight 5 ♂♂ (Nov.) 13.3-15.3; 1 ♀ (Nov.) 14 g (RAP). 11 ♂♀ (Apr.-May) 11-14 (av. 12.8) g — SA.

COLOURS OF BARE PARTS. Iris dark brown. Bill and feet black (Abbott).

1655. Eastern Redflanked Bush Robin. *Erithacus cyanurus rufilatus* (Hodgson)

N.(mura) rufilatus Hodgson, 1845, *Proc. Zool. Soc. London*: 27 (central and northern regions of hills, Nepal) Baker, *FBI* No. 549, Vol. 2: 99 Plate 88, fig. 14

LOCAL NAME. *Manzhil-pho* (Lepcha).

SIZE. Sparrow ±; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 1654, q.v.
STATUS, DISTRIBUTION and HABITAT. Common altitudinal migrant. From western Nepal east through Sikkim, Bhutan and Arunachal Pradesh. Breeds between 3000 and 4400 m, optimum zone 3500-4000 m. Affects forest of spruce, pine or birch with scanty undergrowth, or dense rhododendron bushes in open forest; avoids pure deciduous stands, and scrub above timber-line. Winters at lower altitudes down to the foothills, and occasionally as high as 3800 m (November — Meinertzhagen); optimum zone 1500-2100 m. Also recorded in winter south of the Brahmaputra in the Khasi and Cachar hills and Manipur (possibly visitors from western China breeding grounds?).

x c. 1

THRUSHES AND CHATS

233

Extralimital. Breeds in the mountains of western China north to Kansu and Shensi. Winters south to the northern Indochinese countries.

MIGRATION. In winter quarters from November to April (in the Chin Hills till early May).

GENERAL HABITS. As in 1654.

FOOD. Insects and caterpillars (GD).

VOICE AND CALLS. Alarm-notes *huu huu* and *tack tack* (Schäfer). A short song rendered as *tü trü tü trü* or *ty tür tür* (GD). See 1654 for further details. Song period, mid April till end of June (Proud). Song intensity diminishes rapidly after egg-laying, hardly any song being heard in the third week of June (GD).

BREEDING. As in 1654.

MUSEUM DIAGNOSIS. Differs from *pallidior* in being darker. Only a small percentage of breeding males are in blue plumage, most of them being in brown plumage (yet recognizable by blue rump) [GD]. Blue plumage apparently not acquired before two years old. Young spotted; postjuvinal plumage similar to that of adult female.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	*Tail
♂♂	78-87	13-15	24-27	65-70 mm
♀♀	76-83	13-16	24-27	56-65 mm

(Mayr, BB, NBK, Stres.)

Weight 8 ♂♂ (Nov.-Dec.) 13.6-15.5; 10 ♀♀ (Nov.-Dec.) 12-14.6 g (RAP, SDR). 9 ♂♂ (breeding) 12.2-16; 2 ♀♀ (breeding) 14.2, 16.7 g (GD).

COLOURS OF BARE PARTS. Iris brown. Bill horny brown or black. Legs, feet and claws blackish brown; soles whitish.

1656. Japanese Blue Chat. *Erithacus cyaneus cyaneus* (Pallas)

Metacilla Cyaneus Pallas, 1773, Reise Russ. Reichs 2: 709 (Yenisei)
Baker, FBI No. 548, Vol. 2: 98

LOCAL NAMES. None recorded.

SIZE. Sparrow ±; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 1654 but supercilium white.

STATUS, DISTRIBUTION AND HABITAT. Accidental winter visitor. One record: North Cachar (Baker, loc. cit.).

Extralimital. Breeds in Siberia west to Finland, east to Kamchatka and Japan. Winters mostly in southern China, Formosa and the northern Indochinese countries.

GENERAL HABITS, FOOD AND VOICE. As in 1654.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. Distinguished from the Himalayan races by its white supercilium (r. blue) and cream-coloured underparts (r. greyish white).

Female differs in being browner above, cream-coloured below and having the lores paler (Scully).

THRUSHES AND CHATS

235

FIELD CHARACTERS. Male (adult). *Above*, crown and upper back olive-brown. A yellow supercilium and a black band from lores through eyes and cheeks. Scapulars, sides of back and rump orange. Wings olive-brown. Tail orange, central rectrices and terminal band black. *Below*, entirely orange with narrow, dusky, crescent-shaped markings, sometimes obsolete or absent.

Female. *Above*, olive. An ill-defined yellowish olive supercilium and a buff eye-ring. Whole underparts ochre-yellow.

STATUS, DISTRIBUTION AND HABITAT. Altitudinal migrant, moderately common. Kumaon (where intergrading with *whistleri*), Nepal, Darjeeling, Sikkim, Bhutan and Arunachal Pradesh (Ludlow, *Ibis* 1944: 188), thence south through Nagaland, Manipur and the Cachar and Khasi hills (scarce south of the Brahmaputra). Breeds between 3000 and 4600 m, optimum zone 3600-4200 m, above c. 1800 m south of the Brahmaputra. Winters from c. 3000 m down to the foothills (rarely), mostly between 1400 and 2000 m. Affects dense rhododendron in open conifer forest (Arunachal Pradesh), rhododendron, juniper and birch above timber-line, boulder-strewn slopes with sparse scrub growth, dwarf barberry thickets among boulders and screes, and occasionally scrubless screes in the alpine zone (central Nepal). Partial to the proximity of boulders. In winter affects dense undergrowth in evergreen forest.

Extralimital. Ranges east to northern Yunnan, north to Shensi.

GENERAL HABITS. A typical robin in actions and behaviour. Keeps solitary or in pairs according to season. Hops about quietly under thickets in search of food, jerking up tail and drooping wings, its presence within usually betrayed by its croaking alarm-note. As a rule very secretive when dense cover available; easier to observe on open ground such as screes and dwarf scrub when male often perches on boulders and bush-tops like a redstart.

FOOD. Insects.

VOICE AND CALLS. Alarm-note, a peculiar soft croak *trrr* which once known cannot escape notice; also *fit fit* (GD) and a wren-like *chick* (SDR). Also has a scolding *chirik-chirik* like *Procygna* and some other small babblers. The croaking sometimes of several syllables 'like the subdued grinding of a few stones of an old-fashioned watchman's rattle' (HW). Said to have a 'beautiful song' in breeding season; the same (presumably) as rendered *tee, tee, tee, tee, tee, tee, tee, tee, tee, tee* by Fleming.

BREEDING. As in 1657. Average size of 21 eggs 19.7 × 14.8 mm (Baker). *MUSEUM DIAGNOSIS.* See Field Characters. Young spotted. Postnuptial moult apparently in September-October.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	64-73	15-16	29-32	51-57 mm
♀♀	60-68	14-16	28-33	48-54 mm

(BB, SA, NBK, Stres.)

Weight 12 ♂♂ (July) 11.9-15.7; 5 ♀♀ (July) 13.4-16.4 g (GD, RAP). 1 ♂ (Feb.) 12, 4 ♂♂ (Oct.-Nov.) 13.5-14; 3 ♀♀ (Feb.-Mar.) 12.5-14, 1 ♀ (Oct.) 13 g (SDR, BB, SA). 2 ♂♂ (Oct.) 14, 15 g (SA).

COLOURS OF BARE PARTS. Iris brown. Bill dark brown, commissure and lower mandible yellow. Legs and feet pale fleshy, fleshy yellow or olive-yellow.

1657. Western Golden Bush Robin. *Erithacus chrysaeus whistleri* (Ticehurst)

Tariger chrysaeus whistleri Ticehurst, 1922, Bull. Brit. Orn. Cl. 42: 121 (Simla)
Baker, FBI No. 547, Vol. 2: 97

LOCAL NAMES. None recorded.

SIZE. Sparrow ±; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 1658, q.v.

STATUS, DISTRIBUTION AND HABITAT. Altitudinal migrant, uncommon. The western Himalayas from Hazara to Garhwal. Breeds between 3000 and 3600 m; winters (early November till end of March) from c. 1800 m down to the foothills (rarely); optimum zone 1200-1500 m. In summer affects dwarf rhododendron and juniper near and above timber-line; in winter frequents thickets, undergrowth, gardens and tea plantations.

GENERAL HABITS, FOOD AND VOICE. As in 1658.

BREEDING. Season, May to July. Nest, cup-shaped, made mostly of moss with a few dead leaves and grass, lined with fine grass, hair or wool and occasionally a few feathers; placed in a hole or niche in a bank or sloping hillside, well concealed by grass and bushes. A nest has been found in a hole of a tree about 130 cm above the ground. Eggs, normally 4, sometimes 3, pale verditer blue, unspotted. Average size of 12 eggs 20.5 × 14.6 mm (Baker). Brood-parasitized by *Cuculus canorus* and *C. micropterus*.

MUSEUM DIAGNOSIS. Male like *chrysaeus* but paler olive above with few or no black bases to feathers of back. Orange colour paler.

Female like *chrysaeus* but greener above; upper tail-coverts and olive of tail greener. Underparts paler.

MEASUREMENTS AND COLOURS OF BARE PARTS. As in 1658.

1658. Eastern Golden Bush Robin. *Erithacus chrysaeus chrysaeus* (Hodgson)

Tariger chrysaeus Hodgson, 1845, Proc. Zool. Soc. London: 28 (Nepal)
Baker, FBI No. 546, Vol. 2: 95
Plate 88, fig. 15

LOCAL NAME. Manzhil-pho (Lepcha).

SIZE. Sparrow ±; length c. 15 cm (6 in.).

TURDINAE

236

1659. Whitebrowed Bush Robin. *Erithacus indicus indicus* (Vieillot)

Sylvia indica Vieillot, 1817, Nouv. Dict. d'Hist. Nat., nouv. éd., 11: 267
(India, ex Sonnerat = Darjeeling)
Baker, FBI No. 551, Vol. 2: 102
Plate 88, fig. 13

LOCAL NAMES. None recorded.

SIZE. Sparrow ±; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male (adult). *Above*, slaty blue. A very conspicuous white supercilium. *Below*, orange-ochraceous. Male often breeds in brown female-like dress.

Female. *Above*, olive-brown. A partially concealed white supercilium and a pale eye-ring. *Below*, dull rufous-ochre, paler on belly.

STATUS, DISTRIBUTION AND HABITAT. Resident, subject to vertical movements; locally common. The Himalayas from Garhwal to Arunachal Pradesh (Ludlow, *Ibis* 1944: 188), and south of the Brahmaputra in the Khasi Hills

Erithacus indicus

■ Breeding range *E. i. indicus* (1659).

(Baker) and Nagaland (Ripley, JBNHS 50: 489). Breeds between c. 3000 and 4200 m; winters from c. 3700 m down (uncommonly to the foothills), mostly between 2000 and 3000 m. Affects mixed subalpine forest of birch, fir, rhododendron and bamboo. In the Khasi Hills, inhabits steep ravines running through open pine, oak and rhododendron forest. In winter frequents undergrowth of seedlings and bracken etc. in heavy forest, usually near damp areas.

THRUSHES AND CHATS

237

Extralimital. The species extends to northern Yunnan, Szechuan and Formosa.

GENERAL HABITS. Chiefly terrestrial; typically robin-like. Found singly in dense undergrowth, feeding on the ground or sometimes making sallies for insects from bushes or trees, or searching the leaves. Usually confiding and not difficult to watch if observer keeps still. Flicks tail.

Display. Male perched on a rock or bush, dropped his quivering wings to his feet; after quick bow, wings were slightly raised and quivered faster than before, whilst his tail was expanded and jerked several times up and down. This display was sometimes accompanied by a few dancing steps; after a few minutes feeding would be resumed or an advance made to the female (Baker).

FOOD. Insects and grubs.

VOICE AND CALLS. A croaking *trrr* which, once known, attracts attention. Call-note a sweet *tut-tut* answered by a sharper note. Song, a rapid repetition of this note on an ascending and descending scale (Baker). Song period mid April till early July (Proud).

Tail, $\times c. 1$

MUSEUM DIAGNOSIS. See Field Characters. Young spotted.

MEASUREMENTS

238

TURDINAE

FIELD CHARACTERS. Male (adult). Above, deep purplish blue. Forehead, supercilium, shoulders and lower rump bright ultramarine blue. Below, ochraceous or bright chestnut. Vent and under tail-coverts white.

Female. Above, dark olive-brown. Rump and upper tail-coverts slaty blue. Tail blackish edged with deep blue. Below, rich ochraceous, browner on breast, brightest at sides of belly. Centre of belly and under tail-coverts white.

STATUS, DISTRIBUTION and HABITAT. Altitudinal migrant, very scarce. Eastern Nepal (Stevens, JBNHS 30: 354; Fleming & Traylor, *Fieldiana* 35: 546), Sikkim, Bhutan (SA) and Arunachal Pradesh (Ludlow, *Ibis* 1944: 188; Baker, *Rec. Indian Mus.* 8: 277). Breeds between c. 3400 and 3800 m;

Erithacus hyperythrus

Distributional range

winters (September to March) from c. 3500 m down to the foothills. South of the Brahmaputra, recorded (winter only?) from Margherita, north Cachar and Khasi Hills. In summer inhabits the dwarf rhododendron zone; in winter affects bushes in rather open spaces at the edge of forest, along trails and especially along streams in forest.

Extralimital. Ranges east to northern Yunnan and southwestern Szechuan.

GENERAL HABITS. Little known. Typical robin; found singly, flitting from bush to bush, flicking its tail, sometimes catching insects on the wing. Rather confiding.

FOOD. Insects.

VOICE AND CALLS. Unrecorded.

240

TURDINAE

SIZE. Bulbul; length c. 20 cm (8 in.).

FIELD CHARACTERS. A long-tailed black-and-white robin. Male (adult). Above, glossy blue-black. Wings blackish brown with a prominent long white patch. Tail black with white outer rectrices, graduated. Below, throat and breast blue-black; rest of underparts white.

Female, like male but blue-black replaced by slaty above and grey on throat and breast.

STATUS, DISTRIBUTION and HABITAT. Common and widespread resident. Northern Pakistan in the foothills east of the Indus, and adjacent plains south to Shahpur, Lahore, Bahawalpur, and India from the Himalayan foothills and Nepal east to Sikkim and western Bengal (where it intergrades with *erimelas*), west to central Rajasthan and the Kathiawar peninsula, and south to the Cauvery river (intergrading here with *ceylonensis*).

Copsychus saularis

saularis (1661). *erimelas* (1663). *ceylonensis* (1662). *andamanensis* (1664).

In the Himalayan foothills up to c. 1600 m (Sikkim, Nepal) or 2000 m (Simla, Dharmasala). Mostly a summer visitor (March-September) to higher elevations in arid northwest... human habitations — gardens, orchards and village groves, etc.; also in deciduous forest, and open secondary jungle.

THRUSHES AND CHATS

241

GENERAL HABITS. A familiar bird over most of India, usually seen near human habitations. Keeps singly or in pairs according to season. Feeds largely on the ground, hopping about in gardens, streets, lawns, etc., often perching on walls, gate-posts or roof-tops, holding itself erect, tail cocked and jerked upwards, wings slightly drooping at the sides. Usually fearless near habitations, but in non-breeding season becomes more quiet and secretive, skulking in undergrowth and brushwood. When feeding on ground commonly 'beats out' or stampedes lurking insects from crannies by suddenly flicking open its wings and tail. Flight undulating, tail flicked open at every dip, the white rectrices producing a curious flickering (stroboscopic) effect in the dim light of dusk when the bird is particularly active.

Display. During the breeding season male indulges in much ludicrous puffing out of chest, bill pointed stiffly skyward, and strutting and posturing in front of rivals; this accompanied by upward jerks of the fanned tail, cocked well over back till almost touching head. He becomes very pugnacious and vigorously defends his territory. Stoops diagonally down at intruder whether rival male or prospecting female, wings held open in a wide V above back and legs dangling — very like shrike pouncing on prey. At the end of a swoop shortly before alighting often fluffs out his plumage into a ball and almost floats down with a hovering wing-action. After chasing off the intruder the victor flies back to his own territory performing a 'victory roll', with body stiffly at an upward angle, head held high, and slow, deliberate wing-flaps.

FOOD. A wide variety of insects — ants, moths, grasshoppers, caterpillars, etc. (for some specific details see Mason & Lefroy, 1912). Also snails, earthworms, centipedes and small lizards and some vegetable matter. Flower nectar, e.g. of Silk Cotton (*Salmalia*) and Coral (*Erythrina*) trees.

VOICE AND CALLS. Song, a spirited, clear, rather thin and varied whistling, divided in short phrases repeated over and over again. Seems to have a new theme in a different combination each day though overall pattern of song individualistic and constant. Sings with wings partly drooping and tail depressed (not cocked or spread), more persistently in the morning and late afternoon, from some prominent exposed perch such as a tree- or roof-top, flag pole, fence post or radio aerial; occasionally mimicry of calls of other birds interlarded in the song. Local dialects clearly discernible in the song in different areas. May be heard throughout the year but main period of full song is March to August (Nepal), March to May (Hyderabad). A secondary song heard mostly in October and November (probably of young males) is described as 'an endless, intricate tune with imitations of other species, audible only at close range'; also some 'bursts of loud, sharp *chee-which-which* . . . *chee-chee-which-which-which*, very different from the tuneless song of the breeding season' (Neelakantan, JBNHS 52: 615-20). Call-note, a plaintive *swee-ee* or *swee-swee*; alarm or scolding note, a harsh *chr-r* (SA).

BREEDING. Season, overall February to August, mostly March to July with some local variation: March to June (western Maharashtra), March to July (M.P.), March-April (NE. Andhra), April to July (Bengal), May to August (Kathmandu Valley). Double-brooded. *Nest*, an untidy cup of grass, rootlets, leaves, twigs and a variety of odd materials: bits of rags, cotton, hair, etc., lined with similar material. Usually placed in holes in

THRUSHES AND CHATS

243

VOICE AND CALLS. Not different from 1661. Call-note, a shrill, loud, four-note chirp on a descending scale; alarm-notes, a scolding *chr* and a spitting sound (Henry).

BREEDING. Season, overall February to September with a peak in April and May in the hills, March and April in the low country. In Ceylon breeding begins in November but the chief months are March to May. Three successive broods have been recorded between April and August (S. India, Betts). *Nest* and *eggs* (c/3) as in 1661. For further details see Phillips, 1939, *Ceylon Jour. Sci.* 21: 259-69. Average size of 50 eggs 23.1 × 17.3 mm (Phillips). Female said to do all the building. Young leave nest when c. 14 to 18 days old.

MUSEUM DIAGNOSIS. Differs from *sularis* in that the female is darker above with more sheen; grey of breast darker.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	97-104	20-22	27-28	81-91 mm
♀♀	94-101	20-23	27-30	80-86 mm

Weight 1 ♂ 42 g (SDR).

COLOURS OF BARE PARTS. Iris brown. Bill black; mouth yellowish flesh to slaty ink. Legs, feet and claws brown.

1663. Assam Magpie-Robin. *Copsychus saularis erimelas* Oberholser

Copsychus saularis erimelas Oberholser, 1923, Smiths. Misc. Coll. 76: 1-2
(Kaukarit, Houndraw Branch, Tenasserim)

Baker, FBI No. 558 (part), Vol. 2: 113

LOCAL NAMES. *Dari kâlārā* (Assam); *Uchināo* (Manipur); *Dao-gophu-gachim* (Cachari).

SIZE. Bulbul; length c. 20 cm (8 in.).

FIELD CHARACTERS. As in 1661, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident. Bangladesh, Bengal duars, Bhutan and Assam to Burma; in Bhutan up to c. 1900 m (Wamrong) and in the hills of Assam up to c. 1800 m. Habitat as in 1661.

Extralimital. The species ranges through Thailand, the Indochinese countries and China to Kiangsu south to the Philippines, Borneo and the Sunda Islands.

BREEDING. Season, February to July with a peak in April and May. *Nest* and *eggs* (c/4 or 5) as in 1661.

MUSEUM DIAGNOSIS. Differs from *sularis* in having more black on the fourth rectrix (from outer edge of tail).

MEASUREMENTS AND COLOURS OF BARE PARTS. As in 1661.

1664. Andaman Magpie-Robin. *Copsychus saularis andamanensis* Hume

Copsychus andamanensis Hume, 1874, Stray Feathers 2: 231 (Andamans)

Baker, FBI No. 561, Vol. 2: 116

LOCAL NAMES. None recorded.

SIZE. Bulbul; length c. 20 cm (8 in.).

242

TURDINAE

trees, banks, walls, in rain-water drain-pipes and under eaves of buildings, etc. Nestboxes freely appropriated. Generally built between 1 and 10 metres above the ground, sometimes higher (once in the crown of a palm some 18 m up). *Eggs*, 4 or 5, occasionally 3, exceptionally 6, pale green, profusely blotched with reddish brown with underlying marks of pale lavender and purple-grey. Unspotted eggs are occasionally found. Average size of 100 eggs 21.9 × 17.1 mm (Baker). Building, incubation and care of young by both sexes. Incubation period 12 or 13 days.

MUSEUM DIAGNOSIS. See Field Characters. Young: white parts as in adult. Upperparts dark brown with traces of fulvous. Throat and breast with typical turdine spotting. Postjuvinal and postadult moult complete. No spring moult.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	94-106	21-23	27-31	79-95 mm
♀♀	91-97	20-22	27-30	79-88 mm

(HW, BB, Koelz)

Weight 17 ♂♂ 31-40 (av. 35.6) g — SA. 2 ♂♂ (Oct.) 37.5, 42.5 g (GD). 1 ♂ (Oct.) 31.2 g (BB). 2 ♂♂ (Nov., Jan.) 38.2, 40.1; 2 ♀♀ (Jan.) 33.1, 35.8 g (RAP).

COLOURS OF BARE PARTS. Iris brown. Bill black; mouth greyish pink or pale flesh. Legs and feet slaty brown or black; soles pale yellow.

1662. Ceylon Magpie-Robin. *Copsychus saularis ceylonensis* Sclater

Copsychus ceylonensis Sclater, 1861, Proc. Zool. Soc. London: 186
(Ceylon)

Baker, FBI No. 560, Vol. 2: 115

LOCAL NAMES. *Mannattipechi* (Malayalam); *Peddalananchi*, *Savela-godu* (Telugu); *Gundoo-karitchan*, *Vannati-kūrūci*, *Patkari-kūrūci* (Tamil); *Folkizichā* (Sinhala).

SIZE. Bulbul; length c. 20 cm (8 in.).

FIELD CHARACTERS. As in 1661, q.v.

STATUS, DISTRIBUTION AND HABITAT. Common resident in the hills, scarcer in the plains. Southern India, roughly south of the Cauvery river, and Ceylon in all zones up to c. 1800 m. In the hills of southwestern India up to c. 1200 m (recorded at Kodaikanal, Palni Hills, c. 2200 m — JBNHS 53: 266). Affects the neighbourhood of human habitations — gardens, orchards, wooded compounds, plantations, etc.; also scrub jungle.

GENERAL HABITS. As in 1661. 'Both sexes constantly indulge in a curious gesture; the black and white tail is raised in a series of jerks until it is vertical, then suddenly depressed and spread, the wings being simultaneously expanded downwards.' In defence of territory, 'the males show off before rivals with puffed-out breast feathers, depressed tail, and many absurd, pompous struttings and hoppings while trying to out-sing each other. Occasionally fierce combats take place' (Henry).

FOOD. Insects, caterpillars, dragonflies, small lizards. One bird was seen attacking and killing a young mouse (Betts). Also some vegetable matter such as boiled rice, bread crumbs and kitchen scraps, and fruit.

244

TURDINAE

FIELD CHARACTERS. As in 1661, q.v.

STATUS, DISTRIBUTION AND HABITAT. Resident, not abundant. South and Middle Andaman Islands. Affects scrub jungle and villages.

GENERAL HABITS, FOOD AND VOICE. As in 1661.

BREEDING. As in 1661.

MUSEUM DIAGNOSIS. Differs from *sularis* in having the grey on sides of lower abdomen extending towards the white centre; wing-quills darker; bill heavier in both sexes. Female with more sheen on upper plumage.

MEASUREMENTS AND COLOURS OF BARE PARTS. Probably as in 1661.

Weight 1 ♂ (Feb.) 35.1, 2 ♂♂ (April-May) 34.8, 39.3; 2 ♀♀ (April) 36.3, 37.5 g (RAP).

Muscicapa malabarica Scopoli, 1786, Del. Flor. et Faun. Insubr. 2: 96

(Mahé, Malabar)

Baker, FBI No. 563 (part), Vol. 2: 118

Plate 90, fig. 1

LOCAL NAMES. *Shāmā* (Hindi); *Shyāmā* (Gujarati); *Shāmākkili* (Malayalam).

SIZE. Bulbul, with a long tail; length c. 25 cm (10 in.).

FIELD CHARACTERS. Male (adult). *Above*, head and back glossy black; rump white. Tail strongly graduated: outer rectrices largely white, conspicuous, especially in flight; central rectrices black and elongated. *Below*, throat and breast glossy black; belly and under tail-coverts rufous.

Female similar but black replaced by grey; underparts paler; tail shorter.

STATUS, DISTRIBUTION AND HABITAT. Resident, locally distributed. The western Indian Peninsula from Gujarat (Surat Dangs) south along the Western Ghats complex (including Nilgiri, Palni and associated hills) to southern Kerala and Tamil Nadu south of the Cauvery river; plains level and up to c. 700 m. Affects dense secondary undergrowth and particularly bamboo facies in deciduous foothills forest.

GENERAL HABITS. As in 1667.

FOOD. Grasshoppers, grubs, caterpillars and other insects.

VOICE AND CALLS. A magnificent song of several rich flutey notes alternated with long pauses, rather like that of *Muscicapa tickelliae* (1442) but louder, richer and more thrush-like. Casually confusable with song of Whitethroated Ground Thrush (1734). Song period: from February until

- malabaricus (1665). leggei (1666).
 indicus (1667). albiventris (1668).

well into the monsoon. Alarm: a loud note 'like the creaking of two branches rubbing together in the wind' (Betts).

BREEDING. Season, April to June, occasionally until September. Nest and eggs as in 1667.

MUSEUM DIAGNOSIS. See Key to the Subspecies.

Young. Upperparts and sides of head dark brown with fulvous spots, large on scapulars, small elsewhere; flight-feathers edged with fulvous. Throat and breast fulvous with dusky edges to feathers; belly creamy white.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	94-99	18-21	24-27	160-207 mm
♀♀	87-90	18-20	23-24	113-137 mm (SDR, HW)

Weight 4 ♂ 28-32 g (SA).

COLOURS OF BARE PARTS. Iris dark brown. Bill black; mouth pale yellowish pink. Legs, feet and claws pale flesh.

1666. *Ceylon Shama*. *Copsychus malabaricus leggei* (Whistler)

Kittacina malabarica leggei Whistler, 1941, Ibis: 319 (Uragaha, Ceylon)
 Baker, FBI No. 563 (part), Vol. 2: 118

LOCAL NAMES. *Wāi-pōkicheā* (Sinhala); *Sōlai pādi* (Tamil).
SIZE. Bulbul, with a long tail; length c. 25 cm (10 in.).

THRUSHES AND CHATS

247

certain quiet well-wooded hill-stations, e.g. Matheran in Maharashtra. Distinctly crepuscular, hunting actively well into the dusk. Has a curious habit, chiefly in the breeding season, of striking the wings together as it flies across open ground, producing a clicking sound.

FOOD. Insects and their larvae.

VOICE AND CALLS. Song, of spasmodic, rich melodious phrases, rendered as *oi-o-lee-nou* (Fleming), mostly given in the morning and at dusk. Assam birds said to whistle freely in longer runs like magpie-robin and with fewer pauses than those in SW. India (Betts). Main song period March to May. Call-notes, a musical *chir-chur* and *chur-chi-churr*. Alarm, a harsh scolding. See also 1665.

BREEDING. Season, March to August, chiefly May and June; in some dry areas, breeding correlated with monsoon as in Manbhum dist. (Bihar) where it does not begin before the rains have set in (June). Nest, a pad of rootlets and leaves placed in hollows in trees or bamboo, usually within a couple of metres of the ground; sometimes hidden in rubbish accumulated at the base of a bamboo clump. Eggs, normally 4, occasionally 5 or 3, pale bluish green densely marked all over with umber-brown. Average size of 64 eggs 22 × 17.2 mm (Baker). Nest-building and incubation apparently by female only. Incubation period undetermined. Both parents feed the young, who leave the nest about 12 or 13 days from hatching.

MUSEUM DIAGNOSIS. Differs from *malabaricus* in having, on average, a shorter tail.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	86-99	17-22	25-28	108-200 mm
♀♀	84-93	18-22	25-27	102-131 mm

(HW, SDR, SA, Rand & Fleming)

Weight 1 ♀ (August) 30 g (RAP). 4 ♀♀ 30-32 g (SA, BB).
COLOURS OF BARE PARTS. As in 1665.

Miscellaneous. This species is highly prized as a cage-bird for its rich voice, longevity and ready acclimatization to captivity. It is well-known in aviaries outside as well as within its natural range.

1668. *Andaman Shama*. *Copsychus malabaricus albiventris* (Blyth)

Kittacina albiventris Blyth, 1859, Jour. Asiat. Soc. Bengal 27: 269
 (Andamans)

Baker, FBI No. 564, Vol. 2: 119
 Plate 90, fig. 2

LOCAL NAMES. None recorded.

SIZE. Bulbul, with a long tail; length c. 25 cm (10 in.).

FIELD CHARACTERS. As in 1666 but lower breast and centre of belly white.

STATUS, DISTRIBUTION AND HABITAT. Fairly common in the more densely forested parts of the Andaman Islands. Affects dense jungle, gardens and scrub at the edge of paths and clearings.

246

TURDINAE

FIELD CHARACTERS. As in 1665 but female similar to male.

STATUS, DISTRIBUTION AND HABITAT. Resident. Ceylon in the low country and lower hills up to c. 900 m; fairly common in the Dry zone, rare and local in the Wet zone. Affects scrub and dense undergrowth in forest.

GENERAL HABITS, FOOD AND VOICE. As in 1667.

BREEDING. Season, January to July, chiefly April and May. Nest and eggs (c/3 or 4) as in 1667. For details see Phillips, 1939, *Ceylon Jour. Sci.* 21: 262.

MUSEUM DIAGNOSIS. Differs from the Indian races in having the lower plumage paler rufous in male. Female similar to male, i.e. with upperparts, throat and breast glossy black.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	89-98	19-22	25-27	140-181 mm

 Baker, FBI No. 563 (part), Vol. 2: 118

LOCAL NAMES. *Shāmā* (Hindi, Bengali); *Shāmā sorāi* (Assam); *Poda nalanchi*, *Tenka nalanchi* (Telugu); *Sōlai pādi* (Tamil).

SIZE. Bulbul, with a long tail; length c. 25 cm (10 in.).

FIELD CHARACTERS. As in 1665, q.v. In poorly lit forest interior at dusk the flickering white rump and outer tail-feathers as the bird flies about are diagnostic.

STATUS, DISTRIBUTION AND HABITAT. Resident, unevenly distributed. The Himalayan terai, duars and foothills in Nepal, Sikkim, Darjeeling and Jalpaiguri districts, Bhutan and Arunachal Pradesh; the foothills of Meghalaya, Nagaland, Manipur and Bangladesh south to the Chittagong region. Also northern Uttar Pradesh from c. 79°E. in Kumaon (Ramnagar, Osmaston, JBNHS 36: 427) eastward through Gonda and Gorakhpur districts; Bihar (Madhubani, Rajmahal hills, Lohardaga), eastern Maharashtra and Madhya Pradesh (Chanda, Balaghat, Raipur, Bastar districts), and the Eastern Ghats complex from Orissa south to the Cauvery river. Affects undergrowth in forest, especially bamboo or mixed bamboo forest, on low hills and broken ground.

Extralimital. The species ranges east through Burma, Thailand and the Indochinese countries to Hainan and south to Java and Borneo. Introduced on Kauai (Hawaii).

GENERAL HABITS. In effect the forest counterpart of the magpie-robin, otherwise almost identical with it in ecology and behaviour, q.v. Shyer and more retiring; normally not found near human habitations except at

TURDINAE

248

GENERAL HABITS, FOOD AND VOICE. As in 1667. 'Hand-reared young copied tunes whistled to them with great accuracy' (Osmaston).

BREEDING. Season, at least May and June. Nest and eggs as in 1667. Recorded taking readily to nest-boxes placed in thick forest (Osmaston, JBNHS 17: 160).

MUSEUM DIAGNOSIS. Male differs from *indicus* in having the lower breast, centre of belly and vent white; flanks tinged with ferruginous; tail shorter. Female like male but less glossy on chin and throat.

MEASUREMENTS

Wing 85-89 mm. Tail 91-105 mm (Baker)
COLOURS OF BARE PARTS. As in 1665.

Genus *PHOENICURUS* Forster

Phoenicurus Forster, 1817, Synopt. Cat. Brit. Bds.: 16, 53.

Type, by tautonymy, *Molacilla Phoenicurus* Linnæus

Adelura Bonaparte, 1854, Compt. Rend. Acad. Sci. Paris 38: 8.

Type, by original designation, *Phoenicurus caeruleocephalus* Vigors

Bill short and slender; rictal bristles short. Wing pointed. Tail rather long, more than or nearly twice the length of tarsus, largely rufous in all but *P. caeruleocephalus*. Tarsus fairly long. Sexes not alike.

(Altai)

Baker, FBI No. 529, Vol. 2: 73

Plate 89, fig. 2

LOCAL NAMES. None recorded.

SIZE. Sparrow; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male (adult) summer. Above, head and nape grey. A black band from lores through ear-coverts and sides of neck. Back and rump rufous-chestnut. Wings blackish brown with a large, longitudinal white wing-patch and a smaller white patch near outer edge. Tail rufous with brown tips, dark brown central rectrices and brown outer web of outer rectrices. Below, entirely rufous, centre of belly whitish.

Male in winter has a pale brown head and nape (grey colour being concealed by brown feather-tips). Chestnut of back partly concealed by brown tips. Below, rufous-chestnut partly concealed by whitish tips giving a hoary aspect. By mid-winter, brown and whitish tips wear off, giving place to nuptial plumage.

Female. Above, brown with a pale eye-ring. Lower rump and tail rufous. Below, paler brown, whitish fulvous on belly. Distinguished from other species likely to occur in the same range by broad fulvous-white edges to wing-coverts and tertials. Distinguished from female Blueheaded Redstart (1670) by rufous tail (v. brown).

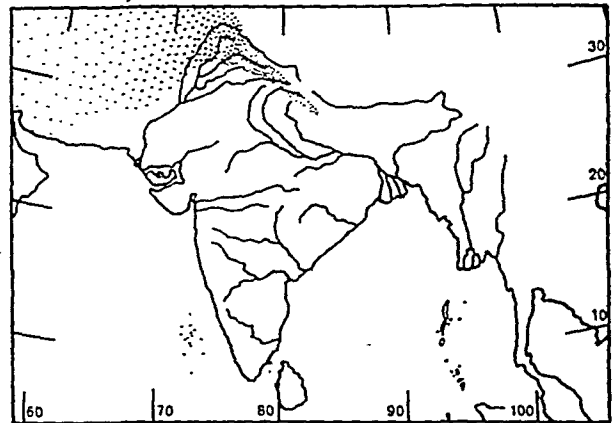

Tail flirled up and down, not shivered, a good field mark.

STATUS, DISTRIBUTION and HABITAT. Winter visitor in variable numbers, as a rule not abundant. The western Himalayas in Gilgit, Kashmir Valley, Kulu, Simla, west-central Nepal (easternmost record: Kali Gandak Valley, c. 83°30'E. — Rand & Fleming, *Fieldiana* 41: 151); the plains and hills of northern Pakistan south to the Jhang District, N.W.F.P. south to Dera Ghazi Khan, and northern Baluchistan (Quetta, Nushki, Chagai). Usually found near the base of hills but noted up to c. 2100 m (Nepal record at 2800 m). Affects arid country — waste land, scrub jungle, olive groves, orchards, dry river-beds, wooded compounds, and avenues and groves of *Acacia*, *Prosopis* and suchlike trees.

Extralimital. Breeds from the Tien Shan to Lake Baikal. Winters from Turkestan to southern Iraq.

250

TURDINAE

Phoenicurus erythronotus

Winter range

MIGRATION. Recorded in winter quarters from October till end of March, mostly December to February. Numbers vary from year to year and month to month, indicating that the species does not have fixed winter quarters, but is nomadic according to weather conditions.

GENERAL HABITS. Solitary. Usually seen perched on a stone or lower branch of a tree or thorn bush, descending momentarily to pick up an insect, and back again to the same or a nearby perch. Does not quiver its tail but flirts it up and down; otherwise a typical redstart.

FOOD. Insects.

VOICE and CALLS. Alarm, a croaking *gre-er* (Whitehead). Call-note, a softer slurred version of same. Song undescribed.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. See Key to the Species. Young spotted. Postjuvenile moult of body, lesser and median coverts.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

Phoenicurus caeruleocephalus Vigors, 1831, Proc. Zool. Soc. London: 35
(Himalayas = Simla-Almora area *vide* Ticehurst & Whistler, 1924, *Ibis*: 411)

Baker, FBI No. 553, Vol. 2: 104

Plate 89, fig. 5

LOCAL NAMES. None recorded.

SIZE. Sparrow ±; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male (adult), summer. Above, crown and nape bluish ashy. Rest of upperparts, including tail, black with a large white patch on wing. Below, throat and breast black. Belly white. In winter, bluish and black colours masked by pale brown fringes to feathers, especially on upperparts.

Female. Above, brown with a pale eye-ring. Wing-coverts and tertials broadly edged and tipped with fulvous-white. Lower rump and upper tail-coverts ferruginous. Tail brown narrowly edged with ferruginous. Below, pale brown tinged with fulvous, becoming white on belly and under tail-coverts.

Female could casually be mistaken for Rufoustailed Flycatcher (1409); in the distance and with naked eye, both sexes respectively also for Pied Bush Chat (*Saxicola c. bicolor*, 1700).

STATUS, DISTRIBUTION and HABITAT. Mostly an altitudinal migrant; on the whole fairly common, scarcer east of Garhwal. The Himalayas from Saled Koh, Chitral, Hunza, Gilgit and Baltistan east to Bhutan

Phoenicurus caeruleocephalus

Distributional range

252

TURDINAE

(Pemberton). Breeds between c. 2400 and 3900 m, optimum zone 2700-3600 m. Winters from c. 3500 m down to the foothills, chiefly between 1200 and 2600 m. In the breeding season prefers rocky ground, steep rocky hillsides, avoiding tall tree forest (Osmaston). Frequents mostly junipers but also open pine forest. In winter affects open pine woods and the more open parts of nullahs and hillsides, olive-groves and gardens.

Extralimital. Breeds also in adjacent parts of eastern Afghanistan and north to the Altai.

MIGRATION. Somewhat irregular in its appearances in winter. Arrives in November and December (earliest date 26 October), reaching peak numbers in January. Upward movement mostly in the first half of March (last date 22 March). On summer (breeding) grounds from the third week of March till the end of September.

GENERAL HABITS. Has been described as 'partly redstart, partly robin' in behaviour, but Meinertzhagen affirms that 'the bird is exactly similar to the true redstarts in habits'. Usually seen singly, fluttering about the branches of trees and bushes, picking insects, then sitting still for a while. Descends to the ground to pick up a titbit, flying up to a perch immediately thereafter. Movement of tail 'more of a shake than the quiver of the redstart' (Whistler). Not a skulker.

FOOD. Insects.

VOICE and CALLS. Call-note *tik-tik* similar to that of a Robin Redbreast (H. G. Alexander). Alarm, near nest, a continual plaintive piping note *tit, tit, tit*... while flitting anxiously about (Whistler). Song strongly reminiscent of *Emberiza cia stracheyi* [2052] (Jones); usually delivered from the top of a bush or a tall juniper.

BREEDING. Season, May to August. Nest, a cup of moss, leaves, dry grass, juniper bark fibre, lined with hair, wool and some feathers. Placed in

recesses or hollows under boulders or fallen logs, among exposed roots of trees, in banks, concealed behind a screen of herbage; occasionally off the ground in a wall or in a hollow at the junction of juniper trunks. Eggs, 3 or 4, pale bluish green with a ring of fine, pale reddish specks at the larger end. Average size of 30 eggs 19.3 × 14.4 mm (Baker).

Tail, × c. 1

MUSEUM DIAGNOSIS. See Field Characters. Brown fringes of male's winter plumage apparently wear off in mid-winter or early spring. Summer plumage of female darker and light edges to wing-coverts worn off (HW). Postnuptial moult apparently in August. Young spotted (for details of plumage see *Ibis* 1925: 175). Young male in spotted plumage readily distinguished from female by white outer margins of inner secondaries (Scully). Postjuvenile moult of body-feathers, lesser, median and inner greater coverts. First-year birds distinguished by browner flight-feathers and primary-coverts, and by fulvous tips to outer greater coverts.

Crown black.....	<i>P. o. rufiventris</i>

1671. Kashmir Black Redstart. *Phoenicurus ochruros phoenicuroides* (Moore)

Ruticilla phoenicuroides Moore, 1854, in Horsfield & Moore, Cat. Bds. Mus. E.I. Co. 1: 301 (Shikarpore)
Baker, FBI No. 531, Vol. 2: 76
Plate 89, fig. 4

LOCAL NAMES. *Sin-tick* (Ladakh); *Thirithra* ('shaker'), *Thirith-kämpä* (Hindi); *Thārtāro* (Gujarati).

SIZE. Sparrow ±; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male (adult), summer. Above, forehead, round the eye, sides of neck and upper back black; crown and lower back grey. Wings brown. Rump and tail rufous; central rectrices dark brown. Below, throat and breast black; rest of underparts rufous. In winter, black parts fringed with grey.

Female. Above, pale brown with a paler eye-ring. Tail rufous, central rectrices dark brown. Below, pale fulvous-brown. But for habitat and behaviour could be mistaken for Rufoustailed Flycatcher (1409).

Males often breed in brown, female-like plumage.

STATUS, DISTRIBUTION AND HABITAT. Abundant summer (breeding) visitor: Pakistan and the western Himalayas from northern Baluchistan and N.W.F.P. through Gilgit, Ladakh and Kashmir to Rupshu, Lahul and Spiti. Breeds between 2100 and 3100 m (Baluchistan) and between 2400 and 4800 m (Himalayas), locally up to 5100 m, in the arid Tibetan facies; optimum zone 3000-4000 m. Winters from the foothills (c. 1400 m) south throughout Pakistan and in northwestern India (including Kutch and Kathiawar) at least to a line running from Baroda (Gujarat) to Etawah (central U.P.). Winter birds from Punjab and Sind 'much smaller than Kashmir breeding series and probably do not come from there' (Whistler). In summer (breeding) affects desolate rocky country and boulder-strewn

THRUSHES AND CHATS

255

sound resembling that made by pouring shot into a bottle' (BBO). Call-note *tue-tue tititititit*; also 'a mousy *whit...whit...whit*...like a squeaking uncoiled bicycle wheel revolving at moderate speed' (SA). Alarm-notes *ee-tick* or *ee-tick-tick*.

BREEDING. Season, from the beginning of May until early August. Nest, a cup of grass stems, moss, juniper bark and rootlets, lined with fine grass, hair and feathers; placed in piled stone walls, buildings, under stones or in rock crevices, etc. Eggs, 3 to 6, usually 4 or 5, pale blue, sometimes almost white, occasionally very faintly marked with reddish. Average size of 28 eggs 20.1 × 14.8 mm (Osmaston), of 60 eggs 19.9 × 14.3 mm (Baker). Brood-parasitized by *Cuculus canorus*. Incubation mostly by female, but to some extent apparently also by male.

MUSEUM DIAGNOSIS. Male differs from *rufiventris* (1672) in having more grey on upperparts, especially on crown. Winter series most satisfactorily separated on somewhat smaller size: Male ♂♂ majority under 85 mm v. majority over 85 mm in *rufiventris*. First-year male keeps brown plumage but has a few rufous feathers on lower breast. Young spotted; for details of plumage see Richmond, 1895, p. 82.

MEASUREMENTS

LOCAL NAMES. *Thirithra*, *Thirith-kämpä* (Hindi); *Phirira*, *Lal-girdi* (Bengali); *Nius bundi gadu* (Telugu); *Kankal* (Munda).

SIZE. Sparrow ±; length c. 15 cm (6 in.).

FIELD CHARACTERS. As in 1671, q.v.

STATUS, DISTRIBUTION AND HABITAT. Summer (breeding) visitor: the northern Himalayas from Garhwal east through Nepal and Sikkim. Breeds between 3300 and 5200 m in Tibetan steppe facies. Habitat as in 1671. Recorded on passage in the Himalayas as high as 6000 m (Mt Everest). Winters from the foothills of Kumaon, Nepal, Sikkim, Bhutan and Arunachal Pradesh south through Assam, Manipur, Bangladesh, and the Peninsula to Mysore and Tamil Nadu [Palni Hills (c. 10°N.), Nichols, JBNHS 44: 394]. Specimens intermediate between *rufiventris* and *phoenicuroides* recorded in Uttar Pradesh, Bihar and western Bengal (Whistler MS.). Winter habitat as in 1671.

MIGRATION. As in 1671.

GENERAL HABITS, FOOD AND VOICE. As in 1671.

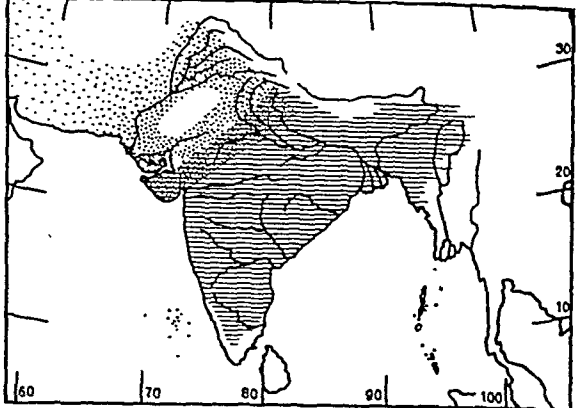

BREEDING. As in 1671. A pair observed with two concurrent nests c. 8 metres apart; while the male was feeding half-grown young in one nest, the

254

TURDINAE

ground above timber-line; also upland villages and, to a lesser extent, juniper forest. In winter frequents stony, sparsely scrubbed, broken country, dry water-courses and the neighbourhood of villages and cultivation.

Phoenicurus ochruros

Winter ranges (for breeding ranges see text)

phoenicuroides (1671).

rufiventris (1672).

Extralimital. Ranges east to the Caspian Sea and north to the Sayans and Altai. The species extends from western Europe and Morocco to Mongolia and western China. Winters in the southern parts of the range to Somalia, Arabia and Iraq.

MIGRATION. Arrives in winter quarters (very punctual locally) in the second half of September — first date in the foothills 30 August. Males appear to precede females by about three weeks. The majority leaves about the end of March (last date 10 May in Kashmir Valley). Noted on breeding grounds from end of March till October.

GENERAL HABITS. Solitary outside the breeding season. Has feeding territories in winter quarters, the same neighbourhood being occupied year after year and often even the same perches for roosting; males appear to greatly outnumber females. Perches on a rock or other low vantage-point shivering its tail and bobbing up and down every little while before darting to the ground to pick up an insect. Also hops on the ground to feed, preferably in shady spots, occasionally entering bungalow verandas. A common and familiar species on its summer grounds where 'every house has its pair'.

FOOD. Insects, largely small beetles.

VOICE AND CALLS. Song, a loud pleasing trill of six or seven notes followed by a wheezy jingle reminiscent of a *Prinia's* — 'a curious husky

256

TURDINAE

female was feeding younger chicks in the other (SA, JBNHS 46: 298). Average size of 100 eggs 20 × 14.6 mm (Baker); of 4 eggs 21.2 × 14.2 mm (Ludlow).

MUSEUM DIAGNOSIS. Male differs from *phoenicuroides* in having the crown and back entirely black. Wing larger, mostly over 85 mm v. under 85 mm in *phoenicuroides*, q.v.

Female like *phoenicuroides* but much darker overall and tinged with orange-brown on belly and flanks.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	84-93 }	14-15	{ 25-26 24-25	{ 60-65 mm 56-64 mm (HW)

(Bokhara)

Not in Baker, FBI

Plate 89, fig. 6

LOCAL NAMES. None recorded.

SIZE. Sparrow ±; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male (adult), summer. Above, forehead and sides of neck black. Forecrown white; rest of crown and back grey. Wings brown. Rump and tail rufous; central rectrices dark brown. Below, throat black; breast and flanks rufous. Centre of belly whitish; under tail-coverts buff. In winter, grey of upperparts fringed with rusty brown; flight-feathers fringed with whitish and rusty; black of lower throat fringed with white as is also the rufous of underparts.

Female very similar to that of *ochruros* (1671) but belly and under tail-coverts whitish buff, not fulvous. Not distinguishable in the field.

Male distinguished from Black Redstart by white forecrown and grey back; black of throat not extending to breast.

STATUS, DISTRIBUTION AND HABITAT. Passage migrant, probably regular: northwestern Baluchistan (Robat — Christison, JBNHS 41: 434) and Chitral (Mastuj Valley, 1650 m — Perreau, *ibid.* 19: 909). Affects gardens and better wooded localities than Black Redstart.

Extralimital. Breeds in the western and central Palearctic from the British Isles to Lake Baikal, north to the limit of trees. Other subspecies from Turkmenia to Turkey and in Morocco. Winters in Africa south of the Sahara.

THRUSHES AND CHATS

257

MIGRATION. Recorded during spring passage, 1 and 22 April in Baluchistan, and middle of May in Chitral. A nocturnal migrant, pausing during the day.

GENERAL HABITS. Solitary. Carriage and movements as in the Black Redstart but more arboreal in habits. Usually perches on top of bushes, trees, fences or wires making short descents to the ground for insects.

FOOD. Insects.

VOICE AND CALLS. Ordinary call-note *weet* very similar to that of Chiffchaff (1574) or Northern Leaf Warbler (1572). Song more melodious than that of Black Redstart, without any grating notes.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS

Ruticilla Hodgsoni Moore, 1854, in Horsfield & Moore, Cat. Bds. Mus. E.I. Co. 1: 303 (Boottan)

Baker, FBI No. 530, Vol. 2: 74

Plate 89, fig. 7

LOCAL NAME. *Thār-cāpni* (Nepal).

SIZE. Sparrow ±; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male (adult). *Above*, forehead to ear-coverts black; forecrown whitish becoming ashy grey on crown, nape and mantle. Wings brown with a conspicuous white patch. Rump and tail rufous, central rectrices dark brown. *Below*, entire throat and breast black. Rest of underparts rufous.

Female. *Above*, greyish brown; no wing-patch; rump and tail as in male. *Below*, throat and breast pale grey-brown becoming whitish on belly.

Male distinguished from Black Redstart (1671) by grey back (v. black) and white patch on wing. Female differs from female of *ochruros* by grey-brown breast contrasting with whitish belly (v. uniform fulvous-brown underparts in *ochruros*).

STATUS, DISTRIBUTION AND HABITAT. Winter visitor, unevenly distributed, locally common. The lower Himalayas from Naini Tal (Meinertzhagen, *Ibis* 1927: 586) east through Nepal, Sikkim, Bhutan and Arunachal Pradesh; from the foothills to c. 2800 m, mostly in the foothills and sometimes adjacent plains; also south of Brahmaputra river in the Patkai hills, Nagaland, and Manipur and Cachar hills. Records from Kashmir and Ladakh appear to be erroneous. May be expected to breed in northern Arunachal (north of the

THRUSHES AND CHATS

259

FIELD CHARACTERS. Male (adult), summer. *Above*, forehead and supercilium bright blue becoming darker blue on crown and back. Wings brown. Rump rufous; tail rufous with central rectrices, outer edge of outer rectrices, and a broad terminal band nearly black. *Below*, throat dark blue forming a rounded bib on breast; rest of underparts orange-chestnut.

Winter plumage similar but crown and back fringed with rusty brown and tertials edged with buff.

Female. *Above*, olive-brown, darker than most redstarts. A pale buffish eye-ring. Tail pattern as in male. *Below*, throat and breast olive-brown; rest of underparts orange-brown.

The black-centred tail with broad black terminal band distinguishes both sexes as well as the young in spotted plumage from all other redstarts.

STATUS, DISTRIBUTION AND HABITAT. Common altitudinal migrant. The Himalayas from Safed Koh, Chitral and Hunza east to Arunachal-Pradesh (Ludlow *Ibis* 1944: 182). Breeds between c. 3000 and 4500 m [on Duala Dhar down to 2700 m, locally to 2000 m (HW); in Nepal up to 5300 m (BB)]. Winters from c. 2700 m down to c. 1000 m, mostly between 1500 and

Phoenicurus frontalis

Distributional range

■ Breeding □ Winter

2400 m; winters also in the hills south of the Brahmaputra, Nagaland and Manipur, south to the Chittagong ranges. In summer affects dwarf rhododendron, juniper, birch and other scrub at and above timber-line, and boulder-strewn slopes in the alpine zone. In winter (October to April)

258

TURDINAE

main range) as it does in adjoining SE. Tibet between 2900 and 4200 m. Has been recorded on the south side of the Tsangpo Valley by Ludlow (Sang, Chayul Dzong). In summer affects dry, barren uplands in the same biotope as *P. ochruros* as well as open cultivation, light forest and valley floors at lower elevations (Schäfer). In winter has a strong predilection for dry or partly dry river-beds in forest or cultivation; occasionally also in scrub, grassland and open parkland.

Extralimital. Breeds in the mountains of western China (in Tibetan steppe facies) and eastern Tibet (western limit unknown). Winters in adjacent regions of Szechuan, Yunnan and northern Burma.

MIGRATION. Arrives in winter quarters about the end of September and October, leaves in the first half of April. On summer grounds from end of March to October, most birds leaving before the end of September.

GENERAL HABITS. Typical of the genus. In winter found in widely separated pairs near streams, or bushes in the outskirts of neighbouring forest. Actions and behaviour on rocks and driftwood in streams particularly reminiscent of Plumbeous Redstart (1679). In summer also frequents high poplars, flitting among branches and catching insects in the manner of a flycatcher.

FOOD. Insects and berries (GD).

VOICE AND CALLS. Normal note a single clicking *prii*, like Bluefronted Redstart, q.v. Alarm-note, a rattling *trrr*, *tschrrr*. Song, short, almost tinny, with little modulation (Schäfer).

BREEDING. Season, May to August. *Nest*, a cup of dry grass, fibres and moss, lined with hair and wool; placed in stone walls, holes in banks, clefts in rocks or underneath a boulder. *Eggs*, 4 or 5, rarely 6, pale blue, as a series decidedly darker than those of *ochruros*, sometimes faintly freckled with reddish. Average size of 50 eggs 20.4 × 14.7 mm (Baker); of 6 eggs 21.2 × 15 mm (Ludlow).

MUSEUM DIAGNOSIS. See Field Characters. First-year male similar to female.

Plate 89, fig. 8

LOCAL NAME. *Tak-tirri-pha* (Lepcha).

SIZE. Sparrow ±; length c. 15 cm (6 in.).

260

TURDINAE

frequents cultivation clearings, gardens, terraced fields, scrub pasture and open forest.

Extralimital. The mountains of western China and eastern Tibet north to Kansu. Winters at lower elevations and south to northern Burma and northern Vietnam.

GENERAL HABITS. Usually solitary, sometimes in small, loose parties after breeding or when migrating. Descends to ground from boulder or bush for insects or hops from branch to branch in bushes, occasionally catching insects in the air. Tail wagged up and down in the manner of Whitecapped Redstart (1716) not shivered as in the Black.

FOOD. Insects, berries and seeds.

VOICE AND CALLS. Call-notes, a single clicking *tik* or *prii*. Alarm-note a soft frequently repeated *ee-tit-tit* or *ti-ti-ti-ti* from a perch as well as in flight, 'which sounds like a noisy watch being wound up a few cogs at a time' (Lister). Song 'typically redstart', a series of sweet warbling and harsh grating notes recalling that of *P. ochruros* (GD) but less wheezy. Main song period is over by mid June, only occasional song being uttered into July.

BREEDING. Season, May to August. *Nest*, a cup of moss and grass lined with a few rootlets, hair and feathers, usually placed in a hollow in a bank, between stones, or in a wall, sometimes in holes in trees up to about seven metres from the ground (once under the eaves of a house). *Eggs*, 3 or 4, pale pinky grey or light buffy, densely covered with minute specks of pale reddish. Average size of 50 eggs 19.4 × 14.7 mm (Baker). Sometimes brood-parasitized by *Cuculus canorus*.

MUSEUM DIAGNOSIS. See Field Characters. First-year birds recognized by ochraceous tips to greater coverts. Postnuptial moult complete, in August and September.

Juvenile in spotted plumage dimorphic according to Diesselhorst: 1. Spots ochre, edges of inner flight-feathers golden brown; underparts ochre, 2. Spots white or nearly white, edges of inner flight-feathers whitish ochre to almost white; underparts whitish ochre. Intermediate plumages occur.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	84-93	15-17	24-25 (once 28)	65-76 mm
♀♀	80-87	14-16	21-25 (SA, BB, SDR.)	64-70 mm

Weight 14 ♂♂ (May-Sept.) 15-19; 5 ♀♀ (May-Sept.) 14.3-17 g (GD).

11 ♂♂ (Oct.-Apr.) 14.5-17.5; 13 ♀♀ (Oct.-Apr.) 12.5-18 g (BB, SA).

COLOURS OF BARE PARTS. Iris brownish black. Bill, legs and feet black.

Plate 89, fig. 9

LOCAL NAMES. None recorded.

SIZE. Sparrow ±; length c. 15 cm (6 in.).

THRUSHES AND CHATS

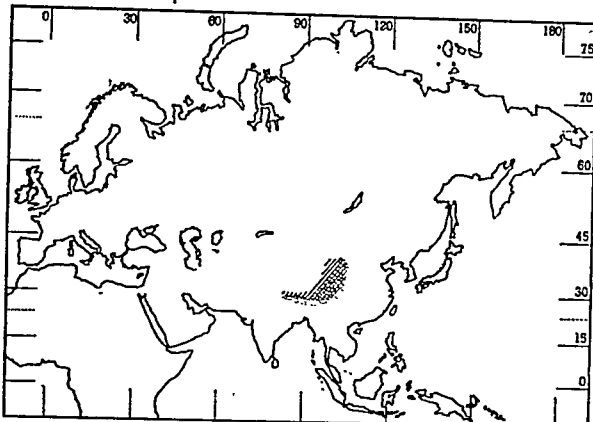

261

FIELD CHARACTERS. Male (adult), summer. *Above*, head dull indigo blue, brighter on forehead. Sides of head and back black. Tips of tertials and rump chestnut. Wing blackish brown with a large, longitudinal white patch. Tail almost entirely black except base of outer rectrices which are chestnut. *Below*, chin and sides of throat black with a large white patch on centre of throat. Rest of underparts chestnut; lower belly whitish. Winter plumage similar but crown and back fringed with rusty brown.

Female. *Above*, dark brown with buff eye-ring. A large whitish patch on wing. Rump and sides of tail chestnut. *Below*, olive-brown, paler than back, with a white throat-patch; belly whitish fulvous.

The white throat-patch easily identifies both sexes. Young in spotted plumage already has a large white wing-patch.

STATUS, DISTRIBUTION AND HABITAT. Resident, subject to rather small altitudinal movements, locally common. The Himalayas from west-central Nepal (Rand & Fleming, 1957) east to Arunachal Pradesh (Ludlow, *Ibis* 1944: 183). Breeds between 2700 and 4900 m (2800 to 3100 m in Arunachal, 3000 to 4900 m in central Nepal). A high-level redstart, recorded in winter

Phoenicurus schisticeps

Distributional ranges

Breeding

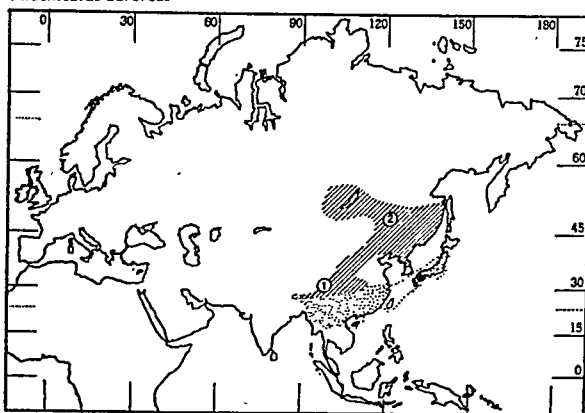

Winter

between 1400 and 4200 m. In summer affects open, park-like forest, scrub oak on ridges, juniper scrub in open conifer forest, and shrubs in semi-dry areas; favours stream banks. This species is strongly differentiated ecologically from other redstarts (Schäfer). In the Himalayas, appears to replace *P. frontalis* as the two species are not found in the same areas. In winter affects open meadows and scrub, sparsely scrub-covered hillsides with boulders and rock outcrops, occasionally forest.

THRUSHES AND CHATS

263

STATUS, DISTRIBUTION AND HABITAT. Summer (breeding) visitor to south-eastern Tibet and adjacent parts of Arunachal Pradesh, between 2800 and 3700 m, mostly 2800–3300 m. Winters in the Himalayan foothills west to Sikkim and Darjeeling and in the hills of Bangladesh, Assam, Nagaland and Manipur. In summer affects open forest, valley floors, cultivation and trees around upland villages. Does not occur in the arid Tibetan steppe facies. In winter found in open country, vicinity of villages, secondary jungle, tea gardens, along roads and tracks in forest, and bushes by streams.

Phoenicurus aureus

Distributional ranges

Breeding

Winter

1 *leucopterus* (1677). 2 *aureus* (RE).

Extralimital. Breeds in western and northern China, north to Ussuriland and the Lake Baikal region. Winters in southern China, Japan, Formosa, Hainan and northern Indochinese countries.

MIGRATION. Recorded in winter quarters from October to March. A party on migration observed in northern Sikkim at c. 4200 m in December (Meinertzhagen).

GENERAL HABITS. Usually solitary or in pairs, occasionally in small loose parties when migrating. Like 1676 feeds much in the manner of a flycatcher and on bushes and medium-sized trees, descending little to the ground. Territorial in winter as well as in summer. Tail flitted nervously.

FOOD. Insects and berries.

VOICE AND CALLS. Alarm-note *tek-tek* (Schäfer). Song undescribed; said to be 'cheerful'. Very silent in winter.

BREEDING. Season, May to August. *Nest*, a cup of moss, grass strips, feathers and hair placed on the ground under exposed roots of trees, or in a

262

TURDINAE

Extralimital. The mountains of western China and eastern Tibet north to Kansu. Winters at lower elevations in same area.

GENERAL HABITS. Keeps singly or in separated pairs; in scattered groups when just arrived on migration. Restless, and usually very wild. Perhaps more arboreal than most redstarts, finding its food largely in bushes or by aerial flycatching sorties. In winter feeds much on left-over berries on shrubs.

FOOD. Insects, berries (of *Hippophae* etc.) and small seeds.

VOICE AND CALLS. Alarm-note, a long-drawn *zieh* followed by a rattling note (Schäfer). Song unrecorded.

BREEDING. Little known and details not recorded within our limits.

Season, May to August (in Tibet, Schäfer). *Nest*, a cup of moss and grass lined with hair, feathers, soft grass stems, vegetable down or rootlets; placed in a hollow in a tree or stream bank, or in a rock cleft concealed by bushes, within a couple of metres from the ground. *Eggs*, 3, of three types: reddish cream with fine orange freckles, evenly distributed or forming a cap at the large end; unspotted pale reddish clay; or pale greenish grey with dense, but almost invisible, fine, clay-coloured flecking. Average size of 10 eggs 19.3 × 14.6 mm (all breeding data by Beick, *J. Orn.* 85: 561–2).

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

1678. Guldenstadt's Redstart. *Phoenicurus erythrogaster grandis* (Gould)

Ruticilla grandis Gould, 1850, Proc. Zool. Soc. London: 112

(Afghanistan and Tibet)

Ruticilla Vigors Moore, 1854, in Horsfield & Moore, Cat. Bds. Mus. E.I. Co. 1: 304

(Bhutan)

Baker, FBI No. 533, Vol. 2: 78

Plate 89, fig. 10

LOCAL NAMES. None recorded.

SIZE. Sparrow +; length c. 16 cm (6½ in.).

FIELD CHARACTERS. Male (adult), summer. *Above*, forehead and round the eye black; crown and nape white. Back and wings black; a large white wing-patch. Lower rump and tail chestnut. *Below*, throat and breast black, rest of underparts chestnut. In winter, white of crown and black of back and breast fringed with ashy.

Female. *Above*, pale brown; a whitish eye-ring. Lower rump rufous; tail brownish rufous. *Below*, pale fulvous-brown; lower breast and flanks ochraceous buff; centre of belly whitish.

Striking colour pattern of male superficially resembles Whitecapped Redstart (1716), but larger size, conspicuous white wing-patch and uniformly chestnut tail diagnostic.

STATUS, DISTRIBUTION AND HABITAT. Resident, subject to altitudinal movements. Breeds in Chitral, Gilgit, Baltistan, Ladakh and along the northern Himalayan slopes (sporadic on southern slopes) through Kumaon, Nepal (Diesselhorst, 1968), Sikkim, Bhutan and Arunachal Pradesh. Breeds between c. 3600 and 5200 m (in Tibet up to 5500 m), optimum zone 3900–4800 m. Winters in the valleys at lower elevations from c. 1500 m (seldom lower) up to 4800 m (Sikkim—Meinertzhagen, 1927); scarce south of the main range in winter when recorded in Kashmir, Chamba (down to 900 m), Nepal and Sikkim. In summer affects river-beds and boulder-strewn meadows and slopes in dry, barren alpine country above the dwarf scrub zone and in Tibetan facies. In winter frequents rocky moraines and river-beds, and sparsely scrubbed hillsides, usually in the vicinity of streams; very partial to *Hippophae* thickets in valley bottoms.

Extralimital. Breeds also in Tibet, Turkestan and western China, north to the Lake Baikal region. Nominate race in the Caucasus and southern Caspian mountains.

THRUSHES AND CHATS

265

Phoenicurus erythrogaster

Distributional ranges

■ *grandis* (1678). □ *erythrogaster* (RE).

MIGRATION. Met with at lower elevations between September and April, but movements irregular and dependent on weather conditions; lowest levels usually reached in January.

GENERAL HABITS. A very hardy species often remaining at very high altitudes even during severe weather conditions. Males apparently harder than females, the latter deserting entirely their high summer grounds (Schäfer). Very shy. Usually 'keeps to itself, but at times may be seen in loose company with other species, when forced down by bad weather to lower levels. Actions and behaviour typically redstart. Flies from rock to rock or perches on boulders or scrub making short descents to the ground to pick insects, or hawking flying insects in the air. Replaces Whitecapped Redstart at high altitudes, taking insects amongst boulders along glacier torrents.

Display. Male soars from a prominent rock with outstretched quivering wings, showing off his striking plumage (Schäfer).

FOOD. Small beetles, ants and other insects. In Tibet often observed searching for insects inside carcasses of dead transport animals. In winter feeds almost exclusively on berries of juniper, *Berberis*, and especially the bountiful *Hippophae*.

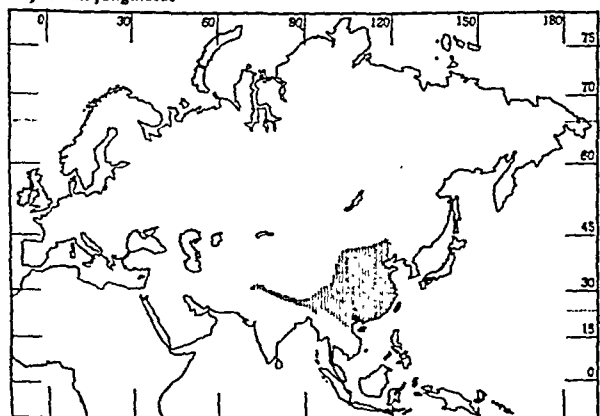

VOICE AND CALLS. Little recorded. Song short and clear, delivered from a prominent perch or during display flight (Schäfer).

BREEDING. *Season*, May to August. *Nest*, a cup of dry grass shreds lined with wool, hair and a few feathers, placed in hollows between stones or in walls. *Eggs*, 4, white with pale reddish freckles. Average size of 9 eggs 22.7 × 17.4 mm (Osmaston).

THRUSHES AND CHATS

267

western Nepal, and 4400 m in Manangbhot (Lowndes), but in eastern Nepal not over 3000 m (Diesselhorst) and down to c. 1500 m in Kathmandu Valley. In Sikkim and Bhutan does not ascend over 3700 m and may breed as low as 600 m (Sálim Ali, *Birds of Sikkim*); south of the Brahmaputra breeds between 1000 and 1800 m. Winters (October to March) from c. 2400 m down to the foothills and terai (chiefly 1000-1800

Rhyacornis fuliginosus

Distributional ranges

□ *fuliginosus* (1679). ■ *affinis* (RE).

m), east of Nepal extending for c. 20 km into the plains along the larger streams; also winters in the foothills of Bangladesh south to the Chittagong region, and along the Burma border. Females and young apparently winter at lower levels than males (Schäfer). Affects rushing torrents and streams, chiefly in a wet climatic zone; does not breed north of the main range.

Extremal. Ranges east to northern Vietnam, Hainan and China, north to Hoph and Kansu. Another subspecies in Formosa.

GENERAL HABITS. Solitary or in pairs. Confined to mountain streams where it flits from boulder to boulder, catching insects by making short sallies in the air or pursuing them with rapid steps over stones, sometimes hovering for an instant and snatching them from the surface of the water. When perched, the tail is continuously opened and shut rapidly with a scissors-like action and simultaneously wagged up and down. Very crepuscular, hunting late into the dusk till too dark to be seen but for the twinkling white in the female's tail. This twinkling produces the exact effect of water cascading over stones in a torrent, and even in good daylight often obliterates the bird against its background in an astonishing way. Maintains jealously guarded feeding territories in winter, demonstrating aggressively against

266

TURDINAE

MUSEUM DIAGNOSIS. See Field Characters. Postnuptial moult in July and August. Plumage of young spotted, variable and with a brown and a whitish phase (GD) as in *frontalis*. Young males recognizable by white wing-patch. Postjuvénal moult in September.

(Himalayas, restricted to Simla-Almora area by Ticehurst & Whistler, 1924, *Ibis*: 471)

Baker, FBI No. 535, Vol. 2: 81

Plate 89, fig. 12

LOCAL NAMES. *Kola tirio* (Kashmir); *Siradum parbo-pho* (Lepcha); *Chubbia nakki* (Bhutanese).

SIZE. Sparrow —; length c. 12 cm (5 in.).

FIELD CHARACTERS. Male (adult). Entirely bluish slaty with chestnut tail and rufous lower belly.

Female. Above, dark grey-brown with two rows of white spots on wing and a pale eye-ring. Base of tail white; rectrices partly white, tipped broadly and edged with brown. Below, mottled slate and white.

Expanded white tail of female exposes a brown triangle with the terminal end as its base.

Males often breed in female-like plumage.

STATUS, DISTRIBUTION AND HABITAT. Common resident, subject to altitudinal movements. The Himalayas from N.W.F.P. eastward through Arunachal Pradesh, thence south through Nagaland, Manipur and the Khasi hills. Vertical distribution uneven. Breeds between c. 1200 and 2100 m in Chitral (one record from Gilgit); c. 1200 to 3900 m from the Sutlej Valley to Simla, mostly above 1800 m but down to 900 m in the Kulu Valley (HW); up to 4300 m in Garhwal, to 3200 — locally to 3600 m — in

268

TURDINAE

intruders of its own kind while tolerating other species, e.g. Whitecapped Redstart and forktails etc. Cranes neck forward, tail fully fanned out and depressed, and utters a sharp, angry, prolonged *kreee* (SA). If this warning unheeded, attacks and chases intruder back to its own borders. Very territorial also in the breeding season, each pair staking out a stretch of river (Diesselhorst, Bates, Schäfer) and assiduously keeping off interlopers. However, Baker (*Nidification* 2: 77) states that two pairs may be seen feeding on the same stretch of water, while nests are often placed within a short distance of one another. If so, this must be exceptional.

Display. Flies almost vertically up in the air some 5 or 6 metres, then swoops down in a wide spiral to its original position (Cranbrook). Also described (if different from above), a slow and fluttering flight with tail fully spread out (Smythies), and a slow flight with rapidly vibrating wings in a short parabola from rock to rock (Whistler). Display very like that of wheatears (Baker).

FOOD. Chiefly insects, occasionally berries (Diesselhorst).

VOICE AND CALLS. Call-note, a sharp *ziet, ziet* (Schäfer); threat call, a sharp *kreee* (above). Song, a sharp, creaky and metallic jingle of about five seconds' duration exactly like a cricket's chirping and similarly rising in pitch (SA); uttered from a boulder or during display flight (q.v.). Song period, mainly February to June (Proud) but may occasionally be heard in winter.

BREEDING. *Season*, April to July. Double brooded. *Nest*, a cup of green moss, grass, rootlets and a few dead leaves lined with rootlets, fibres, hair or wool; usually placed on a ledge of rock, in a crevice or hole in stream banks, in the stonework of bridges, occasionally under the eaves of a streamside house, in hollows in trees or stumps — rarely even against the trunk of a tree up to c. 4 metres above the ground. Seldom built more than 50 metres or so away from streams. *Eggs*, 3 to 6, normally 4, very pale grey-green with reddish brown markings usually forming a ring or cap at the large end. Average size of 14 eggs 19.8 × 14.6 mm (BBO); of 100 eggs 18.7 × 14.5 mm (Baker). Construction of nest by both sexes; incubation by female alone, period undetermined. Both sexes tend the young. Brood-parasitized by *Cuculus canorus* and *C. fugar*.

MUSEUM DIAGNOSIS. See Field Characters. Young. Above, grey-brown with small whitish spots (buffish on wing). Upper tail-coverts white; rectrices except distal half of central rectrices and outer margins of outermost rectrices which are dark brown. Below, throat, breast and flanks grey-brown densely spotted with whitish; belly white with dusky fringes; under surface of tail white except for brown tip. Young moult into brown female-like plumage. Males often breed in this brown dress and apparently do not acquire adult plumage until the second year.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

COLOURS OF BARE PARTS. Iris brown. Bill, legs and feet blackish brown; soles white.

Genus *HODGSONIUS* Bonaparte

Hodgsonius Bonaparte, 1850, *Consp. Gen. Av.* 1: 300. Type, by monotypy, *Brachypterus phoenicuroides* 'Hodgs.' = *Brachypterus phoenicuroides* [sic] Gray. Wing short and rounded. Bill as in *Brachypteryx*. Rictal bristles weak. Tarsus and tail long.

1680. *Hodgson's Shortwing* or *Whitebellied Redstart*. *Hodgsonius phoenicuroides phoenicuroides* (Gray)

Brachypterus phoenicuroides [sic] Gray, 1846, *Cat. Mamms. Bds. Nepal*: 70, 153 (Nepal)

Baker, FBI No. 491, Vol. 2: 21

Plate 89, fig. 13

LOCAL NAMES. None recorded.

SIZE. - Bulbul; length c. 19 cm (7½ in.).

FIELD CHARACTERS. Male (adult). Above, slate-blue with two small white spots on wing. Tail long and graduated, blackish, base of outer rectrices rufous. Below, throat and breast slate-blue; belly white; under tail-coverts blackish tipped white.

White wing-spots conspicuous in flight and when wings drooped.

Female. Above, brown; tail with rufous patch at base as in male. Below, fulvous, centre of belly whitish.

First-year male like female but much darker brown; often breeds in this plumage.

STATUS, DISTRIBUTION and HABITAT. Altitudinal migrant. Summer (breeding) visitor, locally common: the Himalayas from the Indus river (Kagan) east through Arunachal Pradesh. Breeds between 2400 m (isolately) and 3900 m, in Nepal up to 4400 m. Winters (September to May) from at least 1500 m down to the foothills. Affects dense thickets of birch and juniper, chiefly near and above timber-line. In winter frequents bush jungle, undergrowth and edges of forest.

Extratropical. Extends east to Yunnan. The species ranges north to Kansu and Shensi and winters south to the northern Indochinese countries.

GENERAL HABITS. Robin-like; very shy and retiring. Makes short flights from bush to bush; feeds on the ground. Tail often erected almost vertically and expanded, especially when calling, displaying the rufous base otherwise concealed or inconspicuous.

FOOD. Insects; in autumn berries are also taken (Schäfer).

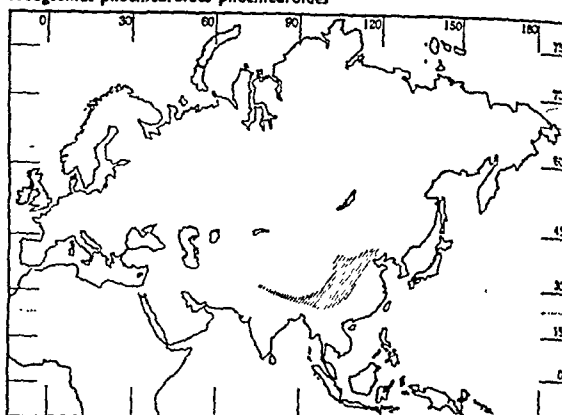

VOICE and CALLS. Song, a complacent-sounding, loud, rather melancholy whistled phrase of three notes, the middle one prolonged and highest, the last a half-tone lower than the first (BBO), rendered as *pe-pee-pit* (SA) or *he did so* (Whitehead). Usually given from a bush-top or tree early morning and late evening — even during moonlit nights. Song period June to August. Alarm-note a robin-like *tsiep tsiep tk tk* or *tek tek sie* (GD). Other notes described as a monosyllabic *chuck*.

TURDINAE

Hodgsonius phoenicuroides phoenicuroides

Distributional range

BREEDING. Season, June to August. Nest, a deep cup of grass and dead leaves, lined with moss or fine grass, hair and a few feathers; reminiscent of a nightingale's. Placed in low bushes within 30 to 50 cm from the ground, or even on the ground itself. Eggs, normally 3, sometimes 2, rarely 4, deep blue-green. Average size of 31 eggs 22.2 × 16.1 mm (Osmaston); of 60 eggs 22.7 × 16.1 mm (Baker). Often brood-parasitized by *Cuculus canorus*. Incubation apparently by female alone; period undetermined. Both sexes tend the young.

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS

	Wing	Bill (from skull)	Tail
2 ♂♂	72, 74	18-19	77, 79 mm
4 ♀♀	69-72		76-78 mm (BB, SA)

Tarsus c. 30 mm

Weight 2 ♂♂ (July) 22.5, 22.7; 4 ♀♀ (August) 22-24.8 g (GD). 1 ♀ (Nov.) 24 g (SA).

COLOURS OF BARE PARTS. Iris dark brown. Bill black (♂), brown (♀). Legs and feet brown, soles paler.

272

Notodula leucura shipidura Koelz, 1952, Jour. Zool. Soc. India 4: 41

(Tekhubarna, Naga Hills)

Baker, FBI No. 554, Vol. 2: 106

Plate 89, fig. 14

LOCAL NAME. *Mengshia* (Lepcha).

SIZE. Bulbul —; c. 17 cm (6½ in.).

FIELD CHARACTERS. Male (adult). Above, lores, round the eye and sides of head black. Forehead, short supercilium and shoulders blue. Rest of upperparts dark indigo. Tail blackish with two white patches on basal half (prominent only in flight). Below, throat and breast black; a white patch on each side of neck, usually concealed. Belly dark indigo.

Female. Above, rufous olive-brown; a ferruginous eye-ring. Tail dark brown edged ferruginous, and with white patches as in male. Below, throat ochraceous; breast rufous-brown; belly greyish brown. The conspicuous white patches in the tail of both sexes diagnostic.

STATUS, DISTRIBUTION AND HABITAT. Resident, subject to vertical seasonal movements, locally common. From central Nepal east through Arunachal Pradesh, thence south through the Patkai Range, Nagaland, Manipur and

× c. 1

2

TURDINAE

Meghalaya in the Cachar, Khasi and Garo hills. Breeds between 1200 and 2700 m; winters from c. 1500 m down to the foothills and, in Meghalaya, adjacent plains. Affects undergrowth in shady, broad-leaved evergreen forest, usually in the vicinity of small streams.

Cinclidium leucurum

Distributional range 1 *leucurum* (1681) 2 *leucurum* (RE)
3 *frontale* (RE)

Extralimital. Extends east to Hupeh, Kweichow and Vietnam, and south through the Malay Peninsula.

GENERAL HABITS. Solitary and as a rule very secretive. Feeds on the ground and in bushes. When disturbed flies on to a dead log or low branch where it sits opening and closing its tail. Presently descends again to hop about and feed, flicking aside and turning over dead leaves in the quest.

FOOD. Insects and, at least in autumn, berries (GD).

VOICE AND CALLS. A clear, liquid song of robin quality — several phrases, each given separately with a considerable pause between: *te-ile-i-te-ux-i* *ti-yi-ya-we-i* (Lister). Often sings from an exposed perch. 'The bird would perch on a twig while singing and lean forwards, at the same time spreading the tail ... One continually raised and depressed its tail quite slowly while singing and at the same time expanded and contracted it' (Lister). Song period, mid March to mid September (Proud). Other notes unrecorded.

BREEDING. Season, April to August, chiefly May and June. The majority of birds have two broods, using the same nest for both (Baker). Nest, a deep cup when sheltered from above, often domed or semi-domed when in open banks; made mostly of rootlets mixed with some dead leaves and green

THRUSHES AND CHATS

3

moss lined with rootlets, placed in a crack or hole in some vertical rock near streams or in a grassy or mossy bank, sometimes among boulders or exposed roots of trees overhanging a stream. Eggs, 3 or 4, almost white to pale pink, some with a faint darker coronal band at the large end and an indistinct indication of a speckled pattern; rather similar to eggs of Large Niltava (1428). Average size of 65 eggs 22.9 × 17 mm (Harrison & Parker, Bull. Brit. Orn. Cl. 86: 71-3). Building of nest by both sexes. Incubation mostly by female, also by male.

MUSEUM DIAGNOSIS. See Field Characters. Young very dark brown (♂) or olive-brown (♀) spotted with ferruginous; white patches in tail as in adult. Post-juvenile moult of body, lesser and median coverts. First-year birds distinguished by retention of ochraceous tips to greater coverts. Postnuptial moult apparently in September (fresh plumage in October).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	89-100	18-19	27-29	69-85 mm
♀♀	88-91	—	—	— mm

(SDR, BB, SA)

Weight 5 ♂♂ (Oct.-Nov.) 24-30 g (GD, SA); 1 ♀ (winter) 26 g (SDR).

COLOURS OF BARE PARTS. Male. Iris brown. Bill, legs and feet black. Female. Iris brown. Bill horny. Legs and feet brown.

1682. Bluefronted Robin. *Cinclidium frontale frontale* Blyth

Cinclidium frontale Blyth, 1842, Jour. Asiat. Soc. Bengal 11: 181 (Sikkim)

Baker, FBI No. 555, Vol. 2: 107

Plate 89, fig. 15

LOCAL NAMES. None recorded.

SIZE. Bulbul ±; length c. 19 cm (7½ in.).

FIELD CHARACTERS. Male (adult). Above, lores, frontal band and round the eye black. Forehead, short supercilium and shoulders cobalt-blue. Rest of upperparts deep slaty blue. Below, deep slaty blue; centre of belly and under tail-coverts whitish.

Female. Whole plumage rufous brown; a pale eye-ring. Centre of belly and vent whitish.

Both sexes very similar in coloration to *C. leucurum* but tail greatly graduated and without any white, and tarsus considerably longer.

STATUS, DISTRIBUTION AND HABITAT. A rare and little known species. Recorded only from Nepal (probably extreme eastern part), Sikkim and Darjeeling. In the latter district taken in June at Palrajua, 2250 m, about 5 km northeast of Tonglu (Paynter, *in litt.*). Affects subtropical wet forest.

Extralimital. Another subspecies in northern Vietnam and Laos.

GENERAL HABITS, FOOD AND VOICE. Unknown. Specimens have been taken in heavy forest near the ground.

BREEDING. Unknown.

MUSEUM DIAGNOSIS. See Field Characters.

(Eddie, Glasgow Univ. Hunterian Mus.)

Weight 2 ♂♂ (June) 25.5, 26.2; 2 ♀♀ (June) 25, 25 g (RAP).

COLOURS OF BARE PARTS. Male. Iris, bill, legs and feet black. Female. Iris very dark brown. Bill black. Legs and feet fleshy grey.

Genus GRANDALA Hodgson

Grandala Hodgson, 1843, Jour. Asiat. Soc. Bengal 12: 447.

Type, by monotypy, *Grandala coelicolor* Hodgson

Wing very long and pointed, first primary (as.) minute, second longest or equal to third. Tail square. Upper tail-coverts very long, about two-thirds of tail. Bill about half the length of the head, rather slender. Rictal bristles short and weak.

1683. *Grandala coelicolor* Hodgson

Gr. (Grandala) coelicolor [sic] Hodgson, 1843, Jour. Asiat. Soc. Bengal 12: 447 (Nepal)

Baker, FBI No. 541, Vol. 2: 89

Plate 90, fig. 3

LOCAL NAMES. None recorded.

SIZE. Bulbul +; length c. 23 cm (9 in.).

FIELD CHARACTERS. Male (adult). Entirely bright purple-blue with a silky sheen, except for lores, wings and tail which are black.

Female very different. Above, head and neck brown streaked with fulvous white. Rest of upperparts brown. Tips of tertials and a patch on wing white, the latter conspicuous in flight. Rump and upper tail-coverts tinged with blue. Below, brown streaked with fulvous white, more so on throat and breast.

STATUS, DISTRIBUTION AND HABITAT. Resident, subject to vertical movements, locally plentiful. The Himalayas from Kashmir (Kishenganga and Liddar valleys) east through Arunachal Pradesh. Found in summer between 3900 and 5400 m, chiefly above 4300 m. Winters mostly above 3000 m and up to at least 4300 m, irregularly descending to lower levels (c. 2200 m) in bad weather. In summer affects boulder-strewn alpine meadows, rocky slopes, screes and cliff above the dwarf scrub zone. In winter frequents

* For systematic position based on osteology see Pycraft, 1927; for affinities based on habits see Meise, 1927; Deshayes, 1965 and Dixon, 1968.

THRUSHES AND CHATS

5

ridges and rocky mountainsides. Both in winter and summer has a preference for rain-swept ridges and heights.

Grandala coelicalor

■ Distributional range

Extralimital. Extends to Yunnan, Szechuan and north to Kansu.

GENERAL HABITS. In summer keeps at the highest elevations in loose flocks of 5 to 60 individuals, presumably breaking up into pairs in late June (cf. Diesselhorst, 1968: 309) and flocking again towards the end of August. A preponderance of adult males over brown-plumaged birds has been noted by Schäfer, Sâlim Ali and Deshayes. However, flocks composed almost entirely of brown-plumaged birds have been recorded by Meinertzhagen and Diesselhorst, thus supporting the view of a segregation of the sexes and brown-plumaged individuals. In winter congregates in restless swarms of several hundred birds (once estimated at over 1000). 'This swarm kept circling high over the valley, chiefly gliding, with occasional wing-beats. The cloud appeared as though wafted here and there by the wind. From time to time the birds would drop steeply like rain more or less in unison to settle on tall leafless trees, covering the top branches in dense clusters. Every little while, for no apparent reason, the swarm would suddenly take wing, circle aloft and tumble again into another tree in a restricted "beat" of rocky mountainside' (SA). 'Their flight is buoyant, beautiful and effortless, and even in the strongest winds they seem to do exactly as they please, wheeling sometimes like flocks of scattered waders and at other times taking the strong, direct flight of a rock-thrush' (Meinertzhagen). Flight sometimes likened to that of starlings or even bee-eaters; this comparison however is superficial and rests upon its long-winged, slim aspect and the formation of large flocks; on closer observation, its movements and carriage

THRUSHES AND CHATS

7

Characterized by long, graduated and deeply forked tail (except *scouleri* in which tail is short, square and only slightly forked), and by convex lower mandible. Bill strong and fairly stout. Rictal bristles well developed. Wing long, first primary (as.) about half the length of second.

1684. Little Forktail. *Enicurus scouleri scouleri* Vigors

Enicurus Scouleri Vigors, 1832, Proc. Zool. Soc. London: 174 (Himalayas = Simla)
Baker, FBI No. 525, Vol. 2: 65

Plate 90, fig. 5

LOCAL NAME. Ooong-sumbrek-pho (Lepcha).

SIZE. Sparrow —; length c. 12 cm (5 in.).

FIELD CHARACTERS. Above, forehead white; rest of head, neck and upper back black. A conspicuous white 'triangular' bar across wing. Lower back and base of tail white, a black band across rump. Tail blackish brown, slightly forked, outer rectrices white. Below, throat black; rest of underparts white smeared with black on breast and flanks. Legs fleshy white. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Resident, subject to seasonal vertical movements; locally common. The Himalayas from N.W.F.P. and Gilgit east through Arunachal Pradesh, thence south to Nagaland and Meghalaya in the Cachar and Khasi hills, Manipur (?) and Bangladesh in the Chittagong ranges. Breeds chiefly between 1800 and 3300 m, uncommonly down to 1000 m (below Mussooree — Rattray; Cachar — Baker) or up to 3700 m (headwaters of Khola river, central Nepal — Deshayes). Winters (October to March) mostly between 1000 and at least 2000 m, locally down to c. 300 m. Affects torrential rocky streams and waterfalls.

Extralimital. Extends west to Tadzhikistan and Kirghizstan, east through China and south to northern Vietnam. Another subspecies in Taiwan.

GENERAL HABITS. Rather similar to those of Plumbeous Redstart (1679), q.v. Met with perched singly or in pairs along small rocky hill streams, usually in the vicinity of waterfalls — its favourite hunting ground — commonly in loose association with Plumbeous and Whitecapped Redstarts, but with some rivalry for coveted stances. Incessantly wags its stumpy tail slowly up and down and rapidly opens and shuts it with a rhythmic, scissors-like action, the flickering black-and-white pattern producing the exact effect of water rippling over the roughnesses of the rocks. Picks insects off the surface of the slippery wet rocks or the water flowing

6

TURDINAE

appear decidedly turdine and do not show the least resemblance to starlings (GD); its flight approaches nearest that of the rock thrush, while on the ground it also resembles the rock thrush (Meinertzhagen). Finds most of its food on the ground, hopping about and often jumping chat-like on to a rock. Feeding territory often several hundred metres away from nest. Probably spends nights in cliffs as birds have been observed at dusk to fly toward mountainside crags. In autumn and winter readily perches on trees and bushes. Has a habit of flicking open its tail and wings simultaneously.

FOOD. Insects, caterpillars, tipulid larvae (GD), pupae, moths, seeds and berries; in autumn berries of *Vaccinium* and in winter those of *Hippophae*. Large flocks occasionally raid cultivated fruit-trees in autumn and cause some damage.

VOICE and CALLS. A very silent bird. Call-note *tji-u* or *tji-ti*. Song, a mere variation of the call-note, a soft, clear *tji-u tji-u ti-tu* audible at close range only, uttered occasionally even in summer; given from a rock or boulder (Deshayes).

BREEDING. *Season*, second half of June and July. *Nest*, a large, neat cup of dry grass covered with moss, lined with feathers and other soft material, placed on a ledge of rock in a vertical or overhanging cliff (Whymper, JBNHS 20: 1158 and 22: 196; Sheriff, *Ibis* 1944: 185). *Eggs*, apparently only 2, greenish white marked all over with reddish brown blotches and purplish secondary markings. Two eggs measure 29.7 × 19.4 and 27.3 × 21 mm (Baker). Young fed by both parents. Breeding biology imperfectly known.

MUSEUM DIAGNOSIS. See Field Characters. Young similar to female but streaks larger, ground colour darker; streaks extend well on to mantle but are faint on rump and upper tail-coverts which are not tinged with blue. First-winter male (after postjuvinal moult) similar to female but streaks narrower. Possibly breeds in this dress? Blue plumage assumed on first postnuptial moult in the second year when plumage shows a mixture of blue and brown feathers; moult apparently starts on abdomen and under tail-coverts. At this time brown rectrices and remiges are also replaced by black. Postnuptial moult complete, in August and September.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	140-152	20-22	29-31	84-91 mm
♀♀	135-147		29-30	77-87 mm
				(NBK, SA)

Weight 4 ♂♂ (July) 42-46, 2 ♂♂ (August) 50, 52; 1 ♀ (July) 38; 4 juv. 43.7-51 g (GD).

COLOURS OF BARE PARTS. Male. Iris dark brown. Bill black; gape and inside of mouth bright orange-yellow (summer, MD); inside of mouth of both sexes bright lemon-yellow (winter; possibly a seasonal variation? — SA). Legs, feet and claws black.

Genus *ENICURUS* Temminck

Enicurus Temminck, 1822, Pl. col. (19), pl. 113. Type, by monotypy, *Enicurus coronatus* Temminck (= *Turdus leschenaulti* Vieillot)

Microcichla Sharpe, 1883, Cat. Bds. Brit. Mus. 7: 312, 322. Type, by monotypy, *Enicurus scouleri* Vigors

TURDINAE

Enicurus scouleri

Distributional ranges

■ *scouleri* (1684)

□ *fortis* (RE)

over them, occasionally flying (hovering) out over the spray in their pursuit. Sometimes plunges into a foaming torrent, like a dipper, apparently running along the bottom against the current (Perreau, JBNHS 19: 908). Feeds chiefly in the morning and evening, usually resting in between in nearby scrub. As a rule frequents smaller and more turbulent streams than the larger forktails, but in winter sometimes seen well out in wide slow-flowing rivers.

FOOD. Aquatic insects and their larvae.

VOICE and CALLS. Unrecorded.

BREEDING. *Season*, April to June. *Nest*, a compact cup of green moss lined with skeleton leaves, placed on a ledge or cleft in rock, often behind a waterfall, or in a hole in moss-covered banks. *Eggs*, normally 3, occasionally 2, rarely 4, white, sparsely speckled with light reddish. Average size of 25 eggs 20.1 × 15 mm (Baker).

MUSEUM DIAGNOSIS. See Field Characters. Young: whole crown, sides of head and back sooty brown. Underparts white, feathers of throat and breast with dark margins. Rest as in adult but black replaced by sooty brown. Postjuvinal moult of body, lesser, and median coverts.

				(Sices, SA, BB)

Weight 2 ♂♂ (Oct.-Nov.) 17, 18.6; 3 ♀♀ (Oct.-Nov.) 12-16 g (RAF, SA, BB).

COLOURS OF BARE PARTS. Iris brown. Bill black. Legs and feet fleshy white.

THRUSHES AND CHATS

9

1685. Blackbacked Forktail. *Enicurus immaculatus* (Hodgson)

Motacilla (*Enicurus*) *immaculatus* Hodgson, 1836, *Asiat. Res.* 19: 190 (Nepal)
Baker, *FBI* No. 520, Vol. 2: 61
Plate 90, fig. 7

LOCAL NAME. *Inruidiba gejeba* (Kacha Naga).

SIZE. Bulbul, with a long tail; length c. 25 cm (10 in.).

FIELD CHARACTERS. General effect of a pied wagtail. *Above*, forehead and supercilium white. Rest of head and back black. Rump white continued as a white band across black wings. Tips of secondaries white. Tail long, very deeply forked and graduated; outer rectrices white, inner ones black with white tips emphasizing the graduated aspect. *Below*, upper throat black, rest white. Sexes alike.

Leschenault's Forktail (1687) is similar but larger and with a black breast. STATUS, DISTRIBUTION AND HABITAT. Resident, scarce west of Sikkim, commoner eastwards. The Himalayan foothills below c. 1450 from Garhwal east through Arunachal Pradesh, the foothills of Meghalaya, Nagaland,

Enicurus immaculatus

▨ Distributional range

Manipur, Mizoram and Bangladesh south to the Chittagong region; in the latter areas breeds below 900 m, mostly below 500 m, and in the adjacent plains in wooded terrain. Affects rocky hill streams and muddy or sandy banks of rivers where current is still rapid, and almost always flowing through dense damp forest; in Nepal restricted to streams running through deciduous forest.

Extralimital. Ranges east through Burma and Thailand.

THRUSHES AND CHATS

11

Enicurus schistaceus

□ Distributional range

Extralimital. Ranges east through the Indochinese countries and southern China to Fukien.

GENERAL HABITS. A low-altitude forktail. Keeps solitary or in pairs on wooded rocky streams. Hops or flits from stone to stone over the surface of water, or trips lightly over boulders in search of insects. Rarely if ever forsakes a streambed. When disturbed and driven to the limit of its territory (which may extend over a 120-metre stretch) the bird promptly doubles back to the stream in a semicircle behind the observer; sometimes seeks shelter in thickets. Often seen in company with *E. immaculatus* (Nepal). Flight and behaviour very reminiscent of a wagtail; flight somewhat less undulating.

FOOD. Insects (beetles and others — GD).

VOICE AND CALLS. Largely as in 1685 and 1688. A high-pitched single note (Smythies).

BREEDING. Season, April to June. *Nest*, a cup of green moss lined with skeleton leaves or rootlets, placed among boulders, on ledges or in crevices of rocks, in hollows in banks, or among the roots of trees and holes in dead stumps overhanging a stream. *Eggs*, 3 or 4, generally the latter, pale bluish white, sparsely but boldly speckled with dark reddish brown with secondary markings of lavender. Average size of 100 eggs 21.4 × 16.3 mm (Baker). Building and incubation by both sexes; incubation period undetermined.

MUSEUM DIAGNOSIS. See Field Characters. Young: slaty parts of adult replaced by brown. No white on forehead. Feathers of underparts margined with slaty brown. Postjuvinal moult of body, lesser, median and greater coverts and tail.

10

TURDINAE

GENERAL HABITS. Those of the genus (cf. 1686, 1688). Solitary. Frequents stones and boulders in and along wooded streams, incessantly wagging its tail.

FOOD. Insects.

VOICE AND CALLS. Call-note a sharp *cutt-see*, the second syllable two notes higher than the first (Fleming); sometimes only the first note is given. Has 'a short song'.

BREEDING. Season, end of March to May. *Nest*, a cup of green moss with a few roots and dead leaves, lined with skeleton leaves; placed on ledges or in crevices of rock, often where water is dripping, or in hollows in fallen trees or stream banks. *Eggs*, normally 3, pinkish, feebly marked with reddish brown specks and irregular blotches, sometimes forming a cap at the large end. Average size of 28 eggs 20.8 × 15.8 mm (Baker). Building and incubation by both sexes; incubation period undetermined.

MUSEUM DIAGNOSIS. See Field Characters and Key to the Species. Young has head, neck and back sooty brown; no white on forehead. Underparts white, breast-feathers with blackish margins. Tail as in adult but shorter and feathers narrower. Postjuvinal moult of body, lesser, median and greater coverts and apparently the tail (HW).

MEASUREMENTS

	Wing	Bill (from skull)	Tail
3 ♂♂	86-98	20	{ 124 (one msd.) mm
2 ♀♀	86, 90		{ 127 (one msd.) mm
			(Rand & Fleming)

Tarsus c. 26 mm

Weight 1 ♀ (October) 25 g (GD); 1 ♂ (Oct.) 26 g (SA).

COLOURS OF BARE PARTS. Iris brown. Bill black. Legs and feet pale fleshy white.

1686. Slatybacked Forktail. *Enicurus schistaceus* (Hodgson)

Motacilla (*Enicurus*) *schistaceus* Hodgson, 1836, *Asiat. Res.* 19: 189 (Nepal)
Baker, *FBI* No. 519, Vol. 2: 59
Plate 90, fig. 6

LOCAL NAME. *Inruidiba* (Kacha Naga).

SIZE. Bulbul, with a long tail; length c. 25 cm (10 in.).

FIELD CHARACTERS. *Above*, a narrow frontal band and short supercilium white. Crown and back slaty. Wings black with a broad white band across, a smaller white patch on primaries and white tips to tertiaries. Rump white. Tail as in *immaculatus* (1685). *Below*, chin and sides of throat black. Rest of underparts white, slaty on sides of breast. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Resident, subject to vertical movements; rare west of Sikkim. The Himalayan foothills from Kumaon east through Arunachal Pradesh and the foothills of Meghalaya, Nagaland, Manipur, Mizoram and Bangladesh south to the Chittagong region. Breeds between c. 300 and 1600 m. In winter extends down to the base of the hills and adjacent plains. Affects rocky torrents in dark dense forest, although it appears to be less a forest bird than *maculatus* (1688), and also frequents nullahs running through cultivated areas; also prefers larger streams.

Weight 4 ♂♂ 29-30; 2 ♀♀ 26, 27 g (SA, BB).

COLOURS OF BARE PARTS. Iris brown. Bill black. Legs, feet and claws whitish grey to fleshy white.

1687. Leschenault's Forktail. *Enicurus leschenaulti indicus* Hartert

Enicurus leschenaulti indicus Hartert, 1909, *Vög. pal. Fauna* 1: 760
(Margherita, Upper Assam)
Baker, *FBI* No. 521, Vol. 2: 62
Plate 90, fig. 9

LOCAL NAME. *Inruidiba gediba* (Kacha Naga).

SIZE. Myna, with long tail; length c. 28 cm (11 in.).

FIELD CHARACTERS. The largest and blackest of the forktails. Very similar to *immaculatus* (1685, q.v.) but larger; white of forehead extending to top of crown, not as a supercilium, and black of underparts extending to breast and flanks. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Resident, subject to seasonal movements, scarce except in eastern Assam where common. The Himalayan foothills from Darjeeling and Sikkim east through Bhutan and Arunachal

THRUSHES AND CHATS

13

Pradesh, thence south through Meghalaya, Nagaland, Manipur and the foothills of Assam and Bangladesh south to the Chittagong region. Found up to c. 300 m in Assam, 600 m in Sikkim. In winter extends a few kilometres into the plains along rivers. Affects rushing torrents and the larger rivers in dense evergreen forest; also tiny rivulets in heavy and dark forest. Sometimes close to plantation labour barracks.

Extralimital. Ranges east to northern Vietnam. The species extends north to Shensi, east to Chekiang, south to Hainan, Malaya, Borneo and the Sunda islands.

GENERAL HABITS. Those of the genus. When disturbed at a jungle stream takes to the forest at once. Often met with along narrow paths in damp forest.

FOOD. Insects.

VOICE and CALLS. 'Has a very sharp single note (uttered in flight) not unlike the sound produced by turning sharply and jerkily the stopper in the neck of a glass bottle' (Davison).

BREEDING. Season, April to June. Nest, a cup of green moss mixed with some dead leaves, rootlets and fibres, lined with skeleton leaves or rootlets, placed in steep banks covered with ferns or other rank vegetation, or in hollows in trees, rocks, or between boulders; usually in very damp situations, the nest often being soaking wet. Eggs, normally 4 sometimes 3, pale cream to deep rich buff densely marked with brick-red or brownish red specks and freckles, with secondary lavender specks. Average size of 40 eggs 24.6 x 17.7 mm (Baker). Share of the sexes in the domestic chores, and period of incubation, not recorded.

MUSEUM DIAGNOSIS. See Field Characters.

Young: Head and back dark smoky brown, no white on forehead; tips of wing-coverts buff; rest of upperparts as in adult. Throat and breast dark smoky brown with fulvous shaft-streaks. Upper belly white mixed with brown; centre of belly white; flanks brown.

MEASUREMENTS

Baker, FBI No. 517, Vol. 2: 57
Plate 90, fig. 8

LOCAL NAMES. *Khānjān* (N.W.F.P.); *Shakel-lōt* (Kashmir).

THRUSHES AND CHATS

15

of this graceful swaying of the tail. When disturbed flies swiftly up or down stream with dipping wagtail-like flight uttering a sharp single note, alighting a short distance off to resume feeding. If followed, repeats this three or four times then suddenly veering off into the forest and circling back to the stream behind the intruder. Sometimes submerges completely like a dipper while feeding. Commonly met at rills and trickles alongside forest roads where it behaves just like a Grey Wagtail (*Motacilla caspica*), flying in repeated spurts ahead of an oncoming car for considerable distances, finally looping back through the forest to the original spot.

FOOD. Aquatic insects and small molluscs.

VOICE and CALLS. A shrill rasping *kreee* or *tseek*, very like a Whistling Thrush's (*Myiophonus*), uttered in flight. A sharp, creaky *cheek-chik-chik-chik* uttered at rest as well as on wing, almost identical with one of the calls of the Blue Magpie (1027). Song undescribed.

BREEDING. Season, April to July. Nest, a cup of green moss, rootlets, hair and fibres, mixed with clay and lined with skeleton leaves; placed on a rock-ledge or crevice, a niche in a steep stream bank or between boulders, often concealed by overhanging ferns etc. Eggs 3 or 4, pale cream or very pale green marked with light reddish brown freckles or spots. Average size of 50 eggs 24.8 x 17.6 mm (Baker). Building, incubation and nest-feeding by both sexes. Female fed on nest by male. Incubation period undetermined. Often brood-parasitized by *Cuculus canorus*.

MUSEUM DIAGNOSIS. See Field Characters.

Downy chick (3 or 4 days old): slaty black, the down tipped with greyish brown. 'When brood lying huddled in nest gave a perfect illusion of an old deserted nest spun across the top with spiders' webs' (SA).

Young (imm.): Above, head and back smoky brown, no white on crown; rest of upperparts as in adult. Below, throat and breast smoky brown with fulvous shaft-streaks; belly white suffused with brown. Postjuvénal moult of body, lesser, median (and greater?) coverts, in August and September.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♂	108-111	24-25	c. 30	146-150 mm
♀ ♀	99-110	22-24	—	129-139 mm (BB, Rand & Fleming)

Weight 1 ♂ (September) 46 g (GD); 1 ♀ (October) 38.5 g (RAP).

COLOURS OF BARE PARTS. Iris dark brown. Bill black. Legs and feet fleshy white.

Enicurus guttatus Gould, 1865, Proc. Zool. Soc. London: 664
(Sikkim = Darjeeling)
Baker, FBI No. 518, Vol. 2: 58

LOCAL NAMES. *Oong-jam ching-pho* (Lepcha); *Chuko-leka* (Bhutia).

SIZE. Bulbul, with long tail; length c. 25 cm (10 in.).

FIELD CHARACTERS. As in 1688, q.v. See Museum Diagnosis.

14

TURDINAE

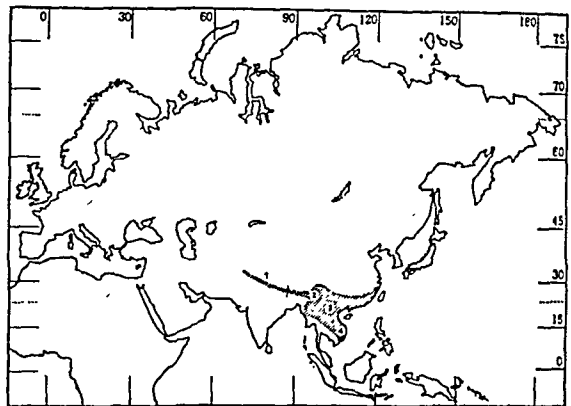

SIZE. Bulbul, with long tail; length c. 25 cm (10 in.).

FIELD CHARACTERS. Above, forehead and forecrown white. Round the eye, sides of head and nape black. Back black spotted with white. A broad wing-bar and rump white. Tertiaries tipped with white. Tail deeply forked and graduated; outer rectrices white, the others black tipped with white. Below, throat and breast black; belly white. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Common resident but rather capricious: the western Himalayas from Chitral to eastern Nepal. Breeds between 1200 and 3000 m, locally up to 3600 m (Sutlej Valley) or down to 900 m (Chamba, Dehra Dun). Some withdrawal from upper levels in winter when recorded at least up to 2300 m and down to 600 m. Affects boulder-strewn, shady nullahs and streams running through forest and narrow gorges, usually shunning large rivers.

Enicurus maculatus

- Distributional ranges 1 *maculatus* (1688) 2 *guttatus* (1689)
3 *bacatus* (RE) 4 *robinsoni* (RE)

Extralimital. Adjacent parts of Afghanistan (Nuristan).

GENERAL HABITS. Movements and behaviour superficially very wagtail-like though essentially turdine. Keeps singly or in separated pairs, tripping lightly over slippery or moss-covered stones at the water's edge, or hopping from stone to stone in the torrent, the long forked tail raised horizontally well off the ground and gently swayed up and down rather than wagged. Pivots slowly on its perch, facing this way and that, to the accompaniment

16

TURDINAE

STATUS, DISTRIBUTION and HABITAT. Common resident, from eastern Nepal east through Arunachal Pradesh thence south through Meghalaya, Nagaland, Manipur and the hills of Mizoram south to the Chittagong ranges. Breeds between 600 and 3000 m, optimum zone apparently 1400-2600 m. Affects small streams in dense forest; in winter may be seen in wide river-beds at the base of the hills.

Extralimital. Extends to Burma, Yunnan and southern Szechuan. The species ranges east to Vietnam and through southern China to Fukien.

GENERAL HABITS. As in 1688. Display (threat or courtship?): 'Two birds careered up and down the stream for several minutes, flying so close to each other as almost to touch. They then landed on a large stone over which they ran with the tail held perpendicular, and half-turning their backs on one another. After a few seconds of this display the chase began once more and continued in ever-increasing tempo until the whole performance ended abruptly and both birds went off in different directions'. (For details see Stonor, 1943, *Ibis* 85: 344.)

FOOD and VOICE. As in 1688.

BREEDING. As in 1688. For details see Baker, *Nidification* 2: 53. Average size of 100 eggs 24.9 x 17.3 mm.

MUSEUM DIAGNOSIS. Differs from *maculatus* (1688) in having no white spots on breast, fewer and smaller white spots on back, and in being somewhat smaller.

MEASUREMENTS

Plate 90, fig. 11

LOCAL NAMES. *Cocho* (Nepal); *Lo-nyun-pho* (Lepcha).

SIZE. Myna +; length c. 28 cm (11 in.).

THRUSHES AND CHATS

17

FIELD CHARACTERS. Male (adult). *Above*, crown lavender-blue. Supercilium, ear-coverts and nape black. Back brownish purple. Wing purple-lavender with black tip and edge, a paler lavender patch near shoulder and one in the middle. Tail purple-lavender with a black terminal band. *Below*, uniform brownish purple.

Female like male but brownish purple parts replaced by reddish brown above, paler (brownish clay) below.

STATUS, DISTRIBUTION AND HABITAT. Resident, rare and little known. The Himalayas from Kumaon (Almora, Naini Tal) east through Nepal, Darjeeling, Sikkim and Bhutan (SA); Meghalaya in the Khasi Hills, and

Cochoa purpurea

▨ Distributional range

Manipur. Recorded between 1000 and 3000 m. Affects dense humid evergreen forest, and undergrowth in ravines running through pine forest (Khasi Hills).

Extralimital. Ranges east to Yunnan and northern Vietnam.

GENERAL HABITS. A very quiet and secretive thrush of dense undergrowth. Keeps singly or in pairs. Feeds on the ground as well as in trees, ascending into the tops for berries.

FOOD. Berries and insects; molluscs (D'Abreu, Jerdon) and aquatic insects; slugs—one c. 2 cm long (SA).

VOICE AND CALLS. A low chuckle, the only sound recorded.

BREEDING. Season, early May to mid July. *Nest*, a rather shallow cup of green moss with some dead leaves, rootlets and scraps of fibres, lined with fine black rootlets, lichen, and white thread-like fungus, the latter apparently being distinctive of the nests of this genus; usually placed in a horizontal fork in small trees between two and six metres above the ground, sometimes

18

TURDINAE

in bushes. *Eggs*, normally 3, occasionally 4, pale sea-green blotched with bright reddish brown and with secondary blotches of lavender and grey, usually more numerous at the large end where they sometimes form a cap. Another type has a pale, reddish stone ground with similar markings. Average size of 50 eggs 31.3 × 21.6 mm (Baker). Incubation by both sexes. Very shy at nest and slips off noiselessly while intruders are still at some distance.

MUSEUM DIAGNOSIS. See Field Characters.

Young male. *Above*, crown-feathers white with black tips. Sides of head black. Back dull purplish brown edged with blackish on mantle and tipped with ferruginous on upper tail-coverts. *Below*, rich rusty ochraceous with bold black bars; throat ochraceous; under tail-coverts brownish; median and lesser wing-coverts dull purple tipped with ochraceous; greater coverts dull purple. Rest of wing and tail as in adult.

Young female, like young male but tips of crown-feathers brown; sides of head brown. Feathers of back brown with darker tips and small ochraceous centres. Greater coverts brown; median and lesser coverts brown with ochraceous tips. Postjuvinal moult of body, lesser and median coverts.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

Plate 90, fig. 10

LOCAL NAMES. None recorded.

SIZE. Myna +; length c. 28 cm (11 in.).

FIELD CHARACTERS. Male (adult). *Above*, crown to nape sky-blue. Lores and supercilium black. Ear-coverts dark blue. Back and wing-coverts deep green obsoletely barred with black; rump and upper tail-coverts deep green. Wing black with a broad, pale blue band, black tips of coverts forming a narrow black bar across the pale blue, and small black patch. Tail blue, outer rectrices and terminal band black. *Below*, deep green washed with blue on throat and belly. Under surface of tail black.

x c. 1

Female similar to male but greater coverts and secondaries marked with yellowish brown instead of blue.

STATUS, DISTRIBUTION AND HABITAT. Rare resident. Kumaon (Naini Tal), Nepal (not recorded since Hodg-

THRUSHES AND CHATS

19

son), Darjeeling, Sikkim, Bhutan(?); Meghalaya and Manipur. Breeds between c. 700 and 1500 m (doubtful records at 3000-3300 m in Sikkim); optimum zone in Manipur 1000-1500 m. Affects undergrowth in dense

Cochoa viridis

▨ Distributional range

evergreen forest watered by small streams and usually on precipitous ground.

Extralimital. Ranges east to Vietnam; a record from Fukien.

GENERAL HABITS. Little known. Keeps singly or in pairs, sometimes in small flocks. Very shy. Often feeds on the ground but at times high up in trees. A bird has been observed flying out after insects from the top of a tall tree.

FOOD. Insects and berries; molluscs.

VOICE AND CALLS. 'A harsh note' is the only sound recorded.

BREEDING. Season, May to July. *Nest*, similar to that of *purpurea* (1690, q.v.), placed in same situations but nearly always near water. *Eggs*, 2 or 3, rarely 4, indistinguishable from those of *purpurea*. Average size of 42 eggs 30.4 × 21.3 mm (Baker). Incubation by both sexes; period undetermined.

MUSEUM DIAGNOSIS. See Field Characters.

Young. Crown-feathers black with a white subterminal bar; ear-coverts similar but white more apparent. A long, black supercilium. Body-feathers, above and below, black with ochraceous centres. Wings and tail as in adult of respective sex. Postjuvinal moult (July to October) of body-feathers, lesser, median, and inner half of greater coverts.

First-year birds with dark shaft-streaks on body-feathers. Male darker than adult, brownish green above and without any blue below. Female paler than male, yellowish green below; under tail-coverts ochraceous green.

(Sanchi, Bhopal State)

Baker, FBI No. 516, Vol. 2: 54

Plate 89, fig. 18

LOCAL NAMES. *Dawra* (U.P.); *Kālo patheral piddo* (Gujarat); *Shēmā* (Hindi in M.P.).

SIZE. Sparrow +; length c. 17 cm (6½ in.).

FIELD CHARACTERS. A plain brown bird, rufous-brown below, with darker wings and blackish tail. Sexes alike.

Young (juvenile), much darker brown without the rufous wash of the adult plumage.

At rest could be confused with female Indian Robin (1717), but is larger and lacks the chestnut patch under tail. In flight-silhouette, and while alighting, could be mistaken for female Blue Rock Thrush (1726).

STATUS, DISTRIBUTION AND HABITAT. An endemic species. Resident; common but capriciously distributed and with some seasonal local movements. (Arrives Dehra Dun mid February departs c. October — SA.) Northeastern Pakistan east of the Chenab river, from the foothills of Jammu south nearly to the Chenab-Jhelum confluence, and India from the Punjab foothills (Kangra, locally up to 1300 m) south through eastern Rajasthan to northern Gujarat (including Kathiawar and Kutch), Madhya Pradesh to the Narmada river, Uttar Pradesh and Bihar to western Bengal. Affects boulders and scarps in rocky hills, ravines, quarries, ruins, old buildings, walls and bungalows in towns and suburbs.

THRUSHES AND CHATS

21

Cercomela fusca

▨ Distributional range

GENERAL HABITS. Keeps singly or in pairs. Usually tame and confiding. May often be seen flitting in and out of gaping windows of ancient palaces and forts, perching on the cornices of tombs and mosques, even fearlessly entering occupied habitations to pick up some titbit, or to shelter from the midday heat or roost at night on rafters and girders. Feeds on the ground, flying down to pick up an insect, often flicking open its wings and tail suddenly to flush out one lurking in a cranny. Has a characteristic habit of flexing its legs, partly spreading its tail and slowly raising it above the level of the back, and bobbing the forepart of its body in a comical curtsy. Is rather pugnacious near nest and will readily attack squirrels, rats, lizards and birds intruding into the vicinity.

FOOD. Beetles, ants and other insects.

VOICE AND CALLS. A short whistling *chee* while bobbing forepart of body and doing a rapid 'bend-stretch'. Alarm-note, a harsh *check-check*. In breeding season a sweet thrush-like song, but less full and of something of the quality of the Striolated Bunting, with snatches of other birds' songs interlarded. Delivered from a wall, cornice or roof-top, sometimes for well over twenty minutes at a stretch with short pauses. Is a good mimic: has been recorded imitating to perfection songs of Yellow-eyed Babbler (1231), Tickell's Blue Flycatcher (1442) and Cuckoo-Shrike (1077) (SA).

BREEDING. Season, February to August, chiefly April to June. Regularly rears two broods, often three. Nest, a rough cup of rootlets, grass bents, wool, hair and sundries, lined with wool, hair or feathers, usually surrounded by a rampart of small pebbles and lumps of earth; placed on ledges or in clefts of rock, hollows in walls or on window sills in ruins, outhouses, garages, etc., often occupied ones. Eggs, 3 or 4, pale blue marked

THRUSHES AND CHATS

1693. *Stoliczka's Bush Chat*. *Saxicola macrorhyncha* (Stoliczka)

Pratincola macrorhyncha Stoliczka, 1872, Jour. Asiat. Soc. Bengal 41: 238 (Rapur and Bhuj, Kachh [Kutch])

Baker, FBI No. 499, Vol. 2: 32

Plate 91, fig. 1

LOCAL NAMES. None recorded.

SIZE. Sparrow ±; length c. 15 cm (6 in.).

FIELD CHARACTERS. Male (adult), winter. Above, sandy buff streaked with brown. A broad pale buff supercilium. Ear-coverts rufous-buff marked with dark brown. A white wing-patch. Upper tail-coverts white or rufous white. Tail dark brown, outer rectrices white. Below, throat white, rest of underparts pale buff.

In summer the pale margins on upperparts are worn off and the bird appears to be sooty brown. Supercilium becomes white.

Female, similar to male but lacks white wing-patch and has no white in tail.

Distinguished from other chats by longer, slimmer build, long tail and conspicuous long black bill. Tail pattern of male in flight—whitish with dark central feathers and ends—confusable with female of some of the wheatears (*Oenanthe*).

STATUS, DISTRIBUTION AND HABITAT. Resident, rare and very local, but not uncommon in some areas. Pakistan east of the Indus river, Haryana (Hissar dist.), eastern Uttar Pradesh (Aligarh), eastern Rajasthan and

Saxicola macrorhyncha

▨ Distributional range

⊗ Extralimital record

Gujarat (Deesa, Kutch and Kathiawar). A desert-loving chat affecting *pāis* in wide, waterless desert studded with *Caparris*, *Calotropis* and other shrubs.

TURDINAE

24

Extralimital. Two records from Kandahar, Afghanistan (cf. JBNHS 31: 706).

GENERAL HABITS. Solitary or in pairs; at times fairly tame, at others excessively wild. Perches on exposed tops of bushes like other members of the genus, descending to the ground to pick up a titbit. Occurs in same biotope as Desert Wheatear (*Oenanthe deserti*) and Short-toed larks (*Calandrella*).

FOOD. Insects.

VOICE AND CALLS. 'A little sharp *chip, chip* note heard now and then' (Hume). Song unrecorded.

BREEDING. Unknown.

MUSEUM DIAGNOSIS. See Field Characters and Key to the Species; for details of plumages H. Whistler, *Ibis* 1922: 302.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	70-77	11-12	24	50-54 mm (Baker)

COLOURS OF BARE PARTS. Iris brown. Bill black, paler at base.

1694. *Hodgson's Bush Chat*. *Saxicola insignis* Gray

Saxicola insignis Gray, 1846, Cat. Mamm. Bds. Nepal: 71, 153 (Nepal)
Baker, FBI No. 500, Vol. 2: 33

Plate 91, fig. 4

LOCAL NAME. Gar-gugga (Patna, Bihar).

SIZE. Sparrow +; length c. 17 cm (6½ in.).

FIELD CHARACTERS. Male (adult), winter. Very similar to ♂ Indian Bush Chat (1697) and easily mistaken for it; but larger size and greater amount of white in the wing distinctive. Above, head black with narrow fulvous fringes. Lores and ear-coverts black. Back black with broad fulvous edges. A large white wing-patch. Upper tail-coverts white. Tail blackish with narrow rufous edges. Below, throat white. Rest of underparts ferruginous, paler on belly; often a few black spots on upper breast.

In summer the pale fringes are worn off the upperparts which become wholly black.

Female. Above, brown; forehead and a faint supercilium fulvous. Two broad fulvous wing-bars. Below, pale rusty fulvous, darker on throat and breast.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor; rare and little known. Occurs mostly in the Gangetic plains of Uttar Pradesh and Bihar from Ambala in the west to northern Bengal in the east; also the Nepal terai (where known only from the type specimen), the Sikkim foothills and the Jalpaiguri duars. Affects heavy grassland, reeds and tamarisks along river beds, and cane fields.

Extralimital. Breeds very locally in the alpine and subalpine zones of the mountains of Kazakhstan, western Mongolia and Inner Mongolia (Ala Shan).

THRUSHES AND CHATS
